

# Section B. Planning, Budgeting and Forecasting

## (30% - Levels A, B, and C)

Last updated 29-Jul-2015

### Strategic Planning

**Strategic Management** (The most important function)

- Is the development and implementation of a sustainable *competitive position* in which the firm's *competitive advantage* provides continued success.<sup>(BL)</sup>
- Sets *overall objectives* for an entity and guides the process of reaching those objectives.
- It is the responsibility of upper management.<sup>(GL)</sup>

**Strategic planning** (sometimes referred to as long-range planning or Strategic analysis)

The purpose of strategic planning is to

- guide the company in its efforts to achieve superior performance, competitive advantage, and maximized shareholder value.
- setting overall organizational objectives and goals and drafting strategic plans. It is a long term process aimed at charting the future course of the organization. <sup>(GL/CMA)</sup>
- is the design and implementation of the *specific steps* and processes necessary to reach the overall objectives.<sup>(GL)</sup>
- Strategic planning involves
  - a comprehensive look at an organization in relation to its industry, competitors, and environment.<sup>(IMA)</sup>
    - A systematic approach to analyzing threats and opportunities and examining why some organizational strategies have better competitive and profit prospects than others
  - drafting of strategic plans.
  - A sound framework for developing an effective operating budget.
  - An organizational learning opportunity for managers to think about strategies and how to best implement them
  - An exercise to **align** management decision making and actions with corporate strategies (e.g., to gain the buy-in of managers and show how their decisions and actions support corporate programs)
  - A basis for both financial and nonfinancial performance measures
  - A channel of communication among all levels of management about strategies, objectives, operational plans, and so on.
  - Guidance for approaching new situations
- It is the responsibility of upper management.<sup>(GL)</sup>
  - Although traditionally the responsibility of top management, all organizational members should be involved in the process. Well thought out strategic planning can help an organization adeptly navigate through turbulent times-both good and bad.<sup>(IMA)</sup>
  - An organizational learning opportunity for managers to think about strategies and how to best implement them

### Limitations of Strategic Planning

- The effort, time, and expense involved in the process
- The fact that planning based on predictions is not an exact science; due to a variety of factors, plans may prove to be incorrect and fail
- The potential for resistance to change resulting from entrenched ways of doing things
- The risk that planning can become a bureaucratic exercise devoid of fresh ideas and strategic thinking

Strategic planning is **based on**:

- identifying and specifying ultimate organizational goals and objectives (usually addressed first),
- evaluating the strengths and weaknesses of the organization, and
- assessing risk levels,
- forecasting the future direction and influences of factors relevant to the organization such as:
  - market trends,
  - changes in technology,
  - international competition, and
  - social change.
- deriving the best strategy for reaching the objectives given the organization's strengths and weaknesses and the relevant future trends.
- The time frame for strategic planning is normally five to ten years. It may, however, be longer.

Setting ultimate objectives for the firm is a necessary prelude to **developing strategies** for achieving those objectives. **Plans** and budgets are then needed to implement those strategies.

Strategic management and strategic planning are thus *closely linked*. By their nature, strategic management and strategic planning have a long-term planning horizon.<sup>(GL)</sup>

The final step is to derive the best **strategy** for reaching the objectives.

### Strategy

**Strategy** is the **organization's plan** to

- match its **strengths/capabilities** with the opportunities in the marketplace to accomplish its desired goals over the short and long term.
- addresses the objectives of the organization;
- locates potential markets;
- considers the impact of events, competitors, and the economy;
- addresses the structure of the organization; and
- evaluates the risks of alternative strategies. <sup>(IMA)</sup>  
set of actions taken by managers of a company to increase the company's performance.

### Steps in the Strategic Planning/Management Process (five-stage process):

**Step 1** Defining/selecting the company's mission and addressing the key corporate goals.

**Step 2** Analyzing the organization's external factors & the internal operating environment .

**Step 3** Formulating and selecting strategies (SWOT analysis) that, Based on the results of the situational analysis, upper management develops a group of strategies describing how the mission will be achieved.

**Step 4 Developing and implementing the chosen strategies.**

Strategic plans are implemented through the execution of component plans at each level of the entity.

**Step 5 Strategic controls and feedback** are used to monitor progress, isolate problems, and take corrective action. Over the long term, feedback is the basis for adjusting the original mission and objectives.

M-A-S-I-C

**Step 1 Defining the company's mission and addressing the key corporate goals.**

**The Mission Statement**

- Provides the guiding compass for an organization.
- Provides the context within which its strategies will be formulated.
- Summarizes the entity's reason for existing.
- It provides the framework for formulation of the company's strategies.
- succinctly articulates an organization's business position.
- expresses how the organization will continuously move toward its vision and provides a clear view of what the firm is trying to accomplish for its customers.

**Characteristics of Effective Missions**

- When they consist of a single sentence.
- Stated in general terms (very broad).
- A mission statement answers this question: Why are we in business? In answering this question, a mission statement must be:
  - accurate,
  - easily understood,
  - motivating, and
  - transferable into action.
- It needs to be **flexible** and ready to adapt to changing conditions and new ways of serving its customers' needs.

**The mission statement includes four components:**

**1) A statement of the company's "rreason to be."**

**2) Its vision, or a statement of a desired future stat.**

**3) A statement of the organization's values.**

**4) A statement of its major goals.**

- In order for plans to be as effective as possible, they must be **coordinated among the different units** and departments in the company so that they are in alignment with the larger goals of the company.

### Types of Plans and General Principles

- **Strategic Plans (Long-Term Plans)**
- **Intermediate Plans**
- **Short-Term Plans**

### Types of Organizations Goals

- Strategic Goals
- Tactical Goals
- Operational Objectives

### Strategic Plans (Long-Term Plans)

- **Strategic plans** are broad, general, long-term plans (usually five years or longer) and are based on the objectives of the organization.
- The results of this annual planning process are usually used, along with tactical and operational planning, in **developing the budget for the coming year**.
  - In this way, the strategic plan is used to determine resource allocation within the company.
- Strategic planning is **directional**, rather than operational. This means that the company focuses on where it wants to go instead of specifically how it will get there.

**Note:** The longer the time frame of the plan, the higher up in the organization the planning should be done. Similarly, the shorter the time frame of the plan, the lower in the organizational hierarchy the planning should be prepared.

### Characteristics of successful strategic plans

A successful strategic plan is one that:

1. Assists the organization in achieving its long-term goals and objectives.
2. It has well-defined goals consistent with the strategic plan and the mission from which the plan we derived.
3. It also has SMART objectives, objectives that are:
  - Specific
  - Measurable
  - Achievable
  - Realistic
  - Timely

### Strategic Goals

- established at the highest levels of an organization, part of the firm's strategic plan, long range in nature.

*Strategic goals require additional goals to be achieved at the tactical level.*

### Intermediate Plans

The **strategic plan** is then broken down into **intermediate or tactical plans** (one to five years), which are designed to implement specific parts of the strategic plan.

- Upper and middle managers develop tactical plans.
- Operational plans are developed by middle and lower-level managers.
  - For example, the board of directors **should not** be involved in developing weekly work plans for an assembly line.

### Tactical Goals

- established at middle and lower levels of an organization.
- established by business (also referred to as responsibility centers and strategic business units {SBUs}) or functional departments

## Short-Term Plans

- All shorter-term plans need to **work toward the strategic** plans of the company.
- **Short-term or operational plans** are the primary basis of **budgets**.
- Operational plans refine the overall objectives from the strategic and tactical plans in order to develop the **programs, policies**, and performance expectations required to achieve the company's long-term strategic goals.
- Short-term objectives and the tactics to achieve them *should flow directly* from the organization's strategic plan and *should be designed to achieve* the goals and objectives set forth in the strategic plan. The short-term objectives would be *milestones* along the road to the achievement of the long term goals.

Q. A firm's statement of broad objectives or mission statement should accomplish all of the following except

- A. Outlining strategies for technological development, market expansion, and product differentiation.
- B. Defining the purpose of the company.
- C. Providing an overall guide to those in high-level, decision-making positions.
- D. Stating the moral and ethical principles that guide the actions of the firm.

Answer (A) is correct. The determination of organizational objectives is the first step in the planning process. A mission statement is a formal, written document that defines the organization's purpose in society, for example, to produce and distribute certain goods of high quality in a manner beneficial to the public, employees, shareholders, and other constituencies. Thus, a mission statement does not announce specific operating plans. It does not describe strategies for technological development, market expansion, or product differentiation because these are tasks for operating management.

Analyzing and reviewing departmental budgets is an aspect of operational management and not a part of strategic planning. Analysis of the current month's budget variances is not an aspect of strategic planning. Setting the target product mix and production schedule for the current year is not a concern of strategic analysis because it is a short-term activity. (GL/CMA)

### Importance of aligning long-term objectives with other tactical short term plans and budget

Explain why short-term objectives, tactics for achieving these objectives, and operational planning (master budget) must be congruent with the strategic plan and contribute to the achievement of long-term strategic goals.

### Alignment of Tactics with Long-Term Strategic Goals

Strategic plan precedes an operational plan; the strategic plan provides the foundation upon which the more detailed operational plan is developed. In that sense, strategic plans are "macro" plans and operational plans are "micro" plans.

## Importance of Strategy in Budgeting

A prerequisite for budget development is a strategic analysis that matches an entity's capabilities with available marketplace opportunities.

### Strategy

A firm's **strategy** is the *path* it chooses for attaining its long-term goals and mission.(B).

**Strategic analysis** is the basis for both long-term and short-term planning. (IMA)  
In turn, these plans lead to the formulation of budgets.

**Budgets** provide feedback to managers about the likely effects of their strategic plans. Managers use this feedback to revise their strategic plans.(H)

**Strategy** is the **organization's plan** to match its strengths with the opportunities in the marketplace to accomplish its desired goals over the short and long term.  
**Strategy** is the starting point in preparing its plans and budgets.

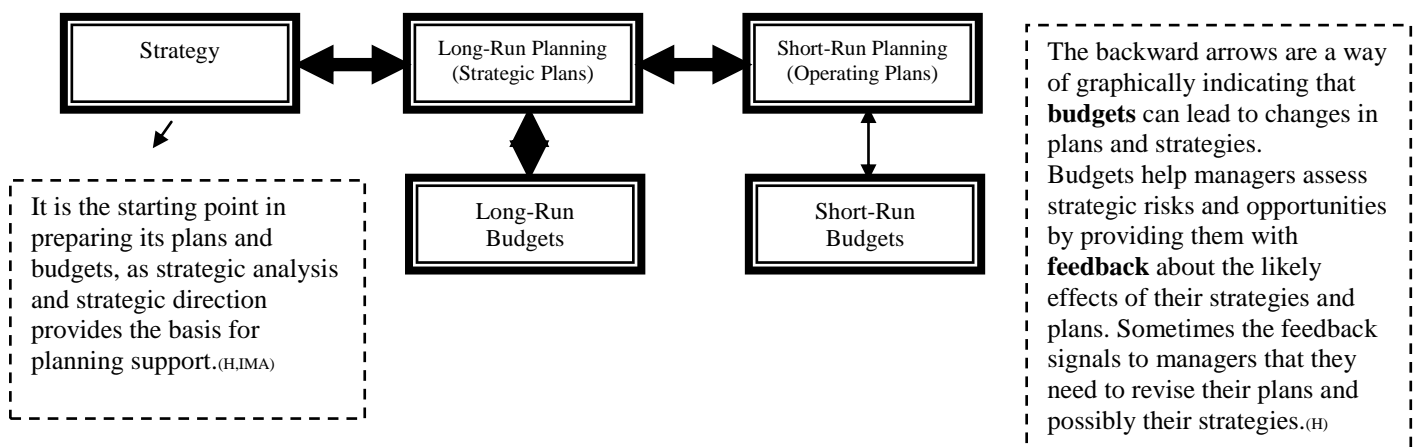

### Budgeting

**Budgeting** is a common accounting tool that companies use for implementing strategy, as budgeting facilitates movement toward strategic goals. (H,IMA)  
A **budget** should start with a careful review and study of the organization's strategic plan. The objective is to build a budget to achieve the organization's strategic goals and objectives. (B)

By not relying on its strategic plan, an organization very likely would not be able to fully utilize its strengths and take full advantage of opportunities. Ignoring the strategic plan can result in **not** adequately funding the projects and initiatives that are critical to achieving results aside from the daily operations of taking and fulfilling sales orders. (B)

## Strategy, Planning, and Budgets

Strategic plans are expressed through long-run budgets and operating plans are expressed via short-run budgets. But there is more to the story! The exhibit shows arrows pointing backward as well as forward. (H)

## Resource Allocation

All entities have a finite amount of resources and want to make the most of their capital. The allocation of scarce resources among competing opportunities is accomplished through implementation of a strategy.<sup>(IMA)</sup>

An organization expresses its

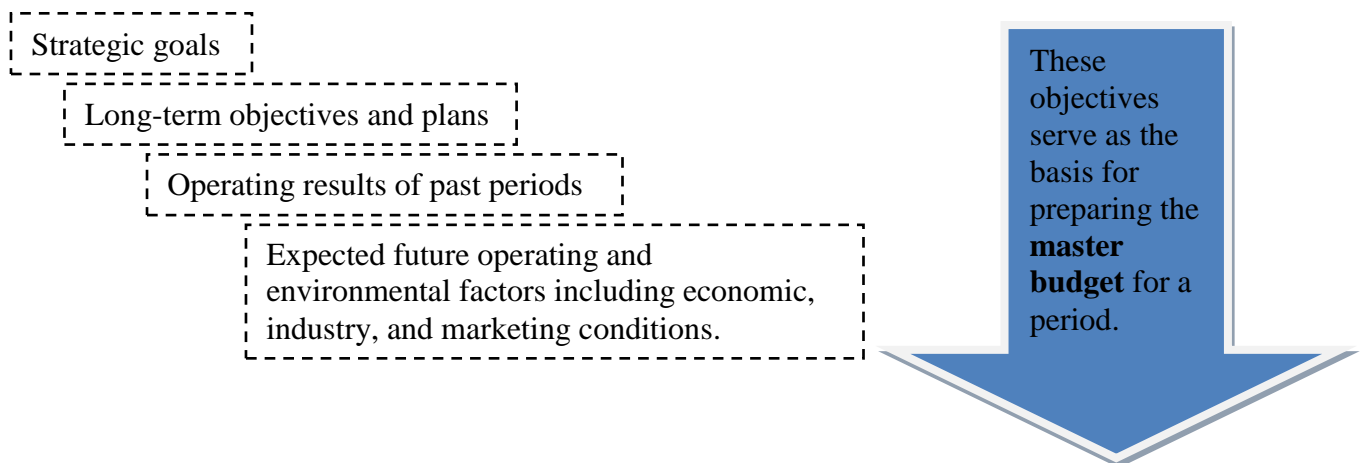

The **strategic goals and objectives** of the organization are, ultimately, accomplished through a focused set of initiatives and projects that creates value for the organization.

### Short-Term Objectives and the Master Budget

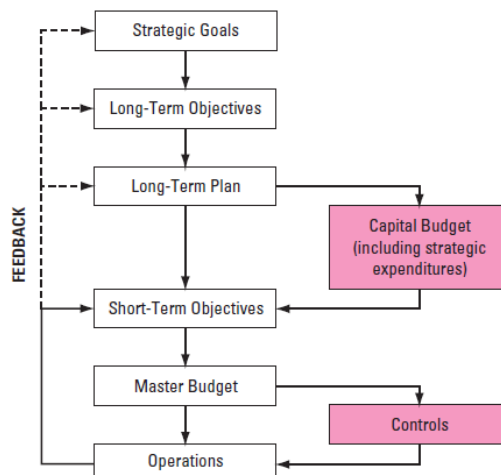

**Short-term objectives** are goals for the coming period, which can be a **month**, a **quarter**, a **year**, or any length of time desired by the organization for planning purposes.<sup>(B)</sup>

An organization determines **short-term objectives for the budget period based on**

A **master budget** translates the organization's **short-term objectives** into action steps. A master budget reflects an organization's operating and financing plans for the upcoming budget period.<sup>(B)</sup>

The relationships among strategic goals, long-term objectives and plans, short-term goals, budgets, operations, and controls. (next CSO discuss the master budget in depth)

**Efficient allocation of organizational resources during the budgeting process can be achieved through:**

- The process of developing the operating budgets for the individual units in an organization.
- Making decisions about the most profitable way to utilize the resources available.

After defining the company's mission and developing its goals, the first step in developing a strategic plan is to analyze the forces that shape the industry in which the company operates and the competition within that industry in order to understand the **opportunities** available to the firm and any **threats** confronting the firm that can affect it in the pursuit of its mission. Understanding its opportunities and threats will enable the company to outperform the competition.

#### **External factors (recognition of OLT)**

- Are external or environmental opportunities and threats that face the organization.
  - **Opportunities** are those things that would enhance the organization's competitive position and profitability.
  - **Threats** are *risks* that, if they occur, would be detrimental to the organization's competitive position and profitability.

The specific external factors affecting an organization's strategy are determined by its industry and broader environment. They are identified by considering

- a) **Macroenvironment** factors (economic, demographic, political, legal, social, cultural, and technical) and
- b) **Microenvironment** factors (suppliers, customers, distributors, competitors, and other competitive factors in the industry).

#### **(LOS) External factors that should be analyzed & recognition of OLT**

Identify the external competitive environment factors that should be analyzed during the strategic planning process and understand how this analysis leads to recognition of organizational opportunities, limitations, and threats

Three environments should be examined, and the three environments are interrelated and shaping the organizational strategy:

1. The **industry** in which the company operates,
  - Market forces, industry trends, and competition.
2. The **country** or the **national environment** in which the company operates as well as the international environment,
3. And the wider environment, or **macroenvironment** in which the company operates.
  - Economic, demographic, political, legal and regulatory factors, social, cultural, and technical changes.
  - Stakeholder groups and their social concerns.
  - Globalization trends, emerging markets, and nongovernment organizations (e.g., United Nations, World Bank, etc.).

**Opportunities** arise when companies can *leverage* external conditions to develop and implement strategies that will make them more profitable.

**Threats** include conditions in the external environment that pose a *danger* to profitability

pe

Once the boundaries of an industry have been identified, managers face the task of analyzing competitive forces within the industry environment in order to identify opportunities and threats. *Michael E. Porter's* well-known framework, known as “**The Five Forces Model**,” has helped managers with this analysis. An extension of his model, shown in Figure 2.2, focuses on six forces that shape competition within an industry:

- (1) the risk of entry by potential competitors,
- (2) the intensity of rivalry among established companies within an industry,
- (3) the bargaining power of buyers,
- (4) the bargaining power of suppliers,
- (5) the closeness of substitutes to an industry's products and
- (6) the power of complement providers (Porter did not recognize this sixth force).

Michael Porter developed a model examining five forces and their collective role in determining the strength of competition and profitability. It includes an analysis of the five competitive forces that determine long-term profitability as measured by long-term return on investment.

#### Porter's Arguments:

- As the **forces grow stronger**, they **limit** the ability of established companies to raise prices and earn greater profits.

According to Porter, the five forces that shape competition within an industry are:

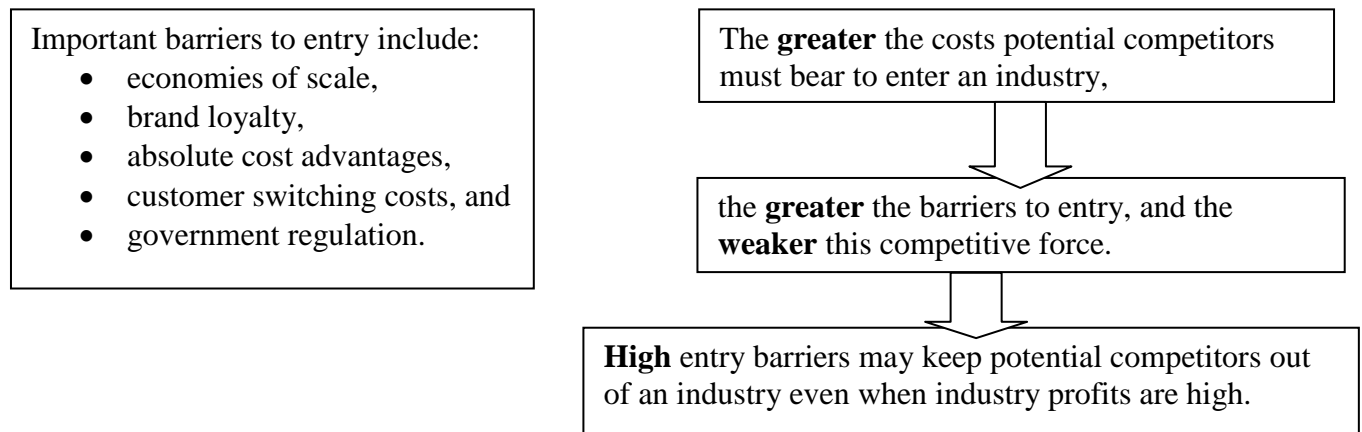

## 1) The risk of entry by potential competitors.

### Definition

**Potential competitors** are companies that are **not** currently competing in an industry, but have the **capability** to do so if they choose.

The risk of entry by potential competitors is a function of the height of barriers to entry, that is, factors that make it costly for companies to enter an industry.

The **greater** the costs potential competitors must bear to enter an industry,

the **greater** the barriers to entry, and the **weaker** this competitive force.

**High** entry barriers may keep potential competitors out of an industry even when industry profits are high.

### Note:

The **most favorable industry condition** is one in which:  
**entry barriers are high** and **exit barriers are low.**

When the **threat** of new entrants is **minimal** and **exit is not difficult**,

**Returns are high, and risk is reduced in the event of poor performance.**

**Low entry barriers** keep long-term **profitability low** because new firms can enter the industry,

**increasing competition** and **lowering prices** and the **market shares** of existing firms.

## 2) The intensity of rivalry among established companies within an industry.

### Definition

Rivalry is the *competition among companies in an industry to gain market share from one another.*

Weapons in the competition include:

- prices,
- product design,
- promotional efforts,
- selling efforts, and
- service and sup-port after the sale.

The intensity of rivalry among established companies within an industry is largely a function of four factors:

- (1) industry competitive structure,
- (2) demand conditions,
- (3) cost conditions, and
- (4) the height of exit barriers in the industry.

### 3) The bargaining power of buyers.

- If buyers such as large discount store chains have the ability to **bargain down prices** or to demand better product quality and service that would increase manufacturers' costs, an industry can become less profitable. Therefore, **powerful buyers are a threat**.

### 4) The bargaining power of suppliers.

- If suppliers have the ability to **raise the prices of inputs** such as materials or direct labor (through labor unions, for instance) or to lower quality, it will raise the costs of companies in the industry. So **powerful suppliers are also a threat**.

### 5) The closeness of substitutes to an industry's products.

- **The existence of close substitutes** for an industry's product is a **threat** because it limits the prices that can be charged for the product, the less attractive the industry is to potential entrants.
- If there are **few or no close substitutes**, then companies have the **opportunity** to raise prices without fear that their customers will switch to a substitute.

#### Linkage of the Five Forces to Strategic Planning

The collective strength of the five competitive forces determines the ability of firms to earn rates of return on investment in excess of the cost of capital. In industries where the strength of the five forces is **favorable** (e.g., pharmaceuticals), *profits are attractive*. Understanding industry structure is a critical starting point during strategy formulation. The strongest force or forces assume increased importance during strategic planning and strategy formulation.

#### 2. Analyzing the **national and international environment** includes assessing:

- domestic as well as international political risk:
  - government expropriation and war
- the impact of **globalization** (migration to international operations) on competition within the industry

#### 3. Analyzing the **macroenvironment (macroeconomic) factors** includes assessing:

- **Economic condition** will affect demand and thus sales revenue and net income in the future.
  - Economic growth
    - leads to more consumer spending and gives companies the opportunity to expand their operations and increase their profits.
  - Economic recession
    - leads to a reduction in consumer spending and, in a mature industry, may cause price wars.
- The level of **interest rates** affect any company's cost of capital and thus its ability to raise capital and invest and expand.
  - Rising interest rates will cause demand to decrease
  - Falling interest rates will cause demand to increase.
- **Changes in currency exchange** rates affect the competitiveness of companies in international trade.
  - A declining local currency creates opportunities for increased international sales while decreasing foreign competition.
  - An increasing local currency causes the opposite condition.

## Step 2.2

### Analyzing the Internal Environment

Analyze the organization's internal operating environment to identify the organization's strengths and weaknesses.

#### Internal factors (recognition of SWC)

- Are the organization's strengths and weaknesses.
  - **Strengths** are those things that would enhance the organization's competitive position and profitability;
  - **Weaknesses** are those that *detract* from its competitive position and profitability.

**Distinctive competencies** are the firm-specific strengths of a company. Valuable distinctive competencies enable a company to earn a profit rate that is above the industry average.

- The distinctive competencies of an organization arise from its:
  - **resources** (its financial, physical, human, technological, and organizational assets) and
  - **capabilities** (its skills at coordinating resources and putting them to productive use).

Therefore, Internal analysis focuses on reviewing the:

- Resources,
- Capabilities, and
- Competencies of a company.

#### Competitive Advantage (efficiency, quality, innovation, and responsiveness to customers).

- A company is said to have competitive advantage when it is *more profitable* than the average company in its industry.
  - It has a sustained competitive advantage if it is able to continue **having above-average profitability over several years** as this is the primary objective of strategy.
- In order to achieve a competitive advantage, a company needs to pursue strategies that build on its existing resources and capabilities and formulate strategies that build additional resources and capabilities (develop new competencies).

## Step 3

### Formulating Strategies (SWOT Analysis also called situational analysis).

Formulating and selecting strategies that, consistent with the organization's mission and goals, will *optimize* the organization's strengths and *correct* its weaknesses and limitations for the purpose of *taking advantage* of external opportunities while countering external threats (SWOT analysis); SWOT analysis consists of generating a series of strategic alternatives that could be pursued given the company's strengths, weaknesses, opportunities and threats in order to select the strategies that will do the best to align the company's resources and capabilities to the demands of its environment.

#### Four Generic Competitive Strategies

The value creation frontier can be reached by choosing among four generic competitive strategies:

- cost leadership,
- focused cost leadership,
- differentiation, and
- focused differentiation.

## **Developing a Competitive Strategy**

In developing a sustainable competitive position, each firm purposefully or as a result of market forces arrives at one of the two competitive strategies: cost leadership or differentiation

### **(1) Cost Leadership to achieve competitive advantage**

#### **Cost Leadership**

Cost leadership is a strategy in which a firm outperforms competitors in producing products or services at the lowest cost for these firms, cost management is critical.<sup>(B)</sup>

**Cost Leader** (A company using cost leadership)

- Firms known to be successful at cost leadership are typically very large manufacturers and retailers, such as Wal-Mart, Texas Instruments, and Dell.
- normally has a relatively large market share and tends to avoid niche or segment markets by using the price advantage to attract a large portion of the broad market.

#### **Cost Leader achieve Higher profits through Lower Prices**

- They have been profitable and have grown over the years on the basis of providing quality products or services at low prices by judiciously managing their costs.<sup>(H)</sup>
- makes sustainable profits at lower prices, thereby limiting the growth of competition in the industry through its success at reducing price and undermining the profitability of competitors, which must meet the firm's low price.

#### **A potential weakness of the cost leadership strategy**

- is the tendency to cut costs in a way that undermines demand for the product or service
  - for example, by deleting key features, This will lead to customer dissatisfaction and in turn, to decreases in demand and sales. The resulting decreased profitability.
  - The cost leader remains competitive only so long as the consumer sees that the product or service is (at least nearly) equivalent to competing products that cost somewhat more.
- The danger in this strategy is that competitors may find ways to lower their cost structures, too.

**(2) Focused cost leadership**, or competing within a narrow market segment using the strategy of cost leadership.

**(3) Differentiation strategy** (sometimes called: **product leadership**) to achieve competitive advantage

#### **Differentiation**

The differentiation strategy is implemented by creating a product or service that is unique/ unusual in some important way, usually:

1. higher excellent quality,
2. customer service product features, responsiveness to customer needs, or
3. superior innovation.

#### **Differentiator**

- A differentiator can charge a **higher price** than its closest competitors because of its perceived advantages to the customer.

- Firms known to be successful differentiator are cosmetics, fashion, and pharmaceutical firms, compete on the basis of product leadership, in which the unusual or **innovative** features of the product make the firm successful.
  - For these firms, the critical management concern is maintaining product leadership through product development and marketing.<sup>(B)</sup>
- Most industries, including, consumer electronics, and clothing, have differentiated firms. The appeal of differentiation is especially strong for product lines for which the perception of quality and image is important, as in cosmetics, jewelry, and automobiles.
  - Tiffany, Bentley, Rolex, Maytag, and BMW are good examples of firms that have a differentiation strategy, Apple Inc., the maker of iPods and iPhones, and Johnson & Johnson, the pharmaceutical giant.

### Differentiator achieve Higher profits differentiated products

- They generate their profits and growth on the basis of their ability to offer differentiated or unique products or services that appeal to their customers and are often priced higher than the less-popular products or services of their competitors.

### Sources of differentiated products

- For instance, differentiation on the basis of innovation requires an effective **R&D function**.
- The differentiator must **control its costs** so that the price of the product is not greater than its customers will pay, but it must not minimize them so much that it loses its source of differentiation.

#### A weakness of the differentiation strategy

Is the firm's tendency to undermine its strength by attempting to lower costs or by ignoring the necessity of having a continual and aggressive marketing plan to reinforce the differentiation. If the consumer begins to believe that the difference is not significant, lower-cost rival products will appear more attractive. is (at least nearly) equivalent to competing products that cost somewhat more.

The danger with a differentiation strategy is that competitors may imitate successful differentiation, eliminating the advantage.

(4) **Focused differentiation**, or a business model that specializes in providing a differentiated product to serve the needs of just one or two market segments or niches.

#### Step 4

#### Developing and Implementing the Chosen Strategies

Implementing strategy involves decisions about organizational design & how to use the

1. organizational structure,
2. corporate culture and
3. control environment to achieve the company's goals and execute its business model.

#### Step 5

#### Strategic controls and feedback

**Strategic controls and feedback** are used to monitor progress, isolate problems, and take corrective action. Over the long term, feedback is the basis for adjusting the original mission and objectives. The Balanced Scorecard is a widely-used strategic performance management tool designed to manage strategic performance.

### How can an organization translate its strategy into a set of performance measures?

It can do so by developing a *balanced scorecard* that provides the framework for a strategic measurement and management system. The balanced scorecard measures performance from four perspectives. One dimension is financial, the other three dimensions are non-financial:

- (1) financial,
- (2) customer,
- (3) internal business processes, and
- (4) learning and growth.

### Companies use the BSC as a management tool to:

- Clarify and communicate strategy
  - that translates an organization's mission and strategy into a set of four performance measures.<sup>(H)</sup>
  - transforms an organization's strategic plan from a passive document into the "marching orders" for the organization in its day-to-day activities.
  - The balanced scorecard enables execution of strategies. But a company's strategy influences the measures it uses to track performance in each of these perspectives.
    - A strategy is essentially a theory about how to achieve the organization's goals.<sup>(G)</sup>
- Align individual and unit goals to strategy
  - promotes **goal congruence** by encouraging everyone in the organization to work toward the same goals.
- Link strategy to the budgeting process
- Get feedback for continuous strategy improvement
  - It provides a framework that not only provides **performance measurements** but helps management to identify what needs to be done and how its achievement can be measured.
- Balanced scorecard-A process of compiling and organizing the key performance indicators (KPIs) of an organization into four segments: financial, customer, internal business process, and learning and growth. Each KPI can be measured in a specific way so that it can be managed appropriately.

### The BCG Matrix

The BCG (Boston Consulting Group) Growth Share Matrix looks at the company's products or services as one of the following: stars, cash cows, dogs, or question marks.

The BCG Growth-Share Matrix is a method of analyzing a *company's portfolio* of products to determine where each product is in its life cycle in order to make better decisions about allocation of resources in planning. Since a large firm may be viewed as a *portfolio* of investments in the form of strategic business units (SBUs), techniques of portfolio analysis have been developed to aid management in making decisions about resource allocation, new business startups and acquisitions, downsizing, and divestitures.

### **Stars (high RMS, high MGR)**

A star is in an industry that has a high market growth rate, and the product has a high share of the market.

Stars are products or services with

- *High Relative Market Share* (high cash generation) capabilities.
- *High Market Growth Rates* (high cash usage) and

Net cash flow (plus/minus) is modest.

- High Cash generation
- High Cash usage

### **Question marks (low RMS, high MGR)**

A **question mark** is a product in an industry with a high market growth rate, but the product has a low share of the market.

Question marks have

- *Low Relative Market Share* (low cash generation) capabilities and
- *High Market Growth Rates* (high cash usage) and

Low cash generation & High cash usage

- High Cash Usage
- Low Cash Generation

### **Cash cows (high RMS, low MGR)**

A cash cow is in an industry with a low market growth rate, but the product has a high share of the market.

- Cash cows are in mature markets in which the growth rate has slowed, but they are market leaders.
- The characteristics of a cash cow product do not change much, customers know what they are getting, and the price does not change much either.

Cash cows have

- *High Relative Market Share* (high cash generation) capabilities....but
- *Low Market Growth Rates* (low cash usage).

### Dogs (low RMS, low MGR)

- A dog is in a mature industry with a low market growth rate, and it has a low share of the market. A dog does not consume much cash, but it does not generate much cash, either.

Dogs have

- *Low Relative Market Share* (low cash generation) capabilities and
- *Low Market Growth Rates* (low cash usage).
  - The **cash cows** supply the cash to fund the future growth of the stars and the question marks.

### Balanced Scorecard

#### Definition

A framework for implementing strategy that translates an organization's mission and strategy into a set of performance measures. <sup>(11)</sup>

A process of compiling and organizing the key performance indicators (KPIs) of an organization into four segments: Financial, Customer, Internal Business Process, and Learning and growth.

KPIs are **measures** that drive the organization to achieve its goals. Each KPI can be measured in a specific way so that it can be managed appropriately.

#### Benefits of Implementing the BSC

- Moving organizations away from concentrating solely on financial data, thus broadens management's attention to **short-run and long-run performance**.
  - does not focus solely on achieving **short-run** financial objectives.
- It also highlights the nonfinancial objectives that an organization must achieve to meet and **sustain** its financial objectives.
- In for-profit companies, the primary goal of the balanced scorecard is to sustain long-run financial performance. Nonfinancial measures simply serve as **leading indicators** for the hard-to-measure long-run financial performance.
- encourages managers to focus on elements that tend to lead to **long-term success** instead of on short-term financial performance by rewarding them for improvements in those elements that tend to lead to long-term success.
  - Evaluating and rewarding managers based on these non-financial indicators should lead to long-term financial performance improvements, if the proper non-financial indicators have been selected.

#### Lagging vs. Leading indicators

##### Financial Measures

- Financial measures that focus on short-term financial performance are in fact **lagging** indicators of how the company is doing.

##### Non- Financial Measures

- Improvements in the non-financial measures provide the prospect of increased future economic value for shareholders. Nonfinancial measures focus on performance that should ultimately result in improved long-term financial performance. Thus nonfinancial measures are **leading** indicators of performance.

**The perspectives and their content have changed since the first article written by Kaplan and Norton. The current perspectives are as follows.**

<sup>1</sup> An **accounting report** that includes the firm's critical success factors in four areas: ...

## The Four Perspectives

### 1) The Financial perspective

- focuses on the organization's financial objectives and enables tracking of financial success and shareholder value.

By Evaluating

- the profitability of the strategy and
- the creation of shareholder value.

#### Common measures of financial performance are:

- Operating income, sales revenue growth, revenue from new products, gross margin percentage, cost reductions, Residual Income, and Return on Investment, New Produce Sales, Price/Earnings Ratio, Quick Ratio, return on equity, earnings per share and accuracy of sales projections, stock prices, operating earnings, earnings trend, revenue growth, gross margin percentage, cost reductions, cash flow coverage and trends, turnover (assets, receivables, and inventory), and interest coverage.

#### Links to Financial Measures

- Financial performance is a priority, but good long-term financial performance **will not be achieved** if goals in other **non-financial** categories are not attained.
- To drive future financial performance, the BSC requires assessment of other non-financial categories

### 2) The Customer perspective involves

- This perspective identifies **targeted customer** and **market segments** and measures the company's success in these segments.

#### Market Share

- measuring this success is the trend in the company's share of the market over time and the degree to which it increases in line with management goals.

#### Customer Satisfaction

- if customers are not satisfied they will take their business elsewhere.
- meeting customer needs better than the competition or being known for high quality and excellent customer service.
- The number of repeat customers and the percentage of deliveries that are made as promised and when promised can measure the degree to which customers' needs are being met.
- Customer surveys can be used to measure the level of customer service provided after the sale.

#### Pricing

- become the **lowest cost supplier**, in which case pricing goals will be part of the customer perspective.
  - Being the lowest cost supplier can be measured by the customer's total cost of using the company's product relative to the customer's total cost to use competitors' products.

#### Quality

- The number of defective products returned and the level of product reliability over time can measure achievement of quality goals.

#### Common measures of Customer satisfaction

- Focusing on the customer is critical to accomplishing goals as the customer drives all of a **company's revenue**.
- The primary customer outcome measures include market share, acquisition, satisfaction, retention, and profitability.

<u>CSF</u>	<u>Financial Measure</u>	<u>Nonfinancial Measure</u>
Customer Satisfaction	Trends in dollar amounts of returns	Market share
Dealer and Distributor Relationships	Trends in dollar amounts of discounts taken	Lead time
Marketing and Selling Performance	Trends in dollar amounts of sales	Market research results
Prompt Delivery	Trend in delivery expenses	On-time delivery rate
Quality	Dollar amount of defects	Rate of defects

1) **Other financial measures** may include dollar amount of sales, dollar amount of returns, and warranty expense.

2) **Other nonfinancial measures** may include unit sales, trends in unit sales, trend in market share, number of returns, rate of returns, customer retention rate, number of defects, number of warranty claims, rate of warranty claims, survey results, coverage and strength of distribution channels, training of marketing people, service response time, and service effectiveness,

### 3) The Internal Process perspective (IBP)

- includes innovations and improvements in products and services, operations, and customer service/support needed to create value for customers, which in turn furthers the Financial perspective.

How “Internal Business Process” (IBP) can help the company with below objectives?

#### If one of the company’s customer goals is to be the lowest cost supplier

- IBP should maintaining efficient, low-cost production,
  - which can be measured by metrics such as the cost of raw materials, the number of employee hours needed to manufacture a unit of product, and plant utilization. Efficient cycle times also keep costs low.

#### If high quality is a customer satisfaction goal

- the support for that objective will also be required within the **IBP** that create high quality, such as good manufacturing practices.

#### Meeting customers’ needs better than the competition

- is supported by innovations in products and services, which can be measured by the number of new product introductions.

#### Technological capability for customer service personnel

- is necessary to provide excellent customer service, and it is also needed in manufacturing in order to produce high quality products efficiently.

#### Internal business process measures

Go beyond simple financial variance measures to include output measures, such as quality, cycle time, yield, order fulfillment, production planning, throughput, and turnover.

<u>CSF</u>	<u>Financial Measure</u>	<u>Nonfinancial Measure</u>
Quality	Scrap costs	Rate of scrap and rework
Productivity	Change in company revenue/change in company costs	Units produced per machine hour
Flexibility of Response to Changing Conditions	Cost to re-purpose machine for new use	Time to repurpose machine for new use
Operating Readiness	Set-up costs	Downtime
Safety	Dollar amount of injury claims	Number of injury claims

1) **Other financial measures** may include such things as quality costs and level of inventory carrying costs.

2) **Other nonfinancial measures** may include new products marketed, technological capabilities, survey results, field service reports, vendor defect rate, cycle time, labor and machine efficiency, setup time, scheduling effectiveness, capacity usage, maintenance, and accidents and their results.

#### 4) The Learning and Growth perspective (originally called the innovation and learning perspective)<sup>2</sup>

The Learning and Growth perspective includes the capabilities that the organization must have in order to achieve its objectives in the **IBP** perspective.

##### Components of the Learning and Growth perspective (3 C's)

- **Human capital**, or the skills, talents, and knowledge of employees;
- **Information capital**, or the information systems, networks, and technology infrastructure of the company; and
- **Organizational capital**, or the company's culture, leadership, degree of teamwork, and knowledge management.

##### Innovation and learning measures

Focus on becoming efficient and effective at producing new products. The measures include time to market, percentage of sales from new products, and new products versus competitor's new products.

##### Learning and growth measures

Focus on education and training of personnel and can be measured by training sessions provided, developing leadership skills, and reducing the number of defects.

<u>CSF</u>	<u>Financial Measure</u>	<u>Nonfinancial Measure</u>
Development of Products	New R&D costs	Number of new patents applied for
Promptness of Their Introduction	Lost revenue (from slow introduction of new product to market)	Length of time to bring a product to market
Human Resource Development	Recruiting costs	Personnel turnover

<sup>2</sup> Originally focused on **employee learning**, but it now covers not only human capital but also **organizational capital and information capital**. Initially innovation was part of this perspective, but users of the balanced scorecard system discovered that innovation properly belonged in the Internal Process category.

Morale

Orientation/team-building costs

Personnel complaints

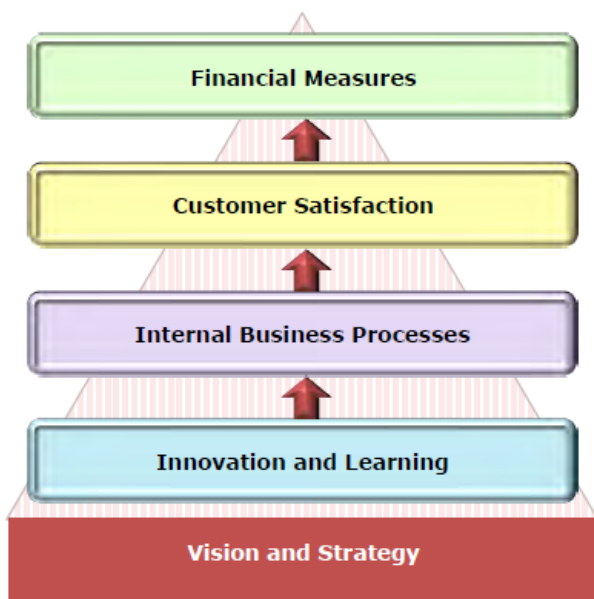

Competence of Work Force    Training/retraining costs

Hours of training

1) **Other financial measures** may include financial and operating results.

2) **Other nonfinancial measures** may include number of design changes and copyrights registered, R&D personnel qualifications, actual versus planned shipping dates, skill set levels attained, personnel survey results, organizational learning, and industry leadership.

### The Hierarchical Four broad categories of performance indicators/ perspectives.

In order for the balanced scorecard to be useful, the organization must be able to identify a cause-and-effect relationship between an action that could be taken (or avoided), that will have an effect on a CSF.

- For example: If the organization increases its R&D budget, then the organization can increase the number of new patents applied for.
- Achievement of the objectives in each perspective makes it possible to achieve the objectives in the next higher perspective.
- This chaining of objectives and perspectives embodies the implementation of a **strategy map**.

### Key Performance Indicators for a Balanced Scorecard<sup>3</sup>

- KPIs are measures of factors *critical to the success* of the organization.
- SWOT analysis helps a company determine its key performance indicators (KPIs).
- KPIs are specific, measurable goals that must be met in order to achieve a firm's strategy.
- Each KPI requires a defined business process, clear objectives for the process, quantitative or qualitative measurements for the objectives, and a plan for identifying and correcting variances from plan.
- KPIs should represent what is essential to the company competitive advantage and therefore its success.
  - To emphasize the importance of using strategic information, both financial and Non-financial, accounting reports of a firm's performance are now often based on **critical successes factors** in the above four different dimensions.
- Once the firm has identified its CSFs, it must establish specific, measurable ways for each CSF that are both relevant to the success of the firm and reliably stated.
- business should select a few critical metrics (KPIs)
  - KPIs should fit within an overall **cause-and-effect relationship** chain that ends with a relevant financial measure and the achievement of part of the company's strategy.

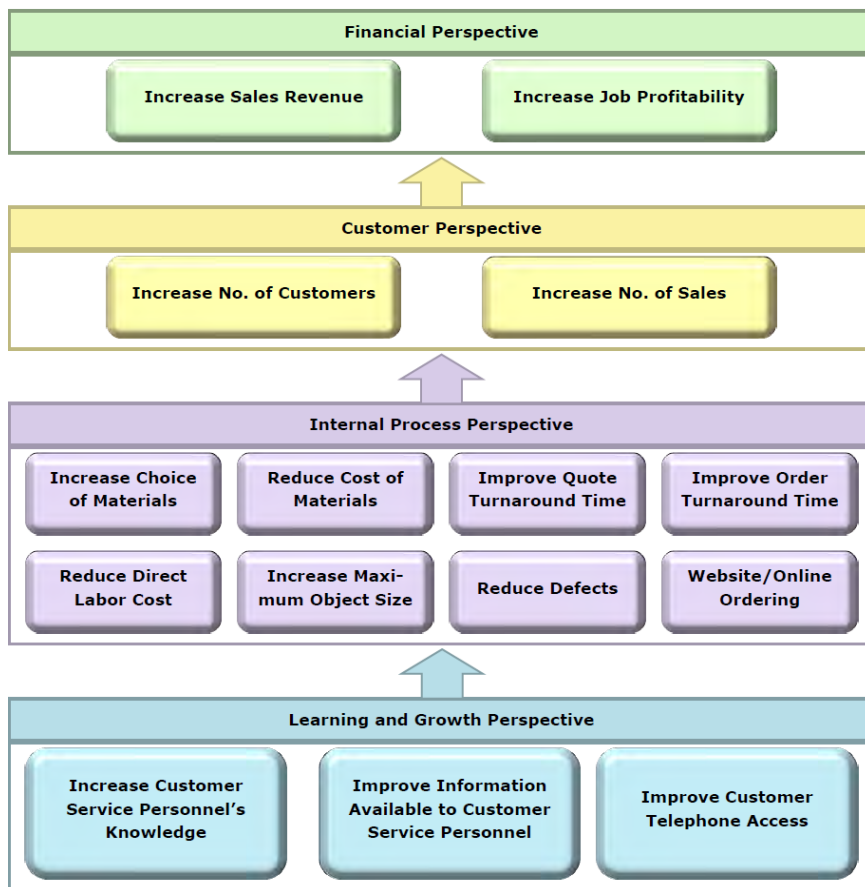

<sup>3</sup> CSFs are the cause of your success, whereas KPIs are the effects of your actions, some people use them interchangeably. The ICMA stop using the term CSFs and replace point "m" with a new one "l" ~~m. define critical success factors and discuss the importance of these factors in evaluating a firm~~ l. define key performance indicators (KPIs) and discuss the importance of these indicators in evaluating a firm.

**Functionality of the BSC/ implementation of a Strategy Map**

For the cause-and-effect chains of KPIs to be useful, they must be linked to a *definite outcome and a performance driver* that says how the outcome can be met

To achieve its objectives, the organization must establish the following:

- 1) Relevant criteria to measure **outcomes**. -This requires the use of **lagging** indicators which measure the results of actions.
  - a. Outcome measures are **lagging indicators**, or historic indicators of success such as measures of profitability, market share, employee skills, or customer retention.
- 2) Relevant performance **drivers** - This requires the use of **leading** indicators which are used to determine how an outcome can be met.

**Strategy Map**

A strategy map **links** these four balanced scorecard perspectives together, beginning with Learning and Growth.

The goals of the **Learning** and Growth perspective contribute to the **Internal Process** perspective because the company's culture of empowering staff members and providing them with the technological support they need makes innovation and improvements in products and services possible. The **innovations** and improvements in products and services support the goals of the **Customer** perspective, such as increasing market share. Increased market share leads to increased **profits**, thereby supporting the goals of the **Financial** perspective.

In a business where customer service is critical, important measurements to track include telephone wait time, the level of knowledge and empowerment of customer service personnel, and the availability to customer service personnel of needed information. For example, a company that provides 3D printing (additive manufacturing) services using 3D design files prepared and uploaded by the customer to its website needs service personnel knowledgeable enough to provide technical advice to customers in order to achieve satisfactory results; it needs adequate numbers of customer service representatives; and it must have sufficient telephone lines to keep customers' wait times to a minimum.

### Implementing a Balanced Scorecard

Implementing the balanced scorecard basically involves executing strategy. Without execution, even the best vision remains a dream. The balanced scorecard lends itself well to strategy execution, because the scorecard itself is a method of describing strategy in a way that can be acted on.

### The characteristics of Successful Implementation of BSC (Different Business Strategies call for Different Scorecards)

A BSC is most successful **when**

- the entire organization is aware of it and supports it.
- senior management support the program, even as high as the board of directors.
- It is tied to the organization's strategy and goals, and the performance measures can be quantified.
- It illustrating the sequence of cause-and-effect relationships
- Each business unit and division should be involved in developing its own customized scorecard.
  - When scorecards as developed by middle managers need to be reviewed and approved with input from senior management to make sure they are congruent with the company's goals.
- It is organized according to the four perspectives, with each selected scorecard measure on a line and classified within its perspective.
  - The target can be in one column followed by the actual results in the next column. Results that are in line and out of line can be identified, perhaps by color.
  - Each manager should be accountable for specific lines on each report, and a division head is accountable for all the lines on the divisional report.
- It identify tradeoffs that managers might make, for instance by reducing R&D spending to achieve short-run financial goals, or making other tradeoffs that could hurt future financial performance.
  - The decline of R&D spending or other problems would be signaled.
- It is marketed to both management and staff to garner support.
- Scorecard evaluation is more effective when it is used to judge the progress of an individual business unit relative to the prior year or relative to its goals rather than when used to compare a manager's performance with that of other managers or a segment's performance with that of other segments.
- a firm have extensive **enterprise resource planning**<sup>4</sup> systems to capture the required information.
- used to create an environment in which everyone can learn and grow.

### Problems With Balanced Scorecard Use for Performance Measurement

**The following are problems in implementation of the balanced scorecard approach:**

- 1) Using **too many measures**, with a consequent loss of focus on CSFs
- 2) Failing to evaluate **personnel** on nonfinancial as well as financial measures
- 3) Including measures that will **not** have long-term financial benefits
- 4) Not understanding that **subjective** measures (such as customer satisfaction) are imprecise
- 5) Trying to achieve improvements in **all areas** at all times
- 6) Not being aware that the hypothesized **connection** between nonfinancial measures and ultimate financial success may not continue to be true.

<sup>4</sup> Enterprise resource planning (ERP) is a usually a suite of integrated business software applications that a company can use to collect, store, manage and interpret data from multiple business activities.(2015 LOS)

Section  
B.2

# Budgeting Concepts

## Operations and Performance goals

### Strategy, the Long-Term Plan, and the Master Budget

**Planning** is the process of charting the future in an uncertain and dynamic world & mapping out the organization's future direction to attain desired goals, selecting a course of action and specifying how the action will be implemented.

**Planning** consists of:

- Selecting organization goals
- predicting results under various alternative ways of achieving those goals
- deciding how to attain the desired goals
- and communicating the goals and how to attain them to the entire organization.(H)

A **budget** provides the foundation for planning, because a successful budget is created by a process of aligning the company's resources with its strategy

### Importance of Strategy in Budgeting

A prerequisite for budget development is a strategic analysis that matches an entity's capabilities with available marketplace opportunities.

**Strategy** specifies how an organization matches its own capabilities with the opportunities in the marketplace to accomplish its objectives. **Strategic analysis** is the basis for both long-term and short-term planning. **Budgeting** is a common accounting tool that companies use for implementing strategy, as budgeting facilitates movement toward strategic goals. A **budget** should start with a careful review and study of the organization's strategic plan. The objective is to build a budget to achieve the organization's strategic goals and objectives.

### Strategy, Planning, and Budgets

Strategic plans are expressed through long-run budgets and operating plans are expressed via short-run budgets, **budgets** can lead to changes in plans and strategies.

**Formulation of Strategy** starts with analyzing external factors and assessing internal capabilities. Having analyzed external factors surrounding the organization and having assessed the internal situations it possesses, management can then match opportunities with the strengths and competitive advantages of the organization and determine the organization's strategic goals and long-term objectives.

## **Resource Allocation**

The allocation of scarce resources among competing opportunities is accomplished through implementation of a strategy.

An organization expresses its

### **Long- term Planning**

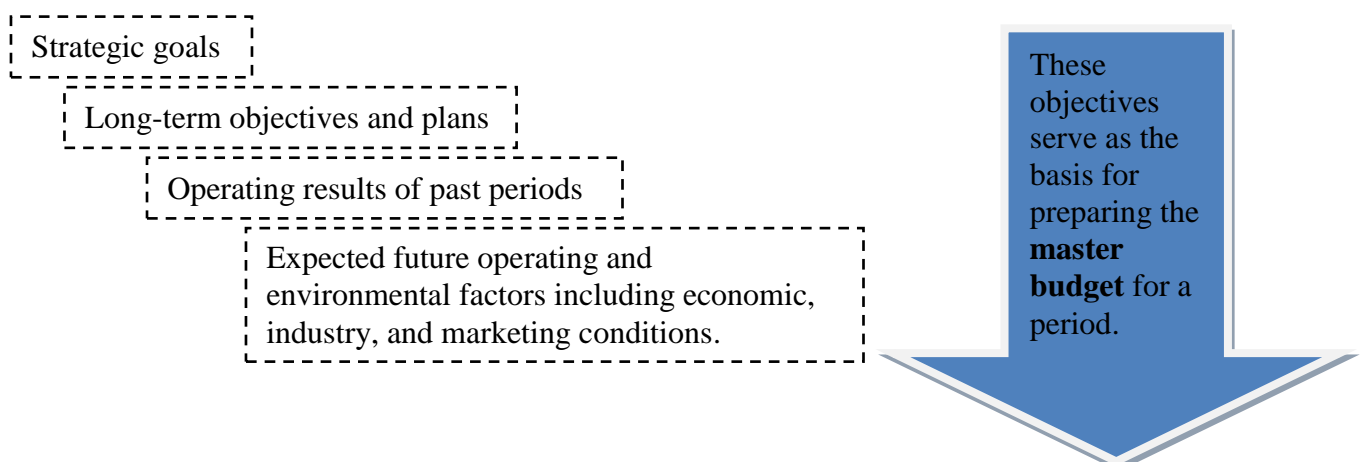

The organization's long-range plan identifies required actions over a 5- to 10 year period to attain the firm's strategic goal(s), **Planning for the long term** can involve discontinuing certain operations over time, arranging for equity or debt financing, and allocating resources gradually to new branches of business. Such major reorganizations can be accomplished only over a period of time and usually involve the use of capital budgeting part of the master budget), **Long-range planning** often entails **capital budgeting**, which is a process for evaluating, selecting, and financing major projects such as purchases of new equipment, construction of a new factory, and addition of new products.

The **strategic goals and objectives** of the organization are, ultimately, accomplished through a focused set of initiatives and projects that creates value for the organization.

### **Short-Term Objectives and the Master Budget**

**Short-term objectives** are goals for the coming period, which can be a **month**, a **quarter**, a **year**, or any length of time desired by the organization for planning purposes.<sup>(B)</sup>

An organization determines **short-term objectives for the budget period based on**

A **master budget** translates the organization's **short-term objectives** into action steps. A master budget reflects an organization's operating and financing plans for the upcoming budget period over a year.

## Fundamentals: Terminology, Budget Cycle, and Advantages of Budgeting

The following budget terms are used in this section.

**Budget:** A budget is (a) the quantitative expression of a proposed plan of action by management for a specified period and (b) an aid to coordinate what needs to be done to implement that plan. <sup>(H)</sup>

Budgeting Or targeting: is the process of preparing a budget

Budgetary Control to help ensure that a budget is achieved

Pro forma Statements

Strategic plan and Strategic budgeting: The strategic plan lays out the means by which a firm expects to fulfill its stated mission. Strategic budgeting is a form of long-range planning. strengths and weaknesses of the organization are evaluated

## Budgeting Cycle and Master Budget

Well-managed companies usually cycle through the following budgeting steps during the course of the fiscal year:

- 1-Plan the performance of the company, Create master budget and subbudgets.
- 2- Set a frame of reference and get manager buy-in, budget is used to test current performance against expectations..
- 3-Variations from the plan are examined, and corrective actions are taken when
- 4- Planning again, in light of feedback and changed conditions when possible.

The preceding four steps describe the ongoing budget process. The working document at the core of this process is called the **master budget**. The master budget expresses management's operating and financial plans for a specified period (usually a fiscal year), and it includes a set of budgeted financial statements. <sup>(H)</sup>

## Advantages of Budget

A budget forces **managers to look ahead**, to translate strategy into plans, to **coordinate** and **communicate** within the organization, and to provide a benchmark for **evaluating** performance. <sup>(H)</sup>

Budgeting often plays a major role in affecting **behavior** and decisions because managers strive to meet budget targets. <sup>(H)</sup>

Budgets play a crucial role in businesses. Without budgets, it's difficult for managers and their employees to know whether they're on target for their growth and spending goals. Budgeting is a common accounting tool that companies use for implementing strategy.

Why does a successful company feel the need to watch its spending so closely? In many profitable companies, a strict budget is actually a key to their success. Through budgeting, managers learn to anticipate and avoid potential problems. <sup>(H)</sup>

Budgets turn managers' perspectives forward and aid in **planning** and **controlling** the actions managers must undertake to satisfy their customers and succeed in the marketplace. Budgets provide measures of the financial results a company expects from its planned activities and help define objectives and timelines against which progress can be measured. <sup>(H)</sup>

Budgets are a big part of most management control systems. When administered wisely, a budget becomes a **p**lanning tool, a **c**ontrol tool, a **m**otivational tool, and a **c**ommunication tool.

As **p**lanning tool budget forces the organization to examine the future.

Budgets promote **c**oordination and **c**ommunication among organization units and activities

As a **c**ontrol tool budget provide a framework for measuring performance

Provide **m**otivation for managers and employees to achieve the company's plans

Promotes the efficient **a**llocation of organizational resources

#### **As planning tool budget forces the organization to examine the future.**

Planning allows for the input of ideas from multiple sources within the organization, and allows for input from **different viewpoints**. The planning process may generate **new ideas** for the organization's direction, or it may provide insight into **better ways to achieve goals** that have already been established. Without a budget, the organization would be operating in a reactive manner, rather than in a **proactive** manner, **minimize the adverse effects** that anticipated problems could have on operations, Budgets force managers to **think about and plan for the future**.

#### **Budgets promote coordination and communication among organization units and activities**

A budget also serves as a **communication** device through which **top management defines its plans** and goals for the period so that other **managers and employees have access to this information**. allows each division to know what it needs to do to satisfy the needs of other divisions.

Each part of the organization must **coordinate** its activities to attain the budgeted goals and objectives.

A budget promotes **goal congruence** and **coordination** among operating units, budgets requires departmental managers to make plans in conjunction with the plans of other interdependent departments,

#### **As a control tool budget provide a framework for measuring performance and provide a means for controlling operations (reporting variances between actual and budgeted spending)**

By **comparing** actual results to the budget for a given period, a manager's performance can be evaluated.

Question

Why budgeted performance is a better criterion than past performance for judging managers?

Answer

Because inefficiencies included in past results can be detected and eliminated in budgeting,Future conditions may be expected to differ from the past, and these can also be factored into budgets

**Monitoring: Provide a means to check on progress toward the organization's objectives.**

By comparing the actual results for a period to the budgeted results for that period, managers can see whether the organization is on track to achieving its goals.<sup>(IMA)</sup>

**Question** Why performance should not be compared against the current budget **only**?

**Answer** Because

- that can result in lower-level managers setting budgets that are **too easy** to achieve

**Question** How the budgetary process serve effectively as a control function?

**Answer** For the budgetary process to serve effectively as a control function, it must be integrated with the accounting system and the organizational structure.

**Question** How the budgetary control process improve future performance?

**Answer** Senior management ask questions about what happened and why, and how this knowledge can be used to ensure that such shortfalls do not occur again.

**Provide motivation for managers and employees to achieve the company's plans**

**Question** How the company use the budget process to improve motivation?

**Answer**

- Setting expected activities and operating results **clearly** in the budget, employees will know what is expected of them; Allow employees to **participate** in the budgeting process, thus helping employees embrace the budget as their own, Set **demanding but achievable goals** for managers. Performance evaluations allow an organization to motivate employees by **rewarding** them for **good performance**

**Question** How challenging should budget targets be??

**Answer** In practice, most companies set their budget targets at a “highly achievable” level as **highly achievable budgets may result in less undesirable behavior** at the end of budgetary periods by managers who are intent on earning their bonuses.

**Promotes the efficient allocation of organizational resources**

A budget helps management to allocate resources efficiently and to ensure that subunit goals are **congruent** with those of other subunits and of the organization.

## Characteristics of Successful Budgeting

Many factors characterize a successful budget, but no single factor can lead to a successful budget. The common factors in a successful budget include the following:

1. The budget must be aligned with the corporate **strategy**.
2. The budget must be perceived by employees as a **planning, communication, and coordinating** tool, and not as a pressure or blame device.
3. The budget must be characterized as a **motivating** tool to help employees work toward organizational goals.
4. A budget should be **coordinated**.
5. The budget should be used to alleviate potential bottlenecks and to **allocate resources** to those areas that will use the funds most efficiently and effectively.
6. The budget must be seen as an **internal control device**, and internal-use budgets should base evaluations on controllable or discretionary costs.

### Take a note:

Points from 1 to 6 discussed before so we will not give a detailed explanation again.

7. The budget must have the support of management at all levels.
8. Management (including top management) must fully endorse the budget-they must accept responsibility for reaching the budget goals.
9. The single most important factor in assuring its success is for **upper management** to demonstrate that they take the project seriously and consider it vital to the organization's future.
10. A higher authority than the team who developed the budget must review and approve the budget.
11. A budget can be successful only if those responsible for its implementation make it happen.
12. People who are charged with carrying out the budget need to feel ownership of the budget.
13. To be useful, the budget should be an accurate representation of what is expected to occur.

### Take a note:

Points from 7 to 13 will be discussed through the topic "Who Should Participate in the Budgeting Process?"

14. The time period for a budget should reflect the purpose of the budget (will discussed next pages).
15. Sales and administrative budgets need to be detailed in order that key assumptions can be better understood (will discussed next pages).
16. A budget should be flexible.  
The final budget should not be easily changed, but it must be flexible enough to be useful.

Budgets should compel planning, promote communication and coordination, and provide performance criteria. The budget process must balance input from those who will need to follow the budget against a thorough and fair review of the budget by upper management. (IMA)

## Characteristics of a Successful Budgeting Process

Whether the organization and its budget are very simple or highly complex, the characteristics of a successful budget process include: the budget period, the participants in the budget process, the basic steps in budgeting, and the use of cost standards (IMA).

### Budget Period

A budget usually is prepared for a set time, most commonly for the fiscal year with subperiod budgets for each of the constituent quarters or months.(B)

Budgets can also be prepared on a **continuous** basis.(HK)

In practice, Johnson & Johnson has only skeleton budgets for its **5- and 10-year budgets**.(B)

### Budget Participants & Budget Process

Three groups make or break a budget: the board of directors, top management, and the budget committee. Middle and lower management also play a significant role, because they create detailed budgets based on upper management's plan. (IMA)

**Methods of budget preparation** differ between companies, but all fall somewhere on a continuum between entirely authoritative and entirely participative.(IMA) , in other words budget development can be done using a participative process, an authoritative process, or a consultative process (combination approach) (HK). Note that the combination approach is sometimes considered to be a form of the participative approach (IMA).

### Basic steps in budgeting

The process usually includes the formation of a budget committee; determination of the budget period; specification of budget guidelines; preparation of the initial budget proposal; budget negotiation, review, and approval; and budget revision.(B)

For instance, the steps that responsibility centers take in preparing their budgets include: the initial budget proposal, budget negotiation, review and approval, and revision.(IMA)

### The use of Cost Standards

Organizations set different types of standards that they strive to achieve, Standards can be either **authoritative** or **participative**, Specific types of standard costs include **ideal** standards and **reasonably attainable** standards, Several sources are often used simultaneously when setting standards: activity analysis, historical data, market expectations, strategic decisions, and benchmarking, establishing a standard cost for direct materials & direct labor . (IMA)

## Budget Department or The budget director/controller

The budget department is responsible for **compiling the budget and managing the budget process**. The budget director and department are **not responsible for actually developing the estimates** on which the budget is based. This role is performed by those to whom the resulting budget will be applicable. The budget director has **staff**, not line, authority. (S)he has a technical and advisory role. The final decision-making responsibility rests with line management. (GL)

## Methods of budget preparation -Authoritative or Participative Budgeting?

The success of a budget program is largely determined by the way a budget is developed. (G)

Methods of budget preparation differ between companies, but all fall somewhere on a continuum between entirely authoritative and entirely participative.

### In an authoritative budget (top-down budget- imposed budget).

Top management sets everything from strategic goals down to the individual items of the budget for each department and expects lower managers and employees to adhere to the budget and meet the goals.

(IMA)

Authoritative budgeting provides better decision-making control than does participative budgeting.

Top management sets the overall goals for the budget period and prepares a budget for operating personnel to attain the goals.

An authoritative budget, however, often lacks the commitment ("buy-in") of lower-level managers and employees responsible for implementing it. (B)

### In a participative budget (bottom-up or self-imposed budget).

Managers at all levels and certain key employees cooperate to set budgets for their areas, and top management usually retains final approval. (IMA)

A participative budget is a good communication device.

The process of preparing a budget often gives top management a better grasp of the problems their employees face and provides the employees a better understanding of the dilemmas that top management deals with. A participative budget also is more likely to gain employee commitment to fulfill budgetary goals. Unless properly controlled, however, a participative budget can lead to easy budget targets or targets not in compliance with the organization's overall strategy.

The ideal process combines the features of each and falls somewhere between these methods, Note that the *combination approach* is sometimes considered to be a form of the participative approach. (IMA)

An effective budgeting process often combines both top-down and bottom-up budgeting approaches. Divisions prepare their initial budgets based on the budget guidelines issued by the firm's budget committee. Senior managers review and make suggestions to the proposed budget before sending it back to the divisions for revisions. The final budget usually is reached after several rounds of negotiations. For this reason, this is generally referred to as a *negotiated budgeting* process. (B)

A *consultative budget* is a *combination* of authoritative and participative budget development methods. Senior management asks for *input from lower-level managers* but then develops the budget with *no joint decision-making or negotiation* involved. (HK)

**Budgeting needs to be both bottom up and top down. Despite its advantages, a budget neither ensures improved cost control nor prevents inefficiencies.**

## Advantages and Disadvantages of Participative Budget Development

### Advantages include the following:

A participative budget is a good communication device. A budget is potentially a good motivational tool. A participative budget is more likely to be achievable. Advantages of a participative budget include greater accuracy of budget estimates. Participatory budgeting involves extensive coordination between departments.

### Disadvantages include the following:

Budget targets that are too easy to achieve. Participative budget can lead to targets not in compliance with the organization's strategy. Time-Consuming.

## Advantages and Disadvantages of Authoritative Budget Development

### Advantages include the following:

Better control. Facilitates the implementation of strategic plans. Reduces the time required for budgeting. Increases coordination of divisional objectives. Budgetary slack is not a problem.

### Disadvantages include the following:

Lacks commitment ("buy-in") of lower-Level managers, May result in a budget that is not possible to achieve, May limit the acceptance of proposed goals and objectives, Reduces the communication between employees and management.

As these comments suggest, **all levels in the organization should work together** to produce the budget. **Lower-level managers are more familiar with day-to-day operations** than top managers. **Top managers** should have a **more strategic perspective** than lower level managers. Each level of responsibility in an organization should contribute its unique knowledge and perspective in a cooperative effort to develop an integrated budget.<sup>(G)</sup>

An effective budgeting process therefore usually combines both top-down and bottom- up budgeting approaches. Divisions prepare their initial budgets based on the budget guidelines issued by the firm's budget committee. Senior managers review and make suggestions to the proposed budget before sending it back to the divisions for revisions. The final budget usually results from more participation, not enforced negotiations.

✚ **Thus, the right approach is a good balance of top management involvement with lower-level managers.**

✚ Greatest amount of positive motivation and goal congruence can be achieved if the firm have the divisional and senior management jointly develop goals and the divisional manager develop the implementation plan.

✚ Senior management must still participate in the budget process to ensure that the combined objectives of the various departments are consistent with profitability objectives of the company and managers pursue objectives consistent with those set by top management.

## Behavioral Issues in Budgeting

The human aspects of budgeting are extremely important

### Budgetary Slack or Padding the budget

Budgetary slack describes the practice of **underestimating budgeted revenues**, or **overestimating budgeted costs**, to make budgeted targets more **easily achievable**.

### Why managers build slack into the budget ?

Line managers are also **unlikely to be fully honest** in their budget communications if top management mechanically institutes **across-the-board cost reductions** (say, a 10% reduction in all areas) in the face of projected revenue reductions. Budgetary slack provides managers with a **hedge against unexpected adverse circumstances**.<sup>(H)</sup>

Managers often justify such practices as **insurance against uncertain future** events.

### Adverse effects of Budgetary Slack

- Budgetary slack **misleads top management**, which **leads to inefficient resource planning and allocation and poor coordination**.<sup>(H)</sup>
- **wastes resources** and could lead employees to **make half-hearted efforts**.<sup>(B)</sup>
- result in a **very inaccurate master budget**.<sup>(IMA)</sup>
- **misrepresent the true profit** potential of the company.

### How companies avoid problems of budgetary slack?

- Some companies use budgets primarily for planning purposes. They **evaluate managerial performance using multiple indicators** that take into account various factors such as the prevailing business environment and performance relative to competitors, use different approaches to obtain accurate information.
- Another approach to reducing budgetary slack is for managers to **involve themselves regularly in understanding what their subordinates are doing**.
- Some companies, such as IBM and Kodak, have designed **innovative performance evaluation measures** that reward managers based on the **subsequent accuracy of the forecasts used in preparing budgets**.
- **use the budget/profit plan as a planning and control tool but not for managerial performance evaluation**.
- **holding in-depth reviews** during budget development, and allowing for **flexibility** in making additional budget changes.

### The Budgeting Process

The **traditional budgeting process** can range from the informal simple processes small firms use that take only days or weeks to complete to elaborate, lengthy procedures large firms or governments employ that span months from start to final approval. The process usually includes the formation of a budget committee; determination of the budget period; specification of budget guidelines; preparation of the initial budget proposal; budget negotiation, review, and approval; and budget revision.

### Best Practice Guidelines for the Budget Process

Best practices in budgeting include the following, some of which have already been discussed:

- **The development of the profit plan should be linked to corporate strategy.**
- **Use the budgeting process to minimize the adverse effects that anticipated problems might have on operations.**
- The profit plan must have the support of management at all levels.
- Communication is vital.
- The profit plan should be coordinated
- The profit plan should be a motivating device.
- Design procedures to allocate funding resources strategically.
- Managers should be evaluated on performance measures other than simply meeting budget targets.

- Link cost management efforts to budgeting.
- The strategic use of variance analysis.
- Reduce budget complexity and budget cycle time.
- The time period for a budget should reflect the purpose of the budget.
- Develop budgets that can be revised if necessary. A budget should be flexible.
- Budgeting should not be rigid.

### Budgeting and Responsibility Accounting

Each manager, regardless of level, is in charge of a responsibility center. A **responsibility center** is a part, segment, or subunit of an organization whose manager is accountable for a specified set of activities. Four types of responsibility centers are cost centers, revenue centers, profit centers, and investment centers. <sup>(H)</sup> **The higher the manager's level, the broader the responsibility center and the larger the number of his or her subordinates.** <sup>(H)</sup> **Responsibility accounting** is a system that measures the plans, budgets, actions, and actual results of each responsibility center. <sup>(H)</sup>

### Responsibility and Controllability

**Controllability** is the degree of **influence** that a specific manager has over costs, revenues, or related items for which he or she is responsible. <sup>(H)</sup>

A **controllable cost** is any cost that is primarily **subject to the influence** of a given responsibility center manager **for a given period.** <sup>(H)</sup>

A responsibility accounting system could either **exclude all uncontrollable costs** from a manager's performance report or **segregate such costs from the controllable costs.** <sup>(H)</sup>

### Cost classification according to performance evaluation VS. the cost classification according to behavior

It is also important to recognize that fixed costs and indirect costs are not always uncontrollable, and variable costs and direct costs are not always controllable. The nature of each cost will vary according to its characteristics and each cost should be analyzed to determine who controls it.

#### Question

Why in practice, controllability is difficult to pinpoint?

#### Answer

For at least two reasons:

- **Few costs are clearly under the sole influence of one manager.**
- **With a long enough time span, all costs will come under somebody's control.**

### Take a Note:

- Executives differ in how they embrace the controllability notion when evaluating those reporting to them.
  - Some CEOs regard the budget as a firm commitment that **subordinates must meet.** Failure to meet the budget is viewed unfavorably.
  - Other CEOs believe a **more risk-sharing approach** with managers is preferable

This distinction between controllable and non-controllable costs is especially important if managers' performance evaluations will be dependent upon meeting budgetary targets. (Although we have said this is **not a good idea**, it may be done in some organizations.) If other performance measures are used to evaluate managers, this distinction may be less important.

Question

Why managers should **avoid** overemphasizing controllability?

Answer

Responsibility accounting is more far-reaching. It focuses on **gaining information and knowledge, not only on control.**

*Responsibility accounting helps managers to first focus on whom they should ask to **obtain information** and **not** on whom they should **blame**.*<sup>(H)</sup>

Responsibility accounting involves holding managers responsible for only those things under his/her discretion and control, such as net revenue and controllable division costs.

Question

How do companies use responsibility centers? Should performance reports of responsibility center managers include only costs the manager can control?

Answer

A responsibility center is a part, segment, or subunit of an organization whose manager is accountable for a specified set of activities.

Responsibility accounting systems are useful because they measure the plans, budgets, actions, and actual results of each responsibility center. **Controllable costs** are costs primarily subject to the influence of a given responsibility center manager for a given time period. **Performance reports** of responsibility center managers **often include** costs, revenues, and investments that the managers **cannot control**. Responsibility accounting associates financial items with managers on the basis of which manager has the **most knowledge** and **information** about the specific items, **regardless** of the manager's ability to exercise **full control**.

### Cost Standards in Budgeting

A **standard cost** is a **carefully** determined cost a firm or organization sets for an operation, the cost the firm or organization **should** incur for the operation. A standard cost usually is expressed on a **per-unit basis**. Standard costs are incorporated into budgets and as such can be used to monitor and control operations, and to evaluate performance.<sup>(B)</sup> A standard is a **carefully** determined *price, cost, or quantity* that is used as a benchmark for judging performance.<sup>(H)</sup> **Standard costs** are **predetermined expectations** about how much a **unit of input**, a **unit of output**, or a given activity should cost. The use of standard costs in budgeting allows the **standard-cost system** to alert management when the actual costs of production differ significantly from the standard.<sup>(GL)</sup>

Question

How are the words “budget” and “standard” related?

Answer

Budget is the broader term. To clarify, **budgeted** input prices, input quantities, and costs **need not be based on standards**.<sup>(H)</sup>

As we saw previously, they could be based on past data or competitive benchmarks, for example. However, when standards are used to obtain budgeted input quantities and prices, the terms “standard” and “budget” are used interchangeably.<sup>(H)</sup>

### Four reasons for using standard costs are:

(i) cost management, ex: standard costs can be used in costing inventory accounts,(ii) pricing decisions,(iii) budgetary planning and control, and(iv) financial statement preparation.

### Advantages of standard cost system

- Assists in performance evaluation.
- Allows employees to better understand what is expected of them.
- Permits development of **flexible budgeting**.

### Ideal/theoretical or perfection or maximum efficient/tight Standards

- Reflects maximum efficiency in every aspect of an operation.
- **Difficult, but not impossible, to achieve.**
- Assume **peak operating efficiency** and the **absence of any production disruptions**.
- ideal standards assume **perfection across all operations**.
- can lead to undue stress on employees that, in turn, may lead to **decreases in morale and ultimately decreases in productivity**.<sup>(B)</sup>
- **attained only under the best circumstances**.<sup>(G)</sup>
- Allow for **no machine breakdowns** or other work interruptions,
- and they call for a level of effort that can be attained only by the **most skilled and efficient employees working at peak effort** 100% of the time.<sup>(G)</sup>
- work into a continuous improvement strategy and total quality management philosophies.<sup>(IMA)</sup>

**Some** managers feel that such standards **spur continual improvement**. These managers argue that even though employees know they will rarely meet the standard, it is a constant reminder of the need for ever-increasing efficiency and effort.<sup>(G)</sup> they can have positive behavioral implications if workers are motivated to strive for excellence.

However, they are not in wide use because they can have negative behavioral effects if the standards are impossible to attain. Few organizations use ideal standards. Most managers feel that ideal standards tend to **discourage** even the most diligent workers.

### Currently attainable (practical) standards costs/ "tight but attainable."

- sets the performance criterion at a level that a person with **proper training** and **experience** can attain most of the time without having to exert extraordinary effort.
- emphasizes normality and allows for some imperfections and inefficiencies.<sup>(B)</sup>
- allow for normal machine downtime and employee rest periods.<sup>(G)</sup>
- can be attained through reasonable, though highly efficient, efforts by the average worker.<sup>(G)</sup>
- achieved by reasonably **well-trained workers** with an allowance for **normal spoilage**, waste, and downtime.<sup>(GL)</sup>
- Serve as a better motivating target for manufacturing personnel.
- A currently attainable standard discourages continuous improvement because the workers are not motivated to perform better than they currently are performing continuous improvement is a key element in TQM.
- An alternative interpretation is that practical standards represent possible but difficult-to-attain results.<sup>(GL)</sup>

**Most companies use practical expected standard costs in their standard cost system and in their flexible budgets.** If they choose not to do this, then management will have an additional variance to report; the variance between the practical expected costs and the Ideal theoretical costs.

**If standards are too tight, repeated failure to achieve them will reduce motivation. When standards are too loose, they represent an invitation to relax and provide little incentive to improve performance.**

## Standard-Setting Procedures

A firm can use either an authoritative or a participative procedure in setting standards. An **authoritative standard** is determined solely or primarily by management. In contrast, a **participative standard** calls, throughout the standard-setting process, for active participation of employees affected by the standard.

### Advantages (HK/B)

- ensure proper consideration of all operating factors,
- expedite the standard-setting process, than when more individuals are involved.
- management's expectations will be reflected in the resulting standard costs;
- ensuring total consistency across all functional areas.
- It is also far less complex and time-consuming than coordinating input from the middle and lower levels.

### Disadvantage

- affected employees will not see them as their own and will be less likely to accept them, which in turn will reduce their motivation to achieve the standards.(HK)

Firms using an authoritative process in standard setting, however, should keep in mind that a standard is useless if ignored by employees.

## A participative (grass-roots) standard-setting

Involves all the employees who will be affected by the standard. When employees participate in setting the standards, they are more likely to accept them and not see them as unreasonable.

### Advantages

- Participation encourages employees to have a **sense of ownership** of the output of the process.
- The result is an **acceptance** of, and **commitment** to, the goals expressed in the budget.
- It provides a broader information base.
- Middle- and lower-level managers are often far **more informed** about operational realities than senior managers.
- Reduces the chance that employees will view the standard as **unreasonable** and increases the likelihood that they will buy into or adopt it as their own.

### Disadvantage

- resulting standards may not support achievement of the firm's strategic goals or operating objectives.(HK)
- costly in terms of time and money.
- the quality of participation is affected by the goals, values, beliefs, and expectations of those involved, but if a budget is to be used as a performance evaluator, a manager asked for an estimate may provide one that is **easily** attained.(GL)

## Sources for Standards Setting

Standard costs are derived from general standards for operations. Several resources are used in determining standards for operations. These are;

- Activity analysis,
- Historical data, and
- Benchmarking

## Strategic Planning

### Strategy, the Long-Term Plan, and the Master Budget

Planning in general refers to the process that provides guidance and direction regarding what an organization needs to do throughout its operations. It determines the answers to the “who, what, when, where and how” questions of a business operation.

Planning is the first activity that management must undertake when **creating** yearly budgets and making other critical decisions that will affect the future.

A company’s **plan** serves as its guide or compass for the activities and decisions made by individuals throughout the entire organization.

**Planning** is the process of charting the future in an uncertain and dynamic world & mapping out the organization's future direction to attain desired goals, selecting a course of action and specifying how the action will be implemented.

**Planning** consists of:

- Selecting organization goals
- predicting results under various alternative ways of achieving those goals
- deciding how to attain the desired goals
- and communicating the goals and how to attain them to the entire organization.(H)

**Good planning** helps managers attain goals, recognize opportunities, providing a basis for controlling operations, forcing managers to consider expected future trends and conditions, checking progress toward the objectives of the organization and minimize the negative effects of unavoidable events.

A **budget** provides the foundation for planning, because a successful budget is created by a process of aligning the company's resources with its strategy. While a plan or budget **may not** guarantee success, the lack of plan can remove opportunities, cause the company to be constantly putting out fires, or cause a complete business failure. When a budget exists without consideration of strategy, it usually begins with the prior year's budget and misses opportunities to change the direction of the company.

### Underlying Assumptions

- A publicly-owned for-profit company must have **maximizing shareholder value** as its ultimate goal. The shareholders are the owners. They have provided risk capital with the expectation that the managers will pursue **strategies** that will give them a good return on their investment.
- Shareholders want to see **profitable growth**: high profitability and also sustainable profit growth.
  - **Shareholder value** is the returns that shareholders earn as a result of having purchased shares in a company. Shareholders’ returns come from both:
    - capital appreciation of their shares’ value and
    - from dividends received.
  - **Shareholder value** is the returns that shareholders earn as a result of having purchased shares in a company. (HK)
  - Profitability and profit growth are the primary means by which **shareholder value increases**.

- Common shareholders, elect the board of directors.
  - Thus, the members of the board of directors represent the owners of the company. The board of directors of a company is responsible for:
  - ensuring that the company is operated in the best interest of the shareholders, who are the owners of the company.
  - sets company-wide policy and advises the CEO and other senior executives, who manage the company's day-to-day activities.
  - Boards review and approve strategy, significant investments, and acquisitions.
  - oversees operating plans, capital budgets, and the company's financial reports to common shareholders.
  - overseeing the internal control system.
  - provide governance (i.e., system by which a company is directed and controlled), guidance and oversight to the management of the company.
  - The board of directors is the critical link between shareholders and managers.
  - Managers carry out three major activities— planning, directing and motivating, and controlling. (next title discuss the roles of managers).
- For most companies, if not all, the ultimate objective is to achieve **superior performance** in comparison with the performance of their competitors.
- Attaining and maintaining both short-term profitability and long-term profit growth is one of the greatest challenges facing managers.

### **The Four Functions of Management**

Management accounting information plays a vital role in the basic management activities—but most particularly in the planning and control functions.

Management accountants

- contribute to *strategic* decisions by providing information about the sources of competitive advantage (H).
- develops cost management information for the CFO, other managers, and employee teams to use to manage the firm and make the firm more competitive and successful.

Cost management information is provided for each of the four major management functions:

1. **Strategic Management.** Cost management information is needed to make sound strategic decisions regarding choice of products, manufacturing methods, marketing techniques and channels, assessing customer profitability and other long-term issues.
2. **Planning and Decision Making.** Cost management information is needed to support recurring decisions regarding replacing equipment, managing cash flow, budgeting raw materials purchases, scheduling production, and pricing.
3. **Management and Operational Control.** Cost management information is needed to provide a fair and effective basis for identifying inefficient operations and to reward and motivate the most effective managers.
4. **Preparation of Financial Statements.** Cost management information is needed to provide accurate accounting for inventory and other assets, in compliance with reporting requirements, for the preparation of financial reports and for use in the three other management functions.

### **Strategic Management:**

The most important function is strategic management, which is the development and implementation of a sustainable competitive position in which the firm's competitive advantage provides continued success.

**A strategy** is a set of goals and specific action plans that, if achieved, provide the desired competitive advantage. Strategic management involves identifying and implementing these goals and action plans.

*Covered in Section B. Part one.*

### **Planning & decision making**

Next, management is responsible for planning and decision making, which involve budgeting and profit planning, cash flow management, and other decisions related to the firm's operations, such as deciding when to lease or buy a facility, when to repair or replace a piece of equipment, when to change a marketing plan, and when to begin development of a new product.

*Covered in Section B. Part one. & Section C Part two.*

**Management accounting information plays a vital role in these basic management activities—but most particularly in the planning and control functions.**

### **Control**

The third area of responsibility, control, consists of two functions, operational control and management control.

**Operational control** takes place when mid-level managers (e.g., site managers, product managers, regional managers) monitor the activities of operating-level managers and employees (e.g., production supervisors and various department heads).

In contrast, **management control** is the evaluation of mid-level managers by upper-level managers (the controller or the CFO).

*Covered in Section C. Part one.*

In the fourth function, **preparation of financial statements**, management complies with the reporting requirements of relevant groups (such as the Financial Accounting Standards Board) and relevant federal government authorities (for example, the Internal Revenue Service and the Securities and Exchange Commission). The financial statement preparation role has recently received a renewed focus as countries throughout the world have adopted International Financial Reporting Standards (IFRS), and the United States is expected to adopt these standards by 2014. The financial statement information also serves the other three management functions, because this information is often an important part of planning and decision making, control, and strategic management

*Covered in Section A. Part one.*

## The Work of Management and the Need for Managerial Accounting Information

Every organization—large and small—has managers. Someone must be responsible for formulating strategy, making plans, organizing resources, directing personnel, and controlling operations. <sup>(G)</sup> planning, Managers everywhere, carry out three major activities, planning, directing and motivating, and controlling.

**Planning** involves establishing a basic strategy, selecting a course of action, and specifying how the action will be implemented. <sup>(G)</sup>

The most important planning tool when implementing strategy is a **budget**. A budget is the quantitative expression of a proposed plan of action by management and is an aid to coordinating what needs to be done to execute that plan. <sup>(H)</sup>

**Directing and motivating** involves mobilizing people to carry out plans and run routine operations. <sup>(G)</sup>

**Controlling** involves ensuring that the plan is actually carried out and is appropriately modified as circumstances change. <sup>(G)</sup>

**Control** comprises taking actions that **implement** the planning decisions, deciding how to **evaluate performance**, and providing **feedback** and **learning** to help future decision making. <sup>(H)</sup>

**Measuring actual performance** informs managers how well they and their subunits are doing. <sup>(H)</sup>

A **budget** serves as much as a **control** tool as a planning tool. Why? Because a budget is a benchmark against which actual performance can be compared. <sup>(H)</sup>

The performance report spurs investigation and learning. Learning can lead to changes in goals, changes in strategies, changes in the ways decision alternatives are identified, changes in the range of information collected when making predictions, and sometimes changes in managers.

Management accountants serve as business partners in these planning activities because of their understanding of what creates value and the key success factors. <sup>(H)</sup> Companies' management accountants will collect, analyze, and summarize these data in the form of budgets. <sup>(G)</sup>

The performance report in would prompt the management accountant to raise several questions directing the attention of managers to problems and opportunities. <sup>(H)</sup> As we shall see in later chapters, one of the central purposes of managerial accounting is to provide this kind of **feedback** to managers. <sup>(G)</sup>

## Basic Concepts/Definitions

### Strategic Management (The most important function)

- Is the development and implementation of a sustainable *competitive position* in which the firm's *competitive advantage* provides continued success.<sup>(BL)</sup>
- Sets *overall objectives* for an entity and guides the process of reaching those objectives.
- It is the responsibility of upper management.<sup>(GL)</sup>

### Strategic planning (sometimes referred to as long-range planning or Strategic analysis)

The purpose of strategic planning is to

- guide the company in its efforts to achieve superior performance, competitive advantage, and maximized shareholder value.
- setting overall organizational objectives and goals and drafting strategic plans. It is a long term process aimed at charting the future course of the organization. <sup>(GL/CMA)</sup>
- is the design and implementation of the *specific steps* and processes necessary to reach the overall objectives.<sup>(GL)</sup>
- Strategic planning involves
  - a comprehensive look at an organization in relation to its industry, competitors, and environment.<sup>(IMA)</sup>
    - A systematic approach to analyzing threats and opportunities and examining why some organizational strategies have better competitive and profit prospects than others
  - drafting of strategic plans.
  - A sound framework for developing an effective operating budget.
  - An organizational learning opportunity for managers to think about strategies and how to best implement them
  - An exercise to **align** management decision making and actions with corporate strategies (e.g., to gain the buy-in of managers and show how their decisions and actions support corporate programs)
  - A basis for both financial and nonfinancial performance measures
  - A channel of communication among all levels of management about strategies, objectives, operational plans, and so on.
  - Guidance for approaching new situations
- It is the responsibility of upper management.<sup>(GL)</sup>
  - Although traditionally the responsibility of top management, all organizational members should be involved in the process. Well thought out strategic planning can help an organization adeptly navigate through turbulent times-both good and bad.<sup>(IMA)</sup>
  - An organizational learning opportunity for managers to think about strategies and how to best implement them

### Limitations of Strategic Planning

- The effort, time, and expense involved in the process
- The fact that planning based on predictions is not an exact science; due to a variety of factors, plans may prove to be incorrect and fail
- The potential for resistance to change resulting from entrenched ways of doing things
- The risk that planning can become a bureaucratic exercise devoid of fresh ideas and strategic thinking

Strategic planning is **based on**:

- identifying and specifying ultimate organizational goals and objectives (usually addressed first),
- evaluating the strengths and weaknesses of the organization, and
- assessing risk levels,
- forecasting the future direction and influences of factors relevant to the organization such as:
  - market trends,
  - changes in technology,
  - international competition, and
  - social change.
- deriving the best strategy for reaching the objectives given the organization's strengths and weaknesses and the relevant future trends.
- The time frame for strategic planning is normally five to ten years. It may, however, be longer.

Setting ultimate objectives for the firm is a necessary prelude to **developing strategies** for achieving those objectives. **Plans** and budgets are then needed to implement those strategies.

Strategic management and strategic planning are thus *closely linked*. By their nature, strategic management and strategic planning have a long-term planning horizon.<sup>(GL)</sup>

The final step is to derive the best **strategy** for reaching the objectives.

## **Strategy**

**Strategy** is the **organization's plan** to

- match its **strengths/capabilities** with the opportunities in the marketplace to accomplish its desired goals over the short and long term.
- addresses the objectives of the organization;
- locates potential markets;
- considers the impact of events, competitors, and the economy;
- addresses the structure of the organization; and
- evaluates the risks of alternative strategies. <sup>(IMA)</sup>
- set of actions taken by managers of a company to increase the company's performance.

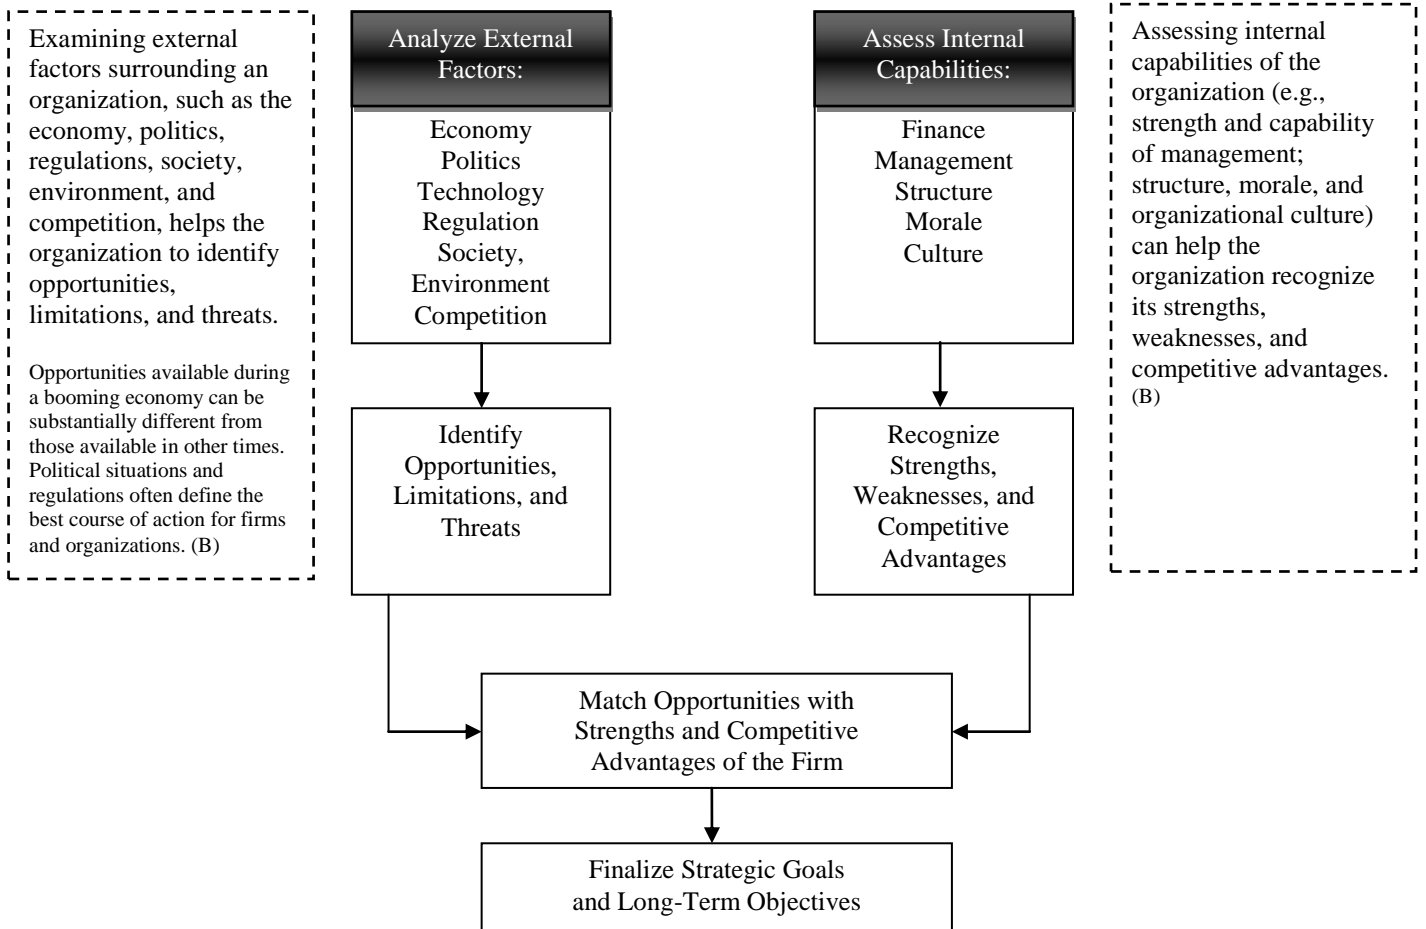

## Strategic Planning Framework

(The success stories of many organizations are stories of good strategy formulation and execution)

Formulation of strategy starts with  
analyzing external factors and assessing internal capabilities

Having analyzed external factors surrounding the organization and having assessed the internal situations it possesses, management can then match opportunities with the strengths and competitive advantages of the organization and determine the organization's **strategic goals** and **long-term objectives**. (B)

**(LOS) Discuss how strategic planning determines the path an organization chooses for attaining its long-term goals and mission**

An organization's strategic plan is a long-term plan that flows directly from the organization's vision and mission. The strategic plan is used to develop long-term goals for the organization. The organization sets long-term objectives as milestones to be achieved on the way to attaining the objectives.

## Steps in the Strategic Planning/Management Process (five-stage process):

**Step 1** Defining/selecting the company's mission and addressing the key corporate goals.

**Step 2** Analyzing the organization's external factors & the internal operating environment .

Analyzing the organization's external competitive environment in order to identify opportunities and threats;

Analyzing the internal operating environment to identify strengths, weaknesses and limitations of the organization;

The organization performs a situational analysis, also called a SWOT analysis

**Step 3** Formulating and selecting strategies (SWOT analysis) that, Based on the results of the situational analysis, upper management develops a group of strategies describing how the mission will be achieved.

Formulating and selecting strategies that, consistent with the organization's mission and goals, will optimize the organization's strengths and correct its weaknesses and limitations for the purpose of taking advantage of external opportunities while countering external threats (SWOT analysis);

**Step 4** Developing and implementing the chosen strategies.

Strategic plans are implemented through the execution of component plans at each level of the entity.

**Step 5** Strategic controls and feedback are used to monitor progress, isolate problems, and take corrective action. Over the long term, feedback is the basis for adjusting the original mission and objectives.

M-A-S-I-C

**Step 1**

**Defining the company's mission and addressing the key corporate goals.**

**The Mission Statement**

- Provides the guiding compass for an organization.
- Provides the context within which its strategies will be formulated.
- Summarizes the entity's reason for existing.
- It provides the framework for formulation of the company's strategies.
- succinctly articulates an organization's business position.
- expresses how the organization will continuously move toward its vision and provides a clear view of what the firm is trying to accomplish for its customers.

**Characteristics of Effective Missions**

- When they consist of a single sentence.
  - mission of Starbucks Coffee Company is “to inspire and nurture the human spirit - one person, one cup and one neighborhood at a time.
- Stated in general terms (very broad).
  - Setting specific objectives in the mission statement can limit an entity's ability to respond to a changing marketplace (i.e., because customer demands can shift quickly, and a given need can be served in more than one way).
- A mission statement answers this question: Why are we in business? In answering this question, a mission statement must be:
  - accurate,
  - easily understood,
  - motivating, and
  - transferable into action.
- It needs to be **flexible** and ready to adapt to changing conditions and new ways of serving its customers' needs.

**The mission statement includes four components:**

- ☐ 1) A statement of the company's “reason to be.”
- ☐ 2) Its vision, or a statement of a desired future stat.
- ☐ 3) A statement of the organization's values.
- ☐ 4) A statement of its major goals.

**Statement of the Company's “Reason To Be”**

In writing the mission statement, management should ask itself, “What is our business? What will it be? What should it be?” In answering the questions, they should think in terms of the **customer**:

- What customer groups are being served?
- What customer needs are being served?
- And by what means (skills, knowledge or distinctive competencies) are customers' needs being served?

The answers should be **customer-centered** rather than product-centered. In other words, the company should be in business not to sell widgets, but to satisfy its customers' needs for the benefits that the company can supply through its widgets.

### Examples

- For instance, **HOCK** is not in business to sell study materials for the CMA exams. Rather, HOCK is in business to help professionals advance in their careers and in their earning capacity by getting certified.
- This company is applying
  - a particular skill (the ability to teach)
  - in order to satisfy a particular need (the need to get certified in order to advance professionally)
  - for a particular group of people (financial professionals).
- **Merck & Co.**, a pharmaceutical company,
  - “Our business is preserving and improving human life.”
- **Hilton Worldwide**
  - To be the preeminent global hospitality company- the first choice of guests, team members, and owners alike.

➤ The next part of the mission statement is the company’s **vision**.

### Statement of the Company’s Vision

- It is what the company would like to achieve
- Is a guiding image of future success and achievement articulated in terms of the organization's contribution to society.
- Is a succinct statement of what an organization will do for future generations and how it wants to be perceived.

### Characteristics of Effective Visions

- Should be challenging
- A clear vision statement is compelling and unites everyone in the organization.
- Stating an ambitious future state that will
  - motivate employees at all levels
    - challenge management and employees alike to action
  - drive the strategies that the company’s management will formulate and implement in order to achieve the vision.
  - reflect organizational values and inspire and

### Examples

- **Du Pont’s** mission statement says,
  - “Our vision is to be the world's most dynamic science company, creating sustainable solutions essential to a better, safer and healthier life for people everywhere.”
- **Hilton Worldwide**
  - To fill the earth with the light and warmth of hospitality.

➤ After the vision comes the company’s values

### Statement of the Company’s Values

- Values state how managers and employees should behave and do business.
- Values are the foundation of its **organizational culture**.
  - The organizational culture consists of the values, norms and standards that govern how the company’s employees work to achieve the company’s mission and goals.
  - A deep respect for the interests of customers, employees, suppliers and shareholders has been associated with high performance in firms and vice versa.

### Statement of the Company's Goals

- Most companies' primary goal is to **maximize shareholder returns**, which accomplished through
  - high profitability and
  - sustained profit growth.
  - However, pursuit of current profits **should not** be permitted to lead to management actions that will be to the detriment of long-term profitability and profit growth.
    - For instance, cutting expenditures for research and development, marketing, and new capital investments will increase short-term profits, but it will do so at the expense of long-term profits.
    - Furthermore, too much pressure to increase current profits can lead managers to take actions that are unethical, such as misrepresenting the true performance of the company to shareholders and others.

### Characteristics of well-constructed Goals

- precise and measurable
  - crucial and address important issues
  - challenging while at the same time being realistic
  - specify when they should be achieved
  - clearly stated in specific terms
  - communicated to all individuals who will be impacted by them.
- In order for plans to be as effective as possible, they must be **coordinated among the different units** and departments in the company so that they are in alignment with the larger goals of the company.
- If plans are not coordinated and aligned with the corporate goals, different parts of the company may be working at cross-purposes and the company will not move in a positive direction.

Various types of plans are used to match what is being planned with the company's goals.

### LOS How mission leads to the formulation of long-term objectives

Demonstrate an understanding of how mission leads to the formulation of long-term business objectives such as business diversification, the addition or deletion of product lines, or the penetration of new markets.

#### Types of Plans and General Principles

- **Strategic Plans (Long-Term Plans)**
- **Intermediate Plans**
- **Short-Term Plans**

#### Types of Organizations Goals

- Strategic Goals
- Tactical Goals
- Operational Objectives

### Strategic Plans (Long-Term Plans)

- The company's top management does the strategic planning.
- **Strategic plans** are broad, general, long-term plans (usually five years or longer) and are based on the objectives of the organization.
  - The plan is updated, or **rolled forward**, each year.
  - Strategic planning is **neither detailed nor focused on specific financial targets**, but instead looks at the strategies, objectives and goals of the company by examining both the internal and external factors affecting the company.

- The results of this annual planning process are usually used, along with tactical and operational planning, in **developing the budget for the coming year**.
  - In this way, the strategic plan is used to determine resource allocation within the company.
- Strategic planning is **directional**, rather than operational. This means that the company focuses on where it wants to go instead of specifically how it will get there.

**Note:** The longer the time frame of the plan, the higher up in the organization the planning should be done. Similarly, the shorter the time frame of the plan, the lower in the organizational hierarchy the planning should be prepared.

### LOS Characteristics of successful strategic plans

Identify the characteristics of successful strategic plans

### Characteristics of successful strategic plans

A successful strategic plan is one that:

1. Assists the organization in achieving its long-term goals and objectives.
2. It has well-defined goals consistent with the strategic plan and the mission from which the plan we derived.
3. It also has SMART objectives, objectives that are:
  - Specific
  - Measurable
  - Achievable
  - Realistic
  - Timely

### Strategic Goals

- established at the highest levels of an organization.
- part of the firm's strategic plan.
- long range in nature.
- Examples:
  - business diversification,
  - the addition or deletion of product lines, and
  - the penetration of new markets.

*Strategic goals require additional goals to be achieved at the tactical level.*

### Intermediate Plans

The **strategic plan** is then broken down into **intermediate or tactical plans** (one to five years), which are designed to implement specific parts of the strategic plan.

- Upper and middle managers develop tactical plans.
- Operational plans are developed by middle and lower-level managers.
  - For example, the board of directors **should not** be involved in developing weekly work plans for an assembly line.

### Tactical Goals

- established at middle and lower levels of an organization.
- established by business (also referred to as responsibility centers and strategic business units {SBUs}) or functional departments

## Short-Term Plans

- All shorter-term plans need to **work toward the strategic** plans of the company.
- **Short-term or operational plans** are the primary basis of **budgets**.
- Operational plans refine the overall objectives from the strategic and tactical plans in order to develop the **programs, policies**, and performance expectations required to achieve the company's long-term strategic goals.
- Short-term objectives and the tactics to achieve them *should flow directly* from the organization's strategic plan and *should be designed to achieve* the goals and objectives set forth in the strategic plan. The short-term objectives would be *milestones* along the road to the achievement of the long term goals.

## Objectives

- provide the details or actions required to support goals.
- Well-conceived objectives specify
  - the quantitative measures that will be used to track progress and performance-the desired action.
  - the timing of the action
  - the level of performance desired,
  - and the function or individual responsible for the action.
- If one goal needs the achievement of multiple objectives, so all the objectives of different departments must be completed to realize the benefit of the goal.

Figure 1B-9 Comparison of Strategic and Operational Plans

	Strategic Plan	Operational Plan
<b>Focus</b>	Underlies both long- and short-run planning; provides the basis for the budget	Formulates specific goals for each business with detailed revenue and expense budgets
<b>Issues Examined</b>	Identifies and analyzes issues such as: <ul style="list-style-type: none"> <li>• New global market entrants</li> <li>• Economic conditions</li> <li>• Plans for diversification</li> </ul>	Identifies and analyzes issues such as: <ul style="list-style-type: none"> <li>• Quarterly earnings</li> <li>• Inventory levels</li> <li>• Major capital expenditures</li> <li>• Marketing plans</li> <li>• Productions plans</li> </ul>
<b>Development</b>	Flows from top down; reflects a comprehensive analysis of external and internal factors	Flows from bottom up; recommends specific options for the upcoming year
<b>Control</b>	Reviewed annually and updated as needed to reflect high-level changes	Reviewed and updated/modified periodically throughout the year to address changing needs (such as lagging major product sales, competitors' new pricing structures, newly opened distribution channel)

Q. A firm's statement of broad objectives or mission statement should accomplish all of the following except

- Outlining strategies for technological development, market expansion, and product differentiation.
- Defining the purpose of the company.
- Providing an overall guide to those in high-level, decision-making positions.
- Stating the moral and ethical principles that guide the actions of the firm.

Answer (A) is correct. The determination of organizational objectives is the first step in the planning process. A mission statement is a formal, written document that defines the organization's purpose in society, for example, to produce and distribute certain goods of high quality in a manner beneficial to the public, employees, shareholders, and other constituencies. Thus, a mission statement does not announce specific operating plans. It does not describe strategies for technological development, market expansion, or product differentiation because these are tasks for operating management. Analyzing and reviewing departmental budgets is an aspect of operational management and not a part of strategic planning. Analysis of the current month's budget variances is not an aspect of strategic planning. Setting the target product mix and production schedule for the current year is not a concern of strategic analysis because it is a short-term activity. (GL/CMA)

#### Importance of aligning long-term objectives with other tactical short term plans and budget

Explain why short-term objectives, tactics for achieving these objectives, and operational planning (master budget) must be congruent with the strategic plan and contribute to the achievement of long-term strategic goals.

### Alignment of Tactics with Long-Term Strategic Goals

Strategic plan precedes an operational plan; the strategic plan provides the foundation upon which the more detailed operational plan is developed. In that sense, strategic plans are "macro" plans and operational plans are "micro" plans.

### Importance of Strategy in Budgeting

A prerequisite for budget development is a strategic analysis that matches an entity's capabilities with available marketplace opportunities.

A firm's **strategy** is the *path* it chooses for attaining its long-term goals and mission.(B).

**Strategic analysis** is the basis for both long-term and short-term planning. (IMA)  
In turn, these plans lead to the formulation of budgets.

**Budgets** provide feedback to managers about the likely effects of their strategic plans. Managers use this feedback to revise their strategic plans.(H)

**Strategy** is the **organization's plan** to match its strengths with the opportunities in the marketplace to accomplish its desired goals over the short and long term.

**Strategy** is the starting point in preparing its plans and budgets.

**Budgeting** is a common accounting tool that companies use for implementing strategy, as budgeting facilitates movement toward strategic goals. (H,IMA)

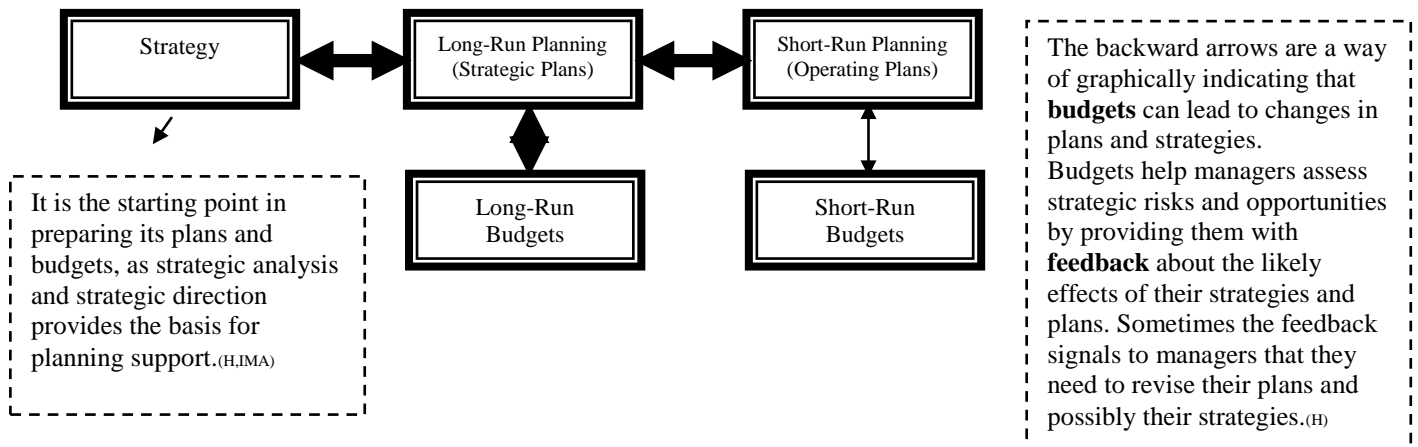

A **budget** should start with a careful review and study of the organization's strategic plan. The objective is to build a budget to achieve the organization's strategic goals and objectives. (B)

By not relying on its strategic plan, an organization very likely would not be able to fully utilize its strengths and take full advantage of opportunities. Ignoring the strategic plan can result in **not** adequately funding the projects and initiatives that are critical to achieving results aside from the daily operations of taking and fulfilling sales orders. (B)

## Strategy, Planning, and Budgets

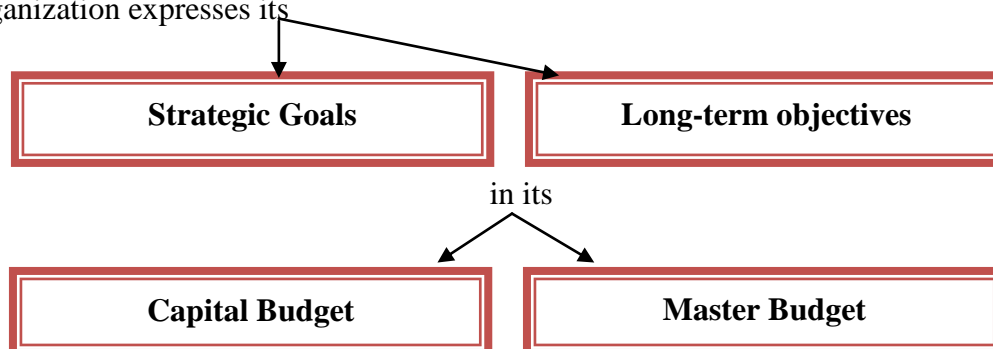

Strategic plans are expressed through long-run budgets and operating plans are expressed via short-run budgets. But there is more to the story! The exhibit shows arrows pointing backward as well as forward. (H)

## Resource Allocation

All entities have a finite amount of resources and want to make the most of their capital. The allocation of scarce resources among competing opportunities is accomplished through implementation of a strategy. (IMA)

An organization expresses its

## Strategy

**Strategy** provides the framework within which a long-range plan is developed. (B)

Implementing the **strategy** requires formulation of **long-term plans**, and **long-term plans** are implemented using a **budget process**. (IMA)

### Long-term Planning

While a strategy is the starting point for achieving organizational goals, a long-term plan is needed to ensure that the strategy is implemented. (IMA)

The organization's long-range plan identifies required actions over a 5- to 10 year period to attain the firm's strategic goal(s). (B)

**Planning for the long term** can involve discontinuing certain operations over time, arranging for equity or debt financing, and allocating resources gradually to new branches of business. Such major reorganizations can be accomplished only over a period of time and usually involve the use of capital budgeting part of the master budget). (IMA)

**Long-range planning** often entails **capital budgeting**, which is a process for evaluating, selecting, and financing major projects such as purchases of new equipment, construction of a new factory, and addition of new products.

**Capital budgets** are prepared to bring an organization's capabilities into line with the needs of its long-range plan and long-term sales forecast. An organization's capacity is a result of capital investments made in prior budgeting periods

**Capital budgeting** is the process of allocating resources to an entity's proposed long-term projects. Because buildings, equipment, and hiring and training staff are all extremely expensive, such allocations must be made in accordance with strategy.

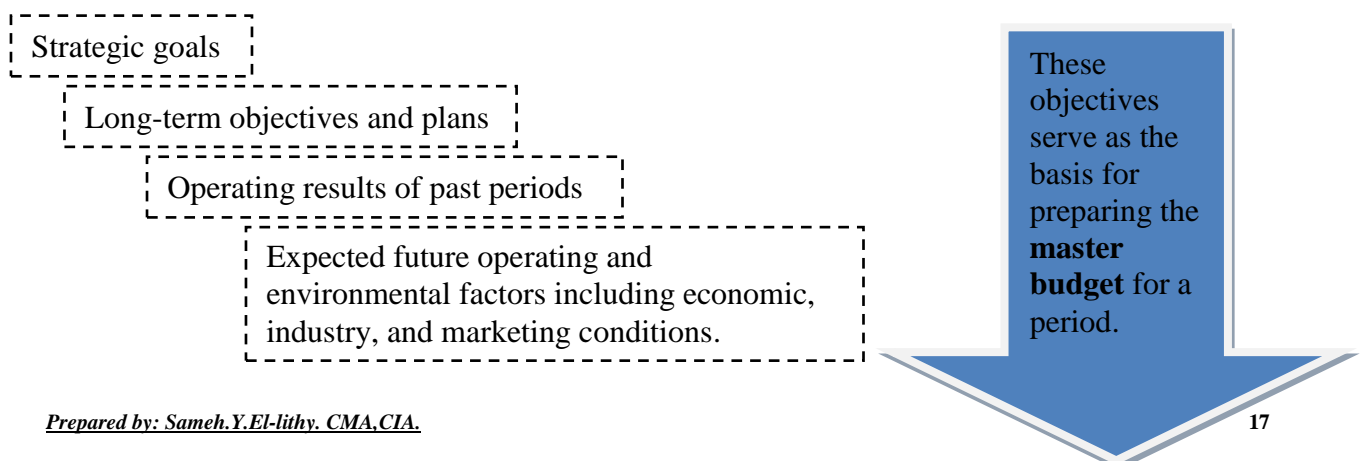

The **strategic goals and objectives** of the organization are, ultimately, accomplished through a focused set of initiatives and projects that creates value for the organization.

As such, it is important that the organization's **annual budgeting process** give prominence to a particular class of capital-budgeting expenditures: **strategic budget expenditures**, including those related to sustainability. Because such expenditures lead to long-term value creation and competitive advantage, it is important that they be clearly identified and, to the extent possible, protected. Too often, such budgetary amounts are buried in ledger accounts and therefore subject to reduced support if not outright cutting. This is true particularly when short-term financial performance is falling short of expectations, with the consequent "need" to cut spending. (B)

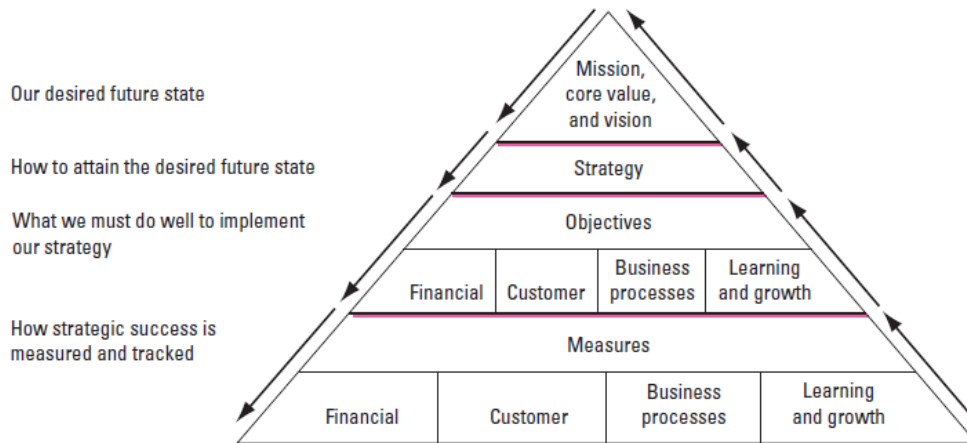

### Short-Term Objectives and the Master Budget

**Short-term objectives** are goals for the coming period, which can be a **month**, a **quarter**, a **year**, or any length of time desired by the organization for planning purposes. (B)

An organization determines **short-term objectives for the budget period based on**

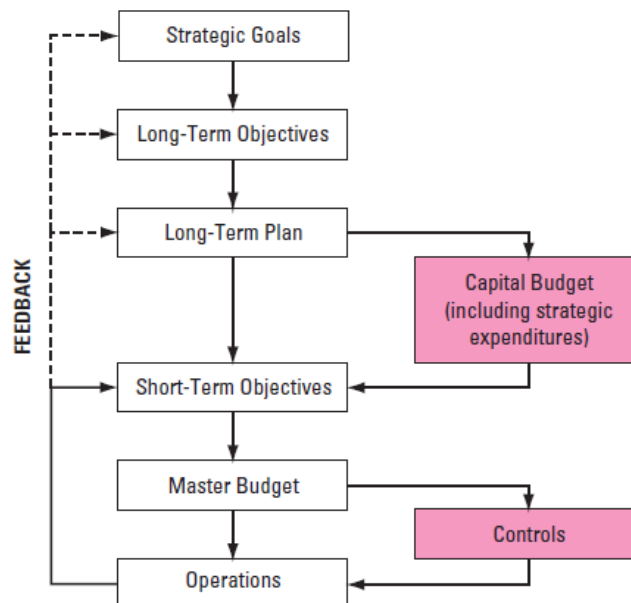

Recognizing that the objective of an organization is multidimensional, more and more organizations are employing strategy maps and their companion, the balanced scorecard, to translate their strategy into objectives. Exhibit 10.2 depicts a translation of strategy into short-term objectives with the balanced scorecard. The arrows suggest that the process is both top-down and bottom-up.<sup>(B)</sup>

A **master budget** translates the organization's **short-term objectives** into action steps. A master budget reflects an organization's operating and financing plans for the upcoming budget period.<sup>(B)</sup>

The relationships among strategic goals, long-term objectives and plans, short-term goals, budgets, operations, and controls. (next CSO discuss the master budget in depth)

The **master budget** is the overall plan for operations for a company or business unit over a year, an operating period, or a shorter duration. The master budget sets quantitative goals for all operations, including detailed plans for raising the required capital.<sup>(IMA)</sup>

The **master budget** is a map showing where the company is heading, and, if it is properly designed, it will show the company heading in the same direction as the strategy and the long-term plan. The budget is more precise and of shorter duration than long-term plans, and it is more focused on responsibility centers than longer-term planning tools. <sup>(IMA)</sup>

A master budget is broken down into an operating budget, a financial budget, and a capital budget.<sup>(IMA)</sup>

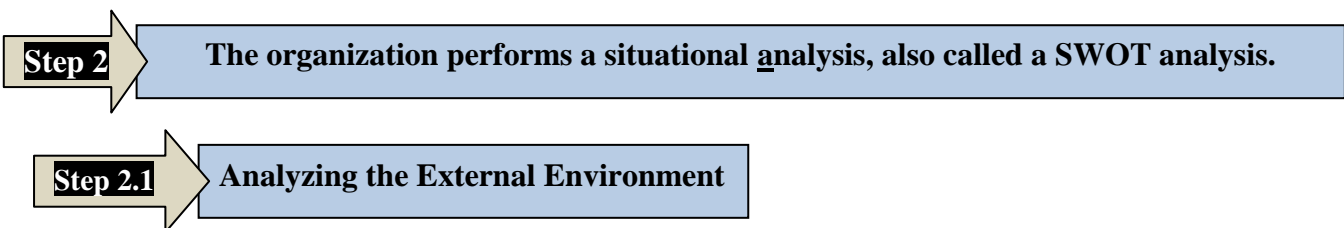

An **operating budget** identifies *resources* that are needed for operations and is concerned with the acquisition of these resources through purchase or manufacture. Production budgets, purchasing budgets, sales promotion budgets, and staffing budgets are all operating budgets.

A **financial budget** matches sources of funds with uses of funds in order to achieve the goals of the firm, including budgets for cash inflows, outflows, financial position, operating income, and capital expenditures.

A **capital budget** is used to plan how resources will be used to support significant investments in projects that have long-term implications. These projects could include the purchase of new equipment or investment in new facilities.

**Efficient allocation of organizational resources during the budgeting process can be achieved through:**

- The process of developing the operating budgets for the individual units in an organization.
- Making decisions about the most profitable way to utilize the resources available.

After defining the company's mission and developing its goals, the first step in developing a strategic plan is to analyze the forces that shape the industry in which the company operates and the competition within that industry in order to understand the **opportunities** available to the firm and any **threats** confronting the firm that can affect it in the pursuit of its mission. Understanding its opportunities and threats will enable the company to outperform the competition.

### External factors (recognition of OLT)

- Are external or environmental opportunities and threats that face the organization.
  - **Opportunities** are those things that would enhance the organization's competitive position and profitability.
  - **Threats** are *risks* that, if they occur, would be detrimental to the organization's competitive position and profitability.

The specific external factors affecting an organization's strategy are determined by its industry and broader environment. They are identified by considering

- a) **Macroenvironment** factors (economic, demographic, political, legal, social, cultural, and technical) and
- b) **Microenvironment** factors (suppliers, customers, distributors, competitors, and other competitive factors in the industry).

### (LOS) External factors that should be analyzed & recognition of OLT

Identify the external competitive environment factors that should be analyzed during the strategic planning process and understand how this analysis leads to recognition of organizational opportunities, limitations, and threats

Three environments should be examined, and the three environments are interrelated and shaping the organizational strategy:

1. The **industry** in which the company operates,
  - Market forces, industry trends, and competition.
2. The **country** or the **national environment** in which the company operates as well as the international environment,
3. And the wider environment, or **macroenvironment** in which the company operates.
  - Economic, demographic, political, legal and regulatory factors, social, cultural, and technical changes.
  - Stakeholder groups and their social concerns.
  - Globalization trends, emerging markets, and nongovernment organizations (e.g., United Nations, World Bank, etc.).

All of these external factors need to be examined during strategic planning in order to understand the opportunities available to the firm and any threats confronting the firm.

**Opportunities** arise when companies can *leverage* external conditions to develop and implement strategies that will make them more profitable.

**Threats** include conditions in the external environment that pose a *danger* to profitability

1. Identifying the **industry** the company competes in is the first step in external analysis.
  - Identifying companies that offer similar products to satisfy the same basic needs of their customers.
  - Implement an **industry analysis** by assessing the:
    - company's industry as a whole
    - company's competitive position within the industry
    - the competitive positions of its major rivals.

Once the boundaries of an industry have been identified, managers face the task of analyzing competitive forces within the industry environment in order to identify opportunities and threats. *Michael E. Porter's* well-known framework, known as "**The Five Forces Model**," has helped managers with this analysis. An extension of his model, shown in Figure 2.2, focuses on six forces that shape competition within an industry:

- (1) the risk of entry by potential competitors,
- (2) the intensity of rivalry among established companies within an industry,
- (3) the bargaining power of buyers,
- (4) the bargaining power of suppliers,
- (5) the closeness of substitutes to an industry's products and
- (6) the power of complement providers (Porter did not recognize this sixth force).

Michael Porter developed a model examining five forces and their collective role in determining the strength of competition and profitability. It includes an analysis of the five competitive forces that determine long-term profitability as measured by long-term return on investment.

#### Porter's Arguments:

- As the **forces grow stronger**, they **limit** the ability of established companies to raise prices and earn greater profits.

when one or more of these competitive forces is **strong**

it creates **limitations** on the company's ability to raise prices and earn greater profits.

- Within Porter's framework, a **strong competitive force** can be regarded as a **threat** because it depresses profits.
- A **weak competitive force** can be viewed as an **opportunity** because it allows a company to earn greater profits.
  - The **strength** of the forces may change overtime as industry conditions change. Managers face the task of recognizing how changes in the forces give rise to new opportunities and threats, and formulating appropriate strategic responses.
    - In addition, Porter says it is possible for a company, through its choice of strategy, to alter the strength of one or more of the forces to its advantage.

Michael Porter's model of competitive strategies has two variables: competitive advantage and competitive scope. The strategy adopted depends on whether the advantage sought is based on lower cost or product differentiation, and on whether the scope is broad or narrow. (GL/CMA)

**Figure 2.2 Competitive Forces**

According to Porter, the five forces that shape competition within an industry are:

### 1) The risk of entry by potential competitors.

#### Definition

**Potential competitors** are companies that are **not** currently competing in an industry, but have the **capability** to do so if they choose.

The risk of entry by potential competitors is a function of the height of barriers to entry, that is, factors that make it costly for companies to enter an industry.

Important barriers to entry include:

- economies of scale,
- brand loyalty,
- absolute cost advantages,
- customer switching costs, and
- government regulation.

The **greater** the costs potential competitors must bear to enter an industry,

the **greater** the barriers to entry, and the **weaker** this competitive force.

**High** entry barriers may keep potential competitors out of an industry even when industry profits are high.

**Note:**

The **most favorable industry condition** is one in which:  
**entry barriers are high** and **exit barriers are low.**

When the **threat** of new entrants is **minimal** and **exit** is **not difficult**,

**Returns are high, and risk is reduced in the event of poor performance.**

**Low entry barriers** keep long-term **profitability low** because new firms can enter the industry,

**increasing competition** and **lowering prices** and the **market shares** of existing firms.

Accordingly the prospects of **long-term profitability** depend on the industry's barriers to entry.

**IF**

Economies of scale (and learning curve effects) are **not significant**.

Costs of switching suppliers are **low**.

Existing firms **do not** have the cost advantages of vertical integration

Product differences are **few**.

Brand identity of existing products is **weak**.

Access to existing suppliers is **not blocked**, and distribution channels are willing to accept new products.

Capital requirements are **low**

Exit barriers are **low**.

**P**

The government's policy is to **encourage new entrants**.

**Threat of entry will Increase**

## 2) The intensity of rivalry among established companies within an industry.

### Definition

Rivalry is the *competition among companies in an industry to gain market share from one another.*

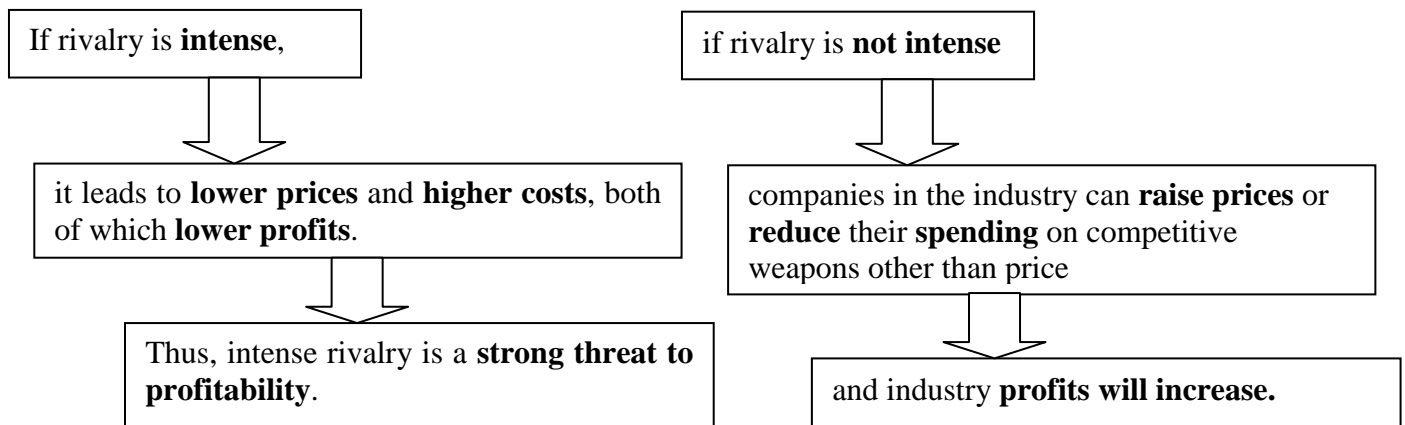

Weapons in the competition include:

- prices,
- product design,
- promotional efforts,
- selling efforts, and
- service and sup-port after the sale.

The intensity of rivalry among established companies within an industry is largely a function of four factors:

- (1) industry competitive structure,
- (2) demand conditions,
- (3) cost conditions, and
- (4) the height of exit barriers in the industry.

### Level of Intensity

### Factors Affecting the Level of Intensity

#### (1) Industry competitive structure

##### Definition

The competitive structure of an industry refers *to the number and size distribution of companies in it, something that strategic managers determine at the beginning of an industry analysis.*

Industry structures vary, and different structures have different implications for the intensity of rivalry.

**A fragmented industry** consists of a large number of small or medium-sized companies, none of which is in a position to determine industry price.

- Low-entry barriers.
- Undifferentiated product
- Accordingly, this constitutes a **threat** rather than an opportunity.

**A consolidated industry** is dominated by a small number of large companies (an oligopoly) or, in extreme cases, by just one company (a monopoly), and companies often are in a position to determine industry prices.

- High-entry barriers.
- Differentiated product
- Companies in consolidated industries sometimes seek to reduce this threat by following.

## Product Differentiation

### Less differentiation:

- tends to **heighten competition** based on price since customers often focus on price, terms, with price cutting leading to **lower profits** and **rivalry intensifies**.

### Highly Differentiated product:

- when customers develop preferences and brand loyalty due to large perceived differentiation. Product differentiation can foster buyer preferences and loyalties to particular suppliers. Naturally, organizations seek differentiation that is sustainable (e.g., a feature that is difficult to imitate, remains useful, and **customers are willing to pay for**).

### Customer switching costs.

- the costs of switching from one competitor's product to another.
  - If costs of switching suppliers are **high** this will **weaken** competition.
    - Changing a computer operating system is an example of a situation in which a customer typically would incur a general disruption of operations and expensive costs.

## (2) Demand Conditions and the stage of the industry life cycle.

- **Growing demand** tends to **reduce rivalry** because all companies can sell more without taking market share away from other companies. **High industry profits** are often the result.
- Conversely, **declining demand** results in **increased rivalry** as companies fight to maintain market share and revenues.
  - Demand declines when customers exit the marketplace, or when each customer purchases less, (i.e., The stage of the industry life cycle decline) . When this is the case, a company can only grow by taking market share away from other companies. Thus, declining demand constitutes a major threat, for it increases the extent of rivalry between established companies.

## (3) Cost Conditions/Structure (Whether fixed costs are high in relation to variable costs)

### High fixed costs indicate that rivalry will be intense.

- In industries where **fixed costs are high**, The **greater the cost** to generate a given amount of sales revenues, **the greater the investment intensity** and the need to operate at or near capacity, profitability tends to be highly leveraged to sales volume, and the desire to grow volume **can spark intense rivalry**.
  - Firms cannot cover their fixed costs and will not be profitable if sales volume is low.
    - Thus they have an **incentive to cut their prices** and/or **increase promotional spending** to drive up sales volume in order to cover fixed costs (i.e., **price cutting to sustain demand is typical**).
  - Capacity utilization is emphasized when fixed costs are high. Any excess capacity often leads to price cutting and a cycle of price matching.
  - Capacity expansion
    - If the size of the expansion must be large to achieve economies of scale, **competition will be more intense**. The need for large-scale expansion to achieve production efficiency may result in an excess of industry capacity over demand.

## (4) Exit Barriers

The height of exit barriers can influence the intensity of rivalry among established companies within an industry. Exit barriers are factors that prevent companies from leaving an industry.

- If **exit barriers are high**, companies may find themselves locked into an industry with declining demand, causing excess capacity which **leads to price wars**.
- An example of a **high exit barrier** is a large investment in assets that are specific to the industry. A company leaving an industry when the industry had over-capacity would not be able to sell its assets or would have to sell them at a very low price resulting in a large loss.

### 3) The bargaining power of buyers.

- If buyers such as large discount store chains have the ability to **bargain down prices** or to demand better product quality and service that would increase manufacturers' costs, an industry can become less profitable. Therefore, **powerful buyers are a threat**.

Buyers' bargaining power varies with the following factors:

- a) When purchasing power is concentrated in a **few buyers** or when buyers are well organized, their **bargaining power is greater**. This effect is reinforced when sellers are in a capital-intensive industry.
- b) **High (low) switching costs decrease (increase) buyers' bargaining power**.
- c) The **threat** of backward (upstream) **vertical integration**, that is, the acquisition of a supply capacity, **increases buyers' bargaining power**.
- d) Buyers are most likely to **bargain aggressively** when their **profit margins are low** and a supplier's product accounts for a substantial amount of their costs.
- e) **Buyers are in a stronger position** when the **supplier's product is undifferentiated**.
- f) The more important the supplier's product is to buyers, the **less bargaining power** they have.

### 4) The bargaining power of suppliers.

- If suppliers have the ability to **raise the prices of inputs** such as materials or direct labor (through labor unions, for instance) or to lower quality, it will raise the costs of companies in the industry. So **powerful suppliers are also a threat**.

Suppliers' bargaining power is greater when

- a) Switching costs are substantial.
- b) Prices of substitutes are high.
- c) They can threaten forward (downstream) vertical integration.
- d) They provide something that is a significant input to the value added by the buyer.
- e) Their industry is concentrated, or they are organized.

### 5) The closeness of substitutes to an industry's products.

- **The existence of close substitutes** for an industry's product is a **threat** because it limits the prices that can be charged for the product, the less attractive the industry is to potential entrants.
- If there are **few or no close substitutes**, then companies have the **opportunity** to raise prices without fear that their customers will switch to a substitute.

Substitutes are types (not brands) of goods and services that have the same purposes, for example, plastic and metal.

Structural considerations affecting the threat of substitutes are

- a) Relative prices,
- b) Costs of switching to a substitute, and
- c) Customers' inclination to use a substitute.

### Linkage of the Five Forces to Strategic Planning

The collective strength of the five competitive forces determines the ability of firms to earn rates of return on investment in excess of the cost of capital. In industries where the strength of the five forces is **favorable** (e.g., pharmaceuticals), *profits are attractive*. Understanding industry structure is a critical starting point during strategy formulation. The strongest force or forces assume increased importance during strategic planning and strategy formulation.

### A Sixth Force: Complementors (products that add value to (complement) the products of companies in an industry)

When complements are an important determinant of demand for an industry's products, industry profits critically depend upon an adequate supply of complementary products.

- When the number of complementors is **increasing** and producing attractive complementary products, **demand increases** and profits in the industry can broaden **opportunities** for creating value.
  - Conversely, if complementors are weak, and are not producing attractive complementary products, they can become a **threat**, **slowing** industry growth and **limiting profitability**.
2. Analyzing the **national and international environment** includes assessing:
- domestic as well as international political risk:
    - government expropriation and war
  - the impact of **globalization** (migration to international operations) on competition within the industry

### Linkage of national and international environment

Multinational or global organization must make considerable investments in resources, and these investments should be carefully crafted during strategic planning.  
An enterprise needs to acquire additional skills and competence as it moves through the stages of globalization.

3. Analyzing the **macroenvironment (macroeconomic) factors** includes assessing:
- **Economic condition** will affect demand and thus sales revenue and net income in the future.
    - Economic growth
      - leads to more consumer spending and gives companies the opportunity to expand their operations and increase their profits.
    - Economic recession
      - leads to a reduction in consumer spending and, in a mature industry, may cause price wars.
  - The level of **interest rates** affect any company's cost of capital and thus its ability to raise capital and invest and expand.
    - Rising interest rates will cause demand to decrease
    - Falling interest rates will cause demand to increase.
  - **Changes in currency exchange** rates affect the competitiveness of companies in international trade.
    - A declining local currency creates opportunities for increased international sales while decreasing foreign competition.
    - An increasing local currency causes the opposite condition.
  - Both **inflation** and **deflation**

- When inflation increases, it is difficult to plan on what the real return will be from an investment.
- Deflation also causes a lack of stability in the economy, because when prices are deflating, companies with a high level of debt and the obligation to make regular fixed payments on the debt can find themselves unable to service that debt.
- **Legal and Regulatory Factors.**<sup>1</sup>:
  - A host of **legal factors** can impact product/service success. Examples include:
    - Patents
    - Copyrights
    - Trademarks
    - Antitrust laws
    - Trade protectionism
    - Product/service liability issues
    - Environmental liability concerns
    - Employment law and litigation
    - Compliance with the Sarbanes-Oxley Act (SOX)
  - General examples of **regulatory factors** that can affect an organization's strategy include:
    - **Social Regulations**
      - **Environmental Protection Agency (EPA)** standards restrict pollution of air, water, and land.
      - **Occupational Safety and Health Administration (OSHA)** standards protect the safety and health of American workers,
      - **Federal Trade Commission (FTC) regulations** protect consumers, require truthful advertising by businesses, and prohibit collusion (e.g., price fixing and allocating markets).
    - **Industry Regulations**
      - **Federal Aviation Administration (FAA)** requirements for airports, air traffic control, safety issues, and routes.
      - **Federal Communications Commission (FCC)** regulations for radio and television frequencies.
      - **Food and Drug Administration (FDA)** requirements for safety in the food and drug industry and in medical device manufacturing.

#### Linkage of Legal and Regulatory Factors to Strategic Planning

The influence of legal and regulatory factors on an organization's strategy can be quite pervasive. The following are just a few examples of how legal and regulatory factors can affect an organization:

- Influence how a firm chooses to compete (e.g., through antitrust laws and licensing requirements).
- Limit global operations (e.g., through trade protectionism).
- Thwart or promote technology innovations (e.g., through tax and patent policies).
- Force environmental accountability (e.g., through EPA controls).
- Increase capital requirements (e.g., through required technical sophistication to meet governmental control requirements).

<sup>1</sup> Depending on the industry, legal and regulatory factors may be interrelated. But the two factors also have some key distinctions. Legal factors are rules of conduct promulgated by legal entities (e.g., federal, state, county provincial, or city laws); they are enforced by the threat of punishment. Regulatory factors (or regulations) are principles or rules designed to control or govern behavior. Theoretically, regulations are voluntary. But in many situations, regulations can have the force of law (i.e., regulatory factors are enforced most often by some form of self-regulation, with the threat of fines and/or disenfranchisement). For example, an organization may not be able to compete in a given market if it does not comply with regulatory factors.

- **Technological Changes**

- Technology can result in the **creation of industry substitutes** (e.g., wireless phones versus land lines).
- Technology can **reduce the need for large-scale distribution** and open a market up to new entrants (e.g., Web-based e-commerce technology versus traditional distribution channels).
- Technology **can accelerate new product designs** and facilitate short production runs in manufacturing-based industries, leading to either intense rivalry or monopoly.

#### Linkage of a Technology Assessment to Strategic Planning

Characteristics of a sound technology strategy include:

- Plans for attaining short-term and long-term objectives and major projects, including goals and milestones.
- Resource allocation.
- Alignment to the organization's financial plan and budget.

A technology strategy also should be easily understood and well communicated. The commitment of key people must be secured. The technology strategy establishes preliminary organizational priorities and commitments to innovation and technology development, always keeping the firm's strategic positioning in mind.

- **Stakeholder Groups and Their Social Concerns**

- Executives
- Managers and employees (including their families)
- The organization's board of directors
- Shareholders (stockholders)
- The industry in which the organization operates
- Customers
- Competitors
- Suppliers
- Business partners

#### Linkage of a Stakeholder Analysis to Strategic Planning

During strategic planning, it is important to identify the various stakeholders to understand their expectations and potential influences on the enterprise and to ensure that their needs and interests are addressed. If not on board, stakeholders can withhold resources and support and potentially undermine the legitimacy of the enterprise.

**Shareholder value and stakeholder analysis are not mutually exclusive.** Obvious decisions that balance expenses with revenues and are aligned to corporate goals are usually prudent courses for action. However, challenges can arise. For example, an organization may face a situation that violates the rights of one at the benefit for many. But most organizations also look for ways "to do the right thing" for all stakeholders while still achieving satisfactory profits for shareholders.

Step 2.2

Analyzing the Internal Environment

Analyze the organization's internal operating environment to identify the organization's strengths and weaknesses.

**Internal factors (recognition of SWC)**

- Are the organization's strengths and weaknesses.
  - **Strengths** are those things that would enhance the organization's competitive position and profitability;
  - **Weaknesses** are those that *detract* from its competitive position and profitability.

**Distinctive competencies** are the firm-specific strengths of a company. Valuable distinctive competencies enable a company to earn a profit rate that is above the industry average.

- The distinctive competencies of an organization arise from its:
  - **resources** (its financial, physical, human, technological, and organizational assets) and
  - **capabilities** (its skills at coordinating resources and putting them to productive use).

Therefore, Internal analysis focuses on reviewing the:

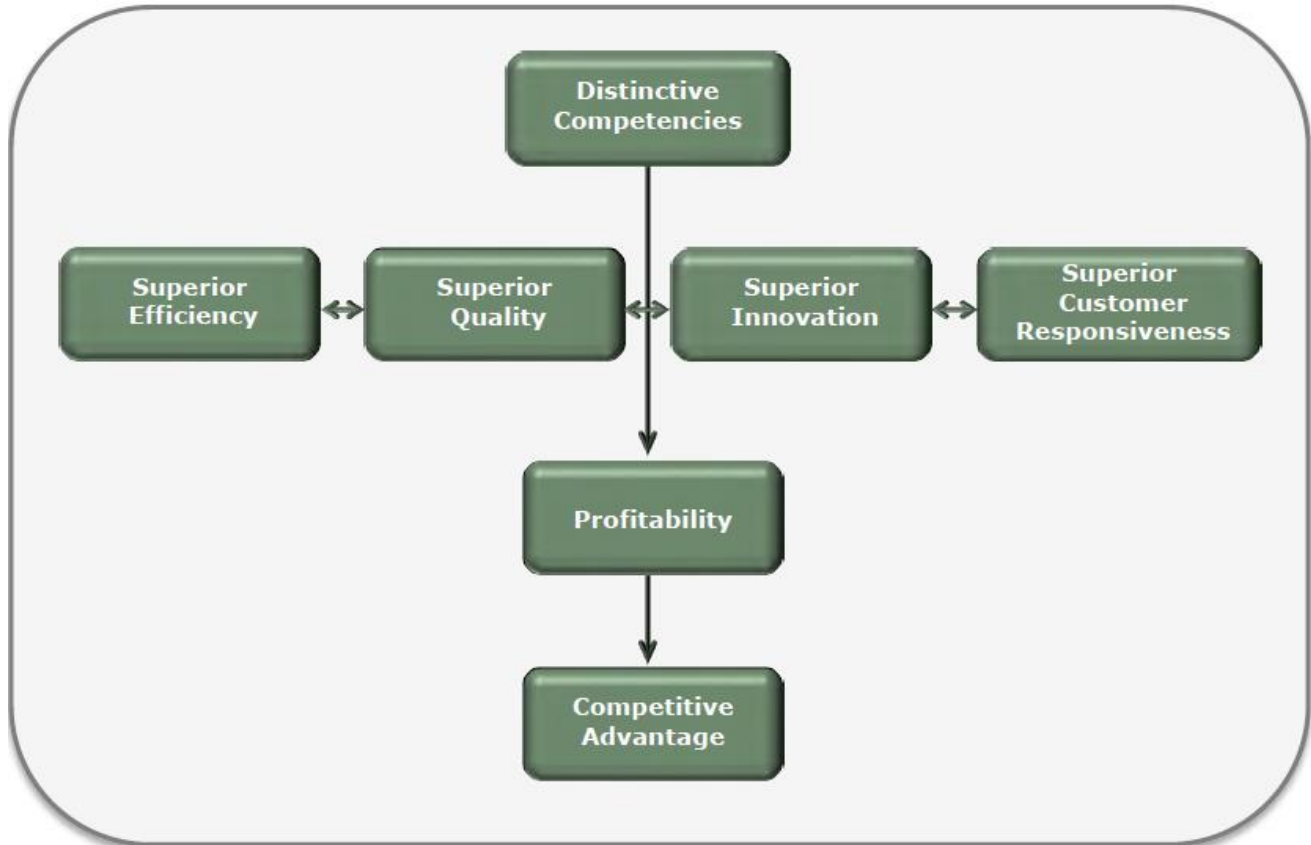

- Resources,
- Capabilities, and
- Competencies of a company.

**Competitive Advantage**

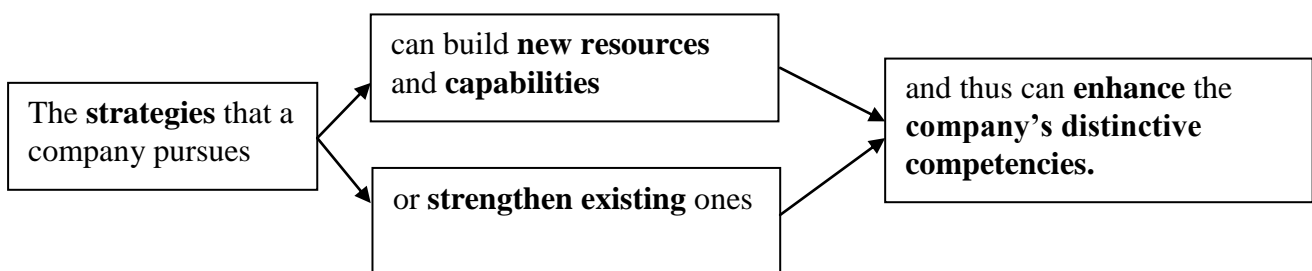

- A company is said to have competitive advantage when it is *more profitable* than the average company in its industry.
  - It has a sustained competitive advantage if it is able to continue **having above-average profitability over several years** as this is the primary objective of strategy.
- In order to achieve a competitive advantage, a company needs to pursue strategies that build on its existing resources and capabilities and formulate strategies that build additional resources and capabilities (develop new competencies).
- Competitive advantage achieved through superior performance, thus a company must have or create two basic things:
  - 1) **Distinctive competencies** and the superior efficiency (superior value creation) , quality, innovation and customer responsiveness that result from them.
    - **Distinctive competencies** stem from two sources:
      - **1) Tangible resources** (land, buildings, inventory, and cash) & **Intangible resources** (brand names, company reputation, intellectual property such as patents and trademarks, and employees' knowledge). and
      - **2) Capabilities (intangible)** that coordinate its resources and to put them to productive use. Therefore, **capabilities** are essential for distinctive competency, whereas special resources are not always necessary.
    - **Distinctive competencies** are strengths that a company has that enable it to have:
      - A differentiation advantage, meaning it is able to provide the customer with benefits that exceed those of its competitors, and/or
      - A cost advantage, meaning it is able to provide to the customer the same benefits as its competitors do, but at a substantially lower cost.

- In other words, to **create superior value (utility)** a company must lower its costs or differentiate its product so that it creates more value and can charge a higher price, or do both simultaneously.
- 2) The **profitability** that is derived from the **value customers** place on its products, the price that it charges for its products, and the costs of creating those products.

### Circular relationship between a company's distinctive competencies and its strategies

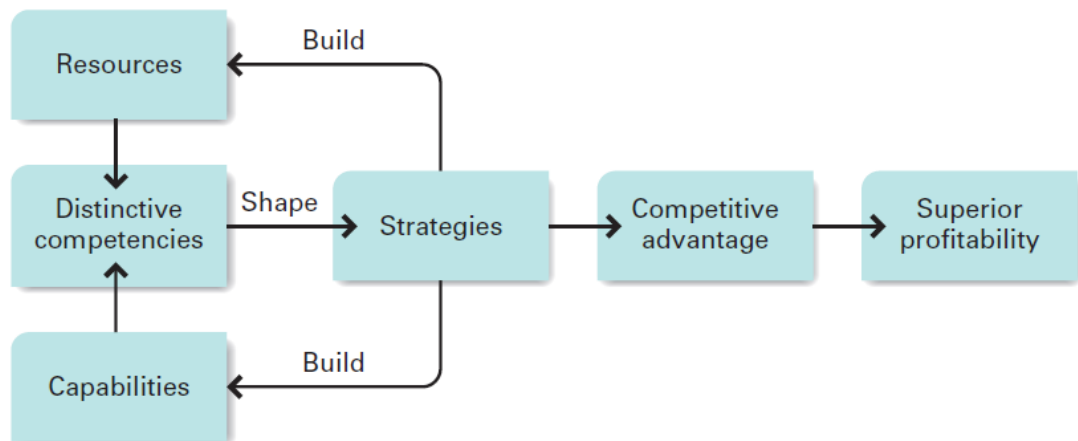

At the same time,

**Figure 3.1** Strategy, Resources, Capabilities, and Competencies

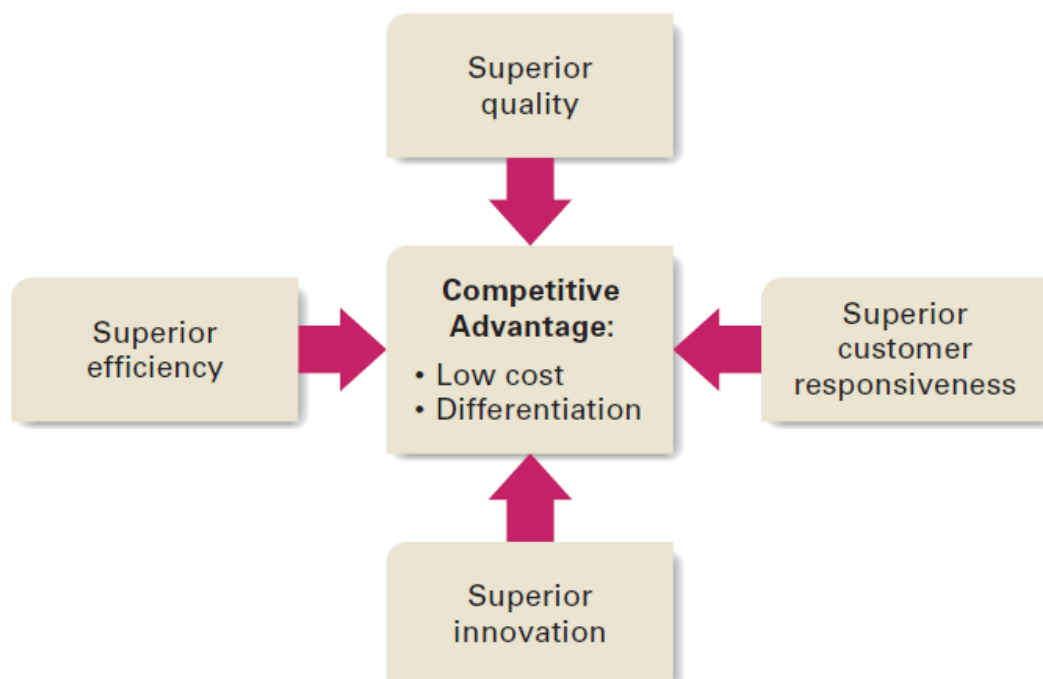

The four building blocks of competitive advantage are:

- efficiency,
- quality,
- innovation, and
- responsiveness to customers.

These are generic distinctive competencies:

- **Superior efficiency** enables a company to lower its costs;
- **Superior quality** allows it to charge a higher price and lower its costs; and
- **Superior customer service** lets it charge a higher price.
- **Superior innovation** can lead to higher prices, particularly in the case of product innovations, or lower unit costs, and in the case of process innovations.

**Figure 3.6** Building Blocks of Competitive Advantage

**Good Internal Analysis** = analyze the financial performance

If a company's managers are to perform a good internal analysis, they need to be able to analyze the financial performance of their company,

- identifying how the strategies of the company relate to its profitability, as measured by the return on invested capital.
- This involves comparing, or **benchmarking**, the company's current financial performance against that of its competitors as well as against the company's own historical performance.
  - management can see whether the company is more or less profitable than its competitors and
  - whether its profitability has been improving or deteriorating.
  - whether the strategies the company is pursuing are maximizing value creation,
  - whether the company's costs' are in line with those of their competitors, and
  - whether the company's resources are being used effectively.
- The greater the **utility** that customers receive from a company's products or services, the greater the number of **pricing** options the company has.
- If a company is going to achieve a sustained competitive advantage and superior profitability, its management needs to make the right choices with respect to **utility**, by using *differentiation* and *pricing*, given the demand in the company's market as well as the company's *cost structure* at various levels of output, all of that will be done through **value chain analysis**.

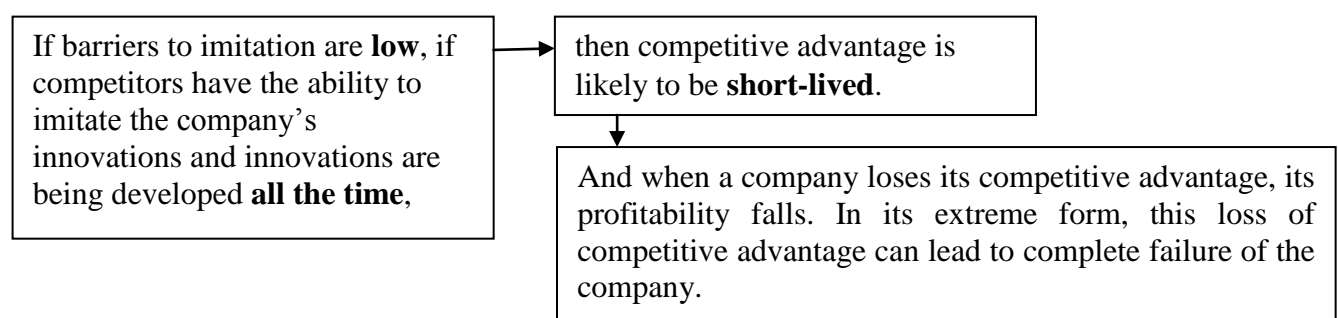

### **Durability of Competitive Advantage**

Another consideration in internal analysis is: How long any competitive advantage that a company has will last?

**The durability of a company's competitive advantage depends on**

- the **height of barriers to imitation**, or factors that make it difficult for a competitor to imitate the company's distinctive competencies, such as patents.
- the **capability of competitors** to imitate the company's competitive advantage, based upon their
  - **prior strategic commitments** that will make it difficult to respond to new competition if it would require changing its commitments.
  - and their **absorptive capacity** (the company's ability to make use of new knowledge)., and
- **environmental dynamism**.
  - When an industry is changing rapidly, a company with competitive advantage may quickly find its market position overtaken by a competitor with a new innovation.

### **Failing Companies**

Failing companies typically earn low or negative profits. Three factors seem to contribute to failure:

- organizational inertia in the face of environmental change,
  - (i.e., reluctance to change strategies in order to adapt to changing conditions in the company's competitive environment).
- the nature of a company's prior strategic commitments
- such as investments, which may limit its ability to imitate rivals and to be flexible, causing a competitive **disadvantage**., and
- the Icarus paradox.
- The Icarus paradox is based on a Greek myth. Icarus (a Greek figure) used a pair of wings that he stuck to his body with wax to escape from an imprisonment. But he flew so well that he flew too close to the sun. The heat of the sun melted the wax holding his wings together. He plunged to his death. The paradox is that his **greatest asset, his ability to fly**, caused his demise. This same paradox can be applied to many companies if they become too dazzled by their by their early and own success that they believe more of the same type of effort is the way to future success. They believe that the way to attain future success is to follow the same strategies that made them successful in the past. They can become so specialized and inner directed that they lose sight of reality and of what is needed to maintain their competitive advantage.

### Avoiding Failure

Avoiding failure requires a constant focus on the basic building blocks of competitive advantage:

- continuous improvement,
- identification and adoption of best industrial practice, and
- victory over inertia.
  - good leadership and appropriate changes in organizational structure and control systems are required in order to implement the changes.

The strategy-making process includes both strategy formulation and strategy implementation.

- **Strategy formulation** is the process of selecting strategies.
- **Strategy implementation** is the process of putting the selected strategies into action. It involves designing, delivering and supporting products; improving efficiency and effectiveness of operations; and designing the organization structure, control systems, and culture.

**Step 3****Formulating Strategies (SWOT Analysis also called situational analysis).**

Formulating and selecting strategies that, consistent with the organization's mission and goals, will **optimize** the organization's strengths and **correct** its weaknesses and limitations for the purpose of **taking advantage** of external opportunities while countering external threats (SWOT analysis);

SWOT analysis consists of generating a series of strategic alternatives that could be pursued given the company's strengths, weaknesses, opportunities and threats in order to select the strategies that will do the best to align the company's resources and capabilities to the demands of its environment.

### Formulation and Selection of Strategy

In developing successful strategies, managers consider questions such as the following: (H)

- What are our objectives?
- How do we create value for our customers while distinguishing ourselves from our competitors?
- Are the markets for our products local, regional, national, or global? What trends affect our markets? How are we affected by the economy, our industry, and our competitors?
- What organizational and financial structures serve us best?
- What are the risks and opportunities of alternative strategies, and what are our contingency plans if our preferred plan fails?

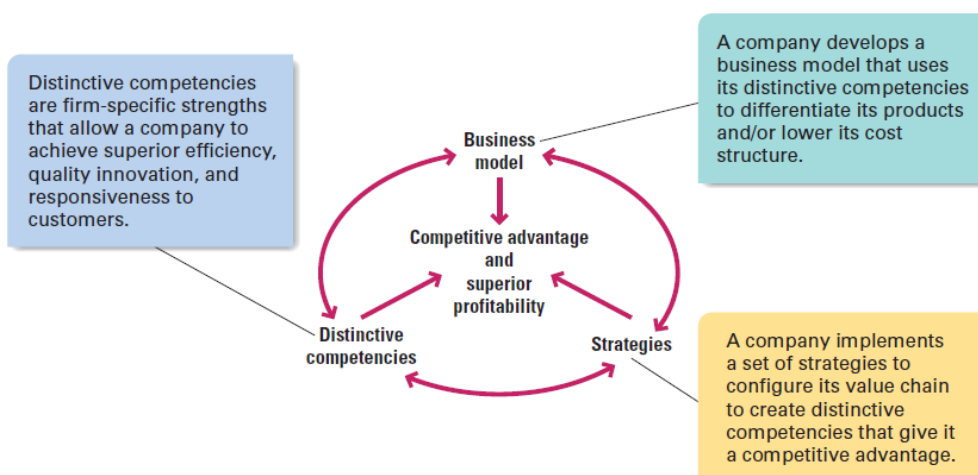

Management selects a set of strategies that will create and sustain a competitive advantage for the company. They consider a range of strategies. The general classifications of strategies considered are: Functional-level, Business-level, Global & Corporate-level strategy.

The strategies that emerge from SWOT analysis should be compatible with each other. Functional-level strategies should support the company's business-level and global strategies. And corporate-level strategies should also support business-level strategies.

The strategies selected by the company will constitute its **business model**. Remember we have said that a company's business model is its managers' idea of how the set of strategies and capital investments that the company makes **should fit together** to generate above-average profitability and, at the same time, profit growth.

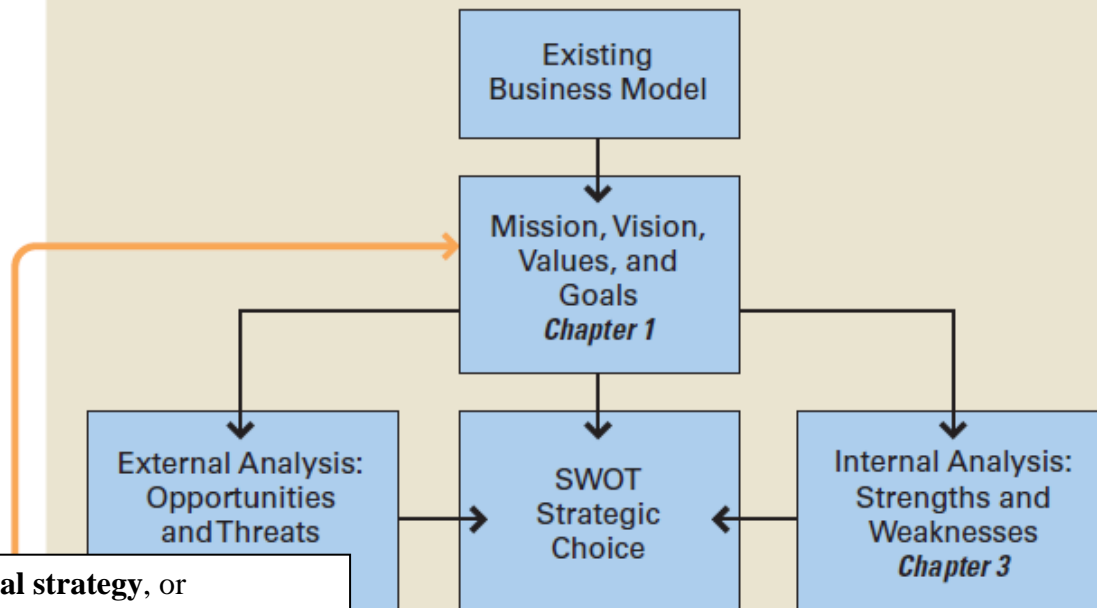

SWOT analysis enables management to choose among possible business models and to fine-tune the business model selected.

**Figure 3.8** Competitive Advantage and the Value Creation Cycle

## STRATEGY FORMULATION

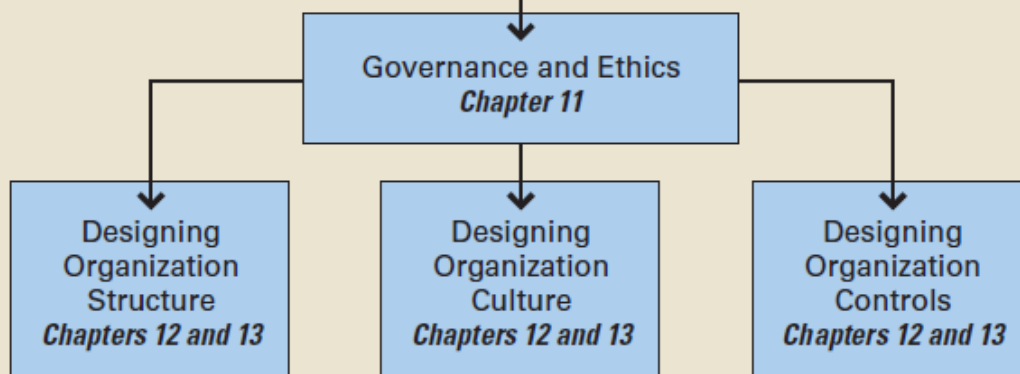

**Global strategy**, or considering how to expand operations outside the home country.

**Business-level strategy**, which includes the position of the business in the marketplace as well as different positioning strategies that could be used. Some examples are (1) cost leadership, (2) differentiation, (3) focusing on a particular marketing niche or segment, or (4) a combination of more than one of these.

**Functional-level strategy**, for the purpose of improving operations inside the company. These operations include areas such as manufacturing, marketing, materials management, product development, and customer service.

**Corporate-level strategy**, considering what business or businesses the company should be in so as to maximize its long-run profitability and profit growth.

## STRATEGY IMPLEMENTATION

## Functional-level strategy

### Purpose

- Improve the effectiveness of a company's operations inside the company
  - These operations include areas such as manufacturing, marketing, materials management, product development, and customer service.
- Which in turn, improves the company's ability to achieve:
  1. superior efficiency,
  2. quality,
  3. innovation, and
  4. customer responsiveness.
- Those four generic distinctive competencies will determine whether
  - the company's products and services will be **differentiated** from those of its competitors.
  - the company will have a **low cost structure**.
- Superior efficiency can be increased by:
  - Adopting just-in-time inventory systems
  - Using flexible manufacturing technologies.
- Superior quality consists of
  - reliability (through the use of Six Sigma) and
  - excellence.

### Superior innovation

Innovation can result in

- improvements to the excellence of existing products as well as new products.
- finding ways to reduce costs.

### Superior responsiveness to customers

Responsiveness to customers is an important way for a company to build brand loyalty and thus differentiate itself from its competitors.

## Business-Level Strategy

Business-level strategy relates to the **business's position** in the market. Successful selection and pursuit of a **business model** is what permits a company to compete effectively. Business-level strategies that create competitive advantage contribute to a successful business model. To create a successful **business model**, managers must choose business-level strategies that give the company a competitive advantage over its rivals; that is, they must optimize competitive positioning.

They must first decide on:

- (a) customer needs, or what is to be satisfied;
- (b) customer groups, or who is to be satisfied; and
- (c) distinctive competencies, or how customer needs are to be satisfied.

These decisions determine which strategies managers formulate and implement to put a company's business model into action.

## Four Generic Competitive Strategies

The value creation frontier can be reached by choosing among four generic competitive strategies:

- cost leadership,
- focused cost leadership,
- differentiation, and
- focused differentiation.

*Deciding between these strategies is a critical part of what managers do.<sup>(H)</sup>*

### Role of cost management

The role of cost management is to support the firm's strategy by providing the information managers need to succeed in their product development and marketing efforts, such as the expected cost of adding a new product feature, the defect rate of a new part, or the reliability of a new manufacturing process.<sup>(B)</sup>

Management accountants work closely with managers in **formulating strategy** by providing information about the sources of competitive advantage—for example, the cost, productivity, or efficiency advantage of their company relative to competitors or the premium prices a company can charge relative to the costs of adding features that make its products or services distinctive.

**Strategic cost management** describes cost management that specifically focuses on strategic issues.

### Developing a Competitive Strategy

In developing a sustainable competitive position, each firm purposefully or as a result of market forces arrives at one of the two competitive strategies: cost leadership or differentiation

#### (1) Cost Leadership to achieve competitive advantage

##### Cost Leadership

Cost leadership is a strategy in which a firm outperforms competitors in producing products or services at the lowest cost for these firms, cost management is critical.<sup>(B)</sup>

**Cost Leader** (A company using cost leadership)

- Firms known to be successful at cost leadership are typically very large manufacturers and retailers, such as Wal-Mart, Texas Instruments, and Dell.
- normally has a relatively large market share and tends to avoid niche or segment markets by using the price advantage to attract a large portion of the broad market.

#### Cost Leader achieve Higher profits through Lower Prices

- They have been profitable and have grown over the years on the basis of providing quality products or services at low prices by judiciously managing their costs.<sup>(H)</sup>
- makes sustainable profits at lower prices, thereby limiting the growth of competition in the industry through its success at reducing price and undermining the profitability of competitors, which must meet the firm's low price.

#### Sources of Cost Advantages

- Cost advantages usually result from
- **productivity** in the manufacturing process, in distribution, or in overall administration.
  - For example, technological innovation in the manufacturing process and labor savings from overseas production are common routes to competitive productivity.
- its distinctive competencies in manufacturing, materials management, and information technology and/or an organizational structure and culture that will allow it to implement this strategy.

### A potential weakness of the cost leadership strategy

- is the tendency to cut costs in a way that undermines demand for the product or service
  - for example, by deleting key features, This will lead to customer dissatisfaction and in turn, to decreases in demand and sales. The resulting decreased profitability.
  - The cost leader remains competitive only so long as the consumer sees that the product or service is (at least nearly) equivalent to competing products that cost somewhat more.
- The danger in this strategy is that competitors may find ways to lower their cost structures, too.

(2) **Focused cost leadership**, or competing within a narrow market segment using the strategy of cost leadership.

- Focused cost leadership means developing the correct strategies to serve just 1 or 2 market segments.
- A company using focused cost leadership may be a **local** business reaching a local market.
- The company competes with the national cost leader only in markets where it does not have a cost disadvantage because of its smaller size.
- The focused cost leader might concentrate on **low volume** products for which it has a cost advantage over a national chain because it purchases its materials locally and economies of scale do not exist in that market.
  - An example of a focused cost leader might be a local brickyard, where bricks are manufactured on site and delivered directly to local construction sites. That company might very well have a cost advantage over a brick manufacturer marketing nationally. The national brick manufacturer could have very high costs to transport its bricks to distributors for further sale and delivery to construction sites.

(3) **Differentiation strategy** (sometimes called: **product leadership**) to achieve competitive advantage

#### Differentiation

The differentiation strategy is implemented by creating a product or service that is unique/ unusual in some important way, usually:

1. higher excellent quality,
2. customer service product features, responsiveness to customer needs, or
3. superior innovation.

#### Differentiator

- A differentiator can charge a **higher price** than its closest competitors because of its perceived advantages to the customer.
- Firms known to be successful differentiator are cosmetics, fashion, and pharmaceutical firms, compete on the basis of product leadership, in which the unusual or **innovative** features of the product make the firm successful.
  - For these firms, the critical management concern is maintaining product leadership through product development and marketing.<sup>(B)</sup>
- Most industries, including, consumer electronics, and clothing, have differentiated firms. The appeal of differentiation is especially strong for product lines for which the perception of quality and image is important, as in cosmetics, jewelry, and automobiles.
  - Tiffany, Bentley, Rolex, Maytag, and BMW are good examples of firms that have a differentiation strategy, Apple Inc., the maker of iPods and iPhones, and Johnson & Johnson, the pharmaceutical giant.

Sometimes a differentiation strategy is called **product leadership** to refer to the innovation and features in the product. In other cases the strategy might be called a **customer-focused** or customer-solution strategy, to indicate that the organization succeeds on some dimension(s) of customer service. This perception allows the firm to charge **higher prices** and outperform the competition in profits without reducing costs significantly.

#### **Differentiator achieve Higher profits differentiated products**

- They generate their profits and growth on the basis of their ability to offer differentiated or unique products or services that appeal to their customers and are often priced higher than the less-popular products or services of their competitors.

#### **Sources of differentiated products**

- For instance, differentiation on the basis of innovation requires an effective **R&D function**.
- The differentiator must **control its costs** so that the price of the product is not greater than its customers will pay, but it must not minimize them so much that it loses its source of differentiation.

#### **A weakness of the differentiation strategy**

Is the firm's tendency to undermine its strength by attempting to lower costs or by ignoring the necessity of having a continual and aggressive marketing plan to reinforce the differentiation. If the consumer begins to believe that the difference is not significant, lower-cost rival products will appear more attractive. is (at least nearly) equivalent to competing products that cost somewhat more.

The danger with a differentiation strategy is that competitors may imitate successful differentiation, eliminating the advantage.

(4) **Focused differentiation**, or a business model that specializes in providing a differentiated product to serve the needs of just one or two market segments or niches.

#### **Focused Differentiator**

- positions itself to compete with the primary differentiator in the market but in only one or two of the market's segments.
  - To do this, it focuses on one type of customer, such as babies or elderly people, or on one type of product, such as organic foods.
  - The company can have greater knowledge of the needs of a small group of customers and can provide **superior responsiveness to those customers**.
  - Or, concentration on just a few products can allow the focuser to be **more innovative** than a larger company could be.

#### **Risk at Focused differentiation**

However, its risk is that its niche may disappear over time because of technology changes or changes in customers' tastes. One of the reasons that so many small companies go out of business is that their niche disappears.

### **Other Strategic Issues**

A firm succeeds, then, by adopting and effectively implementing one of the strategies explained earlier (and summarized in Exhibit 1.9 ).

Recognize that although one strategy is generally dominant, a firm is most likely to work hard at process improvement throughout the firm, whether cost leader or differentiator, and **on occasion to employ both of the strategies at the same time.**

However, a firm following **both** strategies is likely to succeed only if it achieves one of them significantly. A firm that **does not** achieve at least **one** strategy is **not likely** to be successful.

***“getting stuck in the middle”***

#### **Note:**

This situation is what Michael Porter calls “getting stuck in the middle.” A firm that is stuck in the middle is **not able to sustain a competitive advantage.**

For example, giant retailer Kmart/Sears has been stuck in the middle between trying to compete with Wal-Mart on cost and price, and with style-conscious Target on differentiation. Some have suggested that Kmart/Sears might find success by abandoning the suburban locations where Target and Wal-Mart are strong and instead focusing on their many urban locations where they offer convenience to the urban shopper.

### **Distinctive Aspects of the Two Competitive Strategies**

Aspect	Cost Leadership	Differentiation
Strategic target	Broad cross section of the market	Focused section of the market
Basis of competitive advantage	Lowest cost in the industry	Unique product or service
Product line	Limited selection	Wide variety, differentiating features
Production emphasis	Lowest possible cost with high quality and essential product features	Innovation in differentiating products
Marketing emphasis	Low price	Premium price and innovative, differentiating features

- Developing a competitive strategy is the first step for a successful business.
- The critical next step is to implement that strategy, and this is where the management accountant comes in.
- The management accountant works to implement strategy as a part of the management team, by contributing the management accountant’s specific expertise (cost management methods).

## Global Strategy

- Globalization follows a progression.
  - The migration from domestic to global operations typically evolves through a series of relatively predictable stages, from the ordinary initial stage of globalization “Export” to establish a separate “international division and/or sales subsidiaries” and as sales volume and the number of countries significantly increase, an organization evolves to the stage of an Multinational corporation (MNC) and finally to a global organization, the whole world is one market and National boundaries are seamless.
- For some companies, international expansion represents a way of earning greater returns by transferring the skills and product offerings derived from their distinctive competencies to markets where indigenous competitors lack those skills. As barriers to international trade have fallen, industries have expanded beyond national boundaries and industry competition and opportunities have increased.
  - Furthermore, the increase in sales volume that results can help a company realize economies of scale and experience learning curve effects, which can lead to a cost advantage.

### To compete successfully in the global arena,

- organizations must make considerable investments in resources, and these investments should be carefully crafted during strategic planning.
- It can perform each value creation activity in the country where the cost and quality of factors of production (land, labor, capital, energy) are best for that activity. This strategy is called **location economies**.
- Companies usually choose from four basic strategies in their international operations: (1) global standardization, (2) localization, (3) transnational, and (4) international.

### Global Standardization

- focus on reaping the cost reductions that come from scale economies and location economies.
- This strategy works if there are strong competitive pressures for cost reduction and the need to be locally responsive to customers is not great.

### Localization

- Customize their product offering, marketing strategy, and business strategy to national conditions.
- Localization works when consumer tastes vary among nations and when cost pressures are not too intense. This strategy can work
  - if the added value supports higher pricing and thus enables the company to recoup its higher costs.
  - if it creates greater local demand, which can allow the company to reduce its costs through economies of scale in its local markets.

### Transnational (strategy due to high competition)

- involves a simultaneous focus upon reducing costs, transferring skills and products, and being locally responsive. Implementing such a strategy may not be easy (combine high local responsiveness with low cost structure).
- used when requirements for local responsiveness are high and, at the same time, cost pressures are strong.
  - One way is to use centralized manufacturing of standard large-scale components and then to augment that with local assembly plants where local product features are added.

### International Strategy

- transfer the skills and products derived from distinctive competencies to foreign markets, while undertaking some limited local customization.
- used by companies that do not have great pressure to produce low-cost goods and do not have great pressure to be locally responsive.
  - Companies in this position usually centralize their product development while establishing manufacturing or marketing operations in each major geographic area where they do business. They may do some local customization of the product and their marketing strategy, but it is limited.

Five different ways of entering a foreign market: exporting, licensing, franchising, entering into a joint venture, and setting up a wholly owned subsidiary. The optimal choice among entry modes depends on the company's strategy.

### Strategic Alliances

Strategic alliances are cooperative agreements between actual or potential competitors. The advantages of alliances are that they facilitate entry into foreign markets, enable partners to share the fixed costs and risks associated with new products and processes, facilitate the transfer of complementary skills between companies, and help companies establish technical standards.

The drawbacks of a strategic alliance are that the company risks giving away technological knowhow and market access to its alliance partner while getting very little in return.

The disadvantages associated with alliances can be reduced if the company selects partners carefully, paying close attention to reputation, and structures the alliance in order to avoid unintended transfers of know-how.

*To compete successfully in the global arena, organizations must make considerable investments in resources, and these investments should be carefully crafted during strategic planning.*

### Corporate-Level Strategy (long-term perspective)

#### Benefits of formulating a corporate strategy

- enable a company, or one or more of its business units, to perform one or more of the value creation functions at a **lower cost** or in a way that allows for differentiation and a premium price.
- used to redefine and reposition the company's business model as needed to achieve and maintain its *position* in the changing environment through taking advantage of opportunities and defending against threats.
  - analyzing how emerging technologies might impact their business models, how customer needs and customer groups might change as a result, and what new distinctive competencies will be needed.
- Used to determine which industries the company should enter to maximize its long-run profitability.
- Companies can adopt one of the strategies: (1) horizontal integration, (2) vertical integration, (3) Strategic alliances, (4) Strategic outsourcing, and (5) Diversification.

## Step 4

## Developing and Implementing the Chosen Strategies

Implementing strategy involves decisions about organizational design & how to use the

1. organizational structure,
2. corporate culture and
3. control environment to achieve the company's goals and execute its business model.

These are

- the means the organization uses to *motivate* and *coordinate* its members to work toward achieving competitive advantage through its distinctive competencies.
- They determine its *members' behaviors*, *values* and *attitudes* and how the members will implement the organization's business model and strategies.

Incentive systems and employee performance evaluations must be designed so that they encourage employees to focus their efforts on achieving the entity's objectives.

This approach requires communication among senior managers, who devise strategies; middle managers, who supervise and evaluate employees; and human resources managers, who must approve evaluation and compensation plans.

Management accountants, guided by a strategic focus, have responded to the previous changes in the contemporary business environment with **13 methods** that are useful in implementing strategy in these dynamic times.(B)

The first **six** methods focus directly on strategy implementation

1. The balanced scorecard/strategy map (CMA P1.Sec.C),
2. Value chain (CMA P1.Sec.D),
3. Activity-based costing (CMA P1.Sec.D),
4. Business intelligence,
5. Target costing(CMA P2.Sec.C), and
6. Life-cycle costing (CMA P1.Sec.D).

The next **seven** methods help to achieve strategy implementation through a focus on process improvement

7. Benchmarking (CMA P1.Sec.D),
8. Business process improvement (CMA P1.Sec.D),
9. Total quality management ,
10. Lean accounting (CMA P1.Sec.D),
11. The theory of constraints (CMA P1.Sec.D),
12. Enterprise sustainability, and
13. Enterprise risk management (CMA P2.Sec.D).

## Step 5

## Strategic controls and feedback

**Strategic controls and feedback** are used to monitor progress, isolate problems, and take corrective action. Over the long term, feedback is the basis for adjusting the original mission and objectives

The Balanced Scorecard is a widely-used strategic performance management tool designed to manage strategic performance.

### How can an organization translate its strategy into a set of performance measures?

It can do so by developing a *balanced scorecard* that provides the framework for a strategic measurement and management system. The balanced scorecard measures performance from four perspectives. One dimension is financial, the other three dimensions are non-financial:

- (1) financial,
- (2) customer,
- (3) internal business processes, and
- (4) learning and growth.

### Companies use the BSC as a management tool to:

- Clarify and communicate strategy
  - that translates an organization's mission and strategy into a set of four performance measures.<sup>.(H)</sup>
  - transforms an organization's strategic plan from a passive document into the "marching orders" for the organization in its day-to-day activities.
  - The balanced scorecard enables execution of strategies. But a company's strategy influences the measures it uses to track performance in each of these perspectives.
    - A strategy is essentially a theory about how to achieve the organization's goals.<sup>.(G)</sup>
- Align individual and unit goals to strategy
  - promotes **goal congruence** by encouraging everyone in the organization to work toward the same goals.
- Link strategy to the budgeting process
- Get feedback for continuous strategy improvement
  - It provides a framework that not only provides **performance measurements** but helps management to identify what needs to be done and how its achievement can be measured.
- Balanced scorecard-A process of compiling and organizing the key performance indicators (KPIs) of an organization into four segments: financial, customer, internal business process, and learning and growth. Each KPI can be measured in a specific way so that it can be managed appropriately.

## Other Planning Tools and Techniques

### SWOT analysis

- involves Identifying and understanding the organization's strengths and weaknesses (internal factors) and the opportunities and threats external to the organization.
- helps the organization utilize and maximize its strengths, minimize and correct its weaknesses, exploit opportunities, and avoid or minimize risks.

### Michael Porter's five forces industry analysis involves

- analyzing the organization's environment to identify and minimize **threats** posed by the organization's competitors, supplies, and customers.
- The model is Porter's reaction to the ad hoc nature and lack of rigor in the SWOT analysis.

### Situational Analysis

- is a systematic *collection of tools* that an organization may use to analyze and understand both its *internal* and its *external* environments.
- It consists of SWOT analysis and Porter's five forces as well as 5Cs analysis.

The **5Cs** are: the company, its competitors, its customers, its collaborators, and the climate the company operates in.

- Company analysis covers the organization's goals and objectives, market position, performance related to its stated mission, and its product line.
- Competitor analysis looks at the positions of the organization's competition and the threats they may impose.
- Customer analysis encompasses an understanding of past, present, and future customers and their demographics.
- Collaborator analysis includes an understanding of agents, supplies, distributors, and business partners.
- The understanding of organization's climate includes understanding the political, regulatory, economic, social, cultural, and technological environments.

### **PEST Analysis**

involves an understanding of the organization's political, economic, social, and technological environments. Its focus is on the opportunities and threats in the organization's environment.

### **Scenario Planning** (also called scenario thinking or scenario analysis)

- is a strategic planning methodology designed to assist the organization in developing flexible strategic plans “what if” planning.
- It involves simulating or gaming the expected behavior of what are called STEEEPA trends. STEEEPA is an acronym for plausible alternative social, technical, economic, environmental, educational, political, and aesthetic trends.
- These are the key driving forces in the organization's environment. Again, the focus is on opportunities and threats and developing coping mechanisms.

### **Competitive Analysis** (commonly called competitor analysis)

- focuses on understanding one's competition.
- It includes knowing who the competition really is rather than who the organization thinks it is. It involves profiling competitors regarding history, products and services, financial condition, corporate and marketing strategies, facilities, and personnel.
  - It also encourages the organization to scan the environment for potential new customers.

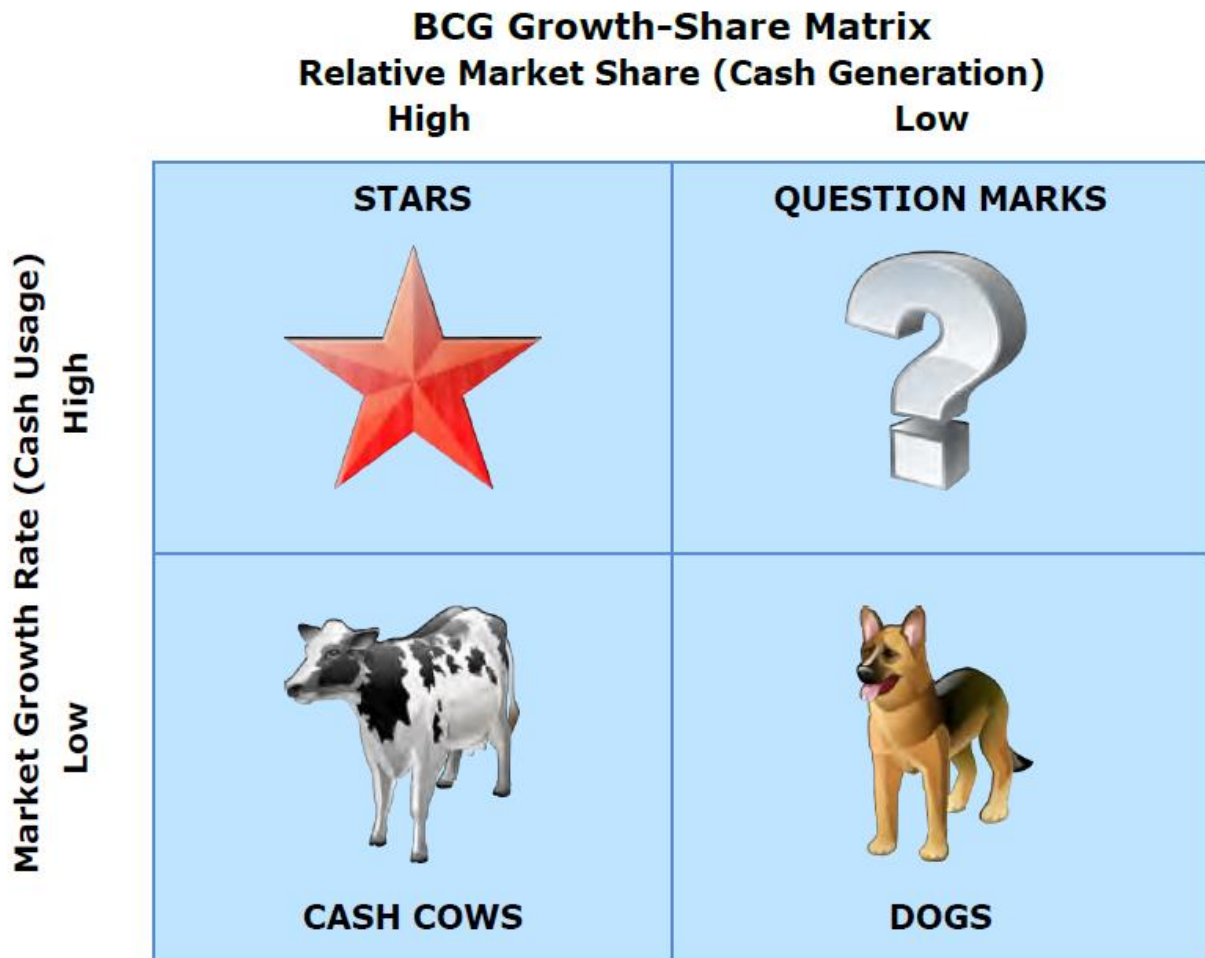

### **Contingency Planning** (also called continuity or sustainability planning or plan B)

- is a process that helps prepare an organization to respond effectively to unplanned events. Contingency plans are part of risk management. They are used to respond to exceptional relatively unlikely risks that if they occur could have catastrophic effects on the organization.
- Contingency planning is an approach that organizations often use in financial planning and analysis because it considers several alternative possibilities, specifically those concerning **external variables**.

### **The BCG Matrix**

The BCG (Boston Consulting Group) Growth Share Matrix looks at the company's products or services as one of the following: stars, cash cows, dogs, or question marks.

The BCG Growth-Share Matrix is a method of analyzing a *company's portfolio* of products to determine where each product is in its life cycle in order to make better decisions about allocation of resources in planning. Since a large firm may be viewed as a *portfolio* of investments in the form of strategic business units (SBUs), techniques of portfolio analysis have been developed to aid management in making decisions about resource allocation, new business startups and acquisitions, downsizing, and divestitures.

The BCG Matrix classifies products into four categories based on the growth of the markets they are in and their share of those markets.

**The annual MGR/Cash usage** (is stated in constant units of the currency used in the measurement).

- It reflects the maturity and attractiveness of the market and the relative **need for cash** to finance expansion.

**The RMS/Cash generation**

- reflects the SBU's competitive position in the market segment. It equals the SBU's absolute **market share** divided by that of its leading competitor.

### Stars (high RMS, high MGR)

A star is in an industry that has a high market growth rate, and the product has a high share of the market.

Stars are products or services with

- *High Relative Market Share* (high cash generation) capabilities.
- *High Market Growth Rates* (high cash usage) and

**Net cash flow (plus/minus) is modest.**

- **High Cash generation**
  - A star generates a lot of cash because it has a high share of its market.
- **High Cash usage**
  - Such an SBU is profitable but needs large amounts of cash for expansion, R&D, and meeting competitors' attacks.
  - However, because the market is growing rapidly, the star's sales are also growing rapidly. Rapidly-growing sales create a need for working capital to support the required increases in accounts receivable and inventory. As a result, a star has a high need for cash for investment.
- Therefore, **the net amount of cash a star generates is not great.**
  - If a star can maintain a high market share, the star will become a **cash cow** when the market's growth rate declines, generating more cash than it consumes. Stars are important because they ensure future cash generation.
  - The company may adjust the price of a star several times, decreasing it to claim market share and then increasing the price to maximize revenue as the product's market share and popularity grow.

### Question marks (low RMS, high MGR)

A **question mark** is a product in an industry with a high market growth rate, but the product has a low share of the market.

Question marks have

- *Low Relative Market Share* (low cash generation) capabilities and
- *High Market Growth Rates* (high cash usage) and

**Low cash generation & High cash usage**

- **High Cash Usage**
  - Because the market is growing rapidly, the question mark's sales are also growing rapidly, so it will **consume a lot of cash for investment**.
  - They need large amounts of cash not only to finance growth and compete in the market, but also to increase RMS since such product has a low share of the market.
- **Low Cash Generation**
  - However, because of its low market share, it does not generate much cash.

**If RMS increases significantly, a question mark may become a star and then eventually a cash cow.**

- A question mark has potential to gain market share and become a **star** and then eventually a **cash cow** when the growth rate of the market slows.

But for the present, a question mark is considered a "problem child" because its net cash generated is negative.

**If RMS not increases significantly, a question mark may become a dog.**

- If the question mark does not attain a greater share of its market, it will turn into a **dog** when the growth rate of the market declines.

**Additional Investment in question mark**

- A question mark may or may not be worthy of the additional investment that would be required to increase its market share. It needs careful analysis to determine whether or not to invest more money in it. Because a question mark needs to increase its market share quickly in order to avoid turning into a **dog**, pricing of a question mark should be aggressive.

**Cash cows (high RMS, low MGR)**

A cash cow is in an industry with a low market growth rate, but the product has a high share of the market.

- Cash cows are in mature markets in which the growth rate has slowed, but they are market leaders.
- The characteristics of a cash cow product do not change much, customers know what they are getting, and the price does not change much either.

Cash cows have

- *High Relative Market Share* (high cash generation) capabilities....but
- *Low Market Growth Rates* (low cash usage).

**High Cash generation**

- Cash cows generate more cash than they consume thus any company would be glad to have them.
- A cash cow ordinarily enjoys high profit margins and economies of scale.
- Financing for expansion is not needed, so the SBU's excess cash can be used for investments in other SBUs.

**Investment in a cash cow**

**Cash cow** should be "milked" to extract their profits *without investing* much cash in them.

- Investment in a cash cow would be **wasted** money because of the slow growth of the industry.
  - However, marketing and R&D expenses should not necessarily be slashed excessively.

**From cash cow to dog**

- Maximizing net cash inflow might precipitate a premature decline from cash cow to dog.

**Dogs (low RMS, low MGR)**

- A dog is in a mature industry with a low market growth rate, and it has a low share of the market. A dog does not consume much cash, but it does not generate much cash, either.

**Dogs have**

- *Low Relative Market Share* (low cash generation) capabilities and
- *Low Market Growth Rates* (low cash usage).

**Net cash flow (plus/minus) is modest.**

- Dogs usually barely breaking even.

**Investment in Dogs**

- The investment money tied up in it has little potential, and it depresses the company's Return on Assets.
- Dogs should be sold off, and pricing is not a major concern.

### Natural Life Cycle

The natural life cycle for a business unit or a product is that it begins as

1. **a question mark**, then turns into
2. **a star**, then when the market stops growing, it turns into
3. **a cash cow**. At the end of its life cycle, the cash cow turns into
4. **a dog**.

However, if the **question mark** never achieves **stardom**, it goes straight to **dogdom** when the market's growth rate slows.

### The Diversified balanced portfolio

- A diversified company with a balanced portfolio will have some stars, some question marks, and some cash cows. But a portfolio of SBUs **should not** have too many dogs and question marks or too few cash cows and stars.
  - The **stars**' high market share and high growth rate assure the future.
  - The **question marks** have potential to become stars if they receive the necessary investment.
  - The **cash cows** supply the cash to fund the future growth of the stars and the question marks.

### Investments in SBUs

#### Cash cows

- should not be **underfunded** because the risk is premature decline.
- However, **overfunding** cash cows means less investment in SBUs with greater growth prospects.

#### Dog

- A large investment in a dog with little likelihood of a turnaround is also a typical mistake.

#### Question Marks

- A firm should not have too many question marks. Results are excess risk and underfunded SBUs.

### Movement within the growth-share matrix and formulating appropriated strategy

Each SBU should have objectives, a strategy should be formulated to achieve those objectives, and a budget should be allocated.

- A **hold strategy** is used for strong cash cows.
- A **build strategy** is necessary for a question mark with the potential to be a star.
- A **harvest strategy** maximizes short-term net cash inflow.
  - Harvesting means zero-budgeting R&D, reducing marketing costs, not replacing facilities, etc. This strategy is used for weak cash cows and possibly question marks and dogs.
- A **divest strategy** is normally used for question marks and dogs that reduce the firm's profitability. The proceeds of sale or liquidation are then invested more favorably.
  - A harvest strategy may undermine a future divestiture by decreasing the fair value of the SBU.

.....  
.....  
.....  
....

## How a Firm Succeeds: The Competitive Strategy

### Question

# How a Firm Succeeds?

### Answer

A firm succeeds by implementing a **strategy**, that is, a plan for using resources to achieve sustainable goals within a competitive environment.

Finding a strategy begins with determining the purpose and long-range direction, and therefore the *mission*, of the company.

Below exhibit lists excerpts from the mission statements of several companies.

#### Ford Motor Company (ford.com)

Provide personal mobility for people around the world.

#### IBM (ibm.com)

To lead in the creation, development, and manufacture of the industry's most advanced information technologies, and to translate these into value for our customers.

#### Google (google.com)

To organize the world's information and make it universally accessible and useful.

#### Walt Disney (disney.com)

To make people happy.

#### Sara Lee (saralee.com)

Simply delight you . . . every day.

The mission is developed into

*specific performance objectives*

which are then implemented by

*specific corporate strategies*

that is, *specific actions* to achieve the *objectives* that will fulfill the mission.

#### Sara Lee Corporate Strategy

The company is focused on building sustainable, profitable growth over the long term by achieving share leadership in its core categories:

- innovating around its core products and product categories;
- expanding into high opportunity geographic markets and strategic joint venture/partnerships;
- delivering superior quality and value to our customers; and
- driving operating efficiencies.

• **Focusing on innovation**, execution and performance. As a branded consumer goods company, we know successful new products are a key driver of Sara Lee's success.

• **Building big brands in big markets**. Sara Lee has a strong portfolio of big and growing brands that compete in large consumer markets around the world.

• **Fostering a new culture**. Living and breathing our values every day, our people around the world work as teams, act with integrity, are inclusive, use the imagination and, most important of all, have the passion to excel.

Note that Sara Lee's broad mission statement is explained in terms of more specific objectives, which are in turn operationalized through specific corporate strategies.

# Section C. Performance Management (20% - Levels A, B, and C)

## Content Specification Outlines

### Section C. Performance Management

- Section C.3. Performance measures
  - The Balanced Scorecard

Above CSOs cover below units in Gleim:

### STUDY UNIT EIGHT: ANALYSIS AND FORECASTING TECHNIQUES

- 8.1 Correlation and Regression
- 8.2 Learning Curve Analysis
- 8.3 Time Series Analysis
- 8.4 Expected Value
- 8.5 Sensitivity Analysis
- 8.6 Strategic Management
- 8.7 The Balanced Scorecard
- 8.8 Strategic Planning

## Levels of Controls in Managerial Accounting

### PERFORMANCE EVALUATION AND CONTROL

**Performance evaluation** is the process by which managers at all levels gain information about the performance of tasks within the firm and judge that performance against pre established criteria as set out in budgets, plans, and goals. Performance evaluation is applied for each of the three management functions: operations, marketing, and finance.

The essence of control is a comparison of actual performance to budgeted or expected performance.

#### Operational Control

The monitoring of **short-term** operating performance; takes place when mid-level managers monitor the activities of operating-level managers and employees.

Focuses on *detailed* short-term performance measures, has a **management-by-exception** approach; that is, it identifies units or individuals whose performance does not comply with expectations so that the problem can be promptly corrected.

#### Management by exception.

Practice of focusing management attention on areas not operating as expected and giving less attention to areas operating as expected.

Standard Costing and Variance Measures (unit 10)

#### Management Control

The evaluation of mid-level managers by upper-level managers, is more consistent with the **management-by-objectives** approach, in which long-term objectives such as growth and profitability are determined and performance is periodically measured against these goals.

#### Management by Objectives (MBO)

MBO is a behavioral, communications-oriented, responsibility approach to management and employee self-direction. It is a comprehensive management approach and therefore is relevant to planning and control.

Responsibility Accounting and Performance Measures (Unit 11), Gleim cover the **BSC** in U.8

## Balanced Scorecard

### Definition

A framework for implementing strategy that translates an organization's mission and strategy into a set of performance measures. <sup>(H)<sup>2</sup></sup>

A process of compiling and organizing the key performance indicators (KPIs) of an organization into four segments:

- Financial,
- Customer,
- Internal Business Process, and
- Learning and growth.

KPIs are **measures** that drive the organization to achieve its goals. Each KPI can be measured in a specific way so that it can be managed appropriately.

### Benefits of Implementing the BSC

- Moving organizations away from concentrating solely on financial data, thus broadens management's attention to **short-run and long-run performance**.
  - does not focus solely on achieving **short-run** financial objectives.
- It also highlights the nonfinancial objectives that an organization must achieve to meet and **sustain** its financial objectives.
- In for-profit companies, the primary goal of the balanced scorecard is to sustain long-run financial performance. Nonfinancial measures simply serve as **leading indicators** for the hard-to-measure long-run financial performance.
- encourages managers to focus on elements that tend to lead to **long-term success** instead of on short-term financial performance by rewarding them for improvements in those elements that tend to lead to long-term success.
  - Evaluating and rewarding managers based on these non-financial indicators should lead to long-term financial performance improvements, if the proper non-financial indicators have been selected.

### Lagging vs. Leading indicators

#### Financial Measures

- Financial measures that focus on short-term financial performance are in fact **lagging** indicators of how the company is doing.

#### Non- Financial Measures

- Improvements in the non-financial measures provide the prospect of increased future economic value for shareholders. Nonfinancial measures focus on performance that should ultimately result in improved long-term financial performance. Thus nonfinancial measures are **leading** indicators of performance.

---

<sup>2</sup> An **accounting report** that includes the firm's critical success factors in four areas: ...

**LOS in 2015 CMA Examination asking the candidates to:**

L. Define **key performance indicators (KPIs)**, and discuss the **importance** of these indicators in evaluating a firm.

- a. Key performance indicators (KPIs) are measures of factors **critical to the success** of the organization. Each KPI requires a defined business process, clear objectives for the process, quantitative or qualitative measurements for the objectives, and a plan for identifying and correcting variances from plan.

M. Define the concept of a **balanced scorecard** and identify its **components**.

- a. Balanced scorecard-A process of compiling and organizing the key performance indicators (KPIs) of an organization into four segments:

- a. **financial**,
- b. **customer**,
- c. **internal business process**, and
- d. **learning and growth**.

- Each KPI can be measured in a specific way so that it can be managed appropriately.

N. Identify and describe the **perspectives** of a BSC, including **financial** measures, **customer** satisfaction measures, internal **business** process measures, and innovation and **learning** measures<sup>3</sup>.

a. **Financial measures** - Cover the traditional financial ratios, such as return on equity, sales growth, return on assets, earnings per share, and the like.

b. **Customer satisfaction measures** - Focusing on the customer is critical to accomplishing goals as the customer drives all of a company's revenue. The primary customer outcome measures include market share, acquisition, satisfaction, retention, and profitability.

c. **Internal business process** measures - Go beyond simple financial variance measures to include output measures, such as quality, cycle time, yield, order fulfillment, production planning, throughput, and turnover.

d. **Innovation and learning** measures - Focus on becoming efficient and effective at producing new products. The measures include time to market, percentage of sales from new products, and new products versus competitor's new products. Learning and growth measures focus on education and training of personnel and can be measured by training sessions provided, developing leadership skills, and reducing the number of defects.

The metrics used fall into four broad categories of performance indicators, also known as **perspectives**. The perspectives are hierarchical, meaning that achievement of the objectives of each perspective supports achievement of the objectives of the perspective on the next level above it.

- Achievement of **learning and internal business process** objectives leads to achievement of **customer satisfaction** and **financial** measures objectives.<sup>.(HK)</sup>

<sup>3</sup> The Learning and Growth perspective (originally called the innovation and learning perspective) originally focused on employee learning, but it now covers not only human capital but also organizational capital and information capital. Initially innovation was part of this perspective, but users of the balanced scorecard system discovered that innovation properly belonged in the Internal Process category.<sup>.(HK)</sup>

**The perspectives and their content have changed since the first article written by Kaplan and Norton. The current perspectives are as follows.**

## **The Four Perspectives**

### **1) The Financial perspective**

- focuses on the organization's financial objectives and enables tracking of financial success and shareholder value.

By Evaluating

- the profitability of the strategy and
- the creation of shareholder value.

### **Common measures of financial performance are:**

- Operating income, sales revenue growth, revenue from new products, gross margin percentage, cost reductions, Residual Income, and Return on Investment, New Produce Sales, Price/Earnings Ratio, Quick Ratio, return on equity, earnings per share and accuracy of sales projections, stock prices, operating earnings, earnings trend, revenue growth, gross margin percentage, cost reductions, cash flow coverage and trends, turnover (assets, receivables, and inventory), and interest coverage.

### **Links to Financial Measures**

- Financial performance is a priority, but good long-term financial performance **will not be achieved** if goals in other **non-financial** categories are not attained.
- To drive future financial performance, the BSC requires assessment of other non-financial categories

### **2) The Customer perspective involves**

- This perspective identifies **targeted customer** and **market segments** and measures the company's success in these segments.

### **Market Share**

- measuring this success is the trend in the company's share of the market over time and the degree to which it increases in line with management goals.

### **Customer Satisfaction**

- if customers are not satisfied they will take their business elsewhere.
- meeting customer needs better than the competition or being known for high quality and excellent customer service.
- The number of repeat customers and the percentage of deliveries that are made as promised and when promised can measure the degree to which customers' needs are being met.
- Customer surveys can be used to measure the level of customer service provided after the sale.

### **Pricing**

- become the **lowest cost supplier**, in which case pricing goals will be part of the customer perspective.
  - Being the lowest cost supplier can be measured by the customer's total cost of using the company's product relative to the customer's total cost to use competitors' products.

**Quality**

- The number of defective products returned and the level of product reliability over time can measure achievement of quality goals.

**Common measures of Customer satisfaction**

- Focusing on the customer is critical to accomplishing goals as the customer drives all of a **company's revenue**.
- The primary customer outcome measures include market share, acquisition, satisfaction, retention, and profitability.

<u>CSF</u>	<u>Financial Measure</u>	<u>Nonfinancial Measure</u>
Customer Satisfaction	Trends in dollar amounts of returns	Market share
Dealer and Distributor Relationships	Trends in dollar amounts of discounts taken	Lead time
Marketing and Selling Performance	Trends in dollar amounts of sales	Market research results
Prompt Delivery	Trend in delivery expenses	On-time delivery rate
Quality	Dollar amount of defects	Rate of defects

1) **Other financial measures** may include dollar amount of sales, dollar amount of returns, and warranty expense.

2) **Other nonfinancial measures** may include unit sales, trends in unit sales, trend in market share, number of returns, rate of returns, customer retention rate, number of defects, number of warranty claims, rate of warranty claims, survey results, coverage and strength of distribution channels, training of marketing people, service response time, and service effectiveness,

**3) The Internal Process perspective (IBP)**

- includes innovations and improvements in products and services, operations, and customer service/support needed to create value for customers, which in turn furthers the Financial perspective.

How “Internal Business Process” (IBP) can help the company with below objectives?

**If one of the company’s customer goals is to be the lowest cost supplier**

- **IBP** should maintaining efficient, low-cost production,
  - which can be measured by metrics such as the cost of raw materials, the number of employee hours needed to manufacture a unit of product, and plant utilization. Efficient cycle times also keep costs low.

**If high quality is a customer satisfaction goal**

- the support for that objective will also be required within the **IBP** that create high quality, such as good manufacturing practices.

**Meeting customers’ needs better than the competition**

- is supported by innovations in products and services, which can be measured by the number of new product introductions.

**Technological capability for customer service personnel**

- is necessary to provide excellent customer service, and it is also needed in manufacturing in order to produce high quality products efficiently.

**Internal business process measures**

Go beyond simple financial variance measures to include output measures, such as quality, cycle time, yield, order fulfillment, production planning, throughput, and turnover.

<u>CSF</u>	<u>Financial Measure</u>	<u>Nonfinancial Measure</u>
Quality	Scrap costs	Rate of scrap and rework
Productivity	Change in company revenue/change in company costs	Units produced per machine hour
Flexibility of Response to Changing Conditions	Cost to re-purpose machine for new use	Time to repurpose machine for new use
Operating Readiness	Set-up costs	Downtime
Safety	Dollar amount of injury claims	Number of injury claims

1) **Other financial measures** may include such things as quality costs and level of inventory carrying costs.

2) **Other nonfinancial measures** may include new products marketed, technological capabilities, survey results, field service reports, vendor defect rate, cycle time, labor and machine efficiency, setup time, scheduling effectiveness, capacity usage, maintenance, and accidents and their results.

#### 4) **The Learning and Growth perspective** (originally called the innovation and learning perspective)<sup>4</sup>

The Learning and Growth perspective includes the capabilities that the organization must have in order to achieve its objectives in the **IBP** perspective.

**Components of the Learning and Growth perspective (3 C's)**

- **Human capital**, or the skills, talents, and knowledge of employees;
- **Information capital**, or the information systems, networks, and technology infrastructure of the company; and
- **Organizational capital**, or the company's culture, leadership, degree of teamwork, and knowledge management.

**Innovation and learning measures**

Focus on becoming efficient and effective at producing new products. The measures include time to market, percentage of sales from new products, and new products versus competitor's new products.

**Learning and growth measures**

Focus on education and training of personnel and can be measured by training sessions provided, developing leadership skills, and reducing the number of defects.

<sup>4</sup> Originally focused on **employee learning**, but it now covers not only human capital but also **organizational capital and information capital**. Initially innovation was part of this perspective, but users of the balanced scorecard system discovered that innovation properly belonged in the Internal Process category.

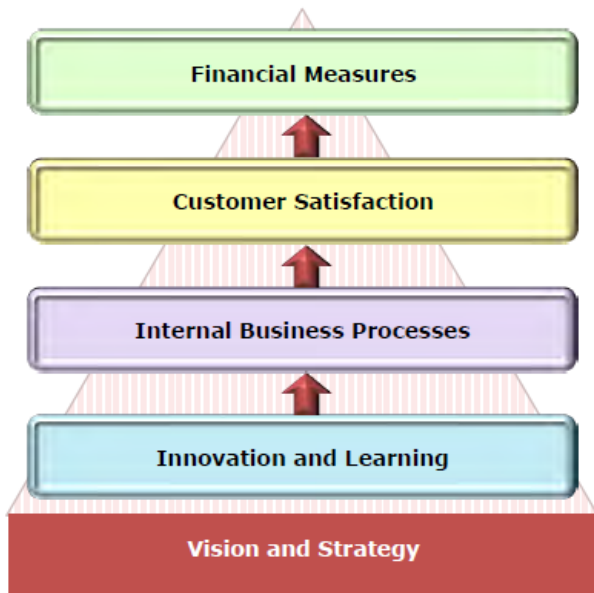

CSF	Financial Measure	Nonfinancial Measure
Development of Products	New R&D costs	Number of new patents applied for
Promptness of Their Introduction	Lost revenue (from slow introduction of new product to market)	Length of time to bring a product to market
Human Resource Development	Recruiting costs	Personnel turnover
Morale	Orientation/team-building costs	Personnel complaints
Competence of Work Force	Training/retraining costs	Hours of training

1) **Other financial measures** may include financial and operating results.

2) **Other nonfinancial measures** may include number of design changes and copyrights registered, R&D personnel qualifications, actual versus planned shipping dates, skill set levels attained, personnel survey results, organizational learning, and industry leadership.

### The Hierarchical Four broad categories of performance indicators/ perspectives.

In order for the balanced scorecard to be useful, the organization must be able to identify a cause-and-effect relationship between an action that could be taken (or avoided), that will have an effect on a CSF.

- For example: If the organization increases its R&D budget, then the organization can increase the number of new patents applied for.
- Achievement of the objectives in each perspective makes it possible to achieve the objectives in the next higher perspective.
- This chaining of objectives and perspectives embodies the implementation of a **strategy map**.

### Key Performance Indicators for a Balanced Scorecard<sup>5</sup>

- KPIs are measures of factors *critical to the success* of the organization.
- SWOT analysis helps a company determine its key performance indicators (KPIs).
- KPIs are specific, measurable goals that must be met in order to achieve a firm's strategy.
- 

<sup>5</sup> CSFs are the cause of your success, whereas KPIs are the effects of your actions, some people use them interchangeably. The ICMA stop using the term CSFs and replace point “m” with a new one “l” ~~m. define critical success factors and discuss the importance of these factors in evaluating a firm~~ l. define key performance indicators (KPIs) and discuss the importance of these indicators in evaluating a firm.

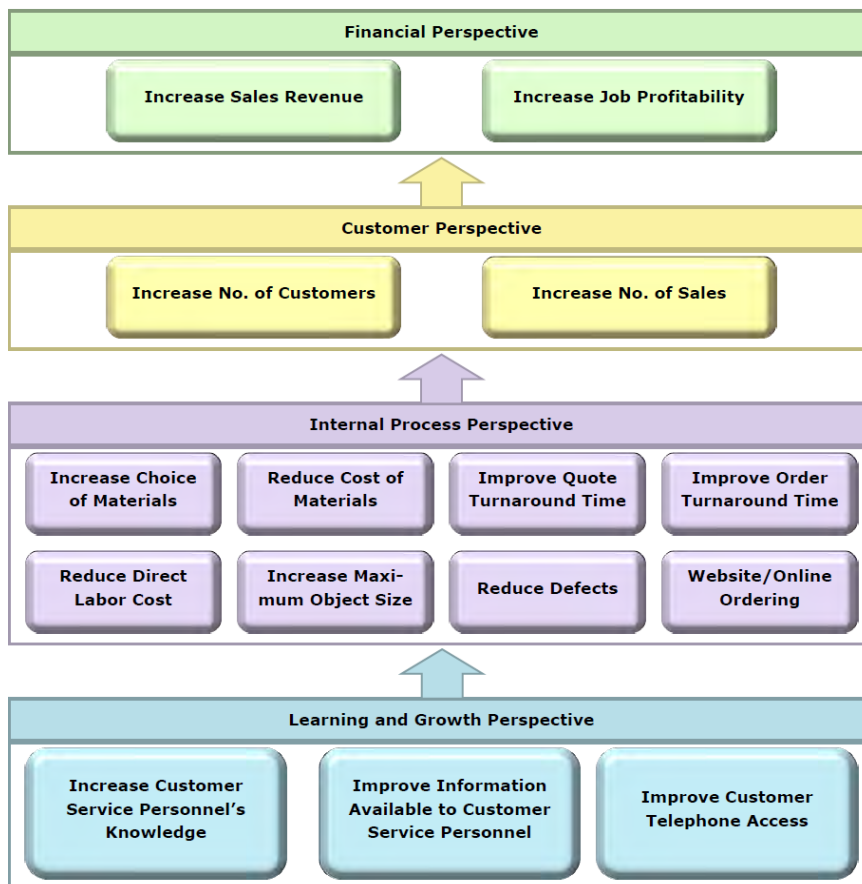

- Each KPI requires a defined business process, clear objectives for the process, quantitative or qualitative measurements for the objectives, and a plan for identifying and correcting variances from plan.
- KPIs should represent what is essential to the company competitive advantage and therefore its success.
  - To emphasize the importance of using strategic information, both financial and Non-financial, accounting reports of a firm's performance are now often based on **critical successes factors** in the above four different dimensions.
- Once the firm has identified its CSFs, it must establish specific, measurable ways for each CSF that are both relevant to the success of the firm and reliably stated.
- business should select a few critical metrics (KPIs)
  - KPIs should fit within an overall **cause-and-effect relationship** chain that ends with a relevant financial measure and the achievement of part of the company's strategy.

### Functionality of the BSC/ implementation of a Strategy Map

For the cause-and-effect chains of KPIs to be useful, they must be linked to a *definite outcome and a performance driver* that says how the outcome can be met

To achieve its objectives, the organization must establish the following:

- 1) Relevant criteria to measure **outcomes**. -This requires the use of **lagging** indicators which measure the results of actions.
  - a. Outcome measures are **lagging indicators**, or historic indicators of success such as measures of profitability, market share, employee skills, or customer retention.
- 2) Relevant performance **drivers** - This requires the use of **leading** indicators which are used to determine how an outcome can be met.

### Strategy Map

A strategy map **links** these four balanced scorecard perspectives together, beginning with Learning and Growth.

The goals of the **Learning** and Growth perspective contribute to the **Internal Process** perspective because the company's culture of empowering staff members and providing them with the technological support they need makes innovation and improvements in products and services possible. The **innovations** and improvements in products and services support the goals of the **Customer** perspective, such as increasing market share. Increased market share leads to increased **profits**, thereby supporting the goals of the **Financial** perspective.

In a business where customer service is critical, important measurements to track include telephone wait time, the level of knowledge and empowerment of customer service personnel, and the availability to customer service personnel of needed information. For example, a company that provides 3D printing (additive manufacturing) services using 3D design files prepared and uploaded by the customer to its website needs service personnel knowledgeable enough to provide technical advice to customers in order to achieve satisfactory results; it needs adequate numbers of customer service representatives; and it must have sufficient telephone lines to keep customers' wait times to a minimum.

**Example:** A Balanced Scorecard report for a company offering 3D printing service to customers who prepare and submit their design files created using 3D design software. The company has been serving the local market, and its strategic plan calls for expansion into the online market, serving customers around the world.

Objectives	KPI	Initiatives	Target	Results
<b>Financial Perspective:</b>				
Increase sales revenue	Rate of growth	Enter online market	20% increase	25% increase
Increase job profitability	Gross margin increase	Decr. DM & DL cost	Incr. gross margin from 40% to 45%	Gross margin incr. to 41%
<b>Customer Perspective:</b>				
Increase no. of customers	% increase	Employ search engine marketing service	10% increase	20% increase
Increase no. of sales	% increase in no. of quote requests that become orders	Speed up quoting process	5% increase	10% increase
<b>Internal Process Perspective:</b>				
Increase customer's choice of materials	No. of unique materials available	Add stainless steel and titanium	Increase from 15 to 17	Stainless steel, titanium and bronze added
Reduce cost of materials	Cost per unit	Seek new suppliers	Reduce by 5%	Reduced by 2%
Improve quote turnaround time	Average time/quote	Purchase new software	Decrease from 24 hours to 12 hours	Average time 15 hours
Improve order turnaround time	Average processing time/order	Purchase new, faster 3D printers	Decrease from 48 hours to 24 hours	Average turn-around 20 hrs.
Reduce direct labor cost	Avg. DL cost as a % of order price	New equipment will need fewer operators	Decrease from 30% to 20%	Decreased to 28%
Increase size of objects that can be manufactured	Maximum size	New equipment will have larger capacity	Increase from 24 cu. in. to 48 cu.in.	Maximum size incr. to 48 cu. in.
Reduce defects	Rate of returns	Institute new quality control program	Decrease from 5% to 2%	Increased to 7%
Develop website for receiving online orders	% of total orders received online	Contract with web-site developer	Online orders 25% of all orders	Online orders 20% of all orders
<b>Learning and Growth Perspective:</b>				
Increase customer svc. personnel's knowledge of 3D design software	No. of calls referred to supervisor	Training for customer service personnel	20% fewer calls referred	15% fewer calls referred
Improve customer information available	Average time spent on calls by customer service personnel	Purchase new Customer Relationship Management software	Reduce average time by 5%	Average call time reduced by 6%
Improve customer telephone access	Average wait time to reach customer service personnel	Add 3 new telephone lines and 2 new customer svc. employees	Reduce average wait time by 3 minutes	Average wait time reduced by 4 minutes

**Financial:** The increase in sales growth was achieved. The increase in gross profit margin was not achieved, though the gross profit margin was improved slightly.

**Customer:** Both targets were achieved.

**Internal Process:** Increased choice of materials, improved order turnaround time, and increased size of manufactured objects targets were achieved. Reduction in cost of materials, improvement in quote turnaround time, reduction in direct labor cost, and percentage of online orders to total orders were improved, though the targets were not achieved. The objective of reducing defects was definitely not achieved, as the defect rate increased.

**Learning and Growth:** Reduction of average time spent on calls by customer service personnel and average wait time to reach customer service personnel targets were achieved. Reduction in number of calls referred to supervisor was not achieved, though the percentage of calls referred to a supervisor did decline.

### Implementing a Balanced Scorecard

Implementing the balanced scorecard basically involves executing strategy. Without execution, even the best vision remains a dream. The balanced scorecard lends itself well to strategy execution, because the scorecard itself is a method of describing strategy in a way that can be acted on.

### The characteristics of Successful Implementation of BSC (Different Business Strategies call for Different Scorecards)

A BSC is most successful **when**

- the entire organization is aware of it and supports it.
- senior management support the program, even as high as the board of directors.
- It is tied to the organization's strategy and goals, and the performance measures can be quantified.
- It illustrating the sequence of cause-and-effect relationships
- Each business unit and division should be involved in developing its own customized scorecard.
  - When scorecards as developed by middle managers need to be reviewed and approved with input from senior management to make sure they are congruent with the company's goals.
- It is organized according to the four perspectives, with each selected scorecard measure on a line and classified within its perspective.
  - The target can be in one column followed by the actual results in the next column. Results that are in line and out of line can be identified, perhaps by color.
  - Each manager should be accountable for specific lines on each report, and a division head is accountable for all the lines on the divisional report.
- It identify tradeoffs that managers might make, for instance by reducing R&D spending to achieve short-run financial goals, or making other tradeoffs that could hurt future financial performance.
  - The decline of R&D spending or other problems would be signaled.
- It is marketed to both management and staff to garner support.
- Scorecard evaluation is more effective when it is used to judge the progress of an individual business unit relative to the prior year or relative to its goals rather than when used to compare a manager's performance with that of other managers or a segment's performance with that of other segments.
- a firm have extensive **enterprise resource planning**<sup>6</sup> systems to capture the required information.
- used to create an environment in which everyone can learn and grow.

### Problems With Balanced Scorecard Use for Performance Measurement

**The following are problems in implementation of the balanced scorecard approach:**

- 1) Using **too many measures**, with a consequent loss of focus on CSFs
- 2) Failing to evaluate **personnel** on nonfinancial as well as financial measures
- 3) Including measures that will **not** have long-term financial benefits
- 4) Not understanding that **subjective** measures (such as customer satisfaction) are imprecise
- 5) Trying to achieve improvements in **all areas** at all times
- 6) Not being aware that the hypothesized **connection** between nonfinancial measures and ultimate financial success may not continue to be true

---

<sup>6</sup> Enterprise resource planning (ERP) is a usually a suite of integrated business software applications that a company can use to collect, store, manage and interpret data from multiple business activities.(2015 LOS)

Section  
B.2

# Budgeting Concepts

2015

## Content Specification Outlines

### Part 1 – Section B.2.

#### 2. Budgeting concepts

- a. Operations and performance goals
- b. Characteristics of a successful budget process
- c. Resource allocation
- d. Other budgeting concepts

### Learning Outcome Statements

#### Part 1 – Section B.2. Budgeting concepts

The candidate should be able to:

- a. describe the role that budgeting plays in the overall **planning** and **performance evaluation** process of an organization
- b. explain the interrelationships between economic conditions, industry situation, and a firm's plans and budgets
- c. identify the role that budgeting plays in formulating short-term objectives and planning and controlling operations to meet those objectives
- d. demonstrate an understanding of the role that budgets play in measuring performance against established goals
- e. identify the **characteristics** that define **successful budgeting processes**
- f. explain how the budgeting process facilitates **communication** among organizational units and enhances **coordination** of organizational activities
- g. describe the concept of a **controllable cost** as it relates to both budgeting and performance evaluation
- h. explain how the **efficient allocation of organizational resources** are planned during the budgeting process
- i. identify the appropriate **time frame** for various types of budgets
- j. identify who should **participate** in the budgeting process for optimum success
- k. describe the **role of top management** in successful budgeting
- l. identify **best practice guidelines** for the **budget process**
- m. demonstrate an understanding of the use of **cost standards** in budgeting
- n. differentiate between **ideal** (theoretical) standards and **currently attainable** (practical) standards
- o. differentiate between **authoritative** standards and **participative** standards
- p. identify the **steps to be taken in developing standards** for both direct material and direct labor
- q. demonstrate an understanding of the **techniques** that are used to develop standards such as activity analysis and the use of historical data
- r. discuss the importance of a policy that allows **budget revisions** that accommodate the impact of significant changes in budget assumptions
- s. explain the role of budgets in **monitoring and controlling expenditures** to meet strategic objectives
- t. define **budgetary slack** and discuss its impact on goal congruence

Last updated 25/Aug/2014

... *BusinessWeek*, *Forbes*, *Fortune*, and other business journals repeatedly have ranked Johnson & Johnson (J&J) as one of the most innovative, well-managed, and admired firms in the world.

***How does Johnson & Johnson do it?***

It relies on a comprehensive formal planning, **budgeting**, and control system in formulating and implementing strategy, coordinating and monitoring operations, and reviewing and evaluating performance.

Every January, each operating unit reviews and revises its 5- and 10-year plans from the previous year and prepares the budget for the coming year as well as a two-year plan. The budgeting process is not completed until the approval of the profit plan in December.

Johnson & Johnson is not unique. Growth and long-term profitability are results of a well formulated strategy with good planning and implementation of the strategy. Firms need to plan for success. (B)

Budgeting is a common tool that organizations use for planning and controlling what they must do to serve their customers and succeed in the marketplace. This chapter discusses the budgeting processes and techniques that many successful companies such as J&J use as part of its overall management processes.(B)

## Fundamentals: Terminology, Budget Cycle, and Advantages of Budgeting

The following budget terms are used in this section.

### Budget

A budget is (a) the quantitative expression of a proposed plan of action by management for a specified period and (b) an aid to coordinate what needs to be done to implement that plan. <sup>(H)</sup>

A budget generally includes both financial and nonfinancial aspects (measures) of the plan into its output, and it serves as a blueprint for the company to follow in an upcoming period. <sup>(H)</sup>

A budget is a detailed (*realistic*) plan for the acquisition and use of financial and other resources over a specified period of time—typically a fiscal year. <sup>(B)</sup>

A detailed plan for the future, usually expressed in formal quantitative terms. <sup>(G)</sup>

A budget is an operational plan and a control tool for an entity that identifies the resources and commitments needed to satisfy the entity's goals over a period. Budgets are primarily quantitative, not qualitative. They set specific goals for income, cash flows, and financial position. <sup>(IMA)</sup>

### Budgeting Or targeting: is the process of preparing a budget

Budgeting is undertaking the steps involved in preparing a budget. Along with clear communication of organizational goals, the ideal budget also contains budgetary controls. <sup>(IMA)</sup>

Budgeting is the most commonly used tool for planning and control. <sup>(H)</sup>

### Budgetary Control

Budgetary control is a management process to help ensure that a budget is achieved by instituting a systematic budget approval process, by coordinating the efforts of all involved parties and operations, and by analyzing variances from the plan and providing appropriate feedback to responsible parties. <sup>(IMA)</sup>

The goals identified in the budget must be perceived by employees as *realistic* if those employees are to be motivated to achieve the goals. <sup>(IMA)</sup>

### Pro forma Statements

A pro forma statement is a budgeted financial statement based on historical documents that is adjusted for events "*as if*" they had occurred. Budgeted balance sheets, budgeted statements of cash flows, and budgeted income statements are forecasts of goals for a future period that assist in the allocation of resources. <sup>(IMA)</sup>

### Take a Note:

A **projected financial statement** can be called a **pro forma financial statement**; however, the **master budget is not a pro forma financial statement**.

The term pro forma is used to refer to a **forecasted financial statement** prepared for a specific purpose (for example, to do “*what if*” analysis in the process of planning).

A company might prepare many different sets of pro forma financial statements for the same period in its planning process. A pro forma financial statement is **not used for formal variance reporting** as the master budget and the flexible budget are. However, if an action that was forecasted is implemented, the company would probably want to compare the actual results with the forecasted, pro forma ones. But **pro forma financial statements are not a part of the formal budgeting process**. They are used for planning and decision-making purposes, and the amounts in them may be quite different from the amounts in the master budget. (Planning and the use of pro forma financial statements is discussed more in the topic of Top-Level Planning and Analysis in this section.) (HK)

### Strategic plan and Strategic budgeting

An organization must complete its strategic plan before any specific budgeting can begin. The strategic plan lays out the means by which a firm expects to fulfill its stated mission.

**Strategic budgeting** is a form of long-range planning based on identifying and specifying organizational goals and objectives. The strengths and weaknesses of the organization are evaluated and risk levels are assessed. The influences of environmental factors are forecast to derive the best strategy for reaching the organization’s objectives.

## Budgeting Cycle and Master Budget

Well-managed companies usually cycle through the following budgeting steps during the course of the fiscal year:

### 1-Plan the performance of the company, Create master budget and subbudgets

Working together, managers and management accountants plan the performance of the company as a whole and the performance of its subunits (such as departments or divisions). Taking into account past performance and anticipated changes in the future, managers at all levels reach a common understanding on what is expected.<sup>(H)</sup>

### 2- Set a frame of reference and get manager buy-in, budget is used to test current performance against expectations.

Senior managers give subordinate managers a frame of reference, a set of specific financial or nonfinancial expectations against which actual results will be compared. , i.e., the budget is used to test current performance against expectations. <sup>(H)</sup>

### 3-Variations from the plan are examined, and corrective actions are taken

Management accountants help managers investigate variations from plans, such as an unexpected decline in sales. If necessary, corrective action follows, such as a reduction in price to boost sales or cutting of costs to maintain profitability.<sup>(H)</sup>

### 4- Planning again, in light of feedback and changed conditions when possible.

Managers and management accountants take into account market feedback, changed conditions, and their own experiences as they begin to make plans for the next period.

For example, a decline in sales may cause managers to make changes in product features for the next period.<sup>(H)</sup>

Feedback is collected, and the plan is revisited and revised if needed.<sup>(IMA)</sup>

The preceding four steps describe the ongoing budget process.

The working document at the core of this process is called the **master budget**.

The master budget expresses management's operating and financial plans for a specified period (usually a fiscal year), and it includes a set of budgeted financial statements. <sup>(H)</sup>

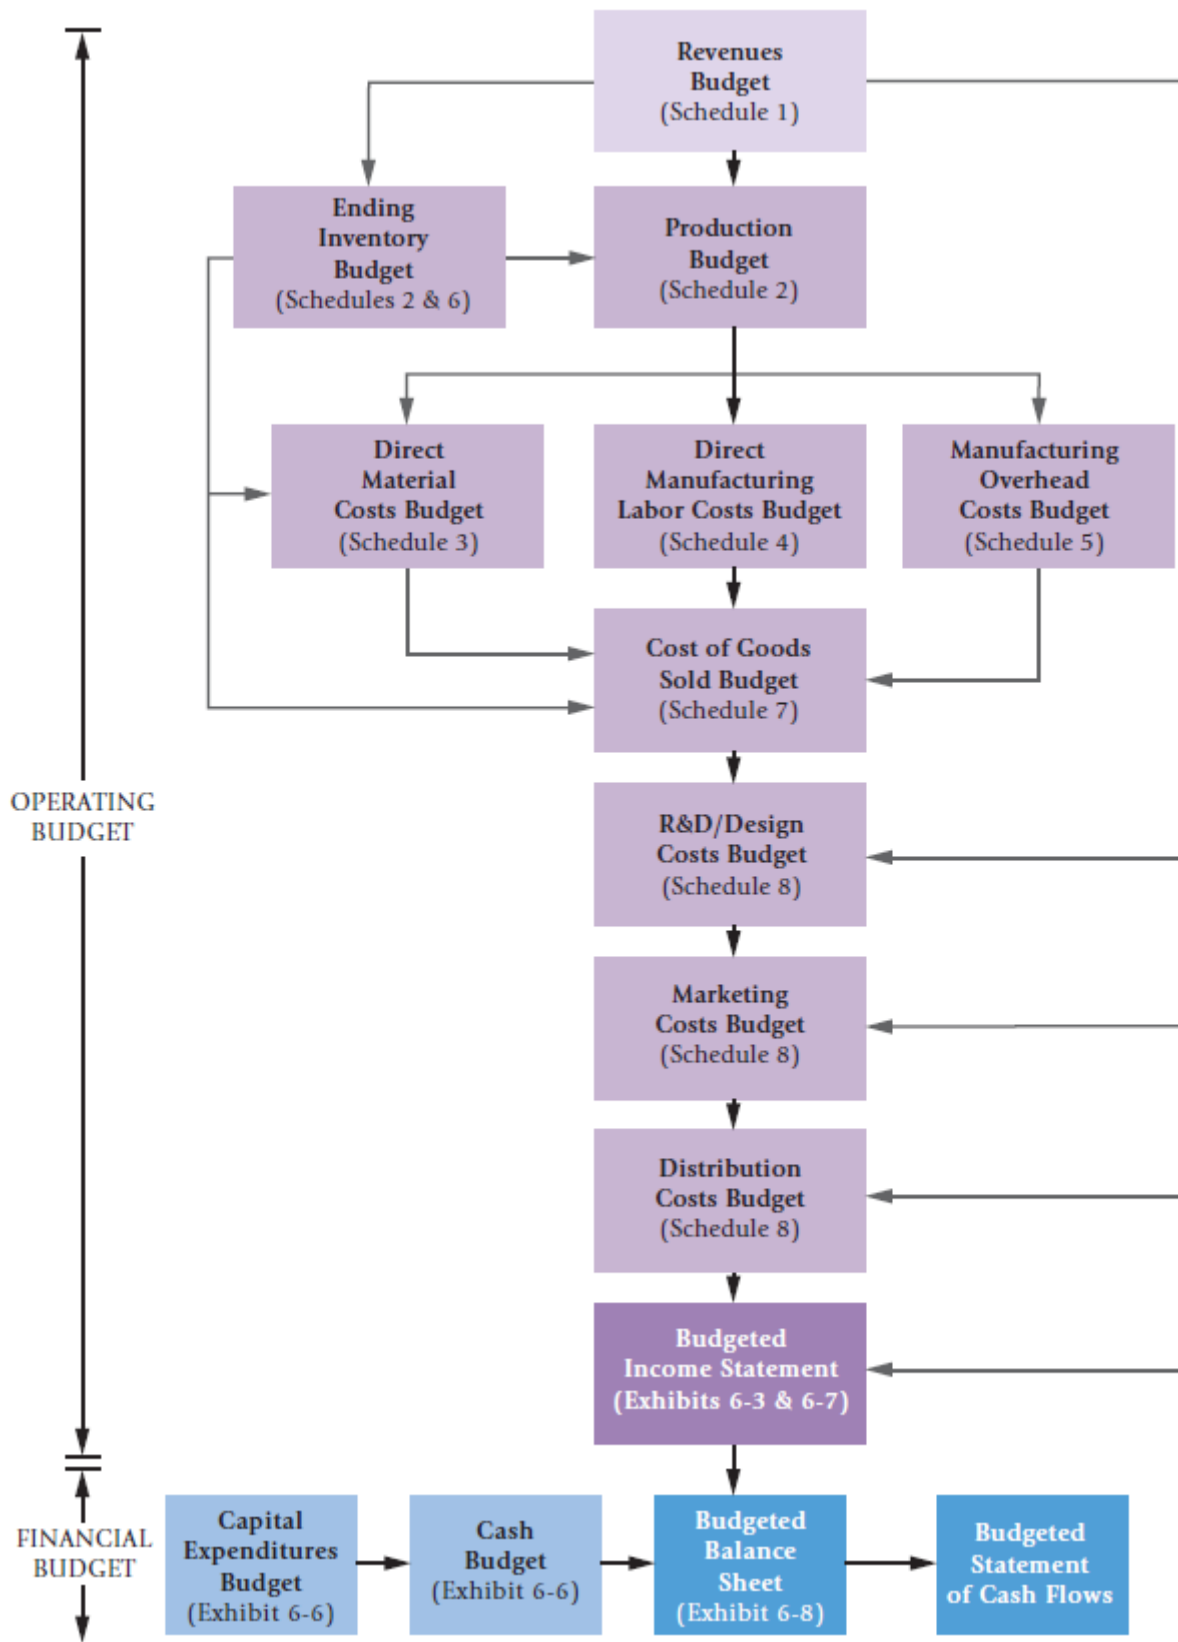

The master budget is the initial plan of what the company intends to accomplish in the budget period. The master budget evolves from both operating and financing decisions made by managers.<sup>(H)</sup>

Operating decisions deal with how to best use the limited resources of an organization.

Financing decisions deal with how to obtain the funds to acquire those resources.

## Overview of the Master Budget

Master budget is a **comprehensive budget** for a specific period. It consists of a capital budget and a set of interrelated operating and financial budgets. As noted earlier, the capital budget includes budgets to support strategic initiatives, programs, and projects.<sup>(B)</sup>

A **financial budget** quantifies management's expectations regarding income, cash flows, and financial position. Just as financial statements are prepared for past periods, financial statements can be prepared for future periods—for example, a budgeted income statement, a budgeted statement of cash flows, and a budgeted balance sheet. <sup>(H)</sup>

Underlying these financial budgets are **nonfinancial budgets** for, say, units manufactured or sold, number of employees, and number of new products being introduced to the marketplace.<sup>(H)</sup>

### **Interrelationships in the Master Budget**

Previous Exhibit shows a diagram of the various parts of the master budget for a manufacturer firm. Most of what you see in the Exhibit comprises a set of budgets the budgeted income statement and its supporting budget schedules - together called the **operating budget**. <sup>(H)</sup>

These schedules are budgets for various business functions of the value chain, from research and development to customer service.

The **financial budget** is that part of the master budget made up of the capital expenditures budget, the cash budget, the budgeted balance sheet, and the budgeted statement of cash flows. A **financial budget** focuses on how operations and planned capital outlays affect cash. <sup>(H)</sup>

The master budget is finalized only after several rounds of discussions between top management and managers responsible for various business functions of the value chain. <sup>(H)</sup>

### **Take a Note:**

As you see the master budget consists of a number of separate but interdependent budgets that formally lay out the company's sales, production, and financial goals. The master budget culminates in a cash budget, a budgeted income statement, and a budgeted balance sheet. <sup>(G)</sup>

The **first step** in the budgeting process is the preparation of the **sales budget**, which is a detailed schedule showing the expected sales for the budget period. An accurate sales budget is the key to the entire budgeting process. As illustrated in the Exhibit, **all other parts of the master budget depend on the sales budget**. If the sales budget is inaccurate, the rest of the budget will be inaccurate. The sales budget is based on the company's sales forecast, which may require the use of sophisticated mathematical models and statistical tools. <sup>(G)</sup>

The sales budget helps determine how many units need to be **produced**. Thus, the production budget is prepared after the sales budget. The production budget in turn is used to determine the budgets for manufacturing costs including the direct materials budget, the direct labor budget, and the manufacturing overhead budget. These budgets are then combined with data from the sales budget and the selling and administrative expense budget to determine the cash budget. A cash budget is a detailed plan showing how cash resources will be acquired and used. Observe from the Exhibit that all of the operating budgets have an impact on the cash budget. <sup>(G)</sup>

## Advantages of Budget

A budget forces **managers to look ahead**, to translate strategy into plans, to **coordinate** and **communicate** within the organization, and to provide a benchmark for **evaluating** performance. <sup>(H)</sup>

Budgeting often plays a major role in affecting **behavior** and decisions because managers strive to meet budget targets. <sup>(H)</sup>

Budgets play a crucial role in businesses. Without budgets, it's difficult for managers and their employees to know whether they're on target for their growth and spending goals. Budgeting is a common accounting tool that companies use for implementing strategy.

Why does a successful company feel the need to watch its spending so closely? In many profitable companies, a strict budget is actually a key to their success. Through budgeting, managers learn to anticipate and avoid potential problems. <sup>(H)</sup>

Budgets turn managers' perspectives forward and aid in **planning** and **controlling** the actions managers must undertake to satisfy their customers and succeed in the marketplace. Budgets provide measures of the financial results a company expects from its planned activities and help define objectives and timelines against which progress can be measured. <sup>(H)</sup>

Budgets are a big part of most management control systems. When administered wisely, a budget becomes a **planning** tool, a **control** tool, a **motivational** tool, and a **communication** tool.

As **planning** tool budget forces the organization to examine the future.

Budgets promote **coordination** and **communication** among organization units and activities

As a **control** tool budget provide a framework for measuring performance

Provide **motivation** for managers and employees to achieve the company's plans

Promotes the efficient **allocation** of organizational resources

### As planning tool budget forces the organization to examine the future.

One of the major benefits of budgeting is that it **forces the organization to examine the future**. Expectations must be established for income, expenses, personnel needs, future growth (or contraction), etc. (IMA)

Planning allows for the input of ideas from multiple sources within the organization, and allows for input from **different viewpoints**. The planning process may generate **new ideas** for the organization's direction, or it may provide insight into **better ways to achieve goals** that have already been established. (IMA)

The budget process provides a **framework to achieve the goals** of the organization. Without the framework of a budget, individual managers would be improvising decisions without the direction and coordination provided by a budget. Without a budget, the organization would be operating in a reactive manner, rather than in a **proactive** manner. (IMA)

Budget preparations allow management time to **work out any problems** the organization might face in the coming periods. This extra time enables the organization to **minimize the adverse effects** that anticipated problems could have on operations. (B)

Budgets force managers to **think about and plan for the future**. In the absence of the necessity to prepare a budget, many managers would spend all of their time dealing with day-to-day emergencies. (G)

### Budgets promote coordination and communication among organization units and activities

**Coordination** is meshing and balancing all aspects of production or service and all departments in a company in the best way for the company to meet its goals. (H)

**Communication** is making sure those goals are understood by all employees. (H)

Management uses budgets to **communicate** directions and goals throughout a company. Completion of a budget for all units of an organization facilitates the **coordination** of activities across departments and other organizational units. (B)

#### Example:

For example, when the sales manager shares sales projections with the production manager, the production manager can plan and budget to produce the inventory that is to be sold. And the sales manager can make better forecasts of future sales by coordinating and communicating with branch managers, who may be closer to the customers and know what they want. (HK)

#### Communication

A budget also serves as a **communication** device through which **top management defines its plans** and goals for the period so that other **managers and employees have access to this information**. The operating plan of a budget allows each division to know what it needs to do to satisfy the needs of other divisions.

The different parts of the organization (production, marketing, materials management, etc.) must communicate their plans and needs to each other during the budget process so that all can evaluate the effect that the plans and needs of others have on their own plans and needs. (IMA)

Budgeting also allows the organization to communicate its goals to everyone in the organization, including those not involved in the budget process. Budgeting sets the stage for everyone in the organization to work toward the goals of the organization. (IMA)

### Example:

The manufacturing division knows, for example, that it needs to complete the production of so many units of a given product before a certain date if the marketing division schedules the delivery of that product to customers for various dates. (B)

### Coordination

Each part of the organization must **coordinate** its activities to attain the budgeted goals and objectives. (IMA)

### Example:

If new products are to be developed, funds must be provided for development, materials will have to be purchased to produce the products, marketing and sales must have sufficient resources to promote and sell the products, and shipping and distribution may need additional space to store the products or additional resources to distribute them. (IMA)

**Coordination** forces executives to think of relationships among individual departments within the company, as well as between the company and its supply chain partners. (H)

### Example:

Consider budgeting at Pace, a United Kingdom-based manufacturer of electronic products. A key product is Pace's digital set-top box for decoding satellite broadcasts.

The **production manager** can **achieve more timely production** by coordinating and communicating with the company's **marketing** team to understand when set-top boxes will be needed.

In turn, the **marketing** team can make better predictions of future demand for set-top boxes by coordinating and communicating with Pace's **customers**.

Suppose BSkyB, one of Pace's largest **customers**, is planning to launch a new high definition personal video recorder service. If Pace's **marketing** group is able to obtain information about the launch date for the service, it can share this information with Pace's **manufacturing** group. The **manufacturing** group must then coordinate and communicate with Pace's **materials-procurement** group, and so on.

The point to understand is that Pace is more likely to have **satisfied customers** (by having personal video recorders in the demanded quantities at the times demanded) if Pace coordinates and communicates both within its business functions and with its **suppliers** and **customers** during the budgeting process as well as during the **production** process. (H)

A budget promotes **goal congruence** and **coordination** among operating units, budgets requires departmental managers to make plans in conjunction with the plans of other interdependent departments, If the firm does not have an overall budget, each department tends to pursue its own objectives without regard to what is good for the firm as a whole.

### Example:

The sales department may want to keep as much inventory as possible so that no sales will be lost, but inventory control may be judged on its turnover rate. If the budget specifies the level of inventory, the two departments have a common framework for decision making and are no longer working at cross purposes. (GL)

### As a control tool budget provide a framework for measuring performance and provide a means for controlling operations (reporting variances between actual and budgeted spending)

Budgets prescribe what performance the organization expects of all divisions and all employees for the period. (B)

The budget provides a formal **benchmark** to be used for feedback and performance evaluation.

At the **end of an operating period**, the budget for the period can serve as a basis for assessing performance by reporting **variances** between actual and budgeted spending and operating results. The budget represents the specific results expected of the firm's divisions and employees for the period against which actual performance can be **compared**. (B).

By **comparing** actual results to the budget for a given period, a manager's performance can be evaluated. (IMA)

### Take a note:

Having **negative or unfavorable** results **does not necessarily** mean that a manager is not performing well, but it does provide an indication that a specific part of the business should be focused on, in order to determine the **root cause of the unfavorable variance**. (IMA)

Likewise, **positive, or favorable**, results **do not necessarily** mean that a manager is performing in an exceptional way. (IMA)

### Question

Why budgeted performance is a better criterion than past performance for judging managers?

### Answer

Because

- inefficiencies included in past results can be detected and eliminated in budgeting, as past results often incorporate past miscues and substandard performance. (H)
  - Last year's results may have been negatively impacted by poor performance and the causes may have now been corrected. In this case, using last year's results would set the bar too low.
- Future conditions may be expected to differ from the past, and these can also be factored into budgets. (H)
  - as the past is never a good predictor of the future, and the profit plan should reflect the conditions anticipated for the coming period, not the conditions that existed in the past period or periods. (HK)

**Monitoring: Provide a means to check on progress toward the organization's objectives.**

By comparing the actual results for a period to the budgeted results for that period, managers can see whether the organization is on track to achieving its goals. (IMA)

Question

Why performance should not be compared against the current budget **only**?

Answer

Because

- that can result in lower-level managers setting budgets that are **too easy** to achieve (i.e., it creates an incentive for subordinates to set a target that is relatively easy to achieve) <sup>(H)</sup>.
- It is also important to measure performance relative to the performance of the industry and even relative to performance in prior years.<sup>(HK)</sup>, many companies consider performance relative to **peers** as well as improvement over prior years <sup>(H)</sup>.

Once the budget is set and **managers** have been advised of their **responsibilities** in relation to budget performance, they can be held responsible for their portion of the budget. Breaking down the organization's master budget to divisional and departmental levels allows each level of the organization to be evaluated. The organization as a whole may be meeting its goals, while individual divisions and departments are failing. <sup>(IMA)</sup>

Question

How the budgetary process serve effectively as a control function?

Answer

For the budgetary process to serve effectively as a control function, it must be integrated with the accounting system and the organizational structure. Such integration enhances control by transmitting data and assigning variances to the proper organizational subunits.<sup>(GL)</sup>

In order to do that, the responsibility centers used for budgeting need to be the same as the responsibility centers used for accounting; the chart of accounts used for budgeting need to be the same as the chart of accounts used for accounting; and so forth. This enables management to compare the budget with the actual levels of activity, revenues and expenditures and calculate variances.<sup>(HK)</sup>

Question

How the budgetary control process improve future performance?

Answer

One of the most valuable benefits of budgeting is that it helps managers gather relevant information for improving future performance. When actual outcomes fall short of budgeted or planned results, it prompts thoughtful senior managers to ask questions about what happened and why, and how this knowledge can be used to ensure that such shortfalls do not occur again. This probing and learning is one of the most important reasons why budgeting helps improve performance.<sup>(H)</sup>

**Provide motivation for managers and employees to achieve the company's plans****Question**

How the company use the budget process to improve motivation?

**Answer**

- Setting expected activities and operating results **clearly** in the budget, employees will know what is expected of them; in turn motivates employees to work to attain the budgeted goals.<sup>(B)</sup>
- Allow employees to **participate** in the budgeting process, thus helping employees embrace the budget as their own.<sup>(B)</sup>
- Set **demanding but achievable goals** for managers.<sup>(H)</sup>
  - Research shows that challenging budgets improve employee performance because employees view falling short of budgeted numbers as a failure. Most employees are motivated to work more intensely to **avoid failure** than to achieve success. As employees get closer to a goal, they work harder to achieve it. Therefore, many executives like to set demanding but achievable goals for their subordinate managers and employees.<sup>(H)</sup>
  - Challenging budgets improve employee performance, because no one wants to fail, and falling short of the budgeted numbers is perceived as failure, a budget helps to motivate employees to do a good job.<sup>(HK)</sup>
  - If they are so high that they are impossible to achieve, however, they are de-motivating.
- Performance evaluations allow an organization to motivate employees by **rewarding** them for **good performance** in a number of ways, such as through performance-based bonuses, and/or by including performance evaluations in the decision process for future compensation or promotion decisions.<sup>(IMA)</sup>

**Question**

How challenging should budget targets be??

**Answer**

Some experts argue that budget targets should be very challenging and should require managers to stretch to meet goals. Even the most capable managers may have to scramble to meet such a “stretch budget” and they may not always succeed. In practice, most companies set their budget targets at a “highly achievable” level. A highly achievable budget may be challenging, but it can almost always be met by competent managers exerting reasonable effort.<sup>(G)</sup> Bonuses based on meeting and exceeding budgets are often a key element of management compensation. Typically, no bonus is paid unless the budget is met. The bonus often increases when the budget target is exceeded, but the bonus is usually capped out at some level. For obvious reasons, managers who have such a bonus plan or whose performance is evaluated based on meeting budget targets usually prefer to be evaluated based on highly achievable budgets rather than on stretch budgets. Moreover, **highly achievable budgets may help build a manager’s confidence and generate greater commitment to the budget.** And finally, **highly achievable budgets may result in less undesirable behavior** at the end of budgetary periods by managers who are intent on earning their bonuses.<sup>(G)</sup>

A budget helps to motivate employees if some degree of flexibility is allowed, and seen as realistic, the later will be achieved through the participation approach.

Unfortunately, the budget is not always viewed in a positive manner. Some managers view a budget as a **restriction**. **Many managers regard budgets negatively**. To them, the word budget is about as popular as, say, *downsizing, layoff, or strike*. Top managers must convince their subordinates that the budget is a tool designed to help them set and reach goals. Whatever the manager's perspective on budgets—pro or con—budgets are not remedies for weak management talent, faulty organization, or a poor accounting system. (H)

#### Take a note:

The traditional budgeting process **may lead to across-the-board cuts** when early budget iterations show that planned expenses are too high. However, budgeting should not necessarily require across the board cuts, even when expenses are higher than desired. Cost cutting should be based on what is best for the organization. Frequently cuts based on what is best for the organization will not be equally distributed. (HK)

#### Promotes the efficient allocation of organizational resources

A budget helps management to allocate resources efficiently and to ensure that subunit goals are **congruent** with those of other subunits and of the organization.

The budget also can help managers identify current and potential bottlenecks in operations. Critical resources can then be acquired to ease any bottlenecks and prevent such bottlenecks from becoming obstacles to attaining budgetary goals. (B)

Budgets also **provide authority to acquire and to use resources**. The authorization function of budgets is especially important for government and not-for-profit organizations because budgeted amounts, sometimes referred to as *appropriations*, often serve both as approval of activities and as a ceiling for expenditures. (B)

The allocation of scarce resources among competing opportunities is accomplished through implementation of a strategy. A budget is a plan based on a company's strategy for controlling its operations for a specific period of time.

#### Efficient allocation of organizational resources & the preparation of the operating budgets

The process of developing the operating budgets for the individual units in an organization includes identifying the resources that each unit will need to carry out the planned activities.

#### Example:

The process of developing the **production budget** requires projections for direct materials and direct labor that will be required to produce the planned output.

The process of budgeting for **administrative salaries** requires forecasts of administrative employees that will be needed by each department. If funds will be available for only a certain number of administrative employees in the organization, some units' projections may have to be adjusted. This leads to efficient allocation of organizational resources. (HK)

**Efficient allocation of organizational resources during the budgeting process may also include making decisions about the most profitable way to utilize the resources available.**

A decision about what product or products to produce may need to be made under a situation of constraint. A constraint exists when one or more of the factors of production are limited in some way. This type of decision would be required if a plant were operating at full capacity and management wanted to maximize net income without being able to increase capacity.

Decisions made under situations of **constraint** are usually short-run decisions. In the short run, managers must do the best they can with the resources they have. In the long run, however, capacity can be expanded and constraints eliminated, or at least reduced.

When operating at capacity, operating income is maximized by maximizing contribution **margin per unit of the resource that is limiting either the production or the sale of products.**<sup>(HK)</sup>

### Example:

Assume our plant has only 3,000 machine hours available to produce its products, tables and chairs.

The price and variable costs and the number of machine hours required to produce each product are as follows:

	Per Unit Data	
	Chair	Table
Selling Price	\$450.00	\$600.00
Variable Costs	200.00	300.00
Contribution margin	\$250.00	\$300.00
Machine hours/unit	2	4
Contribution margin per machine hour	\$125	\$75

In the short run, under the existing constraint of 3,000 machine hours available per month, producing only chairs will maximize operating income.

## Characteristics of Successful Budgeting

Many factors characterize a successful budget, but no single factor can lead to a successful budget. The common factors in a successful budget include the following:

1. The budget must be aligned with the corporate **strategy**.
2. The budget must be perceived by employees as a **planning, communication, and coordinating** tool, and not as a pressure or blame device.
3. The budget must be characterized as a **motivating** tool to help employees work toward organizational goals.
4. A budget should be **coordinated**.
5. The budget should be used to alleviate potential bottlenecks and to **allocate resources** to those areas that will use the funds most efficiently and effectively.
6. The budget must be seen as an **internal control device**, and internal-use budgets should base evaluations on controllable or discretionary costs.

### Take a note:

Points from 1 to 6 discussed before so we will not give a detailed explanation again.

7. The budget must have the support of management at all levels.
8. Management (including top management) must fully endorse the budget-they must accept responsibility for reaching the budget goals.
9. The single most important factor in assuring its success is for **upper management** to demonstrate that they take the project seriously and consider it vital to the organization's future.
10. A higher authority than the team who developed the budget must review and approve the budget.
11. A budget can be successful only if those responsible for its implementation make it happen.
12. People who are charged with carrying out the budget need to feel ownership of the budget.
13. To be useful, the budget should be an accurate representation of what is expected to occur.

### Take a note:

Points from 7 to 13 will be discussed through the topic "Who Should Participate in the Budgeting Process?"

14. The time period for a budget should reflect the purpose of the budget (will discussed next pages).
15. Sales and administrative budgets need to be detailed in order that key assumptions can be better understood (will discussed next pages).
16. A budget should be flexible.

The final budget should not be easily changed, but it must be flexible enough to be useful.

Budgets should compel planning, promote communication and coordination, and provide performance criteria. The budget process must balance input from those who will need to follow the budget against a thorough and fair review of the budget by upper management. (IMA)

## Characteristics of a Successful Budgeting Process

Whether the organization and its budget are very simple or highly complex, the characteristics of a successful budget process include: the budget period, the participants in the budget process, the basic steps in budgeting, and the use of cost standards (IMA).

### Budget Period

A budget usually is prepared for a set time, most commonly for the fiscal year with subperiod budgets for each of the constituent quarters or months.(B)

Budgets can also be prepared on a **continuous** basis.(HK)

In practice, Johnson & Johnson has only skeleton budgets for its **5- and 10-year budgets**.(B)

### Budget Participants & Budget Process

Three groups make or break a budget: the board of directors, top management, and the budget committee. Middle and lower management also play a significant role, because they create detailed budgets based on upper management's plan. (IMA)

**Methods of budget preparation** differ between companies, but all fall somewhere on a continuum between entirely authoritative and entirely participative.(IMA) , in other words budget development can be done using a participative process, an authoritative process, or a consultative process (combination approach) (HK). Note that the combination approach is sometimes considered to be a form of the participative approach (IMA).

### Basic steps in budgeting

The process usually includes the formation of a budget committee; determination of the budget period; specification of budget guidelines; preparation of the initial budget proposal; budget negotiation, review, and approval; and budget revision.(B)

For instance, the steps that responsibility centers take in preparing their budgets include: the initial budget proposal, budget negotiation, review and approval, and revision.(IMA)

### The use of Cost Standards

Organizations set different types of standards that they strive to achieve, Standards can be either **authoritative** or **participative**, Specific types of standard costs include **ideal** standards and **reasonably attainable** standards, Several sources are often used simultaneously when setting standards: activity analysis, historical data, market expectations, strategic decisions, and benchmarking, establishing a standard cost for direct materials & direct labor . (IMA)

## Budget Period /Time Frames for Budgets

### One Year

A budget/profit plan is generally prepared for a set period of time, ***commonly for one year***, and the annual profit plan is **subdivided** into months or possibly quarters. Usually the budget /profit plan is developed for the **same time period covered by a company's fiscal year**.

When the budget period is the same as the fiscal year, budget preparation is easier and comparisons between actual results and planned results are facilitated. This comparison is called a *variance report*. Variance reporting will be covered in detail in the next major section, Performance Management.(HK)

### Continuous Basis

Budgets can also be prepared on a continuous basis. At all times, the budget covers a set number of months, quarters, or years into the future. Each month or quarter, the month or quarter just completed is dropped and a new monthly or quarterly budget is added to the end of the budget.

At the same time, the other periods in the budget can be **revised** to reflect any new information that has become available. Thus, the budget is **continuously** being updated and always covers the same amount of time in the future. This is called a **rolling budget** or a **perpetual /continuous budget**.

A continuous or perpetual budget is a 12-month budget that rolls forward one month (or quarter) as the current month (or quarter) is completed. In other words, one month (or quarter) is added to the end of the budget as each month (or quarter) comes to a close. This approach **keeps managers focused** at least one year ahead so that they do not become too narrowly focused on short-term results.(G)

### Long-term budget in parallel with the master budget

Firms usually have longer-term budgets, as well. Budgets for the years beyond the coming year usually contain only essential operating data and do not attempt to present a full operating and financial budget.(HK)

In practice, firms **seldom** have budgets for **only one year**. The budgets for the years beyond the coming year, however, usually contain only essential operating data. For example, Johnson & Johnson has *only skeleton budgets for its 5- and 10-year budgets*. (B)

Having a long-term budget in parallel with the master budget allows alignment of strategic goals and short-term operations.(B)

## Who Should Participate in the Budgeting Process?

### Budget Participants

Three groups make or break a budget: the board of directors, top management, and the budget committee. Middle and lower management also play a significant role, because they create detailed budgets based on upper management's plan.<sup>(IMA)</sup>

To gain the benefits of budgeting, **management at all levels** of a company should understand and support the budget and all aspects of the management control system. This is critical for obtaining lower-level management's participation in the formulation of budgets and for successful administration of budgets. Lower-level managers who feel that top management does not "believe" in a budget are unlikely to be active participants in a budget process.<sup>(H)</sup>

The profit plan must have the support of **management at all levels**. The support of top management is critical to gain the support of lower-level managers, and the support of lower-level managers is critical in order to gain the support of the affected employees.<sup>(HK)</sup>

### Board of Directors

The budget process begins with the **mission** statement formulated by the board of directors.<sup>(GL)</sup> The board of directors **does not create the budget**, but the BOD responsible for reviewing the budget and either approves it or send it back for revision. The board usually appoints the members of the budget committee.<sup>(IMA)</sup>

### Top Management

#### Responsibilities

- Senior management translates the **mission** statement into a **strategic plan** with measurable, realizable goals.<sup>(GL)</sup>
- Either senior management or a budget committee made up of senior managers **provides budget guidelines** based on their strategic plans, assumptions about the economy, and other relevant factors.<sup>(HK)</sup>
- Top management is ultimately responsible for their budgets, and their primary means of exercising this responsibility is to **ensure that all levels of management understand and support** the budget and the overall budget control process (i.e., using the budget process to communicate goals).<sup>(IMA)</sup>
- Top management should use the budget to define its plans and goals for the period so that other managers and employees have access to this information. <sup>(B)</sup>
- Senior managers **review the initial budgets** that received from division heads, and send them back to the department heads for revision.
- Top managers should **give** their subordinates **incentives for making truthful and complete budgets**, such as rewarding accuracy.
- A common problem that needs to be avoided is budget slack. Budget slack occurs when budgeted performance differs from actual performance because managers tend to build in some extra money for their budget to deal with the unexpected. Budget slack is built-in freedom to fail, and cumulative budget slack at each sublevel can result in a very inaccurate master budget. <sup>(IMA)</sup>
- In administering the budget program, it is particularly important that top management **not use the budget to pressure or blame employees**. Using budgets in such negative ways will breed hostility, tension, and mistrust rather than cooperation and productivity.<sup>(G)</sup>
- Top management should use the budget and variance reports to reevaluate the strategy if needed.<sup>(H)</sup>

### Nature of senior management's involvement

- Top management involvement does not extend to dictating the exact numerical contents of the budget since top management lacks a detailed knowledge of daily operations.<sup>(GL)</sup>

### The importance of senior management's involvement

- Top management's belief in and support of the planning and budgeting process is the single most important element in its success.<sup>(GL)</sup>
- Budgeting is a cross-functional activity. Top management's strategies for achieving revenue and operating income goals **influence the costs planned for the different business functions of the value chain**. For example, a budgeted increase in sales based on spending more for marketing must be matched with higher production costs to ensure that there is an adequate supply of tables and with higher distribution costs to ensure timely delivery of tables to customers.<sup>(H)</sup>
- If top management is not perceived to endorse a budget, **line managers will be less likely to follow the budget precisely**.<sup>(IMA)</sup>
- The importance of senior management's involvement cannot be over-emphasized. The support of top management is crucial in order to **obtain successful development and administration of the budget**.<sup>(HK)</sup>
- Furthermore, top management support is necessary in order to **gain lower-level management participation**. If lower-level managers feel that top management does not support the effort, they are not likely to support it either.<sup>(HK)</sup>
- The budget review and approval process ensures top management that **budget guidelines are being followed**.
- Top management's active involvement in reviewing and approving the proposed budget is an effective way to **discourage lower-level managers from playing budget games**. (Submitting budgets with easy targets and adding slack to a budget.)
- The active involvement of top management also motivates lower managers to believe in the budget, be candid in its preparation, and be dedicated to attaining its goals because they know that the boss cares about the budget.
- An organizational budget requires a significant commitment of internal resources. **The single most important factor** in assuring its success is for upper management to demonstrate that they take the project seriously and consider it vital to the organization's future.<sup>(GL)</sup>

### Budget Committee

#### Committee Structure

Large corporations usually need to form a budget committee that have the highest authority in an organization for all matters related to the budget, composed of senior management, and often led by the **chief executive officer** or a vice president. The size of the committee will vary depending on the organization. <sup>(IMA,B)</sup>

- A typical budget committee includes the chief executive officer (CEO) or one or more vice presidents, heads of strategic business units, and the chief financial officer (CFO). In some organizations, the CEO makes all budget decisions and there is no committee.<sup>(B)</sup>
- This committee may consist of the president; vice presidents in charge of various functions such as sales, production, and purchasing; and the controller.<sup>(G)</sup>

### Responsibilities

The budget committee oversees all budget matters, responsible for overall policy relating to the budget program and for coordinating the preparation of the budget itself.<sup>(G)</sup>.

- **Directs budget preparation & providing initial budget guidelines** that **set the tone** for the budget and govern its preparation.
- Establish the **priorities** and provide the necessary support.
- **Sets and approves** the overall budget **goals** for all major business units,
- **Resolves conflicts** and differences that may arise during budget preparation and rules on disagreements,
- **Coordinates** budget preparation,
- **Monitors** the budget,
- **Monitors** operations as the year unfolds,
- **Reviews** the operating results at the end of the period.
- **Reviews** the budget for consistency with the budget guidelines, attainment of the desired short-term goals and strategic objectives of the organization
- **Approves major revisions** of the budget during the period.
- **Approves the final budget**, the budget committee gives final approval, and the CEO then approves the entire budget and submits it to the board of directors.<sup>(B,IMA)</sup>

### Middle and Lower Management

Once the budget committee sets the tone for the budget process, many others in the organization have some role to play. Middle and lower management **do much of the specific budgeting work**.

#### Question

Why Top managers want lower-level managers to participate in the budgeting process?

#### Answer

Top managers want lower-level managers to participate in the budgeting process **because lower-level managers have more specialized knowledge** and first-hand experience with day-to-day aspects of running the business, they know what is possible, what is not possible, and what resources are required to meet a specific level of activity and this is the bottom up part.<sup>(H,HK)</sup>

**Participation creates greater commitment and accountability** toward the budget among lower-level managers. This is the bottom-up aspect of the budgeting process.<sup>(H)</sup>

### Responsibilities

Middle and lower management receive their budget instructions, **draw up their departmental budgets** in conformity with the guidelines, and **submit them to the budget committee**.

### Budget Department or The budget director/controller

The budget department is responsible for **compiling the budget and managing the budget process**. The budget director and department are **not responsible for actually developing the estimates** on which the budget is based. This role is performed by those to whom the resulting budget will be applicable. The budget director has **staff**, not line, authority. (S)he has a technical and advisory role. The final decision-making responsibility rests with line management. <sup>(GL)</sup>

## Methods of budget preparation -Authoritative or Participative Budgeting?

The success of a budget program is largely determined by the way a budget is developed. (G)

Methods of budget preparation differ between companies, but all fall somewhere on a continuum between entirely authoritative and entirely participative.

### In an authoritative budget (top-down budget- imposed budget).

Top management sets everything from strategic goals down to the individual items of the budget for each department and expects lower managers and employees to adhere to the budget and meet the goals. (IMA)

Authoritative budgeting provides better decision-making control than does participative budgeting.

Top management sets the overall goals for the budget period and prepares a budget for operating personnel to attain the goals.

An authoritative budget, however, often lacks the commitment ("buy-in") of lower-level managers and employees responsible for implementing it. (B)

### In a participative budget (bottom-up or self-imposed budget).

Managers at all levels and certain key employees cooperate to set budgets for their areas, and top management usually retains final approval. (IMA)

A participative budget is a good communication device.

The process of preparing a budget often gives top management a better grasp of the problems their employees face and provides the employees a better understanding of the dilemmas that top management deals with. A participative budget also is more likely to gain employee commitment to fulfill budgetary goals. Unless properly controlled, however, a participative budget can lead to easy budget targets or targets not in compliance with the organization's overall strategy.

The ideal process combines the features of each and falls somewhere between these methods, Note that the *combination approach* is sometimes considered to be a form of the participative approach. (IMA)

An effective budgeting process often combines both top-down and bottom-up budgeting approaches. Divisions prepare their initial budgets based on the budget guidelines issued by the firm's budget committee. Senior managers review and make suggestions to the proposed budget before sending it back to the divisions for revisions. The final budget usually is reached after several rounds of negotiations. For this reason, this is generally referred to as a *negotiated budgeting* process. (B)

A *consultative budget* is a *combination* of authoritative and participative budget development methods. Senior management asks for *input from lower-level managers* but then develops the budget with *no joint decision-making or negotiation* involved. (HK)

**Budgeting needs to be both bottom up and top down. Despite its advantages, a budget neither ensures improved cost control nor prevents inefficiencies.**

## Advantages and Disadvantages of Participative Budget Development

### Advantages include the following:

#### A participative budget is a good communication device.<sup>(HK)</sup>

The process of preparing the budget participatively gives senior managers a **better grasp of the problems** their employees face. The employees' knowledge is more specialized and they have the hands-on experience of running the business on a day-to-day basis. At the same time, employees gain a better understanding of the problems experienced by top management.<sup>(HK)</sup>

#### A budget is potentially a good motivational tool.<sup>(GL)</sup>

- A budget is potentially a good motivational tool. If lower level managers have participated in preparing the budget, instead of simply receiving a budget imposed by top management, they are **more likely to understand and share the goals of top management** and to **work to keep costs within the budget**.<sup>(GL)</sup>
- Managers are **more motivated** to achieve budgeted goals when they are involved in budget preparation. A broad level of participation usually leads to **greater support** for the budget and the entity as a whole, as well as a greater understanding of what is to be accomplished.<sup>(GL)</sup>
- Bottom-up budgeting is the **best way of motivating managers** to meet budget estimates because it permits participation in the budget process. Lower level managers who take part in budgeting decisions are **more likely to support the result** and **less likely to feel that the budget has been imposed from above**.<sup>(GL)</sup>
- However, a budget is also a motivator in the sense that **managers are accountable for variances in controllable costs** but are rewarded for good performance. Moreover, budgeting coupled with analysis of variances **tends to improve motivation by allowing upper-level managers to concentrate on problems** (exceptions) rather than engaging in routine supervision of subordinates, which may be viewed as unnecessarily intrusive and unwelcome. <sup>(GL)</sup>
- It gives them a **feeling of ownership of the process**.<sup>(HK)</sup>

#### A participative budget is more likely to be achievable.<sup>(GL)</sup>

- A participative budget is more likely to gain **employee commitment** to fulfill budgetary goals. People are more willing to devote extra effort to attain goals they perceive as their own.<sup>(HK)</sup>
- A participative budget is more likely to be **achievable** because it was developed with input from the people responsible for achieving it.<sup>(HK)</sup>
- Participation and understanding are also likely to result in budgets that are **reasonably attainable and viewed as realistic**, as participative budgeting is a practical means of setting **realistic, achievable budget goals**.<sup>(GL)</sup>
- Also, managers **cannot blame unrealistic objectives** as an excuse for not achieving budget expectations when they have helped to establish those objectives. Despite the involvement of lower level managers, senior management must still participate in the budget process to ensure that the combined objectives of the various departments are **consistent with profitability objectives** of the company. <sup>(GL)</sup>
- Participation **adds credibility** to the budgeting process and **creates greater commitment and accountability** toward the budget.<sup>(H)</sup>

### Advantages of a participative budget include greater accuracy of budget estimates

Managers with immediate operational responsibility for activities have a better understanding of what results can be achieved and at what costs. (GL)

Since department managers have the most detailed knowledge about organizational operations, they should use this information as the **building blocks** of the operating budget.

### Participatory budgeting involves extensive coordination between departments. (GL)

Goal congruence is one of the advantages of participatory budgeting. (GL)

### Disadvantages include the following:

#### Budget targets that are too easy to achieve.

- Unless senior management controls the budget process properly, a participative budget can lead to budget targets that are too easy to achieve, or **budgetary slack**. Budgetary slack, which will be discussed later in more depth, is the practice of **underestimating planned revenues** and **overestimating planned costs** to make the overall budgeted profit more achievable. It is the difference between the amount budgeted and the amount the manager actually expects. (HK)
- Without a review, self-imposed budgets may be **too slack**, resulting in **suboptimal performance**. (G) Suboptimal decision making is not likely to occur when guidance is given to subunit managers about how standards and goals affect them. (GL)

### Participative budget can lead to targets not in compliance with the organization's strategy

- Unless properly controlled, however, a participative budget can lead to easy budget targets or targets **not in compliance with the organization's strategy or budget**. (B)
- Integrating corporate **strategic plans** into the budget can be **more difficult** when it has a bottom-up process. (HK)
- Budgets proposed by the lower-level managers will **lack coherent direction**. (G)

### Time-Consuming

Participative budgeting is more **time-consuming** than authoritative budgeting because lower-level managers and employees need to meet and negotiate their budgets. (HK)

### Advantages and Disadvantages of Authoritative Budget Development

#### Advantages include the following:

#### Better control

An authoritative budget process gives senior management **better control** over the decision-making process than participative budgeting. (HK)

### Facilitates the implementation of strategic plans

Authoritative budgeting places more emphasis on the achievement of the **strategic plans** developed by top management. <sup>(HK)</sup>

Strategic plans are long-term in nature and require a good deal of coordination in order to be successful. Senior management's job is to position each division and department appropriately to fulfill their role in the long term organizational plan. Top-down budgeting achieves this more readily than bottom-up budgeting, because senior management has the required long-term perspective and lower level managers do not.

### Reduces the time required for budgeting

Authoritative budget development can be done **more rapidly** and with **greater flexibility** than participative budgeting because it eliminates the need to meet with lower-level managers to negotiate their budgets. <sup>(HK)</sup>

When the budget is dictated from above, departmental managers do not need to spend time putting together their plans and ideas for the future. Furthermore, there is no need for lower level managers to make adjustments to the first draft of the budget, as is done with bottom up budgeting after senior management has examined the first draft budgets of the lower level managers. The result is that **less time is required** for the budgeting process. <sup>(HK)</sup>

### Increases coordination of divisional objectives

Since a top-down budget is imposed by upper management, coordinating the objectives of separate divisions is simplified. <sup>(GL)</sup>

Frequently, departmental managers have blinders on and are unaware of what is happening in other areas of the company. Senior management has a better perspective of the big picture and what will be necessary to achieve overall organizational objectives. <sup>(HK)</sup>

### Budgetary slack is not a problem.

#### Disadvantages include the following:

#### Lacks commitment ("buy-in") of lower-Level managers

Because lower-level managers and employees (that is, those responsible for implementing the budget) have no input into the budget development process, they will usually have **less commitment** to the budget and be less accepting of it. <sup>(HK)</sup>

#### May result in a budget that is not possible to achieve

Because an authoritative budget lacks input from lower-level managers, its **objectives may not be practical** or possible to achieve because it does not take into account existing limitations that senior management might not be aware of. <sup>(HK)</sup>

#### May limit the acceptance of proposed goals and objectives

When senior management determines the budget without input from the departments being held to that budget, employees **are less likely to feel they can / want to achieve the target**. It wasn't their idea and no one listened to them.

An authoritative budget issues, or dictates, orders. People are likely to resent being given orders and a **morale problem** may result. <sup>(HK)</sup>

## Reduces the communication between employees and management

**Communication** between senior management and lower-level management and employees is reduced with an authoritative budgeting process.

As these comments suggest, **all levels in the organization should work together** to produce the budget. **Lower-level managers are more familiar with day-to-day operations** than top managers. **Top managers** should have a **more strategic perspective** than lower level managers. Each level of responsibility in an organization should contribute its unique knowledge and perspective in a cooperative effort to develop an integrated budget.<sup>(G)</sup>

Unfortunately, most companies **do not follow the budgeting process** we have described. Typically, **top managers** initiate the budgeting process by **issuing profit targets**. Lower-level managers are directed to prepare budgets that meet those targets. The difficulty is that the targets set by top managers may be **unrealistically high or may allow too much slack**. If the targets are **too high** and employees know they are **unrealistic**, **motivation will suffer**. If the targets allow **too much slack**, **waste will occur**.

Unfortunately, the budget is too often used as a **pressure device** and **excessive emphasis** is placed on “**meeting the budget**” **under all circumstances**. Rather than being used as a weapon, the budget should be used as a positive instrument to assist in establishing goals, measuring operating results, and isolating areas that need attention.<sup>(G)</sup>

### Advantages and Disadvantages of Consultative Budget Development

Since consultative budget development is a compromise between participative and authoritative budgeting, it has many of the advantages and disadvantages of both.

- Since senior management makes the final decisions without any negotiation, management maintains control over the process. As a result, senior management’s **strategic plans are integrated** into the budget and **budgetary slack is not a problem**.
- The amount of **time required** to develop a consultative budget is **greater** than the time required for an authoritative budget but less than the time required for a participative budget.
- If lower-level managers see the input they provided incorporated into the final budget, they may be nearly as **accepting** and **committed** to the budget as they would have been had it been developed participatively. However, if they feel their input has been disregarded, they may be even more resentful than if they had never been asked to provide input in the first place. To ask for input and then not use it is dismissive. The lower-level managers whose input has been ignored could probably not be expected to provide much input into future budget development processes.

An effective budgeting process therefore usually combines both top-down and bottom- up budgeting approaches. Divisions prepare their initial budgets based on the budget guidelines issued by the firm's budget committee. Senior managers review and make suggestions to the proposed budget before sending it back to the divisions for revisions. The final budget usually results from more participation, not enforced negotiations.

✚ **Thus, the right approach is a good balance of top management involvement with lower-level managers.**

✚ Greatest amount of positive motivation and goal congruence can be achieved if the firm have the divisional and senior management jointly develop goals and the divisional manager develop the implementation plan.

✚ Senior management must still participate in the budget process to ensure that the combined objectives of the various departments are consistent with profitability objectives of the company and managers pursue objectives consistent with those set by top management.

## Behavioral Issues in Budgeting

The human aspects of budgeting are extremely important.<sup>(G)</sup> To encourage a successful budgeting process management must consider a number of behavioral issues, as discussed below.<sup>(B)</sup>

As we discussed earlier in this chapter, budgeting is most effective when lower-level managers actively participate and meaningfully engage in the budgeting process. Participation adds credibility to the budgeting process and creates greater commitment and accountability toward the budget. But participation requires **“honest” communication** about the business from subordinates and lower-level managers to their bosses. At times, subordinates may try to **“play games”** and build in **budgetary slack**.<sup>(H)</sup>

### Budgetary Slack or Padding the budget

Budgetary slack describes the practice of **underestimating budgeted revenues**, or **overestimating budgeted costs**, to make budgeted targets more **easily achievable**. It frequently occurs when budget variances (the differences between actual results and budgeted amounts) are used to evaluate performance.<sup>(H)</sup>

**Budgetary slack, or padding the budget**, is the practice of managers **knowingly** including a higher amount of expenditures (or lower amount of revenue) in the budget than they actually believe will occur. When the actual cost (or revenue) amounts are realized and compared to “budgeted” figures, an appearance of successful effort is indicated.<sup>(B)</sup>

### Why managers build slack into the budget ?

Line managers are also **unlikely to be fully honest** in their budget communications if top management mechanically institutes **across-the-board cost reductions** (say, a 10% reduction in all areas) in the face of projected revenue reductions. Budgetary slack provides managers with a **hedge against unexpected adverse circumstances**.<sup>(H)</sup>

Managers often justify such practices as **insurance against uncertain future** events. After all, no one knows exactly how the future will unfold.<sup>(B)</sup>

**On the positive side**, budgetary slack can provide managers with a cushion against unforeseen circumstances. This can limit managers’ exposure to uncertainty and thereby reduce their risk aversion. The reduced anxiety about risk may help the managers make decisions that are more closely congruent with the goals of senior management. However, budgetary slack often creates more problems than it solves.<sup>(HK)</sup>

### Adverse effects of Budgetary Slack

- Budgetary slack **misleads top management** about the true profit potential of the company, which **leads to inefficient resource planning and allocation and poor coordination** of activities across different parts of the company.<sup>(H)</sup>
- Budgetary slack, however, **wastes resources** and could lead employees to **make half-hearted efforts** to meet or exceed the budget.<sup>(B)</sup>
- Budget slack is built-in freedom to fail, and cumulative budget slack at each sublevel can result in a **very inaccurate master budget**.<sup>(IMA)</sup>
- Budgetary slack can **misrepresent the true profit** potential of the company.
  - As a result, planning inaccuracy spreads throughout the company. If **sales** are planned **too low**, **production** will also be planned **too low**, possibly leading to **product shortages** because budgeted demand has been understated. The advertising program and distribution expense budgets may be planned incorrectly, and the cash budget might be inaccurate.<sup>(HK)</sup>

## How companies avoid problems of budgetary slack?

- Some companies use budgets primarily for planning purposes. They **evaluate managerial performance using multiple indicators** that take into account various factors such as the prevailing business environment and performance relative to competitors.
  - Evaluating performance in this way takes time and requires careful exercise of judgment. <sup>(H)</sup>
- Other companies use budgets for both planning and performance evaluation and use different approaches to obtain accurate information.
  - To explain one approach, let's consider the plant manager of a beverage bottler who is suspected by top management of understating the productivity potential of the bottling lines in his forecasts for the coming year. His presumed motivation is to increase the likelihood of meeting next year's production bonus targets. Suppose top management could purchase a consulting firm's study that reports productivity levels—such as the number of bottles filled per hour—at a number of comparable plants owned by other bottling companies. This report shows that its own plant manager's productivity forecasts are well below the actual productivity levels being achieved at other comparable plants. Top management could share this independent information source with the plant manager and ask him to explain why his productivity differs from that at other similar plants. Management could also base part of the plant manager's compensation on his plant's productivity in comparison with other “benchmark” plants rather than on the forecasts he provided. Using external benchmark performance measures reduces a manager's ability to set budget levels that are easy to achieve. <sup>(H)</sup>
- Another approach to reducing budgetary slack is for managers to **involve themselves regularly in understanding what their subordinates are doing**.
  - Such involvement should **not** result in managers **dictating the decisions** and actions of subordinates. Rather, a manager's involvement should take the form of providing support, challenging in a motivational way the assumptions subordinates make, and enhancing mutual learning about the operations.
  - Regular interaction with subordinates allows managers to become knowledgeable about the operations and diminishes the ability of subordinates to create slack in their budgets. <sup>(H)</sup>
- Some companies, such as IBM and Kodak, have designed **innovative performance evaluation measures** that reward managers based on the **subsequent accuracy of the forecasts used in preparing budgets**. For example, the *higher and more accurate* the budgeted profit forecasts of division managers, the higher their incentive bonuses. <sup>(H)</sup>
  - The best way to avoid the problems caused by budgetary slack is to **use the budget/profit plan as a planning and control tool but not for managerial performance evaluation**.
    - If the company does use the budget to evaluate managers, it could **reward them based on the accuracy of the forecasts** they used in developing their budgets.
      - For example, the company's senior management could say that the more accurate a division manager's budgeted profit forecast is and the greater the amount by which it is exceeded, the higher the manager's bonus will be. <sup>(HK)</sup>
- A firm may decrease slack by emphasizing the consideration of all variables, **holding in-depth reviews** during budget development, and allowing for flexibility in making additional budget changes.

## **Budgetary Slack and Its Impact on Goal Congruence**

**Goal congruence** is a term that refers to the **degree of consistency between the goals of the firm, its subunits, and its employees.**<sup>(B)</sup>

**Goal congruence** exists when individuals and groups **work toward achieving the organization's goals**—that is, managers working in their own best interest take actions that **align with the overall goals of top management.**<sup>(H)</sup>

In general, a firm's goals should be as consistent as possible with the goals of its employees.

A **budget** devoid of considerations for goal congruence is **not likely to achieve** the most desirable results. A **budget** that aligns the firm's goals with those of its employees has a much better chance to realize **successful** operations and attain desirable results.<sup>(B)</sup>

There are at least three major factors that affect the level of goal congruence achieved: (1) the extent to which employees participate in the budgeting process; (2) the level of difficulty embedded in the budget; and (3) whether and how compensation is linked to budgeted performance.

### **Spending the budget**

Spending the budget is another serious ethical issue in budgeting. Managers could believe that if they do not use all the budgeted amounts, their future budgets will be reduced.

## **The Budgeting Process**

The **traditional budgeting process** can range from the informal simple processes small firms use that take only days or weeks to complete to elaborate, lengthy procedures large firms or governments employ that span months from start to final approval. The process usually includes the formation of a budget committee; determination of the budget period; specification of budget guidelines; preparation of the initial budget proposal; budget negotiation, review, and approval; and budget revision.

### **Budget guidelines are set and communicated.**

In a traditional budgeting process the **budget committee** (or senior management) is responsible for providing initial budget guidelines that **set the tone** for the budget and govern its preparation.

The committee issues budget guidelines after careful considerations on:

- the general outlook of the economy and the market;
- the organization's strategic goals, long-term plan, strategic projects, and
- expected operating result of the current period;
- specific corporate decisions or policies such as mandates for downsizing, reengineering, pollution control, and
- special promotions; and short-term objectives.

All responsibility centers (or budget units) follow the budget guidelines in preparing their budgets.

### **Initial budget proposals are prepared by responsibility centers**

Each responsibility center manager prepares an initial budget proposal using the budget guidelines as well as their own knowledge about their own area (such as introduction of new products or changes to be made in product design or manufacturing processes).

In addition, budget units need to consider a number of internal and external factors in preparing their budget proposals.

### **Negotiation, review, and approval.**

The executives of budget units **examine** initial budget proposals. The examination includes:

- determining adherence to the budget guidelines,
- verifying that the budget goals can be reasonably attained and are in line with the goals of the immediately higher organizational unit, and
- assuring that the budgeted operations are consistent with those of other budget units.

As budget units complete their budgets within the units, the budgets go through successively higher levels of the organization until they reach the top level and the combined unit budgets become the organization's budget. Any changes that are needed are **negotiated** between the responsibility center managers and their superiors. Budgets go through successive levels of management, and at each point they may be **renegotiated**. These **negotiations are the most important part** of the budget preparation process and also the most time-consuming part. Eventually, all of the individual unit budgets are combined into the consolidated master budget (first draft). The consolidated master budget will consist of a set of budgeted financial statements: balance sheet, income statement, and statement of cash flows.

The budget committee **reviews** the budget for consistency with the budget guidelines, attainment of the desired short-term goals and strategic objectives of the organization.

The **budget committee gives final approval**, and the CEO then approves the entire budget and submits it to the board of directors.

### **Revisions.**

Even after the profit plan has finally been adopted, it should **be able to be changed** if the assumptions upon which it was built change significantly. New information about internal or external factors may make revision of the profit plan necessary.

In addition, periodic review of the approved budget for possible changes or use of a **continuous budget** that is continually being updated might be advisable. Although updating the budget provides better operating guidelines, budget revisions that are too easy or too frequent might encourage responsibility centers to not take the budgeting process seriously. The budget should be **revised only** when circumstances have changed significantly and the changes are beyond the control of the responsibility center manager or the organization.<sup>(HK)</sup>

Procedures for budget revisions vary among organizations. For organizations that allow budget revisions only under special circumstances, obtaining approval to modify a budget can be difficult. Not all events, however, unfold as predicted in a budget. Strictly implementing a budget as prescribed, even when the actual events differ significantly from those expected, certainly is not a desirable behavior. In such cases, managers should be encouraged **not** to rely on the budget as the absolute guideline in operations.<sup>(B)</sup>

Management **should not** be required to rely on the budget as the sole operational guideline. Regular revisions may provide better operating guidelines, however this may lead managers to anticipate regular changes and not prepare budgets as carefully as they should. Organizations that allow regular revisions should make sure that the threshold for revision is set high enough to keep employees working as efficiently as possible. When regular revisions occur, a copy of the original budget should be kept for comparison with actual results at the end of the period.<sup>(IMA)</sup>

### **Best Practice Guidelines for the Budget Process**

Best practices in budgeting include the following, some of which have already been discussed:

- **The development of the profit plan should be linked to corporate strategy.**
- **Use the budgeting process to minimize the adverse effects that anticipated problems might have on operations.**
- The profit plan must have the support of management at all levels.
- Communication is vital.
- The profit plan should be coordinated
- The profit plan should be a motivating device.
- Design procedures to allocate funding resources strategically.
- Managers should be evaluated on performance measures other than simply meeting budget targets.

- Link cost management efforts to budgeting.
- The strategic use of variance analysis.
- Reduce budget complexity and budget cycle time.
- The time period for a budget should reflect the purpose of the budget.
- Develop budgets that can be revised if necessary. A budget should be flexible.
- Budgeting should not be rigid.

**Develop budgets that can be revised if necessary. A budget should be flexible.**

- If conditions change during the budget period, the budget should not be used as an excuse for not doing some-thing that is strategically important to the company, such as acting on an unforeseen business opportunity that arises.
  - If an unplanned large maintenance expense is needed, the budget should not require a manager to postpone repairs if doing so will hurt the company in the long run. By having a process in place to revise the budget when change is warranted, a company can respond to competitive threats or opportunities more quickly.
  - Furthermore, when budget developers know that the budget will have some flexibility, they **will feel less need to pad their budgets** with budgetary slack (see Budgetary Slack and Its Impact on Goal Congruence, below), which they otherwise might do in order to cover any possible development. This leads to more realistic profit plans.
  - Review the profit plan on a regular basis throughout the year. These reviews should report on changes in business conditions and **alert managers that new tactics** may be called for if they are to meet their targets for the year. This goes along with **revising the budget when necessary**. The budget should not be revised to cover up for poor performance or poor planning, but best-practice companies choose to revise the profit plan rather than stick with a plan that no longer reflects current conditions.

**Budgeting should not be rigid.**

- If revenue decreases are anticipated for the coming year, an “across the board” cost reduction applied to all areas can create additional problems. A coordinated effort should be made to find where making cuts would do the least damage to company operations.
- However, rigid enforcement of budgets will, in some situations, cost an organization more in the long run than if some flexibility is allowed.
  - For example, a manufacturer could lose thousands of dollars if the maintenance manager refuses to approve overtime for its mechanics to make an urgent repair because "it would use up too much of the maintenance budget." (IMA)

**Budgets should not be administered rigidly.**

Attaining the **budget is not an end in itself**, especially when conditions change dramatically. A manager may commit to a budget, but if a situation arises in which some unplanned repairs or an unplanned advertising program would serve the long-run interests of the company, the manager should undertake the additional spending.

## Budgeting and Responsibility Accounting

To attain the **goals** described in the **master budget**, a company must coordinate the efforts of all its employees—from the top executive through all levels of management to every supervised worker. Coordinating the company's efforts means assigning *responsibility* to managers who are *accountable* for their actions in planning and controlling human and other resources.<sup>(H)</sup>

Each manager, regardless of level, is in charge of a responsibility center. A **responsibility center** is a part, segment, or subunit of an organization whose manager is accountable for a specified set of activities. Four types of responsibility centers are cost centers, revenue centers, profit centers, and investment centers.<sup>(H)</sup>

Control in an organization is exercised through responsibility centers. Therefore, as we have maintained throughout this discussion, budgeting must also be done at the responsibility center level. However, responsibility center managers should be responsible for budgeting only the costs that they can control.<sup>(HK)</sup>

### Take a Note:

When we look at performance measurement in Section C, we will see this idea again. In Section C we discuss that managers should only be evaluated on things that they are able to control or influence.

**The higher the manager's level**, the **broader** the responsibility center and the **larger** the number of his or her subordinates.<sup>(H)</sup>

**Responsibility accounting** is a system that measures the plans, budgets, actions, and actual results of each responsibility center.<sup>(H)</sup>

## Responsibility and Controllability

**Controllability** is the degree of **influence** that a specific manager has over costs, revenues, or related items for which he or she is responsible.<sup>(H)</sup>

A **controllable cost** is any cost that is primarily **subject to the influence** of a given responsibility center manager **for a given period**.<sup>(H)</sup>

### Take a Note:

A responsibility accounting system could either **exclude all uncontrollable costs** from a manager's performance report or **segregate such costs from the controllable costs**.<sup>(H)</sup>

For example, a machining supervisor's performance report might be confined to direct materials, direct manufacturing labor, power, and machine maintenance costs and might **exclude costs such as rent & taxes paid on the plant**.<sup>(H)</sup>

Some costs are controllable by a given manager and some costs are not. "**Controllable costs**" refers to costs for which the manager has the **authority** to make the decisions about how money will be spent. "**Non-controllable costs**" refers to costs that are ordinarily controlled at a **higher level** in the organization, such as the manager's salary or bonus. **The manager's salary or bonus is controllable**, but not by the manager. The manager's salary will usually be assigned to his or her responsibility center's budget and will appear on reports comparing actual results to the budgeted amount, but the manager should not be held responsible for it.

**The allocation of the indirect costs** of the organization as a whole may be another **non-controllable cost**, since indirect costs may be allocated on any of a number of bases, some of which may be controllable by the manager of the responsibility center and some of which may not.

Each budgeted cost assigned to a responsibility center should be identified as either controllable or non-controllable by that responsibility center's management. For example, salaries in the accounting system may be segregated in two accounts: controllable salaries and non-controllable salaries. Each would then be budgeted by the person who has control over it, and that person would be responsible for explaining the variances.

### Cost classification according to performance evaluation VS. the cost classification according to behavior

It is also important to recognize that fixed costs and indirect costs are not always uncontrollable, and variable costs and direct costs are not always controllable. The nature of each cost will vary according to its characteristics and each cost should be analyzed to determine who controls it.

#### Question

Why in practice, controllability is difficult to pinpoint?

#### Answer

For at least two reasons:

- **Few costs are clearly under the sole influence of one manager.**
  - For example, **prices of direct materials** may be influenced by a purchasing manager, but these prices also depend on **market conditions** beyond the manager's control. **Quantities** used may be influenced by a production manager, but quantities used also depend on the **quality of materials purchased**. Moreover, managers often work in teams. Think about how difficult it is to evaluate individual responsibility in a team situation. (H)
- **With a long enough time span, all costs will come under somebody's control.**
  - However, most performance reports focus on periods of a year or less. A current manager **may benefit** from a predecessor's accomplishments or **may inherit** a predecessor's problems and inefficiencies.
    - For example, present managers may have to work under undesirable contracts with suppliers or labor unions that were negotiated by their predecessors. How can we separate what the current manager actually controls from the results of decisions made by others? Exactly what is the current manager accountable for? Answers may not be clear-cut. (H)

All costs should be included on some manager's variance report and identified as the responsibility of that manager on whose report they appear. If an expense is classified as non-controllable on a given manager's budget reports, then that expense should be included as a controllable expense on the report of the higher-level manager who makes the decisions that affect that expense.

Note: All costs should be controlled by someone. Whenever no one is responsible for a cost, the uncontrolled cost creates great risk for the company.

#### Take a Note:

- Executives differ in how they embrace the controllability notion when evaluating those reporting to them.
  - Some CEOs regard the budget as a firm commitment that **subordinates must meet**. Failure to meet the budget is viewed unfavorably.
  - Other CEOs believe a **more risk-sharing approach** with managers is preferable, in which noncontrollable factors and performance relative to competitors are taken into account when judging the performance of managers who fail to meet their budgets. (H)

This distinction between controllable and non-controllable costs is especially important if managers' performance evaluations will be dependent upon meeting budgetary targets. (Although we have said this is **not a good idea**, it may be done in some organizations.) If other performance measures are used to evaluate managers, this distinction may be less important.

## Question

Why managers should **avoid** overemphasizing controllability?

## Answer

Responsibility accounting is more far-reaching. It focuses on **gaining information and knowledge, not only on control**.

*Responsibility accounting helps managers to first focus on whom they should ask to **obtain information** and **not** on whom they should **blame**.*<sup>(H)</sup>

Responsibility accounting involves holding managers responsible for only those things under his/her discretion and control, such as net revenue and controllable division costs.

For example, if actual revenues at a Marriott hotel are less than budgeted revenues, the managers of the hotel may be tempted to **blame the sales manager** for the poor performance. The fundamental purpose of responsibility accounting, however, is **not** to fix **blame but to gather information** to enable future improvement.<sup>(H)</sup>

Managers want to know who can tell them the most about the specific item in question, regardless of that person's ability to exert personal control over that item.

For instance, **purchasing managers** may be held accountable for total purchase costs, **not** because of their **ability to control market prices**, but because of their **ability to predict uncontrollable prices** and to explain uncontrollable price changes.<sup>(H)</sup>

Similarly, managers at a Pizza Hut unit may be held responsible for operating income of their units, even though they (a) do **not** fully **control selling prices** or the **costs** of many food items and (b) have **minimal flexibility** about what items to sell or the ingredients in the items they sell. They are, however, in the best position to **explain differences** between their actual operating incomes and their budgeted operating incomes.

## Question

How do companies use responsibility centers? Should performance reports of responsibility center managers include only costs the manager can control?

## Answer

A responsibility center is a part, segment, or subunit of an organization whose manager is accountable for a specified set of activities.

Responsibility accounting systems are useful because they measure the plans, budgets, actions, and actual results of each responsibility center. **Controllable costs** are costs primarily subject to the influence of a given responsibility center manager for a given time period. **Performance reports** of responsibility center managers **often include** costs, revenues, and investments that the managers **cannot control**. Responsibility accounting associates financial items with managers on the basis of which manager has the **most knowledge and information** about the specific items, **regardless** of the manager's ability to exercise **full control**.

## Cost Standards in Budgeting

A **standard cost** is a **carefully** determined cost a firm or organization sets for an operation, the cost the firm or organization **should** incur for the operation. A standard cost usually is expressed on a **per-unit basis**. Standard costs are incorporated into budgets and as such can be used to monitor and control operations, and to evaluate performance.<sup>(B)</sup>

A standard is a **carefully** determined *price, cost, or quantity* that is used as a benchmark for judging performance. <sup>(H)</sup>

**Standard costs** are **predetermined expectations** about how much a **unit of input**, a **unit of output**, or a given activity should cost. The use of standard costs in budgeting allows the **standard-cost system** to alert management when the actual costs of production differ significantly from the standard.  
(GL)

### Take a Note:

The term “standard” refers to many different things. Always clarify its meaning and how it is being used.

Consider Webb Company, a firm that manufactures and sells jackets. The jackets require tailoring and many other hand operations.

Consider how Webb determines its **direct manufacturing labor standards**.

Webb conducts *engineering studies* to obtain a detailed breakdown of the steps required to make a jacket. Each step is assigned a standard time based on work performed by a **skilled** worker using equipment operating in an **efficient** manner. There are two advantages of using standard times:

(i) They aim to *exclude past inefficiencies* and (ii) they aim to take into account *changes expected to occur in the budget period*. Similarly, Webb determines the standard quantity of square yards of cloth required by a **skilled** operator to make each jacket.

Standard **cost** per output unit for  
each variable direct-cost input

=

Standard **input** allowed  
for one output unit

X

Standard **price**  
per input unit

**A standard cost** is a carefully determined cost of a unit of output—for example, the standard direct manufacturing labor cost of a jacket at Webb.

**A standard input** is a carefully determined quantity of input—such as square yards of cloth or direct manufacturing labor-hours—required for one unit of output, such as a jacket.

**A standard price** is a carefully determined price that a company expects to pay for a unit of input. In the Webb example, the standard wage rate that Webb expects to pay its operators is an example of a standard price of a direct manufacturing labor-hour.

Standard direct material cost per jacket: 2 square yards of cloth input allowed per output unit (jacket) manufactured, at \$30 standard price per square yard

Standard direct material cost per jacket = 2 square yards \* \$30 per square yard = \$60

Standard direct manufacturing labor cost per jacket: 0.8 manufacturing labor-hour of input allowed per output unit manufactured, at \$20 standard price per hour

Standard direct manufacturing labor cost per jacket = 0.8 labor-hour \* \$20 per labor-hour = \$16

### Standard Costs versus a Standard Cost System<sup>(B)</sup>

It is useful to distinguish between standard costs and a standard cost system. The latter refers to an accounting system in which standard costs, and associated standard cost variances, are recorded in the formal accounting system. The flow of direct manufacturing costs in the accounting records is illustrated in section C.

#### Take a Note:

Note, however, that **standard costs can be used for control purposes outside of the formal accounting system**. That is, at the end of the accounting period accountants can compare actual and standard costs and analyze variances using the procedures discussed in the previous section of this chapter, regardless of whether standard costs are incorporated formally in the accounting system. <sup>(B)</sup>A standard-cost system can be used in job-order, process-costing, and activity-based systems to isolate variances.<sup>(GL)</sup>

#### Question

How are the words “budget” and “standard” related?

#### Answer

Budget is the broader term. To clarify, **budgeted** input prices, input quantities, and costs **need not be based on standards**.<sup>(H)</sup>

As we saw previously, they could be based on past data or competitive benchmarks, for example. However, when standards are used to obtain budgeted input quantities and prices, the terms “standard” and “budget” are used interchangeably.<sup>(H)</sup>

The standard cost of each input required for one unit of output is determined by the standard quantity of the input required for one unit of output and the standard price per input unit. See how the standard-cost computations shown previously for direct materials and direct manufacturing labor result in the budgeted direct material cost per jacket of \$60 and the budgeted direct manufacturing labor cost of \$16 referred to earlier.

In the long run, these costs should be the same. In the short run, however, they may differ because **standard costs represent what costs should be**, whereas **budgeted costs are expected actual costs**. Budgeted costs may vary widely from standard costs in certain months, but, for an annual budget period, the amounts should be similar.<sup>(GL)</sup>

A standard cost is an estimate of what a cost should be **under normal operating** conditions based on studies by accountants and engineers. <sup>(GL)</sup> The assumptions used, such as the number of direct labor hours allowed for each unit produced, **should be challenging but attainable under normal conditions**. If the standards are too rigorous, they will not be attained and the company will have large variances in its reporting that may cause inventory and cost of goods sold to be reported improperly.<sup>(HK)</sup>

### Four reasons for using standard costs are:

- (i) cost management, ex: standard costs can be used in costing inventory accounts,
- (ii) pricing decisions,
- (iii) budgetary planning and control, and
- (iv) financial statement preparation.

### Advantages of standard cost system

- Assists in performance evaluation.
- Allows employees to better understand what is expected of them.
- Permits development of **flexible budgeting**.

Note: A flexible budget is a budget that is prepared using the **standard costs** and the **actual level of activity**. Flexible budgets work with standard cost systems. The standard cost system provides data for the computation of the predetermined overhead rates to use in the flexible budget, for variance analysis of overhead expense, and for variance analysis of the direct inputs, which are direct materials and direct labor. (Variance analysis is covered in Section C.) <sup>(HK)</sup>

Another view is that it is based on cost formulas, or standard costs. Thus, the cost formulas are fed into the computerized budget program along with the actual level of sales or production. The result is a budget created for the actual level of activity. <sup>(GL)</sup>

### Setting Standard Costs

Setting price and quantity standards ideally combines the expertise of everyone who has responsibility for purchasing and using inputs. In a manufacturing setting, this might include accountants, purchasing managers, engineers, production supervisors, line managers, and production workers. Past records of purchase prices and input usage can be helpful in setting standards. However, the standards should be designed to encourage efficient *future* operations, not just a repetition of *past* operations that may or may not have been efficient. <sup>(G)</sup>

Firms have different expectations for the proper level at which to set their standards. Differences in expectations lead to two types of standards: **ideal**, and **currently attainable** standards. <sup>(B)</sup>

### Ideal/theoretical or perfection or maximum efficient/tight Standards

- Reflects maximum efficiency in every aspect of an operation.
- **Difficult, but not impossible, to achieve.**
- Assume **peak operating efficiency** and the **absence of any production disruptions**.
- ideal standards assume **perfection across all operations**.
- can lead to undue stress on employees that, in turn, may lead to **decreases in morale** and **ultimately decreases in productivity**. <sup>(B)</sup>
- **attained only under the best circumstances**. <sup>(G)</sup>
- Allow for **no machine breakdowns** or other work interruptions,
- and they call for a level of effort that can be attained only by the **most skilled and efficient employees working at peak effort** 100% of the time. <sup>(G)</sup>
- work into a continuous improvement strategy and total quality management philosophies. <sup>(IMA)</sup>

### Variances from ideal standards

Moreover, variances from ideal standards are difficult to interpret. Large variances from the ideal are normal and it is therefore difficult to “manage by exception.” <sup>(G)</sup> and so are **not practical for use in standard costs**, but they can be useful for some special analytical and decision-making purposes and as goals to strive for.

**Some** managers feel that such standards **spur continual improvement**. These managers argue that even though employees know they will rarely meet the standard, it is a constant reminder of the need for ever-increasing efficiency and effort.<sup>(G)</sup> they can have positive behavioral implications if workers are motivated to strive for excellence.

However, they are not in wide use because they can have negative behavioral effects if the standards are impossible to attain. Few organizations use ideal standards. Most managers feel that ideal standards tend to **discourage** even the most diligent workers.

As an alternative to the use of ideal standards, some organizations employ what are referred to as **continuous-improvement standards**. Such standards, as a **function of time** (e.g., months), become progressively **tighter** (i.e., more difficult to achieve). The use of this approach is somewhat analogous to the Japanese use of **kaizen** costing. Organizations that use ideal standards often modify performance evaluation and reward structures so that employees are not frustrated by frequent failures to attain the standards. Organizations can, for example, use progress toward an ideal standard rather than deviations from it as the primary benchmark in its performance-evaluation and reward system.<sup>(B)</sup> Ideal standards have been adopted by some companies that apply continuous improvement and other total quality management principles.<sup>(GL)</sup>

#### **Currently attainable (practical) standards costs/ “tight but attainable.”**

- sets the performance criterion at a level that a person with **proper training** and **experience** can attain most of the time without having to exert extraordinary effort.
- emphasizes normality and allows for some imperfections and inefficiencies.<sup>(B)</sup>
- allow for normal machine downtime and employee rest periods.<sup>(G)</sup>
- can be attained through reasonable, though highly efficient, efforts by the average worker. <sup>(G)</sup>
- achieved by reasonably **well-trained workers** with an allowance for **normal spoilage**, waste, and downtime.<sup>(GL)</sup>
- Serve as a better motivating target for manufacturing personnel.
- A currently attainable standard discourages continuous improvement because the workers are not motivated to perform better than they currently are performing continuous improvement is a key element in TQM.
- An alternative interpretation is that practical standards represent possible but difficult-to-attain results. <sup>(GL)</sup>

#### **Variances from practical standards**

Practical standards are the costs that are used in most standard costing systems, challenging to attain, but attainable under normal conditions and are incorporated into the flexible budget.

Variances from practical standards typically signal a need for management attention because they represent deviations that fall outside of normal operating conditions.<sup>(G)</sup>

**Most companies use practical expected standard costs in their standard cost system and in their flexible budgets.** If they choose not to do this, then management will have an additional variance to report; the variance between the practical expected costs and the Ideal theoretical costs.

**If standards are too tight, repeated failure to achieve them will reduce motivation. When standards are too loose, they represent an invitation to relax and provide little incentive to improve performance.**

## Selection of Standards

Which standards—*ideal or currently attainable*—should a firm use?

There is no single answer for all situations.

Firms struggling for survival in intensely competitive industries may choose to use ideal (or continuous-improvement) standards to motivate employees to put forth their best efforts.

Ideal standards are not effective, however, if frequent failures in meeting the standards discourage employees or lead them to ignore the standards.

Currently attainable standards, however, may have built into them some degree of inefficiency.

Allowing some inefficiencies is strategically unwise if the firm operates in an intensely competitive environment.

## Standard-Setting Procedures

In addition, line management is usually involved in the setting of standard costs as are quality control personnel. Top management would not be involved because cost estimation is a lower level operating activity. Participation by affected employees in all control systems permits all concerned to understand both performance levels desired and the measurement criteria being applied.<sup>(GL)</sup>

A firm can use either an authoritative or a participative procedure in setting standards. An **authoritative standard** is determined solely or primarily by management. In contrast, a **participative standard** calls, throughout the standard-setting process, for active participation of employees affected by the standard.

## Advantages <sup>(HK/B)</sup>

- ensure proper consideration of all operating factors,
- expedite the standard-setting process, than when more individuals are involved.
- management's expectations will be reflected in the resulting standard costs;
- ensuring total consistency across all functional areas.
- It is also far less complex and time-consuming than coordinating input from the middle and lower levels.

## Disadvantage

- affected employees will not see them as their own and will be less likely to accept them, which in turn will reduce their motivation to achieve the standards.<sup>(HK)</sup>

Firms using an authoritative process in standard setting, however, should keep in mind that a standard is useless if ignored by employees.

Using outside consultants setting the standards without participation from the involved employees could have potential consequences: consultant firms may not fully understand the company's manufacturing process, resulting in suboptimal performance, in addition employees could react negatively since they did not participate in setting the standards and there could be dissatisfaction if the standards contain costs which are not controllable by the unit held responsible.

### **A participative (grass-roots) standard-setting**

Involves all the employees who will be affected by the standard. When employees participate in setting the standards, they are more likely to accept them and not see them as unreasonable.

### **Advantages**

- Participation encourages employees to have a **sense of ownership** of the output of the process.
- The result is an **acceptance** of, and **commitment** to, the goals expressed in the budget.
- It provides a broader information base.
- Middle- and lower-level managers are often far **more informed** about operational realities than senior managers.
- Reduces the chance that employees will view the standard as **unreasonable** and increases the likelihood that they will buy into or adopt it as their own.

### **Disadvantage**

- resulting standards may not support achievement of the firm's strategic goals or operating objectives.<sup>(HK)</sup>
- costly in terms of time and money.
- the quality of participation is affected by the goals, values, beliefs, and expectations of those involved, but if a budget is to be used as a performance evaluator, a manager asked for an estimate may provide one that is **easily** attained.<sup>(GL)</sup>

Even when an authoritative standard-setting process is followed, production employees and supervisors must be involved in some aspects of the process. These people are close to the production process and their input is important if management expects to do a good job of setting the standards. The actual standard setting is accomplished through the efforts of management, product design engineers, industrial engineers, management accountants, production supervisors, purchasing, personnel, and employees affected by the standards.

### **Sources for Standards Setting**

Standard costs are derived from general standards for operations. Several resources are used in determining standards for operations. These are;

- Activity analysis,
- Historical data, and
- Benchmarking

### **Activity Analysis**

Activity analysis is the **most accurate way of determining standard costs**, If It Is properly executed.

- It Involves Identifying and evaluating all the Input factors and activities that are required to complete a job, a project or an operation efficiently.
- Activity analysis is performed by people from several different areas, including product engineers, industrial engineers, management accountants and the production workers.
  - Product engineers specify the components to be used in the manufacturing of a product.
  - Industrial engineers analyze the procedures required to complete the manufacturing process.Management accountants work with the engineers to complete the analysis.
- **Activity analysis “Team development approach”.**
  - incorporates communication, bargaining, and interaction among product line managers; the immediate supervisors for whom the standards are being developed; and the accountants and engineers before the standards are accepted by top management.

- The analysis specifies the quantity and the quality of the direct materials, the required skills and experience of the employees who will produce the product, and the equipment to be used in producing the product. The management accountants contribute the costs of the direct materials, the employees, the overhead and other items to arrive at the total standard cost.

### Historical Data

While activity analysis is the most accurate means to determine standard costs, the cost of the activity analysis itself can be prohibitively high. If a firm cannot justify the high cost of activity analysis, it can use historical data instead. Data on **costs involved in the manufacture of a similar product in prior periods** can be used to determine the standard cost of an operation, if accurate data is available. Analysis of historical data is much **less** expensive than activity analysis for determining standard costs.

However, a standard cost based on the past may perpetuate **past inefficiencies**. Furthermore, a standard based on the past **does not incorporate continuous improvements**, which are an important standard in the competitive environment in which businesses operate today.

### Benchmarking

- Benchmarking is the continuous process of comparing an organization's performance metrics with those of others in the same industry, or even of other industries. The goal is to set standards with an eye to those of the best-in-class organization.
- These other firms need not be in the same industry or country. If they have similar operations, they can offer good guidelines even if they are from a different industry or country. Benchmarking data can also come from associations of manufacturers that collect information from their members. In benchmarking, the best performance anywhere can be chosen as the attainable standard. Using the best performing company as a standard can help a firm maintain its competitive edge. However, the benchmark must be evaluated in light of the company's own unique situation.

- **Benchmarking standards can take the form of :**
  - the best performance of the unit in comparable past periods,
  - a comparison with a similar unit within the same company,
  - the best performance of a competitor with a similar operation

### Establishing Direct Materials Standards

Three considerations go into establishing a standard cost for direct materials;

- Quality,
- Quantity, and
- Price.

Specifying the **quality** is the first step, because the quality of the direct materials will affect all phases of production, such as the quantity of the materials that will be required, the time required for processing, and the amount of supervision that will be needed during the production process. The marketing department, engineering department, production department and management accountants all need to be involved in making the determination of the quality in order to assess the trade-offs that will be involved as well as determine the **optimum quality that will produce the lowest overall cost**.

The **quantity** standard is based upon the product design, the cost drivers of the manufacturing activities, the quality of the direct materials, and the condition of the plant and equipment that will be used to manufacture the product. The industrial engineering department, the production department and the management accountants work together to develop the quantity standard.

The **price** standard is developed after the quality and quantity standards, because the quality and quantity standards are considerations in setting the price standard. Timing of the purchases is a consideration, as well.

When the price takes a range with lowest and highest level the appropriate standard should be set at the price agreed upon by the purchasing manager and the appropriate level of company management. As those affected by the standards should participate in their establishment. Standards are more likely to be perceived as fair and accepted by employees who participate in the development process.

### **Establishing Direct Labor Standards**

The standard for direct labor depends on the type of work, the nature of the manufacturing process, the type of equipment that will be used, and the required skill level of the employee.

The **quantity** standard for direct labor is determined by the industrial engineers, the production department, the labor union, the personnel department, and the management accountants, using the factors listed above. In setting the company's standards for DL management should constantly revise standards to reflect learning curves. Time and motion studies are often used to determine standard costs.

The **price** standard for direct labor, or the standard wage rate, is provided by the personnel department and is a function of the competitive labor market and any labor contracts that may exist. The standard wage rate varies according to the type of employees needed and the skill level required.

Note: Learning curves are an established phenomenon. Workers learn a new task at a predictable rate and the resulting improvements in productivity should be factored into standard setting and variance analysis.<sup>(GL)</sup>

# Self Assessment Quiz

# CMA PROGRAM

## Examination Questions for Practice

Studying for and passing the CMA Exams is a mission that requires dedication and hard work.

- + Avoid studying CMA questions to learn the correct answers. Use questions to help you learn how to answer CMA questions under exam conditions. Expect the unexpected and be prepared to deal with the unexpected.
- + Become an educated guesser when you encounter questions in doubt; you will outperform the inexperienced exam taker.
- + FOCUS on why you selected the incorrect answer, NOT the correct answer.
- + You want to learn from your mistakes during study so you avoid mistakes on the exam.

### Reasons for missing questions include:

- 1) Misreading the requirement.
- 2) Not understanding what is required
- 3) Making a math error.
- 4) Applying the wrong rule or concept
- 5) Being distracted by one or more of the answers
- 6) Incorrectly eliminating answers from consideration
- 7) Not having any knowledge of the topic tested
- 8) Employing bad intuition when guessing

Never leave a multiple-choice question unanswered. Make your best educated guess in the time allowed. Remember that your score is based on the number of correct responses. You will not be penalized for guessing incorrectly.

### For each multiple-choice question,

- a. Try to ignore the answer choices. Do not allow the answer choices to affect your reading of the question.
  - 1) If four answer choices are presented, three of them are incorrect. These choices are called distractors for good reason. Often, distractors are written to appear correct at first glance until further analysis.
  - 2) In computational items-the distractors are carefully calculated such that they are the result of making common mistakes. Be careful, and double-check your computations if time permits.

## Quick Check IMA Questions

**Kallert Manufacturing currently uses the company's budget only as a planning tool. Management has decided that it would be beneficial to also use budgets for control purposes. In order to implement this change, the management accountant must**

- a) develop forecasting procedures
- b) synchronize the budgeting and accounting system with the organizational structure.
- c) organize a budget committee.
- d) appoint a budget director.

The correct answer is: synchronize the budgeting and accounting system with the organizational structure. Control is the process of monitoring the actions of those responsible for executing the plan, measuring the actions against the plan, and making the necessary corrections to the actions and/or the plan. Synchronizing the budgeting and accounting system with the organizational structure would allow management to use budgets for control purposes.

**The major disadvantage of a top-down budgeting process is**

- a) inconsistencies of goals with strategic plans.
- b) lack of buy-in by middle and lower-level management
- c) the introduction of budgetary slack.
- d) lack of involvement by upper-level management

The correct answer is: lack of buy-in by middle and lower-level management. In a top-down approach, upper-level management creates the budget and communicates goals to managers at lower levels. Two advantages of this method are lack of budgetary slack and consistency of goals with strategic plans. One disadvantage is lack of buy-in from lower-level managers.

**The budgeting technique that is most likely to motivate managers is**

- a) top-down budgeting.
- b) zero-base budgeting.
- c) bottom-up budgeting.
- d) incremental budgeting.

The correct answer is: bottom-up budgeting. Motivation is enhanced by having lower-level managers involved in the budgeting process. Bottom-up, participative budgeting promotes such involvement.

**Which one of the following best describes the role of top management in the budgeting process? Top management**

- a) needs to separate the budgeting process and the business planning process into two separate processes.
- b) should only be involved in the approval process.
- c) lacks the detailed knowledge of the daily operations and should limit their involvement.
- d) needs to be involved, including using the budget process to communicate goals.

The correct answer is: needs to be involved, including using the budget process to communicate goals. Top management is ultimately responsible for the organization's budget. To exercise this responsibility, top management ensures that all level of management understand and support the budgeting process and its relationship to control and performance measurement.

**Upper management has a morale problem with middle management. Many middle managers are getting poor performance appraisals, but these managers don't feel that they are to blame. Which of the following could best help this company out of their situation?**

- a) Separate uncontrollable costs from controllable costs and judge managers only on the latter.
- b) Base the performance appraisals upon only variable costs.
- c) Separate product costs from period costs and judge managers only on the former.
- d) Replace managers who get poor performance appraisals.

The correct answer is: Separate uncontrollable costs from controllable costs and judge managers only on the latter. Holding managers accountable for uncontrollable costs can be unmotivating. Controllable costs, on the other hand, are useful for performance evaluations and budgeting because managers perceive these as fair. Some fixed costs are controllable costs.

**A firm interested in implementing total quality management (TQM) should consider discontinuing the use of which of the following?**

- a) Ideal standards
- b) Currently attainable standards
- c) Controllable/uncontrollable cost segregation
- d) Benchmarking

The correct answer is: Currently attainable standards. A currently attainable standard discourages continuous improvement because the workers are not motivated to perform better than they currently are performing. Continuous improvement is a key element in TQM.

## CMA Exam Retired Questions

(1).1. All of the following are advantages of the use of budgets in a management control system **except** that budgets

- a. force management planning.
- b. provide performance criteria.
- c. promote communication and coordination within the organization.
- d. limit unauthorized expenditures.

(2).3. All of the following are criticisms of the traditional budgeting process **except** that it

- a. makes across-the-board cuts when early budget iterations show that planned expenses are too high.
- b. incorporates non-financial measures as well as financial measures into its output.
- c. overemphasizes a fixed time horizon such as one year.
- d. is not used until the end of the budget period to evaluate performance.

(3).5. The following sequence of steps are employed by a company to develop its annual profit plan.

\*Planning guidelines are disseminated downward by top management after receiving input from all levels of management.

\* A sales budget is prepared by individual sales units reflecting the sales targets of the various segments. This provides the basis for departmental production budgets and other related components by the various operating units. Communication is primarily lateral with some upward communication possible.

\* A profit plan is submitted to top management for coordination and review. Top management's recommendations and revisions are acted upon by middle management. A revised profit plan is resubmitted for further review to top management.

\* Top management grants final approval and distributes the formal plan downward to the various operating units.

This outline of steps **best** describes which one of the following approaches to budget development?

- a. Imposed budgeting by top management.
- b. Bottom-up approach.
- c. Top-down approach.
- d. Total justification of all activities by operating units.

(4).6. All of the following are advantages of top-down budgeting as opposed to participatory budgeting, **except** that it

- a. increases coordination of divisional objectives.
- b. reduces the time required for budgeting.
- c. may limit the acceptance of proposed goals and objectives.
- d. facilitates implementation of strategic plans.

(5).7. In developing the budget for the next year, which one of the following approaches would produce the **greatest** amount of positive motivation and goal congruence?

- a. Permit the divisional manager to develop the goal for the division that in the manager's view will generate the greatest amount of profits.
- b. Have senior management develop the overall goals and permit the divisional manager to determine how these goals will be met.
- c. Have the divisional and senior management jointly develop goals and objectives while constructing the corporation's overall plan of operation.
- d. Have the divisional and senior management jointly develop goals and the divisional manager develop the implementation plan.

(6).8. Which one of the following is **not** an advantage of a participatory budgeting process?

- a. Coordination between departments.
- b. Communication between departments.
- c. Enhance employee motivation.
- d. Control of uncertainties

(7).10. Which one of the following statements concerning approaches for the budget development process is **correct**?

- a. The top-down approach to budgeting will not ensure adherence to strategic organizational goals.
- b. To prevent ambiguity, once departmental budgeted goals have been developed, they should remain fixed even if the sales forecast upon which they are based proves to be wrong in the middle of the fiscal year.
- c. With the information technology available, the role of budgets as an organizational communication device has declined.
- d. Since department managers have the most detailed knowledge about organizational operations, they should use this information as the building blocks of the operating budget

(8).12. Helen Thomas, Amador Corporation's vice president of planning, has seen and heard it all. She has told the corporate controller that she is "....very upset with the degree of slack that veteran managers use when preparing their budgets." Thomas has considered implementing some of the following activities during the budgeting process.

- 1. Develop the budgets by top management and issue them to lower-level operating units.
- 2. Study the actual revenues and expenses of previous periods in detail.
- 3. Have the budgets developed by operating units and accept them as submitted by a company-wide budget committee.
- 4. Share the budgets with all employees as a means to reach company goals and objectives.
- 5. Use an iterative budgeting process that has several "rounds" of changes initiated by operating units and/or senior managers.

Which one of these activities should Amador implement in order to **best** remedy Thomas's concerns, help eliminate the problems experienced by Amador, and motivate personnel?

- a. 1 only.
- b. 2 and 3.
- c. 2 and 4.
- d. 2, 4, and 5.

(9).13. Budgeting problems where departmental managers are repeatedly achieving easy goals or failing to achieve demanding goals can be **best** minimized by establishing

- a. preventive controls.
- b. a policy that allows managers to build slack into the budget.
- c. participative budgeting where managers pursue objectives consistent with those set by top management.
- d. better communication whereby managers discuss budget matters daily with their superiors.

(10).15. Which one of the following items would **most** likely cause the planning and budgeting system to fail? The lack of

- a. historical financial data.
- b. input from several levels of management.
- c. top management support.
- d. adherence to rigid budgets during the year.

(11).16. All of the following are disadvantages of top-down budgeting as opposed to participatory budgeting, **except** that it

- a. may result in a budget that is not possible to achieve.
- b. may limit the acceptance of proposed goals and objectives.
- c. reduces the communication between employees and management.
- d. reduces the time required for budgeting.

(12).17. Suboptimal decision making is **not** likely to occur when

- a. there is little congruence among the overall organization goals, the subunit goals, and the individual goals of decision makers.
- b. goals and standards of performance are set by the top-management.
- c. guidance is given to subunit managers about how standards and goals affect them.
- d. the subunits in the organization compete with each other for the same input factors or for the same customers.

(13).18. All of the following statements concerning standard costs are correct **except** that

- a. time and motion studies are often used to determine standard costs.
- b. standard costs are usually set for one year.
- c. standard costs can be used in costing inventory accounts.
- d. standard costs are usually stated in total, while budgeted costs are usually stated on a per-unit basis.

(14).19. One approach for developing standard costs incorporates communication, bargaining, and interaction among product line managers; the immediate supervisors for whom the standards are being developed; and the accountants and engineers before the standards are accepted by top management. This approach would **best** be characterized as a(n)

- a. imposed approach.
- b. centralized top-down approach.
- c. engineering approach.
- d. team development approach.

(15).20. When compared with ideal standards, practical standards

- a. produce lower per-unit product costs.
- b. result in a less desirable basis for the development of budgets.
- c. incorporate very generous allowances for spoilage and worker inefficiencies.
- d. serve as a better motivating target for manufacturing personnel.

(16).21. Diana Stinson, Cherry Valley Inc.'s factory manager, had lost her patience. Six months ago, she had appointed a team from the production and service departments to finalize the allocation of costs and setting of standard costs. They were still feuding, and so she had hired Brennan and Rose, a large consulting firm, to resolve the matter. All of the following are potential consequences of having the standards set by Brennan and Rose **except** that

- a. Brennan and Rose may not fully understand Cherry Valley's manufacturing process, resulting in suboptimal performance.
- b. employees could react negatively since they did not participate in setting the standards.
- c. there could be dissatisfaction if the standards contain costs which are not controllable by the unit held responsible.
- d. the standards may appear to lack management support.

(17).22. Jura Corporation is developing standards for the next year. Currently XZ-26, one of the material components, is being purchased for \$36.45 per unit. It is expected that the component's cost will increase by approximately 10% next year and the price could range from \$38.75 to \$44.18 per unit depending on the quantity purchased. The appropriate standard for XZ-26 for next year should be set at the

- a. current actual cost plus the forecasted 10% price increase.
- b. lowest purchase price in the anticipated range to keep pressure on purchasing to always buy in the lowest price range.
- c. highest price in the anticipated range to insure that there are only favorable purchase price variances.
- d. price agreed upon by the purchasing manager and the appropriate level of company management.

(18).23. Which one of the following will allow a better use of standard costs and variance analysis to help improve managerial decision-making?

- a. Company A does not differentiate between variable and fixed overhead in calculating its overhead variances.
- b. Company B uses the prior year's average actual cost as the current year's standard.
- c. Company C investigates only negative variances.
- d. Company D constantly revises standards to reflect learning curves.

(19).24. After performing a thorough study of Michigan Company's operations, an independent consultant determined that the firm's labor standards were probably too tight. Which one of the following facts would be **inconsistent** with the consultant's conclusion?

- a. A review of performance reports revealed the presence of many unfavorable efficiency variances.
- b. Michigan's budgeting process was well-defined and based on a bottom-up philosophy.
- c. Management noted that minimal incentive bonuses have been paid in recent periods.
- d. Production supervisors found several significant fluctuations in manufacturing volume, with short-term increases on output being followed by rapid, sustained declines

(20).25. All of the following are examples of benchmarking standards **except**

- a. the performance of the unit during the previous year.
- b. the best performance of the unit in comparable past periods.
- c. a comparison with a similar unit within the same company.
- d. the best performance of a competitor with a similar operation.

B.5

## Annual profit plan and supporting schedules

2015

### Content Specification Outlines

#### Part 1 – Section B.5.

#### 5. Annual profit plan and supporting schedules

- a. Operational budgets
- b. Financial budgets
- c. Capital budgets

### Learning Outcome Statements

#### Part 1 – Section B.5. Annual profit plan and supporting schedules

The candidate should be able to:

- a. explain the role of the **sales budget** in the development of an annual profit plan
- b. identify the **factors** that should be considered when preparing a sales forecast
- c. identify the components of a sales budget and prepare a sales budget
- d. explain the **relationship between the sales budget and the production budget**
- e. identify the role that **inventory levels** play in the preparation of a **production budget** and define other **factors** that should be considered when preparing a production budget
- f. prepare a production budget
- g. demonstrate an understanding of the **relationship between the direct materials budget, the direct labor budget, and the production budget**
- h. explain how **inventory levels** and procurement policies affect the direct materials budget
- i. prepare **direct materials and direct labor budgets** based on relevant information and evaluate the feasibility of achieving production goals on the basis of these budgets
- j. demonstrate an understanding of the **relationship between the overhead budget and the production budget**
- k. separate costs into their **fixed** and **variable** components
- l. prepare an **overhead budget**
- m. identify the components of the **cost of goods sold budget** and prepare a cost of goods sold budget
- n. demonstrate an understanding of **contribution margin per unit** and **total contribution margin**, identify the appropriate use of these concepts, and calculate both unit and total contribution margin
- o. identify the components of the **selling and administrative expense budget**
- p. explain how specific components of the selling and administrative expense budget may affect the contribution margin
- q. prepare an **operational (operating) budget**
- r. prepare a **capital expenditure budget**
- s. demonstrate an understanding of the **relationship between the capital expenditure budget, the cash budget, and the pro forma financial statements**
- t. define the **purposes of the cash budget** and describe the **relationship between the cash budget and all other budgets**
- u. demonstrate an understanding of the **relationship between credit policies and purchasing (payables) policies and the cash budget**
- v. prepare a **cash budget**

### The Annual/Master Budget or Profit Plan

The development of an annual profit plan for a large corporation may take many months to complete because the annual profit plan is made up of several different budgets, and some budgets cannot be developed until other budgets have already been completed.<sup>(HK)</sup>

The preparation of a complete organizational budget usually takes several months. A firm with a calendar year-end may start the budget process in September, anticipating its completion by the first of December.

The **budget planning calendar** is the schedule of activities for the development and adoption of the budget. It includes a list of dates indicating when specific information is to be provided to others by each information source. Because all of the individual departmental budgets are based on forecasts prepared by others and the budgets of other departments, it is essential to have a planning calendar to integrate the entire process

### The Master Budget

The master budget is the culmination and the goal of the budgeting process. The master budget is also called the comprehensive budget. The master budget is a summarized set of budgeted financial statements, including the budgeted balance sheet, budgeted income statement, and budgeted statement of cash flows.<sup>(HK)</sup>

The master budget is the document an organization relies on as it carries out its strategic plan to meet its goals. The master budget for the period is prepared following the budget guidelines; this is the organization's operating plan and budget.

The master budget is prepared for just **one planned activity level**, and the activity level is whatever is projected before the period begins.<sup>(HK)</sup>

The master budget is created using both **non-financial and financial assumptions**, which come about as a result of the planning process. For instance, companies develop budgets for the number of units of each product that they expect to manufacture and sell, the number of employees they will need, and so forth. The master budget is a result of both **operating decisions** and **financing decisions**. Operating decisions are concerned with the best use of the company's limited resources. Financing decisions are concerned with obtaining the funds to acquire the resources the company needs.

**Operating budgets** are used to identify the resources that will be needed to carry out the planned activities during the budget period, such as **sales**, services, **production**, **purchasing**, **marketing**, and **R&D** (research and development). The operating budgets for individual units are compiled into the **budgeted income statement**.<sup>(HK)</sup>

**Financial budgets** identify the sources and uses of funds for the budgeted operations. Financial budgets include the **cash budget**, **budgeted statement of cash flows**, **budgeted balance sheet**, and the **capital expenditures budget**.<sup>(HK)</sup>

### Development of the Master Budget

The master budget consists of two classifications: the operating budget and the financial budget.

#### The Operating Budget

The operating budget includes the income statement and all the budgets that support it, which will be detailed in the following pages, including:

- Sales budget
- Production budget
- Direct materials usage budget
- Direct materials purchases budget
- Direct labor budget
- Manufacturing overhead costs budget
- Ending inventories budget (finished goods and direct materials)
- Cost of goods sold budget
- Nonmanufacturing budget

#### The Financial Budget

The financial budget includes:

- Capital expenditures budget
- Cash budget
- Budgeted balance sheet
- Budgeted statement of cash flows

## The Operating Budget

The operating budget is the **budgeted income statement** and all the individual budgets that feed into it. We will take a look here at the individual budgets and what each is prepared for, as well as the order in which they are prepared.<sup>(HK)</sup>

### Steps in Preparing an Operating Budget

The best way to explain how to prepare an operating budget is by walking through the steps a company would take to do so. Most companies have a **budget manual** that contains a company's particular instructions and relevant information for preparing its budgets. Everyone involved in preparing the budget at all levels must be educated on the **detailed procedures** for preparing and submitting their part of the overall budget. Because of the number of component departments, budgets must be prepared in a standard format. Distribution instructions are vital because of the interdependencies of a, master budget. One department's budget may be dependent on another's, and functional areas must be aggregated from their constituent department budgets. The distribution instructions coordinate these interdependencies.

Although the details differ among companies, the following basic steps are common for developing the operating budget for a manufacturing company. Beginning with the revenues budget, each of the other budgets follows step-by-step in logical fashion.

Note: For the Exam, you may need to know the order in which the different budgets are prepared. Some of the questions may be based on the order of preparation. As you will see below, it is critical to produce the sales budget first so that the company knows how many units will need to be produced or purchased.

We next present the steps in preparing an operating budget for **Stylistic Furniture** for Aug/2012. Stylistic sells one model of granite-top coffee tables Deluxe. Revenue unrelated to sales, such as interest income, is zero.

Work-in-process inventory is negligible and is ignored.

Direct materials inventory and finished goods inventory are costed using the first-in, first-out (FIFO) method. Unit costs of direct materials purchased and unit costs of finished goods sold remain unchanged throughout each budget year but can change from year to year.

There are one type of direct materials: red oak (RO). Direct material costs are variable with respect to units of output—coffee tables.

Direct manufacturing labor workers are hired on an hourly basis; no overtime is worked.

Direct manufacturing labor-hours is the cost driver for the variable portion of manufacturing operations overhead. The fixed component of manufacturing operations overhead is divided to the manufacturing capacity planned for 2012.

For computing inventoriable costs, Stylistic allocates all (variable and fixed) manufacturing operations overhead costs using direct manufacturing labor-hours and the fixed component of manufacturing operations overhead is divided to the manufacturing capacity.

Nonmanufacturing costs consist of product design, marketing, and distribution costs.

All product design costs are fixed costs for 2012. The variable component of marketing costs equals the 14% sales commission on revenues paid to salespeople.

The following data are available for the 2012 budget:

**Direct materials** Two pounds of direct materials (Red Oak) are budgeted per unit at a cost of \$2.00 per pound, \$4.00 per unit. (same as in 2011)

Three direct labor-hours are budgeted per unit at \$7.00 per hour, \$21.00 per unit

Variable overhead is budgeted at \$8.00 per direct labor-hour, \$24.00 per unit.

Fixed overhead is budgeted at \$5,400 per month.

Variable nonmanufacturing costs are expected to be \$0.14 per revenue dollar.

Fixed nonmanufacturing costs are \$7,800 per year.

### Step 1: Prepare the Sales/Revenues Budget.

A revenues budget, calculated in Schedule 1, is the usual starting point for the operating budget. That's because the production level and the inventory level—and therefore manufacturing costs—as well as nonmanufacturing costs, generally depend on the forecasted level of unit sales or revenues.<sup>(H)</sup>

#### The first operating budget to be prepared is always the sales budget:

Manufacturing and service firms attain their desired goals through sales. Almost all activities of the firm emanate from efforts to attain sales goals and sales growth. For this reason, a **sales budget** often is regarded as the **cornerstone of the entire master budget** and in addition the **production budget** and **all the other budgets** for the company are derived from the sales budget.<sup>(HK)</sup>

- If sales are expected to be low, the company does not need as much inventory or as many sales people, and so on. On the other hand, if sales are expected to be high, more of each of these resources will be required.

#### The sales budget has three components:

- forecasted sales volume,
- forecasted sales mix, and
- budgeted selling prices.<sup>(B)</sup>

**The starting point in preparing a sales budget is the sales forecast.** An inaccurate sales forecast can render the entire budget a futile exercise and, when inaccurate, can impose costly expenses to the firm as well as to its suppliers.<sup>(B)</sup> Additionally, the sales budget needs to be based on realistic estimates of sales, since this budget will be the driver behind all of the remaining budgets. If the sales budget is too optimistic, production will be too high, inventory will be too high, and problems such as cash shortfall will result. If the sales budget is too low, production and inventory will be too low, and sales will be lost because of a lack of product to sell.<sup>(HK)</sup>

Sales forecasting by its nature is, in part, subjective. To reduce subjectivity in forecasts, many firms generate more than one independent sales forecast before preparing the sales budget for the period.

#### The following factors should be considered in sales forecasting:

- Current sales levels and sales trends of the past few years.
- General economic and industry conditions.
- Market research studies
- Competitors' actions and operating plans.
- Pricing policies.
- Credit policies.
- Advertising and promotional activities.
- Competition, and regulatory policies
- Unfilled back orders.

The sales budget is probably the **most difficult to produce** because it relies entirely on information and estimations that are outside of the direct control of the company. The company has no direct control over the economy as a whole or over competitors and technological advances that may make the company's product obsolete.<sup>(HK)</sup>

The sales budget will need to incorporate information about sales revenues expected from any capital projects that are expected to begin generating sales during the coming year.

## Schedule 1: Revenues Budget

For the Year Ending December 31, 2012

Units	Selling Price	Total Revenues
1,100	\$240	<u>\$264,000</u>

The revenues budget is often the result of elaborate information gathering and discussions among sales managers and sales representatives who have a detailed understanding of customer needs, market potential, and competitors' products. The usual starting point for Step 1 is to base revenues on expected demand. Occasionally, a factor other than demand limits budgeted revenues. For example, when **demand is greater than available production capacity** or a manufacturing input is in short supply, the revenues budget would be based on the **maximum units that could be produced**. Why? Because sales would be limited by the amount produced.<sup>(H)</sup> or find alternatives to satisfy the demand. **If the available capacity exceeds the budgeted production level**, the budget allows management ample time to find **alternative uses of the idle capacity** or to schedule other activities such as preventive maintenance and trial runs of new production processes. This ability to coordinate sales needs and production activities is another benefit of having a budget that allows firms to identify mismatches between capacity and output.

Now we have the inputs necessary to the formulation of the production budget

**Manufacturing Budgets**

Step 2: Prepare the Production Budget (in Units).

After revenues are budgeted, the manufacturing manager prepares the production budget, which is calculated in Schedule 2. The total finished goods units to be produced depend on budgeted unit sales and expected changes in units of inventory levels:

$$\begin{array}{rcccl} \text{Budget} & & \text{Budget} & & \text{Target ending} \\ \text{production} & & \text{sales} & & \text{finished} \\ \text{(units)} & = & \text{(units)} & + & \text{goods} \\ & & & & \text{inventory} \\ & & & & \text{(units)} \end{array} \quad - \quad \begin{array}{r} \text{Beginning} \\ \text{finished} \\ \text{goods} \\ \text{inventory} \\ \text{(units)} \end{array}$$

## Schedule 2: Production Budget (in Units)

For the Year Ending December 31, 2012

Budgeted unit sales (Schedule 1)	1,100
Add target ending finished goods inventory	<u>80</u>
Total required units	1,180
Deduct beginning finished goods inventory	<u>100</u>
Units of finished goods to be produced	<u>1,080</u>

Maintaining a **constant production level** enables the firm to keep a constant employment level. However, manufacturing excess units during slow periods **builds up inventory that is costly to hold**. The new manufacturing environment and increasing use of **just-in-time (JIT)** production-scheduling methods have led many companies to adjust production activity to changes in anticipated sales volume (and mix). JIT requires a **more flexible workforce** with broader skills to move the employee to the work center needed for immediate production. As well, JIT involves deploying relatively more temporary and contract laborers to match labor supply with the short-term demand for products and services.<sup>(B)</sup>

**Step 3: Prepare the Direct Material Usage Budget and Direct Material Purchases Budget.**

The number of units to be produced, calculated in Schedule 2, is the key to computing the usage of direct materials in quantities and in dollars. The direct material quantities used depend on the efficiency with which materials are consumed to produce a table. In determining budgets, managers are constantly anticipating ways to make process improvements that increase quality and reduce waste, thereby reducing direct material usage and costs.

Like many companies, Stylistic has a bill of materials, stored and updated in its computer systems. This document identifies how each product is manufactured, specifying all materials (and components), the sequence in which the materials are used, the quantity of materials in each finished unit, and the work centers where the operations are performed. For example, the bill of materials would indicate that 2 board feet of red oak are needed to produce each Deluxe coffee table. This information is then used to calculate the amounts in Schedule 3A.

**Schedule 3A: Direct Material Usage Budget in Quantity and Dollars  
For the Year Ending December 31, 2012**

**Material  
Red Oak**

**Physical Units Budget**

Direct materials required for Deluxe tables	2,160
(1,080 units * 2 b.f.)	
Total quantity of direct materials to be used	2,160

**Cost Budget**

Direct materials to be used this period	
(2,160 b.f.* \$2)	\$ 4,320

The purchasing manager prepares the budget for direct material purchases, calculated in Schedule 3B, based on the budgeted direct materials to be used, the beginning inventory of direct materials, and the target ending inventory of direct materials:

Purchases of direct materials	=	Direct materials used in production	+	Target ending inventory of direct materials	-	Beginning inventory of direct materials
-------------------------------------	---	--	---	--	---	--

Desired ending inventory equals 15% of the materials required to produce next month's sales. September sales are forecasted to be 1,600 units. What is the ending inventory in August? 480 pounds  
September sales:  $1,600 \times 2 \text{ pounds per unit} = 3,200 \text{ pounds}$ ,  $3,200 \times 15\% = 480 \text{ pounds}$  (the desired ending inventory), What is the beginning inventory in August?  $1,100 \text{ units} \times 2 \times 15\% = 330 \text{ pounds}$ .

**Schedule 3B: Direct Material Purchases Budget**  
**For the Year Ending December 31, 2012**

**Material**  
**Red Oak**

**Physical Units Budget**

To be used in production (from Schedule 3A)	2,160
Add target ending inventory	<u>480</u>
Total requirements	2,640
Deduct beginning inventory	<u>330</u>
Purchases to be made	2,310

**Cost Budget**

Red Oak: Unit purchase price	\$ <u>2.00</u>
Purchases	<u>\$4,620</u>

Step 4: Prepare the Direct Manufacturing Labor Costs Budget.

In this step, manufacturing managers use labor standards, the time allowed per unit of output, to calculate the direct manufacturing labor costs budget in Schedule 4. These costs depend on wage rates, production methods, process and efficiency improvements, and hiring plans.

Each unit requires 3 direct labor-hours at \$7.00 per hour.

**Schedule 4: Direct Manufacturing Labor Costs Budget**  
**For the Year Ending December 31, 2012**

	Output Units Produced (Schedule 2)	Direct Manufacturing Labor-Hours per Unit	Total Hours	Hourly Wage Rate	Total
Deluxe	1,080	3	3,240	\$7	<u>\$22,680</u>
Total			<u>3,240</u>		<u>\$22,680</u>

Step 5: Prepare the Manufacturing Overhead Costs Budget. As we described earlier, direct manufacturing labor-hours is the cost driver for the variable portion of manufacturing operations overhead and the fixed portion divided by the number of units produced.

For the 3,240 direct manufacturing labor-hours, Stylistic's manufacturing managers estimate various line items of overhead costs that constitute manufacturing operations overhead (that is, all costs for which direct manufacturing labor-hours is the cost driver). Managers identify opportunities for process improvements and determine budgeted manufacturing operations overhead costs in the operating department. They also determine the resources that they will need from the two support departments—kilowatt hours of energy from the power department and hours of maintenance service from the maintenance department. The support department managers, in turn, plan the costs of personnel and supplies that they will need in order to provide the operating department with the support services it requires. The costs of the support departments are then allocated (first-stage cost allocation) as part of manufacturing operations overhead.

Section D.3 describes how the allocation of support department costs to operating departments is done when support departments provide services to each other and to operating departments. The upper half of Schedule 5 shows the various line items of costs that constitute manufacturing operations overhead costs—that is, all overhead costs that are caused by the 3,240 direct manufacturing labor-hours (the cost driver).

The factory overhead budget includes all production costs other than direct materials and direct labor. The manufacturing overhead budget reflects the nature of overhead as a mixed cost, i.e., one that has a variable component and a fixed component. The total of these costs depends on how individual overhead costs vary with respect to the cost driver.

Unlike direct materials and direct labor, which tend to vary in direct proportion with the number of units manufactured, manufacturing overhead costs include costs that do not vary in direct proportion with the units manufactured but with the facilities the firm has and the way the production is performed.

1. Variable overhead contains those elements that vary with the level of production.
  - Indirect materials
  - Some indirect labor
  - Variable factory operating costs (e.g., electricity)
2. Fixed overhead contains those elements that remain the same regardless of the level of production.
  - Real estate taxes
  - Insurance
  - factory depreciation expenses and
  - Salaries of production supervisors.
3. Other costs of facilities and costs that vary with the batch size and number of setups in production.

### Classification in practice

Many firms separate the factory overhead budget into variable and fixed overhead items. All factory overhead costs other than those that vary in direct proportion to the units manufactured are treated as fixed costs. Such practices are justified because nonvariable factory overhead costs usually remain the same within a given range of production activities.

Data needed to prepare Overhead budget

Budgeting for factory overhead costs requires:

- forecasting the number of units to be produced,
- determining the way in which production is to be performed, and
- Incorporating factors that affect factory overhead.

Variable overhead is budgeted at \$8.00 per direct labor-hour.

Fixed overhead is budgeted at \$5,400 per month.

### Schedule 5: Manufacturing Overhead Costs Budget Manufacturing Operations Overhead Costs

Variable Overhead:

(3,240 × \$8.00)	\$25,920
------------------	----------

Fixed Overhead	<u>5,400</u>
----------------	--------------

<b>Total</b>	<b>\$31,320</b>
--------------	-----------------

Step 6: Prepare the Ending Inventories Budget. The management accountant prepares the ending inventories budget, calculated in Schedules 6A and 6B. In accordance with generally accepted accounting principles, Stylistic treats both variable and fixed manufacturing overhead as inventoriable (product) costs. Stylistic is budgeted to operate at capacity. Manufacturing operations overhead costs are allocated to finished goods inventory at the budgeted variable rate of \$8 per direct manufacturing labor-hour (total budgeted manufacturing operations overhead, \$25,920 ÷ 3,240 budgeted direct manufacturing labor-hours).

**Schedule 6A: Unit Costs of Ending Finished Goods Inventory**  
**December 31, 2012**

**Cost per finished unit:**

Materials	\$ 4
Labor	21
Variable manufacturing overhead	24
Fixed manufacturing overhead	<u>5*</u>
Total	\$54

$$*\$5,400 \div 1,080 = \$5$$

**Schedule 6B: Ending Inventories Budget**  
**December 31, 2012**

	Quantity	Cost per Unit	Total
Direct materials			
Red Oak	480	\$2	\$960
Finished goods	80	\$54	<u>\$4,320</u>
Total ending inventory			\$5,280

What is the cost of the target ending inventory for materials?

$$480 \times \$2 = \$960$$

What is the cost of the target finished goods inventory?

$$80 \times \$54 = \$4,320$$

Step 7: Prepare the Cost of Goods Sold Budget. The manufacturing and purchase managers, together with the management accountant, use information from Schedules 3 through 6 to prepare Schedule 7.

**Schedule 7: Cost of Goods Sold Budget**  
**For the Year Ending December 31, 2012**

	From Schedule	Total
Beginning finished goods inventory, January 1, 2012	Given*	5,400
Direct materials used	3A \$4,320	
Direct manufacturing labor	4 22,680	
Manufacturing overhead	5 31,320	
Cost of goods manufactured		\$58,320
Cost of goods available for sale		\$63,720
Deduct ending finished goods inventory, December 31, 2012	6B	<u>\$4,320</u>
<b>Cost of goods sold</b>		<b><u>\$59,400</u></b>

Step 8: Prepare the Nonmanufacturing Costs Budget (Selling and General Administrative Expense Budget). Schedules 2 through 7 cover budgeting for Stylistic's production function of the value chain. For brevity, other parts of the value chain—product design, marketing, and distribution—are combined into a single schedule. Just as in the case of manufacturing costs, managers in other functions of the value chain build in process and efficiency improvements and prepare nonmanufacturing cost budgets on the basis of the quantities of cost drivers planned for 2012.

Product design costs are fixed costs, determined on the basis of the product design work anticipated for 2012 (\$1,560). The variable component of budgeted marketing costs is the commissions paid to sales people equal to 14% of revenues. The fixed component of budgeted marketing costs equal to \$6,240 is tied to the marketing capacity for 2012.

**Schedule 8: Nonmanufacturing Costs Budget (S,G&A)**

Business Function	Variable Costs	Fixed Costs	Total Costs
Product design		\$1,560	1,560
Marketing (Variable cost: $\$264,000 \times 0.14$ )	\$36,960	6,240	43,200
	<b><u>\$36,960</u></b>	<b><u>7,800</u></b>	<b><u>44,760</u></b>

Many selling and general administrative expenditures are the result of sales and marketing activities and programs. Firms are known to reduce or eliminate selling and administrative expenses to increase operating income for the period. For example, in an attempt to increase operating income and to show good control of operating expenses, the manager of a retail business proposes to decrease customer service expenditures by \$15 million from \$20 million to \$5 million. Although reduced customer services are likely to lead to decreases in sales, the budgeted total saving in expenditures exceeds the budgeted decrease in earnings for the year and the firm expects its budgeted operating income for the year to increase by \$11 million as a result. Decreases in customer services, however, will likely have negative effects on the firm's reputation as well as its future sales.<sup>(B)</sup>

In large organizations, this budget would be a compilation of many smaller, individual budgets submitted by department heads and other persons responsible for selling and administrative expenses. For example, the marketing manager would submit a budget detailing the advertising expenses for each budget period.<sup>(C)</sup>

Note: Each of the individual budgets prepared for expenses should be broken down into variable and fixed costs. This breakdown is significant because fixed costs cannot be changed. The breakdown is necessary in order to develop a flexible budget as well, since in a flexible budget variable items are adjusted to their equivalent values using actual activity while fixed items are unchanged. Also, the budgeted variable costs (particularly for overhead and selling and administration) are needed to determine the budgeted contribution margin from each business unit. The contribution margin is total revenue minus variable expenses.<sup>(Hk)</sup>

The nonmanufacturing budgets need to be developed in enough detail to be useful. The assumptions underlying the amounts in them should be documented for reference. When the first drafts of the budgets are revised, those documented assumptions will be needed in order to determine where changes can be made. For example, the budgeted employees and their salaries underlying the budgeted salaries and wages amount should be documented. If it is necessary to revise and cut budgeted salaries and wages, it will be much easier to make that revision if detail is available about the salaries and wages used to develop the first draft of the budget. <sup>(Hk)</sup>

After the operating budget is completed, the company can evaluate the expected profit for the upcoming period. This evaluation may be done using earnings per share, an industry average, or a price-earnings ratio. In addition, the budgeted net income becomes a part of the budgeted balance sheet through its effect on retained earnings in the equity section. <sup>(Hk)</sup>

Step 9: Prepare the Budgeted Income Statement. The CEO and managers of various business functions, with help from the management accountant, use information in Schedules 1, 7, and 8 to finalize the budgeted income statement, shown in Exhibit 6-3. The style used in Exhibit 6-3 is typical, but more details could be included in the income statement; the more details that are put in the income statement, the fewer supporting schedules that are needed for the income statement.

Budgeting is a cross-functional activity. Top management's strategies for achieving revenue and operating income goals influence the costs planned for the different business functions of the value chain. For example, a budgeted increase in sales based on spending more for marketing must be

matched with higher production costs to ensure that there is an adequate supply of tables and with higher distribution costs to ensure timely delivery of tables to customers.

### Budgeted Income Statement for Stylistic Furniture

Sales revenues	Schedule 1	\$264,000	100%
Less cost of goods sold	Schedule 7	59,400	22%
Gross margin		\$204,600	78%
Operating costs			
Product design	Schedule 8	1,560	
Marketing costs	Schedule 8	43,200	
		44,760	17%
Operating income		<u>\$159,840</u>	61%

## Financial Budgets

### Cash Budget

Cash Budget a table showing cash flows (receipts, disbursements, and cash balances) for a firm over a specified period.

The budget preparation process normally begins with the sales budget and continues through the preparation of pro forma financial statements. The last schedule prepared before the financial statements is the cash budget. The cash budget is the most important part of a company's budget program. The cash budget is a schedule of estimated cash collections and payments. The various operating budgets and the capital budget are inputs to the cash budgeting process. A cash budget may be prepared monthly or even weekly to facilitate cash planning and control. A cash budget is an example of a feedforward control because it anticipates cash needs and allows for the provision of resources to meet those needs.

#### Major sections in the cash budget

A cash budget generally includes three major sections:

1. Cash available
2. Cash disbursements
3. Financing

- The cash budget is a primary tool of short-run financial planning.
  - It allows the financial manager to identify short-term financial needs (and opportunities).
  - It will tell the manager the required borrowing for the short term.
  - It is the way of identifying the cash-flow gap on the cashflow time line.
  - The idea of the cash budget is simple: It records estimates of cash receipts and disbursements.
- We illustrate cash budgeting with the following example of Fun Toys.

- All of Fun Toys' cash inflows come from the sale of toys. Cash budgeting for Fun Toys starts with a sales forecast for the next year, by quarter:

	First Quarter	Second Quarter	Third Quarter	Fourth Quarter
Sales (\$ millions)	\$100	\$200	\$150	\$100

- Fun Toys' fiscal year starts on July 1. Fun Toys' sales are seasonal and are usually very high in the second quarter, due to Christmastime sales.

- But Fun Toys sells to department stores on credit, and sales do not generate cash immediately. Instead, cash comes later from collections on accounts receivable. Fun Toys has a 90-day collection period, and 100 percent of sales are collected the following quarter.
  - In other words, Collections = Last quarter's sales
  - This relationship implies that
  - Accounts receivable at end of last quarter = Last quarter's sales

equation (27.5)

- We assume that sales in the fourth quarter of the previous fiscal year were \$100 million. From equation (27.5), we know that accounts receivable at the end of the fourth quarter of the previous fiscal year were \$100 million and collections in the first quarter of the current fiscal year are \$100 million.
- The first quarter sales of the current fiscal year of \$100 million are added to the accounts receivable, but \$100 million of collections are subtracted. Therefore, Fun Toys ended the first quarter with accounts receivable of \$100 million. The basic relation is
- End A/R = Starting A/R + Sales - Collection
- Table 27.3 shows cash collections for Fun Toys for the next four quarters. Though collections are the only source of cash here, this need not always be the case. Other sources of cash could include sales of assets, investment income, and long-term financing.

■ **TABLE 27.3 Sources of Cash (in millions)**

	First Quarter	Second Quarter	Third Quarter	Fourth Quarter
Sales	\$100	\$200	\$150	\$100
Cash collections	100	100	200	150
Starting receivables	100	100	200	150
Ending receivables	100	200	150	100

- Next, we consider the cash disbursements. They can be put into four basic categories, as shown in Table 27.4.
- *Payments of Accounts Payable.*
  - These are payments for goods or services, such as raw materials.
  - These payments will generally be made after purchases. Purchases will depend on the sales forecast. In the case of Fun Toys, assume that
    - Payments = Last quarter's purchases
    - Purchases = 1/2 next quarter's sales forecast
- *Wages, Taxes, and Other Expenses.*
  - This category includes all other normal costs of doing business that require actual expenditures. Depreciation, for example, is often thought of as a normal cost of business, but it requires no cash outflow.
- *Capital Expenditures.*
  - These are payments of cash for long-lived assets. Fun Toys plans a major capital expenditure in the fourth quarter.
- *Long-Term Financing.*
  - This category includes interest and principal payments on longterm outstanding debt and dividend payments to shareholders.

**Cash Outflow****■ TABLE 27.4 Disbursement of Cash (in millions)**

	First Quarter	Second Quarter	Third Quarter	Fourth Quarter
Sales	\$100	\$200	\$150	\$100
Purchases	100	75	50	50
Uses of cash				
Payments of accounts payable	50	100	75	50
Wages, taxes, and other expenses	20	40	30	20
Capital expenditures	0	0	0	100
Long-term financing expenses: interest and dividends	10	10	10	10
Total uses of cash	\$ 80	\$150	\$115	\$180

The total forecasted outflow appears in the last line of Table 27.4.

**The Cash Balance**

- The net cash balance appears in Table 27.5, and a large net cash outflow is forecast in the second quarter. This large outflow is not caused by an inability to earn a profit. Rather, it results from delayed collections on sales. This results in a cumulative cash shortfall of \$30 million in the second quarter.

**■ TABLE 27.5 The Cash Balance (in millions)**

	First Quarter	Second Quarter	Third Quarter	Fourth Quarter
Total cash receipts	\$100	\$100	\$200	\$150
Total cash disbursements	80	150	115	180
Net cash flow	20	(50)	85	(30)
Cumulative excess cash balance	20	(30)	55	25
Minimum cash balance	5	5	5	5
Cumulative finance surplus (deficit) requirement	15	(35)	50	20

**Short-Term Financing Problem**

- Fun Toys had established a minimum operating cash balance equal to \$5 million to facilitate transactions, protect against unexpected contingencies, and maintain compensating balances at its commercial banks. This means that it has a cash shortfall in the second quarter equal to \$35 million.
- Fun Toys has a short-term financing problem.
  - It cannot meet the forecasted cash outflows in the second quarter from internal sources. Its financing options include:
    - (1) unsecured bank borrowing,
    - (2) secured borrowing, and
    - (3) other sources.

# Self Assessment Quiz

## CMA Exam Retired Questions

(1)47. CSO: 1A4a LOS: 1A4c

Netco's sales budget for the coming year is as follows.

Item	Volume in Units	Sales Price	Sales Revenue
1	200,000	\$50	\$10,000,000
2	150,000	10	1,500,000
3	300,000	30	9,000,000
Total sales revenue			<b><u>\$20,500,000</u></b>

Items 1 and 3 are different models of the same product. Item 2 is a complement to Item 1. Past experience indicates that the sales volume of Item 2 relative to the sales volume of Item 1 is fairly constant. Netco is considering an 10% price increase for the coming year for Item 1, which will cause sales of Item 1 to decline by 20%, while simultaneously causing sales of Item 3 to increase by 5%. If Netco institutes the price increase for Item 1, total sales revenue will decrease by

- a. \$1,050,000.
- b. \$850,000.
- c. \$750,000.
- d. \$550,000.

(2)48. CSO: 1A4a LOS: 1A4i

Hannon Retailing Company prices its products by adding 30% to its cost. Hannon anticipates sales of \$715,000 in July, \$728,000 in August, and \$624,000 in September. Hannon's policy is to have on hand enough inventory at the end of the month to cover 25% of the next month's sales. What will be the cost of the inventory that Hannon should budget for purchase in August?

- a. \$509,600.
- b. \$540,000.
- c. \$560,000.
- d. \$680,000.

(3)49. CSO: 1A4a LOS: 1A4f

Streeter Company produces plastic microwave turntables. Sales for the next year are expected to be 65,000 units in the first quarter, 72,000 units in the second quarter, 84,000 units in the third quarter, and 66,000 units in the fourth quarter. Streeter maintains a finished goods inventory at the end of each quarter equal to one half of the units expected to be sold in the next quarter. How many units should Streeter produce in the second quarter?

- a. 72,000 units.
- b. 75,000 units.
- c. 78,000 units.
- d. 84,000 units.

(4)53. CSO: 1A4a LOS: 1A4f

Data regarding Rombus Company's budget are shown below.

Planned sales	4,000 units
Material cost	\$2.50 per pound
Direct labor	3 hours per unit
Direct labor rate	\$7 per hour
Finished goods beginning inventory	900 units

Finished goods ending inventory	600 units
Direct materials beginning inventory	4,300 units
Direct materials ending inventory	4,500 units
Materials used per unit	6 pounds

Rombus Company's production budget will show total units to be produced of

- a. 3,700.
- b. 4,000.
- c. 4,300.
- d. 4,600.

(5)61. CSO: 1A4a LOS: 1A4g

In preparing the direct material purchases budget for next quarter, the plant controller has the following information available.

Budgeted unit sales	2,000
Pounds of materials per unit	4
Cost of materials per pound	\$3
Pounds of materials on hand	400
Finished units on hand	250
Target ending units inventory	325
Target ending inventory of pounds of materials	800

How many pounds of materials must be purchased?

- a. 2,475.
- b. 7,900.
- c. 8,700.
- d. 9,300.

(6)62. CSO: 1A4a LOS: 1A4g

Playtime Toys estimates that it will sell 200,000 dolls during the coming year. The beginning inventory is 12,000 dolls; the target ending inventory is 15,000 dolls. Each doll requires two shoes which are purchased from an outside supplier. The beginning inventory of shoes is 20,000; the target ending inventory is 18,000 shoes. The number of shoes that should be purchased during the year is

- a. 396,000 shoes.
- b. 398,000 shoes.
- c. 402,000 shoes.
- d. 404,000 shoes.

(7)63. CSO: 1A4a LOS: 1A4g

Maker Distributors has a policy of maintaining inventory at 15% of the next month's forecasted sales. The cost of Maker's merchandise averages 60% of the selling price. The inventory balance as of May 31 is \$63,000, and the forecasted dollar sales for the last seven months of the year are as follows.

June	\$700,000
July	600,000
August	650,000
September	800,000
October	850,000
November	900,000
December	840,000

What is the budgeted dollar amount of Maker's purchases for July?

- a. \$355,500.
- b. \$360,000.
- c. \$364,500.
- d. \$399,000.

(8)78. CSO: 1A4b LOS: 1A4x

Prudent Corporation's budget for the upcoming accounting period reveals total sales of \$700,000 in April and \$750,000 in May. The sales cash collection pattern is 20% of each month's sales are cash sales.

5% of a month's credit sales are uncollectible.

70% of a month's credit sales are collected in the month of sale.

25% of a month's credit sales are collected in the month following the sale.

If Prudent anticipates the cash sale of a piece of old equipment in May for \$25,000, May's total budgeted cash receipts would be

- a. \$560,000.
- b. \$702,500.
- c. \$735,000.
- d. \$737,500

(9)81. CSO: 1A4b LOS: 1A4x

Health Foods Inc. has decided to start a cash budgeting program to improve overall cash management. Information gathered from the past year reveals the following cash collection trends.

40% of sales are on credit

50% of credit sales are collected in month of sale

30% of credit sales are collected first month after sale

15% of credit sales are collected second month after sale

5% of credit sales result in bad debts

Gross sales for the last five months were as follows.

January	\$220,000
February	240,000
March	250,000
April	230,000
May	260,000

Sales for June are projected to be \$255,000. Based on this information, the expected cash receipts for March would be

- a. \$230,000.
- b. \$237,400.
- c. \$242,000.
- d. \$243,200

(10)83. CSO: 1A4b LOS: 1A4x

Data regarding Johnsen Inc.'s forecasted dollar sales for the last seven months of the year and Johnsen's projected collection patterns are as follows.

Forecasted sales

June	\$700,000
July	600,000
August	650,000
September	800,000
October	850,000
November	900,000
December	840,000

Types of sales

Cash sales 30%

Credit sales 70%

Collection pattern on credit sales (5% determined to be uncollectible)

During the month of sale 20%

During the first month following the sale 50%

During the second month following the sale 25%

Johnsen's budgeted cash receipts from sales and collections on account for September are

- a. \$635,000.
- b. \$684,500.
- c. \$807,000.
- d. \$827,000.

## Top-level Planning and Analysis

### Pro Forma Financial Statements

#### Definition & Methods of preparation

The term **pro forma** is used to refer to a **forecasted/projected** financial statement prepared for a specific purpose (for example, to do “*what if*” analysis in the process of planning).

i.e. Financial statements containing projected amounts that are expected if a particular course of action is followed.

A company might prepare many different sets of pro forma financial statements for the same period in its planning process.

Pro forma financial statements are **not** prepared individually for each department and then consolidated into budgeted statements for the whole company the way budgeted financial statements are. They may be prepared for the company as a whole or for only one department or division.

Pro forma is a Latin phrase meaning “according to form.” It can be loosely translated to mean “as if.” Financial statements are referred to as pro forma when they reflect projected, rather than actual, results.

#### Timing of Pro Forma FS preparation

Pro forma statements may be prepared after the formal budget for the year has been adopted, if the company is considering an activity that was not foreseen before the formal budget was adopted.

#### Master Budget & Pro Forma Financial Statements

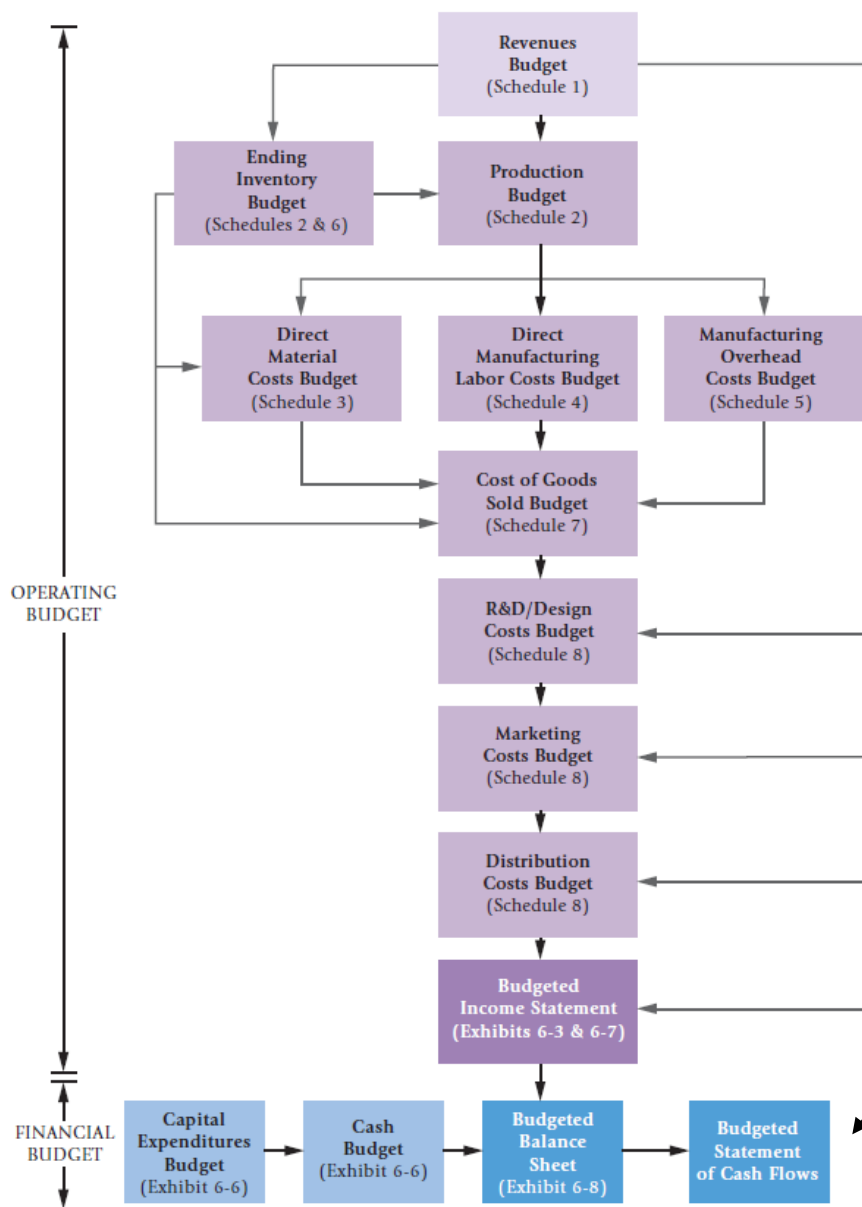

The master budget is **not** a pro forma financial statement. A pro forma financial statement is **not** used for formal variance reporting as the master budget and the flexible budget are, but in the meantime one or several versions of pro forma financial statements may be prepared as a part of the formal planning process that will eventually result in the master budget.

However, if an action that was forecasted is implemented, the company would probably want to compare the actual results with the forecasted, pro forma ones. But pro forma financial statements are **not** a part of the formal budgeting process. They are used for planning and decision-making purposes, and the amounts in them may be quite different from the amounts in the master budget.

The term “pro forma” is sometimes used to refer to the master budget financial statements as well, but this is an inappropriate use of the term. This text uses the term “pro forma” properly; however, be aware that “pro forma” might be used improperly elsewhere, possibly even on the exam.

#### Components of Pro Forma FS

- pro forma income statement,
- pro forma statement of financial position (balance sheet), and
- pro forma statement of cash flows.

**Interrelationships of Pro Forma Financial Statements**

After the income statement is complete, the company can prepare the pro forma balance sheet based on estimated dividends and information from the other operating budgets.

This will provide the company with projected solvency and liquidity figures for analysis purposes.

After the balance sheet and income statement are complete, the company can complete the pro forma cash flow statement.

**Note:**

Financial Budget represent the set of the financial statement based on the static/master budget assumption that can be used in "what if analysis".

The capital expenditures budget and the operating budgets combine to assess the cash needs of the organization. It is also necessary to gather information on the company's collection pattern and purchases (payables) pattern in order to determine when inflows and outflows can be expected based on the capital and operating budgets.

## Uses/Benefits of Pro Forma Financial Statements

### Uses Pro Forma FS

- *used* internally in the planning and decision-making purposes.
- *used* in order to see what the financial statements of the firm will look like if something that is under consideration or forecasted actually happens.
- *used* to evaluate the effects on the company's finances if a particular sales forecast is realized, although they can be used for other "what if" scenarios as well.
  - used for "what if" analysis in order to forecast the effect of a proposed change.
    - For example, if the company is contemplating a price increase that it anticipates will reduce the level of demand for its product, it will prepare a pro forma financial statement to determine the result on the financial statements if the price increase is put into effect.
- *used* to compare the company's anticipated performance with its target performance and with investor expectations.(management control).
- *used* to determine in advance what the company's future financing needs will be
- *used* to forecast the capital requirements of the plans in order to select the plan that maximizes shareholder value.
- *used* to determine whether the company will be able to remain in compliance with the required covenants on its long-term debt.

### Benefits of Pro Forma FS

By analyzing pro forma statements, managers can tell what the company's cash position will be, whether it will need to borrow, whether it will be able to make its scheduled loan payments, whether it will remain in compliance with debt covenants, and so forth.

The pro forma income statement *shows* a company's

- projected sales revenue,
- costs, and
- profit

derived from the individual *operating* budgets that previously discussed.

Pro forma income statement is used to

- decide whether the budgeted activities will result in an acceptable level of income.
  - If the initial pro forma income shows a loss or an unacceptable level of income, adjustments can be made to the component parts of the master budget.
- Other strategic objectives can also be observed from the pro forma income statement, such as
  - a target gross margin percentage and the interest coverage ratio (times interest earned).
  - The adequacy of earnings per share can also be observed from the pro forma income statement.

### Forecasting for Planning

#### Sales Forecasts

The sales forecast starts by looking back at historical trends and seeks to determine a pattern so that next year's sales can be predicted.

#### Percent of Sales Method (quicker way of forecasting year-end results)

After sales are forecasted, future financial statements must be forecasted. The most common method is the percent of sales method. Under this method, many items on the income statement and balance sheets are assumed to increase proportionately to sales. Other items may be based off historical data (i.e., interest expense may remain constant due to contracts previously entered into) or be based off forecasted net sales (i.e., cost of goods sold will be 60% of net sales).

The percentage-of-sales method is

- a simple approach that ties many of the items in the pro forma income statement and balance sheet to future sales revenue.
- It assumes that the relationship between these income statement and balance sheet items and sales revenue remains constant, which means that they grow proportionally with sales growth.

**The first financial statement forecasted is generally the income statement**

### EXAMPLE

LisaCo's Actual Year 5 and Projected Year 6 Income Statement  
(millions of dollars)

	Actual Year 5	Forecast Basis	Year 6 Forecast
Sales	\$4,000	1.11 x Year 6 sales	\$4,440
Cost of goods sold	(3,200)	80% of net sales	(3,552)
Gross margin	\$ 800		\$ 888
Selling and admin exp.	(300)	1.11 x Year 6 sales	(333)
Operating income	\$ 500		\$ 555
Other revenue	200	Same as last year	200
Earnings before interest and taxes (EBIT)	\$ 700		\$ 755
Earnings before taxes (EBT)	\$ 600		\$ 655
Taxes (40%)	(240)		(262)
Net income	\$ 360		\$ 393

### Analysis of Pro Forma Financial Statements

The following ratios will be used in analyzing pro forma financial statements:

#### Profitability Ratios (ICMA-2014)

- (1) Gross profit margin percentage = gross profit / sales
- (2) Operating profit margin percentage = operating income / sales  
Return on sales is equal to operating income divided by sales
- (3) Net profit margin percentage = net income / sales

22. Shoo Inc. owns several retail stores. After all initial budget requests were received for the upcoming year, Shoo's abbreviated pro forma income statement is as follows.

Sales	\$46,000,000
Cost of goods sold	20,700,000
Selling and administrative costs	19,800,000
Operating income	\$ 5,500,000

The cost of goods sold and a 5% sales commission are the only variable costs. Shoo's upper management believes that the sales manager underestimated projected sales units and wants the sales budget increased such that the company can achieve its goal of a 15% return on sales. The amount by which sales must increase to achieve this goal is

- a. \$4,000,000.
- b. \$3,500,000.
- c. \$1,750,000.
- d. \$1,400,000.

22. a

Return on sales is equal to operating income divided by sales. For every dollar added to sales, 45% will be the cost of goods sold ( $\$20,700,000 \div \$46,000,000$ ), and 5% will be sales commissions. Therefore, for every dollar that is added to sales, \$.50 is added to operating income. To find how much the sales budget must be increased by to raise the return on sales to 15%, algebra is the most appropriate tool, as follows:

$$\begin{aligned} [(\$5,500,000 + .5X) \div (\$46,000,000 + X)] &= .15 \\ (\$5,500,000 + .5X) &= .15 \times (\$46,000,000 + X) \\ \$5,500,000 + .5X &= \$6,900,000 + .15X \\ .35X &= \$1,400,000 \\ X &= \$4,000,000 \end{aligned}$$

After the pro forma statements have been compiled, they need to be analyzed to determine if the company is meeting its predetermined financial targets based on the estimates. The strategic objectives are defined prior to the formulation of the pro forma statements and are compared against the estimated results to determine if the company will meet goals if the estimates are achieved.

### Pro Forma Balance Sheet

a. The pro forma balance sheet is prepared using the cash and capital budgets and the pro forma income statement.

- 1) The pro forma balance sheet is the beginning-of-the-period balance sheet updated for projected changes in cash, receivables, payables, inventory, etc.
- 2) If the balance sheet indicates that a contractual agreement may be violated, the budgeting process must be repeated.
  - a) For example, some loan agreements require that owners' equity be maintained at some percentage of total debt or that current assets be maintained at a given multiple of current liabilities.

### Pro Forma Statement of Cash Flows

- a. The pro forma statement of cash flows is normally the last statement prepared.
- b. The pro forma statement of cash flows classifies cash receipts and disbursements depending on whether they are from operating, investing, or financing activities.
  - 1) The direct presentation reports the major classes of gross cash operating receipts and payments and the difference between them.
  - 2) The indirect presentation reconciles net income with net operating cash flow.

c. All the pro forma statements are interrelated (articulated), e.g., the pro forma cash flow statement will include anticipated borrowing. The interest on this borrowing will appear in the pro forma income statement.

**The percentage-of-sales method can be used to prepare**

- pro forma balance sheets and
- the statement of cash flows.

The pro forma income statements and balance sheets play a key role in determining the requirements for financing and dividend policy. If key line items on a balance sheet need to be maintained at a certain percentage of sales (i.e., cash 5% of sales, accounts receivable 15%, inventory 25%, and accounts payable 10%) in order to maintain company operations, management can derive the amount of funds available for dividends or the need for external financing.

To derive those numbers,

- the balance sheet items are set at the percentage of sales as defined, and
- retained earnings is computed from the beginning-of-year amount plus pro forma net income less estimated dividends,
- The long-term debt isn't expected to change with changes in sales.
- After the computations are made, there will be a shortfall either in assets or in liabilities and equity.
  - If assets are less than liabilities and equity, debt can be paid down or additional dividends can be paid.
  - If assets are higher than liabilities and equity, external financing is needed in order to support the asset base.

38. Golding Company has used the following data to prepare a pro forma income statement for the first quarter of next year. The company's effective income tax rate is 40%. The company's targeted gross margin percentage is 50%.

Sales	\$4,678,500
Beginning finished goods inventory	12,600
Ending finished goods inventory	18,900
Selling and administrative expenses	1,250,760
Cost of goods manufactured	2,445,790

Which one of the following is the **best** course of action?

- Since the pro forma gross margin percentage is lower than 50%, management should plan to lower the company's tax rate to improve next quarter's results.
- Since the pro forma gross margin percentage is higher than 50%, management should plan to follow the master budget to achieve the targeted results.
- Since the pro forma gross margin percentage is lower than 50%, management should plan to decrease manufacturing costs next quarter.
- Since the pro forma gross margin percentage is higher than 50%, management should plan to increase the sales price next quarter.

38. c

The gross margin percentage is 47.72%  $[(\$4,678,500 - \$2,445,790) \div \$4,678,500]$ . This is lower than the targeted gross margin percentage of 50%. If management decreases manufacturing costs, the gross margin percentage will increase.

23. Alton Machine Company has established a strategic initiative to increase operating income by increasing market share through being the lower cost provider. Assuming the total market size remains the same, and based on the information provided below, has Alton achieved the stated objectives?

	<u>Current year</u>	<u>Next year</u>
Revenues	\$325,000	\$325,000
Cost of goods sold	<u>152,000</u>	<u>146,000</u>
Gross margin	173,000	179,000
Operating costs		
Marketing	100,000	100,000
Administrative	<u>50,000</u>	<u>50,000</u>
Operating income	<u>\$ 23,000</u>	<u>\$ 29,000</u>
Units sold	1,000	1,000

- a. Yes, because Alton was able to lower costs and increase operating income.
- b. No, because Alton did not reduce marketing and administrative costs.
- c. Yes, because the statements show a reduced cost of goods sold.
- d. No, because it does not appear that Alton has increased market share.

23. d

81. Bolton Corporation manufactures goods that are sold by independent sales agents who receive a 20% payment based on sales value. Bolton's pro forma income statement for the upcoming year follows below.

Sales	\$15,000,000
Cost of goods sold (all variable)	6,000,000
Payment to sales agents	3,000,000
Other expenses (all fixed)	2,000,000
Operating income	\$ 4,000,000

After the budget was created, Bolton became aware that its primary competitors would each be raising their selling prices by 5%. If Bolton also increased its selling price by 5%, the company's revised operating income would be

- a. \$4,750,000.
- b. \$4,600,000.
- c. \$4,300,000.
- d. \$4,200,000.

81. b

Raising the selling prices by 5% would increase Bolton's revenue by \$750,000 ( $\$15,000,000 \times 0.05$ ). However, payments to sales agents increase by 5% as well, which results in a gain of \$150,000 ( $\$3,000,000 \times 0.05$ ). The net increase in operating income is therefore \$600,000, which makes the revised operating income \$4,600,000.

22. Tarleton Company operates several retail stores. To support the company's long-term goals, operating income should be at least 10% of sales. Tarleton's abbreviated pro forma income statement for next year is shown below.

Revenues	\$7,500,000
Cost of goods sold	3,750,000
Operating fixed costs	3,125,000
Operating income	\$ 625,000

The **best** action for Tarleton to take in order to meet its income goal is to

- a. increase the advertising budget by \$25,000 which would increase sales units by 5%.
- b. raise the selling price by 2% which would reduce sales units by 2% but save \$50,000 in operating costs.
- c. require all managers to reduce their budgeted operating fixed costs by 3%.
- d. wait until the end of next year's first quarter to re-evaluate its situation.

22. a

25. Bryan Corporation, a retailer, uses flexible budgeting as a planning tool. The company's original budget for the upcoming year is shown below.

Sales	\$90,000,000
Cost of goods sold	36,000,000
Administrative expenses (all fixed)	21,000,000
Advertising expense	9,000,000
Sales commissions	6,750,000
Other marketing expenses (all fixed)	9,250,000
Operating income	\$ 8,000,000

The manager of Bryan's Marketing Department believes sales volume will increase by 10% if the advertising budget is increased by \$5,000,000. Should Bryan approve the increased advertising request?

- a. Yes, because the increase in sales is \$4,000,000 greater than the increase in advertising costs.
- b. No, because advertising is 10% of sales so the maximum increase in sales would be \$900,000.
- c. Yes, because operating income would increase by \$400,000.
- d. No, because operating income would decrease by \$275,000.

25. d

### 2015 LOS

Define the purpose of a **pro forma** income statement, a pro forma balance sheet, and a pro forma statement of cash flows; and demonstrate an understanding of the relationship among these statements and all other budgets

Prepare **pro forma** income statements based on several revenue and cost assumptions

Evaluate whether a company has achieved strategic objectives based on pro forma income statements

Use financial projections to prepare a pro forma balance sheet and a pro forma statement of cash flows

Identify the factors required to prepare medium- and long-term cash forecasts

Use financial projections to determine required outside financing and dividend policy

# BUDGET METHODOLOGIES

## **MASTER BUDGET**

There are numerous types of budget systems that meet a variety of purposes. The most common budget system contemplates the development of the annual business plan or master budget, a budget that essentially anticipates the pro forma financial statements at a particular level of activity, so it is also called static budget.

Although the master budget is easy to understand because it deals with familiar concepts and formats, other budgetary systems have been developed to more effectively plan multi-year operations, identify and control costs, stimulates continuous improvement, or facilitate more refined performance evaluation.

*To use its budget as an effective planning and management tool, a company must choose a budget methodology that supports and reinforces its management approach.*

**Factors affecting the selection of budget methodology:** a company can choose different approaches in formulating its master budget.

- types of business,
- organizational structure;
- complexity of operations, and
- management philosophy,

**The company can even adopt different approaches for different pieces of its master budget, six common different budgeting systems that a company can use to create its budgets are:**

**Flexible budgeting** — serves as a control mechanism that evaluates the performance of managers by comparing actual revenue and expenses to the budgeted amount for the actual activities (and not the budgeted activities)

**Project budgeting** — used for creating a budget for specific projects or programs rather than for an entire company, such as the design of a new airliner or the building of a single ship.

**Continuous (or rolling) budgeting** — allows the budget to be continually updated(revised) by removing information for the period just ended (e.g., March of this year) and adding estimated data for the same period next year (e.g., March of next year).

**Kaizen budgeting** -The Japanese term kaizen means continuous improvement, and **kaizen budgeting** assumes the continuous improvement of products and processes. Accordingly, kaizen budgeting is based not on the existing system but on changes yet to be made.

**Activity-based budgeting (ABB)** — focuses on classifying costs based on activities rather than based on departments or products; ABB applies activity-based costing principles to budgeting. It focuses on the numerous activities necessary to produce and market goods and services and requires analysis of cost drivers.

**Zero-based budgeting (ZBB)**— starts each new budgeting cycle from scratch as though the budgets are prepared for the first time; ZBB is a budget and planning process in which each manager must justify his/her department's entire budget every budget cycle.

**Other types of budgets: (Incremental budgets)**

## I. ANNUAL BUSINESS PLANS (MASTER BUDGET OR COMPREHENSIVE BUDGET/ Profit Plan)

### A.GENERAL

Annual business plans (or master budgets) are sometimes referred to as profit planning or targeting budgets. Budgets of this character are based **one level of activity** and are, consequently also referred to as **static budgets**. A compilation of all the separate operational and financial budget schedules of the organization

#### 1. Purpose

Annual business plans are prepared to provide comprehensive and coordinated budget guidance for an organization.

#### 2. Appropriate Use

Annual business plans are appropriate for most industries but are particularly useful in manufacturing settings that require coordination of financial and operating budgets.

#### 3. Timeframe

Annual business plans summarize activity for a one-year period.

### B.MECHANICS OF ANNUAL PLAN BUDGETING

#### 1. Budget Components

The annual plan anticipates the coming year's activities that will contribute to the accomplishment of the long-term and short-term goals outlined in the company's strategic plan.

The master budget expresses management's operating and financial plans for a specified period (usually a year) and it **reflects the impact of both operating and financing decisions**.

- Operating decisions deal with the use of scarce resources.
- Financing decisions deal with how to obtain the funds to acquire those resources.

The previous two types of decisions covered by the budgetary components of the master budget as follows:

- a. Operating budget
- b. Financial budget

#### a. Operating budget

#### Interrelationships in the Master Budget

Exhibit 1-5 shows a diagram of the various parts of the master budget for a manufacturer firm. Most of what you see in Exhibit 1-5 comprises a set of budgets the budgeted income statement and its supporting budget schedules - together called the **operating budget**.

These schedules are budgets for various business functions of the value chain, from research and development to customer service.

The **financial budget** is that part of the master budget made up of the capital expenditures budget, the cash budget, the budgeted balance sheet, and the budgeted statement of cash flows. A financial budget focuses on how operations and planned capital outlays affect cash. The master budget is finalized only after several rounds of discussions between top management and managers responsible for various business functions of the value chain.

**C.DEVELOPMENT OF AN ANNUAL PLAN**

This unit devotes a separate section to the development of the annual profit plan and supporting schedules and provides a comprehensive concept exercise that illustrates the steps required to develop an annual plan.

**D. BENEFITS AND LIMITATIONS OF THE MASTER BUDGET**

The benefits of having a master budget are numerous and the drawbacks are few. Virtually every company needs some form of master budget.

**1. Benefits**

Master budgets are relatively easy to prepare and are the most commonly developed budget system.

**2. Limitations**

Master budget amounts are confined to one year at a single level of activity.

**E.CONCEPT EXAMPLE**

The below example illustrates how the master (static) budget fail to be a control tool when the actual activity level deviate from the planned one in the master budget

**EXAMPLE:** A company has the following information for the period:

	Actual	Static Budget	Static Variance
Production in units	1,000	1,200	200 U
Direct materials (units × \$6)	\$ 6,000	\$ 7,200	\$1,200 F
Direct labor (units × \$10)	10,000	12,000	2,000 F
Variable overhead (units × \$5)	5,000	6,000	1,000 F
Total variable costs	\$21,000	\$25,200	\$4,200 F

From these results, it appears that, although the production manager failed to achieve his/her production quota, (s) he did a good job of cost control.

Contrast this with a **flexible budget**, which is a series of budgets prepared for many levels of activity.

At the end of the period, management can compare actual performance with the appropriate budgeted level in the flexible budget, so we have to prepare another budget **but based on the actual activity 1000 units**.

**II. FLEXIBLE BUDGETING****A.GENERAL****1. Purpose**

Flexible budgets represent adjustable to accommodate changes in actual activity.

**2. Appropriate Use**

Flexible budgets are most appropriate for a firm facing a significant level of uncertainty in unit sales volumes for next periods.

**B.MECHANICS OF FLEXIBLE BUDGETING****1. Budget Components**

Flexible budgets include consideration of revenue per unit, variable costs per unit, and total fixed costs over the relevant range. Flexible budgets also consider the amount of cost per unit allowed for units of output.

## C.DEVELOPMENT OF FLEXIBLE BUDGETING

- Flexible budgets represent a series of budgets that provide the ability to accommodate comparison with many levels of actual sales or production volume.

## D.BENEFITS AND LIMITATIONS OF THE FLEXIBLE BUDGETING

### 1. Benefits

- Flexible budgets can be displayed on any number of volume levels within the relevant range.
- Comparisons of actual and budgeted activity are **not distorted by mere volume differences** and can better pinpoint areas where efficiencies have been achieved or where waste has occurred, thus flexible budget allows management to focus on the variances that may be caused by production or administrative problems that need attention.
- Flexible budgets offer managers a **more realistic comparison** of budget and actual revenue and cost items under their control, i.e., control of direct labor and direct materials but not fixed factory overhead.

### 2. Limitations

- Flexible budgets are highly dependent on the accurate identification of fixed and variable costs and the determination of the relevant range.
- the potential for the firm to focus principally on the flexible budget level of output and disregard the fact that the sales target was missed.

## E.CONCEPT EXAMPLE

The Flex-o-matic Corporation produces the Flex -o-matic, a piece of exercise equipment. Corporate controller Felix Flexmeister is developing a flexible budget. Felix has already developed a master budget but estimates that the relevant range extends 20 percent above and below the master budget. What is the relevant range in dollars assuming a selling price of \$60 per unit variable costs of \$40 per unit, fixed costs of \$1 00,000 and anticipated output according to the master budget of 500 units?

	80% of <u>Master</u>	Master <u>Budget</u>	120% of <u>Master</u>
Sales	\$240,000	\$300,000	\$360,000
Variable costs	<u>(160,000)</u>	<u>(200,000)</u>	<u>(240,000)</u>
Contribution margin	80,000	100,000	120,000
Fixed costs	<u>(100,000)</u>	<u>(100,000)</u>	<u>(100,000)</u>
Operating income	\$ <u>(20,000)</u>	\$ <u>0</u>	\$ <u>20,000</u>

As per the previous example we note that a flexible budget provides cost allowances for different levels of activity, whereas a static budget provides costs for one level of activity.

Barnes Corporation expected to sell 150,000 board games during the month of November, and the company's master budget contained the following data related to the sale and production of these games:

Revenue	\$2,400,000
<b><u>Cost of goods sold:</u></b>	
Direct materials	675,000
Direct labor	300,000
Variable overhead	450,000

**Contribution margin**      **\$ 975,000**

Fixed overhead      250,000

Fixed selling      500,000

**Operating income**      **\$ 225,000**

Actual sales during November were 180,000 games. Using a flexible budget, the company expects the operating income for the month of November to be

- A. \$225,000
- B. \$270,000
- C. \$420,000
- D. \$510,000

Flexible budgets will be discussed in more depth in ch.7 (Performance Management (Variances)).

Answer (C) is correct.

### III. PROJECT BUDGETING (PROGRAM BUDGETING)

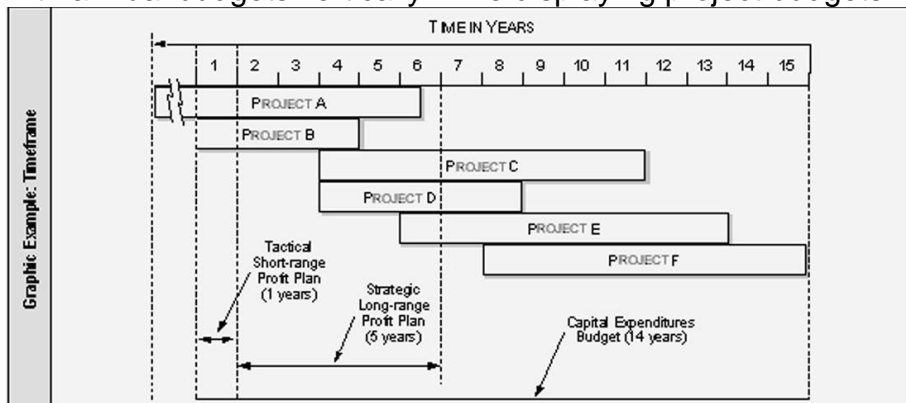

#### A. GENERAL

##### 1. Appropriate use

Project budgets are appropriate for specific tasks (e.g., construction of building, infrequent events such as discontinuation of a division or a product line, or groups of projects such as new product development, marketing, and refinement, the design of a new airliner or the building of a single ship).

##### 2. Timeframe

The time frame for a project budget is simply the duration of the project, but a multi-year project could be broken down by year. Timelines that display project budgets in coordination with annual budgets vertically while displaying project budgets horizontally.

#### B. BENEFITS AND LIMITATIONS OF THE PROJECT BUDGET

##### 1. Benefits

- Project budgets allow for a focused look at a particular project's resource requirements and timing & the ability to contain all of a project's costs so that its individual impact can be easily measured.

##### 2. Limitations

- If the budget process improperly done, project budgets may not afford a comprehensive look at the manner in which the project impacts the organization.

## V. CONTINUOUS (ROLLINGS) BUDGET

### A. GENERAL

#### 1. Purpose

- Initially is developed just like any other budgets. The difference is that instead of preparing, for example, an annual budget at the beginning of each year, the budget is **reviewed monthly** as time passes. The most recent period is dropped off and a new period at the end is added.
- Continuous (rolling or perpetual) budgets add a new budget month - rolls forward- (or quarter) as each current month (or quarter) expires. According to this model, budgeting becomes a perpetual process and *long-range planning* is performed continually rather than annually.

#### 2. Appropriate Use

- Continuous (rolling) budgets are most effective in **dynamic environments** where constant re-evaluation of products and activities are required by the market place or where results of activities are critical to operations

#### 3. Timeframe

Although a continuous (rolling) budget contemplates a year of activity, it usually does not coincide with the organization's fiscal period because it adds either a month or a quarter to the budget as each month or quarter is completed.

### B. BENEFITS AND LIMITATIONS OF CONTINUOUS (ROLLINGS) BUDGET

#### 1. Benefits

- Longer strategic perspective
- have up-to-date budgets because the preparation of a budget for a new quarter or month often leads to revision of the existing budget.
- requires managers to always be thinking ahead.
- continuous budget is more relevant than a budget prepared once a year. It can reflect current events and changes in its estimates, and
- it has the advantage of breaking down a large process into manageable steps.

#### 2. Limitations

- the amount of time managers must constantly spend on budget preparation
  - can be weakened by incomplete analysis.
- the need to have a budget coordinator and/or the opportunity cost of having managers use part of each month working on the next month's budget.

## VII. KAIZEN (CONTINUOUS IMPROVEMENT) BUDGETING

### A. GENERAL

#### 1. Purpose

- explicitly demands continuous improvement and incorporates all expected improvements in the resulting budget.
- Kaizen budgeting process bases budgets on the desired future operating processes rather than the continuation of the current practices as is often the case in traditional budgeting.
- Kaizen budgeting assumes innovation and high performance not only from the organization but also from its suppliers.

#### 2. Appropriate Use

- Kaizen is often used in highly competitive manufacturing environments where continuous improvement of products and manufacturing processes are necessary to ensure strategic position and survival.

### B. DEVELOPMENT OF KAIZEN (CONTINUOUS IMPROVEMENT) BUDGETING

- Kaizen budgeting begins by analyzing current practices to identify areas for improvement and determine expected changes needed to attain the desired
- improvement(s). then budgets are prepared based on improved practices or procedures.
- As a result, **budgeted costs often are lower than those in the preceding period.**
- Kaizen budgeting is not limited to internal improvements. Many firms expect and demand continuous improvements of their **suppliers** and explicitly incorporate consequent effects on costs and delivery schedules of parts and components in budgeted production cost and manufacturing schedules.
- A kaizen budget decrease is ***not*** the same as the budget cuts we often see firms or governments make when facing a budget crunch because of diminishing profits, decreasing sales, or declining tax revenues.
- Much of the cost reduction associated with kaizen budgeting arises from **many small improvements rather than "quantum leaps."**
- A significant aspect of kaizen budgeting is the quantity and quality of employees' suggestions.
- A decrease in cost in a kaizen budget is a result of performing the same activity **more efficiently and with higher quality**; it is not a result of arbitrarily eliminating activities or components.

### C. BENEFITS AND LIMITATIONS OF KAIZEN (CONTINUOUS IMPROVEMENT) BUDGETING

#### 1. Benefits

Kaizen budgets keep managers continuously in search of improved cost and value

#### 2. Limitations

Kaizen budgets can be discouraging to managers and suppliers and focus on cost rather than value.

## VIII. ACTIVITY BASED BUDGETING (ABB)

### A.GENERAL

#### 1. Purpose

Activity-based budgeting (ABB) is a budgeting process that focuses on costs of activities or cost drivers necessary for operations instead of departments or products. Each activity is matched with the most appropriate cost driver, which is any volume-based or activity-based unit of measurement of the cost of a job or activity needed to sustain operations. The time frame is usually short term but continuous.

#### 2. Appropriate use

ABB is most appropriate in businesses that have complexity in their number of products, number of departments, or other factors such as setups. **Timeframe** Activity based budgeting is generally applied to annual time periods or less.

### B. DEVELOPMENT OF ACTIVITY BASED BUDGETING (ABB)

Development of an activity based budget involves a number of specifically identifiable discrete steps discussed in depth in U.5.

### C. BENEFITS AND LIMITATIONS OF ACTIVITY BASED BUDGETING (ABB)

#### 1. Benefits

Greater precision in determining costs, Activity-based budget-Proponents believe that traditional costing obscures the relationships between costs and outputs by oversimplifying the measurements into such categories as labor hours, machine hours, or output units for an entire process or department. Instead of using only volume drivers as a measurement tool, an activity-based budget uses activity based cost drivers, such as number of setups, to make a clear connection between resource consumption and output.

#### 2. Limitations

Although this may provide greater precision in determining costs, a potential drawback can occur if the cost of designing and maintaining the system exceeds the cost savings from better planning.

## IX. ZERO-BASED BUDGETING

### A.GENERAL

#### 1. Purpose

- budgeting process that requires **justification of all expenditures every year**, i.e., requires managers to prepare budgets from ground zero.
- Many budget systems are referred to as incremental budgets because they assume that previous budgets represent required levels of effort and need only be adjusted for additional or incremental expenses. Zero-based budgets are designed to challenge that assumption and require that manager begin the budget process from zero.
- Thus, managers must conduct **in-depth reviews** and analyses of all budget items and of each area under their control to provide such **justification**.

- Such a budgeting process encourages managers to be aware of activities or functions that have outlived their usefulness or have been a waste of resources. A tight, efficient budget often results from zero-base budgeting.

## C.DEVELOPMENT OF ZERO-BASED BUDGETING

- The first step in developing a zero-based budget is to have each department manager **rank** all of its activities from most to least important and assign a cost to each activity. This step requires determination of objectives, operations, and costs for each activity and the alternative means of carrying out that activity.
- For each budgetary unit, a **decision package** (lists of budgeted activities) is prepared that describes various levels of service that may be provided, including at least one level of service lower than the current one.
- Upper management asks questions, such as
  - "Should the activity be performed?"
  - If it is not, what will happen?" or "Are there substitute methods of providing this function, such as outsourcing or customer self-service?"
- Upper management reviews these lists (decision packages), and cuts items that lack justification or are less critical.
- Benchmarks and standards can be used to develop the budget figures instead of just relying on historical numbers.
- In other words ZBB divides the activities of individual responsibility centers into a series of packages that are prioritized.

## D. BENEFITS AND LIMITATIONS OF ZERO-BASED BUDGETING

### 1. Benefits

- ZBB forces review of all elements of a business.
- Focusing on every line item instead of just the exceptions.
- should motivate managers to identify and remove items that are more costly than the benefits provided.

### 2. Limitations

- it can require a nearly impossible amount of work to review all of a company's activities every year.
- Thus ZBB is time-consuming and expensive annual review process as a result the review often is less thorough than it should be.

### Alternatives

As an alternative, many organizations schedule zero-base budgeting periodically or perform zero-base budgeting for different divisions each year.

The time and expense of a zero-based budget is often mitigated by performing zero- based budgets only on a periodic basis, such as **once every five years**, and applying a different budget method in the other years. Or, the firm might rotate the use of zero- based budgeting for a different division each year.

## X. OTHER TYPES OF BUDGETS

### A. INCREMENTAL BUDGET

An incremental budget is a general type of budget that starts with the prior year's budget and uses projected changes in sales and the operating environment to adjust individual items in the budget upward or downward. It is the opposite of a zero-based budget. The main drawback to using this type of budget (and the reason that some companies use zero-based budgets) is that the budgets tend to only increase in size over the years.

An advantage of incremental budgeting when compared with zero-based budgeting is that incremental budgeting accepts the existing base as being satisfactory. i.e., offers to managers the advantage of requiring **less managerial effort** to justify changes in the budget.

### B. LIFE CYCLE BUDGET

A life-cycle budget estimates a product's revenues and expenses over its entire life cycle beginning with initial research and development and ending with the withdrawal of customer support (i.e., cradle –to-grave budgeting). Life-cycle costing discussed in more depth in U.5

# Self Assessment Quiz

## CMA Exam Retired Questions

(1)40. CSO: 1A3a LOS: 1A3b

Many companies use comprehensive budgeting in planning for the next year's activities. When both an operating budget and a financial budget are prepared, which one of the following is **correct** concerning the financial budget?

	Capital Budget	Pro-forma Balance Sheet	Cash Budget
a.	Yes	No	Yes.
b.	No	Yes	No.
c.	Yes	Yes	Yes.
d.	No	No	No.

(2)41. CSO: 1A3a LOS: 1A3b

What would be the correct chronological order of preparation for the following budgets?

- I. Cost of goods sold budget.
- II. Production budget.
- III. Purchases budget.
- IV. Administrative budget.

- a. I, II, III, IV.
- b. III, II, IV, I.
- c. IV, II, III, I.
- d. II, III, I, IV.

(3)42. CSO: 1A3a LOS: 1A3c

Which one of the following **best** describes the order in which budgets should be prepared when developing the annual master operating budget?

- a. Production budget, direct material budget, revenue budget.
- b. Production budget, revenue budget, direct material budget.
- c. Revenue budget, production budget, direct material budget.
- d. Revenue budget, direct material budget, production budget.

(4)43. CSO: 1A3d LOS: 1A3a

A budgeting approach that requires a manager to justify the entire budget for each budget period is known as

- a. performance budgeting.
- b. program budgeting.
- c. zero-base budgeting.
- d. incremental budgeting.

(5)46. CSO: 1A3f LOS: 1A3a

Country Ovens is a family restaurant chain. Due to an unexpected road construction project, traffic passing by the Country Ovens restaurant in Newtown has significantly increased. As a result, restaurant volume has similarly increased well beyond the level expected. Which type of budget would be **most** appropriate in helping the restaurant manager plan for restaurant labor costs?

- a. Zero-based budget.
- b. Rolling budget.
- c. Activity-based budget.
- d. Flexible budget.

7. The type of budget that is available on a continuous basis for a specified future period by adding a month, quarter, or year in the future as the month, quarter, or year just ended is deleted, is called a
- rolling budget.
  - kaizen budget.
  - activity-based budget.
  - flexible budget.
8. In the budgeting and planning process for a firm, which one of the following should be completed first?
- Sales budget.
  - Financial budget.
  - Cost management plan.
  - Strategic plan.
10. In preparing a corporate master budget, which one of the following is most likely to be prepared last?
- Sales budget.
  - Cash budget.
  - Production budget.
  - Cost of Goods Sold budget.

- 10. b

# Forecasting Techniques

## Forecasting techniques

Forecasting is a critical part of any business, and it involves looking into the future and attempting to determine what future conditions and/or results will be. Forecasts are the basis for business plans. Forecasts are used to project product demand, inventory levels, cash flow, etc. A budget is a form of forecasting. Forecasting methods are both Qualitative methods and Quantitative methods, Qualitative methods of forecasting rely on the manager's experience and intuition (NOT TESTED).

## Forecasting techniques:

### A. Quantitative Forecasting Methods

- Causal forecasting methods (Regression Analysis)
- Time Series Smoothing methods
  - ✓ Moving Average,
  - ✓ Weighted Moving Average,
  - ✓ Exponential smoothing

### B. Learning Curves

### C. Expected Value

## A. Quantitative Forecasting Methods

- I. **Causal forecasting methods (Regression Analysis)** which look for a cause-and-effect relationship between the variable we are trying to forecast (the **dependent variable**) and one or more other variables (the **Independent variables**).
- II. **Time Series methods:** which look only at the historical pattern of one variable and generate a forecast by extrapolating the pattern using one or more of the **components** of the time series.
  - ✓ Smoothing (Moving Average, Weighted Moving Average, Exponential smoothing)

## I. Causal Forecasting: Regression analysis (least-squares analysis)

Causal forecasting methods are used when the value that we are forecasting can be determined to be affected by some other value. If we can identify a **cause and effect relationship** between what we are forecasting and the other value, and if that relationship is a linear one, we can use a projection of the other value to forecast the value we are interested in.

### A regression equation estimates the dependent variables.

Regression analysis is used to find an equation for the linear relationship among variables. The behavior of the dependent variable is explained in terms of one or more independent variables. Regression analysis is often used to estimate a dependent variable (such as cost) given a known independent variable (such as production).

## Simple Linear Regression

If there is only one independent variable and one dependent variable and the relationship between them is linear, regression analysis is called **simple linear regression**.

## Two basic assumptions of simple Regression Analysis

- 1) Changes in the value of the dependent variable can be explained by changes in the level of the independent variable; and
- 2) The relationship between the dependent variable and the independent variable is linear within the relevant range.

**The simple regression equation**

$$Y = a + b X$$

**Y** = value of the dependent variable, estimated cost

**a** = a fixed quantity, the intercept, that represents the value of Y when X = 0

**b** = the unit variable cost, the coefficient of the independent variable measuring the increase in Y for each unit increase in X (the slope)

**X** = value of the independent variable, the cost driver

Regression analysis is almost a necessity for computing the fixed and variable portions of mixed costs for flexible budgeting.

**Example:**

<u>Month</u>	<u>Supplies Expense (Y)</u>	<u>Production Level (X)</u>
1	\$250	50 units
2	310	100 units
3	325	150 units
4	?	125 units

**Y** = value of the dependent variable, estimated cost of Supplies Expense

**a** = a fixed quantity, assume Fixed cost =\$220

**b** = the unit variable cost, assume variable cost per unit= **\$.75**

**X** = value of the independent variable, the cost driver, 125 units

Regression analysis will enable us to predict the amount of supplies expense for month four

$$Y = a + bX + e$$

$$Y = \$220 + \$.75 \text{ per unit} \times 125 \text{ units}$$

$$Y = \$313.75 \quad \text{Expense estimate for month 4}$$

**Correlation analysis****Coefficient of correlation R**

Correlation is the strength of the linear relationship between two variables, expressed mathematically in terms of the coefficient of correlation (r).

The **coefficient of correlation** measures the relative strength of the linear relationship. r ranges from 1 (perfect direct relationship) to -1 (perfect inverse relationship).  $\{-1.0 < r < 1.0\}$ .

- ✓ A value of -1.0 indicates a perfectly inverse linear relationship between x and y.
- ✓ A value of zero indicates no linear relationship between x and y.
- ✓ A value of +1.0 indicates a direct relationship between x and y.

**Coefficient of determination R-squared** (coefficient of correlation squared):

A number between zero and one that describes the explanatory power of the regression (the degree to which the change in Y can be explained by changes in X)

The maximum value for  $R^2$  is 1.00 (i.e., 100%)

If the coefficient of determination, or  $r^2$ , is low, it may mean that we are using the wrong independent variable in our analysis. The coefficient of determination ( $r^2$ ) measures the percentage of the **total variance** in cost that can be explained by the regression equation.

**EXAMPLE:** A car dealership determines that new car sales are a function of disposable income with a coefficient of correlation of .8. This is equivalent to stating that 64% ( $.8^2$ ) of the variation of new car sales from the average can be explained by changes in disposable income.

### **T-value**

The t-value measures the reliability of each independent variable, which is the degree to which the independent variable has a valid, long-term relationship with the dependent variable.

### **Standard error of the estimate (SE)**

A measure of the accuracy of the regression's estimate. SE can be compared to the average size of the dependent variable. If the SE value is relatively small compared to the value of the dependent variable, the regression model can be viewed as relatively "good"

### **Multiple Regression Analysis**

However, it is also possible for one dependent variable (for example, sales) to be affected by more than one independent variable (for example, advertising expenditures, size of the sales staff, competition, the economy and any number of other possible causes). When there is more than one independent variable, the regression analysis is called **multiple regression analysis**.

## **Benefits and Limitations of Regression Analysis**

### **The benefits or advantages of regression analysis are:**

- Regression analysis is a quantitative method and as such, it is objective. A given data set generates a specific result. That result can be used to draw conclusions and make forecasts.
- Thus, regression analysis is an important tool for use in budgeting and cost accounting. In budgeting, it is virtually the only way to compute fixed and variable portions of costs that contain both fixed and variable components (**mixed costs**).

### **The shortcomings or limitations of regression analysis are:**

- To use regression analysis, historical data is required for the variable that we are forecasting or for the variables that are causal to this variable. If historical data is not available, regression analysis cannot be used.
  - Even when historical data is available, if there has been a significant change in the conditions surrounding that data, its use is questionable for predicting the future.
  - analysis are valid only for the range of data in the sample
  - In causal forecasting, the usefulness of the data generated by regression analysis depends upon the choice of independent variable (s). If the choice of independent variable (s) is inappropriate, the results can be misleading.
-

## II. Time Series Methods

- **Time series data** reflects activity for one variable – an organization, plant, activity, or one expense classification – over a sequence of past time periods.
- A **time series method of forecasting** uses only these historical values in an attempt to find (discover) a pattern in them that can be used in forecasting the future. Only that one set of historical time series data is used in time series analysis and that historical data is not compared to any other set of data.

## Components of the Time Series

A time series may have one or more of four **patterns** (also called components) that influence its behavior over time:

- **Trend or secular trend** (Resulting from long term- multiyear -factors)
- **Cyclical** (Resulting from long term- multiyear- cyclical movements in the economy)
- **Seasonal** (Resulting from factors within one year or one day)
- **Irregular or Random Variation** (Resulting from short term, unanticipated ,and nonrecurring factors)

## Trend Pattern

- Over a long period of time, the historical data may exhibit a **trend**, which is a gradual shifting to a higher or lower level.
- For example, sales from year to year may fluctuate but overall, they may be going up, as is the case in the graph below.

- The long-term sales trend has been upward from 1994 to 2003, despite the dips in 1996 and 2000. According to this trend, a reasonable sales forecast for 2004 would be \$3,250,000.

## Cyclical Pattern

- A long-term trend line can still be established even if the sequential data fluctuates greatly from year to year due to cyclical factors. Any recurring fluctuation that lasts longer than one year is attributable to the **cyclical component** of the time series.
- The cyclical component is usually due to the cyclical nature of the economy.
  - ✓ For example: periods of modest inflation followed by periods of rapid inflation can lead to many time series that alternate below and above a generally increasing trend line.

## Seasonal Pattern

- In order to identify trend and cyclical components of a time series, we track the annual historical movements of the data over several years. That is, we look only at results for full years, such as total sales for the years 1994 through 2003.
- However, a time series can fluctuate within the year due to seasonality in the business.
  - ✓ For example, a manufacturer of swimming pools expects low sales activity in winter months, with peak sales in summer.
- Seasonal variations are common in many businesses. **In practice**, a variety of methods exist for including seasonal variations in a forecasting model, but most methods use a seasonal index. Alternatively, seasonal variations can be removed from data by using a weighted average of several time periods instead of data from individual periods.

## Irregular Pattern

- A time series can also vary in a random pattern, not repeating itself in any regular pattern.
- This is called the **irregular pattern or random variables**. It is caused by short-term, nonrecurring factors, and its impact on the time series cannot be predicted.
  - ✓ For example, business can be affected by random happenings (e.g., weather, strikes, fires, etc.).

## Using Time Series methods

The objective of time series analysis is to develop a forecast for future results.

Time series **Smoothing** methods are:

- **Moving averages,**
- **Weighted moving averages and**
- **Exponential smoothing.**

### a. Simple Moving Averages

Use the average of the most recent data in the time series.

### b. Weighted Moving Average

Is a variation of the simple moving average method. When utilizing this method, we use different **weights** for each value and compute a weighted moving average, using the most recent data in the time series.

- **EXAMPLE** :ABC Corporation wants to use a four-month weighted moving average method to forecast sales for the month of May. Actual sales for ABC for the months of January, February, March and April are as follows:

January	\$21,000,000
February	23,000,000
March	25,000,000
April	20,000,000

- ABC has assigned a descending weight to each month's values, starting with the most recent month. Each of the month's results is multiplied by the weight, and then these individual monthly values are added together to determine the May forecast. The weights ABC has assigned to the four previous months are 40%, 30%, 20% and 10%. This means that the results in the most recent month (April) will have four times the impact on the May forecast as the oldest month (January). Note that the total of all the weights equals 10/10, or 1.
- The weighted moving average is the total, \$22,200,000, and this is the expected result for the month of May.

			<u>Weight</u>		
April	\$20,000,000	*	4/10	=	\$ 8,000,000
March	25,000,000	*	3/10	=	7,500,000
February	23,000,000	*	2/10	=	4,600,000
January	21,000,000	*	1/10	=	<u>2,100,000</u>
					<b><u>\$22,200,000</u></b>

### c. Exponential Smoothing

- Is a special type of weighted moving average. With exponential smoothing, we forecast a value for the next period by calculating a weighted average of two numbers only:
  - ✓ The most recent period's **actual** value, and
  - ✓ The most recent period's **forecasted** value, using exponential smoothing.
- The calculation is expressed algebraically as follows:

$$F_{t+1} = \alpha Y_t + (1 - \alpha) F_t$$

Where:

- o  $F_{t+1}$  = forecast for the next period
- o  $Y_t$  = actual value for period  $t$
- o  $F_t$  = forecasted value for period  $t$
- o  $\alpha$  = smoothing constant (between 0 and 1)
- **EXAMPLE:** In January, ABC Corporation began using exponential smoothing to forecast sales for each month. Actual and forecasted sales, in millions, for ABC for the months of January, February, March and April are as follows. Forecasted sales for January through April have been calculated using exponential smoothing and an *alpha* of .1.

	Actual (Y)	Forecasted* (F)
January	\$21.0	N/A
February	23.0	\$21.0
March	25.0	21.2
April	20.0	21.6

\*Forecasted by means of exponential smoothing.

- To calculate a sales forecast for the month of May using exponential smoothing, use only the **actual sales for the month of April** and the **forecasted sales (forecasted using exponential smoothing) for the month of April**.
- As you may have noticed, not just any forecast can be used in this calculation. For exponential smoothing to work, the forecasted value used can only be one that was calculated using exponential smoothing.
- The forecasted sales figure for the month of May will be:  
 $F_{t+1} = (.1 * 20) + (.9 * 21.6)$   
 $F_{t+1} = 21.4$

Note: 1) The current period's actual results multiplied by the smoothing factor, and  
 2) The current period's forecast multiplied by the smoothing factor's complement.

## C.Learning Curves

**Learning curves** describe the fact that the more experience people have with something, the more efficient they become in doing that task. Higher costs per unit early in production are part of the start-up costs. It is commonly accepted that new products and production processes experience a period of low productivity followed by increased productivity.

However, the rate of productivity improvement declines over time until it reaches a level where it remains, until another change in production occurs.

### There are two learning-curve models:

#### ➤ Cumulative Average-Time Learning Model

- ✓ Evaluates the **average** time per unit required to produce a given number of units.

#### ➤ Incremental Unit-Time Learning Model

- ✓ Evaluates the time needed to produce the **last unit** in a quantity of units.

CMA questions have historically used the (cumulative-average-time method).

### Cumulative Average-Time Learning Model

- The Cumulative Average-Time Learning Model uses a constant percentage of decline in **average time per unit** each time that the cumulative quantity of units produced doubles.
  - ✓ In other words, if a plant that manufactures automobiles is subject to an 80% learning curve, and if the time required to build the **first** automobile is 10 hours, then the total time required to manufacture **the first 2** autos will be 80% of (10 hours \* 2), or 16 hours, which equates to an **average of 8 hours** for each automobile.
  - ✓ Note that this model measures **total** time required, which includes the time for the first unit, and uses that total time to determine **average time per unit** for the entire amount produced. This is what "cumulative average" means.
- If learning had not taken place, it would have taken 20 hours (2 \* 10 hours) to produce 2 autos. Thus, a learning rate of 1.00 or 100% is equivalent to no learning taking place.
- The maximum learning rate is 50%, or .50, because at a rate of 50%, the total time required for production of 2 automobiles would be equal to the time required to produce the first automobile (100 \* 2 \* .5), and it is impossible to produce 2 units in less time than it took to produce 1. Therefore, the learning rate will always be between 50% and 100%.

### CMA Example

The cost accountant for Ray Lighting Manufacturing Company is planning production costs for a new lamp. Production of the new lamp will be subject to a 60% learning curve, since it involves only minimal adjustments to established processes. The initial lot of 500 lamps is expected to require 1,000 hours of labor.

Costs are as follows:

- ✓ Direct Labor \$20/hr.
- ✓ Direct Materials \$50/DLH
- ✓ Variable OH Applied \$25/DLH
- ✓ Fixed OH Applied \$2,000/lot manufactured

**(1) What is the cumulative average time per unit after 8 lots have been manufactured, if the cumulative average-time model is used?**

- **Answer:** With a 60% learning curve, when the quantity of units produced doubles, the cumulative average time per unit for the doubled number of units is 60% of the cumulative average time per unit for the original number of units.

- In this case, we are working with lots of 500 rather than units. However, the question asks for average time **per unit**, and there are 500 units in each lot.
- The first doubling will occur when the second lot of 500 has been produced. The second doubling will occur when the fourth lot of 500 has been produced. The third doubling will occur when the eighth lot of 500 has been produced.

Therefore, the **total** number of labor hours required for 8 lots of 500 lamps is:

**1000 hours for the first lot (500 units)**  
**1000 hours X 2 (double) X60% =1200 (1000 units,2 lots)**  
**1200 hours X 2 (double) X60% =1440 (2000 units,4 lots)**  
**1440 hours X 2 (double) X 60%=1728 (4000 units ,8 lots)**

- Or,  $1,000 * (2 * .60) * (2 * .60) * (2 * .60) = 1,000 * 1.2 * 1.2 * 1.2 = 1,728$  **total** labor hours required for 8 lots.
- $1,728$  total labor hours required  $\div$  8 lots = average of 216 labor hours **per lot**.
- Average 216 labor hours per lot  $\div$  500 lamps per lot = .432 cumulative average number of labor hours required **per lamp** for 8 lots of 500 lamps each.

#### What is the total cost for the eighth lot?

- **Answer:** To determine an **incremental** cost under the cumulative average-time learning model, set up a chart such as the following:

Cum # of Lots	Cum Avg Time/Lot	Cum Tot Time	Cumulative Cost	Addition to Cum. Cost
1	* 1,000	= 1,000	$(\$95 * 1,000)^{(a)} + (\$2,000 * 1)^{(b)} = \$97,000$	\$97,000
2	* 600	= 1,200	$(\$95 * 1,200) + (\$2,000 * 2) = \$118,000$	21,000
4	* 360	= 1,440	$(\$95 * 1,440) + (\$2,000 * 4) = \$144,800$	26,800
8	* 216	= 1,728	$(\$95 * 1,728) + (\$2,000 * 8) = \$180,160$	35,360

- Addition to Cumulative Cost is the cumulative cost of the total number of lots manufactured. The total number of lots manufactured is in the first column. Here, that is \$118,000 after the second lot. Subtract the previous cumulative cost, which was \$97,000 after the first lot, from it, and you will have the cost of only Lot 2.
- The Addition to Cumulative Cost for Lots 3 and 4 (the third doubling) is \$144,800 minus \$118,000, or \$26,800. Since there are 2 lots (Lots 3 and 4) that have cost a total of \$26,800, the cost of each lot is 1/2 that amount. Thus, Lot 3 costs \$13,400 and Lot 4 costs \$13,400.
- The total cost for the **final 4 lots** (Lots 5, 6, 7 and 8) is \$35,360, which is \$180,160 minus \$144,160. Thus, the total cost for just the eighth lot is 1/4 of that, or \$8,840.
  - (a) \$95 is the total variable cost per DLH: \$20 for direct labor, \$50 for direct materials, and \$25 for variable overhead applied. 1,000 is the number of hours required to manufacture the first lot. After 2 lots have been manufactured (the first doubling), the average time per lot will be 60% of 1,000 hours, or 600 hours, so the cumulative total time will be (600 hours \* 2), or 1,200 hours.
  - (b) \$2,000 is the fixed overhead applied per lot. Multiply the fixed overhead applied per lot by the number of lots (in column 1).

#### Benefits of Learning Curve Analysis

- Decisions such as the following can be aided by learning curve analysis:
  - ✓ Life-Cycle costing – in calculating the cost of a contract, learning curve analysis can ensure that the cost estimates are accurate over the life of the contract, leading to better bidding.
  - ✓ Development of production plans and labor requirements – production and labor budgets should be adjusted to accommodate learning curves.

### Limitations of Learning Curve Analysis

- ➔ There are three limitations and problems associated with learning curve analysis:
  - ✓ Learning curve analysis is **appropriate only for labor-intensive operations involving repetitive tasks** where repeated trials improve performance. If the production process is designed to have fast set-up times using robotics and computer controls, there is little repetitive labor and thus little opportunity for learning to take place.
  - ✓ The **learning rate is assumed to be constant**.
  - ✓ Third, a carefully estimated learning curve might be unreliable because the observed change in productivity in the data used to fit the model was actually associated with factors other than learning. For example, the increase in productivity might have been due to a change in labor mix, a change in product mix, or some combination of other related factors. In such cases, the learning model is unreliable and produces inaccurate estimates of labor time and cost.

## D.Expected Value

Is the Weighted average of the outcomes of a decision with the probability of each outcome serving as the weight. Also called expected monetary value.

- The **expected value** of a discrete random variable is the **weighted average of all the possible values** of the random variable. The weights are the probabilities for each of the values. The expected value is the **mean** value, also known as the **average** value.
- We will construct a comprehensive example illustrating all the tested terms .

## Risk, Uncertainty and Expected Value

- There are many definitions of **risk**. One definition is “a condition in which there is a possibility of an adverse deviation from a desired outcome.” This is risk defined in its negative connotation.
- However, in a very real sense, risk does not carry a negative connotation. Where investments are concerned (both capital investments and security investments), risk is the possibility that an investment’s **actual** return will differ from its **expected** return. This difference may be either a positive difference or a negative difference.
- **Risk** for a security can be measured by the **variability** of its historical returns or the **dispersion** of its historical returns around their average, or mean, return. Thus, risk is measured by **variance** and **standard deviation**.
- **Uncertainty** is risk that cannot be measured. In discussing a capital investment, we may or may not have information about historical returns on similar investments. If there is no information about historical returns for a particular investment, we are in the position of **decision-making under a condition of uncertainty**. When we are in this position, the probability distribution of possible returns must be determined **subjectively**.

## Example:

- PDC has purchased land, which will be the site of a new luxury condominium complex. PDC plans to price the individual condominium units between \$300,000 and \$1,400,000. PDC has preliminary design with three different size of the condominium.
  - ✓ One with 30 cond.
  - ✓ One with 60 cond.
  - ✓ One with 90 cond.
- The financial success of the project depend upon the size of the cond. Complex and the chance event concerning the demand for the cond.
- The statement of the PDC decision problem is to select the size of the new cond. Project that will lead to the largest profit giving the uncertainty concerning the demand for cond..
- So , it is clear that the decision is to select the best size for the cond. complex .

### ➤ PDC has the following three decision alternatives

- ✓ d1 = a small complex with 30 cond.
- ✓ d2 = a medium complex with 60 cond.
- ✓ d3 = a large complex with 90 cond.

- A factor in selecting the best decision alternatives is the uncertainty associated with the chance event concerning the demand for the cond.

- When asked about the possible demand for the cond. , the PDC’s president acknowledge a wide range of possibilities , **but decided that it would be adequate to consider two possible chance event outcomes :**

- ✓ Strong demand and ,
- ✓ Weak demand.

- In decision analysis the possible outcomes for a chance event are referred to as states of nature. The state of nature are defined so that one and only one of the possible states of nature will occur.

- For the PDC problem, the chance event concerning the demand for condos. has two states of nature:

- ✓ S1 = Strong demand for the condos.
- ✓ S2 = Weak demand for the condos.

- Thus, management must first select a decision alternative (Complex Size), then a state of nature follows (demand for the cond.), and finally a consequence will occur. In this case, the consequence is the PDC's profit.

## Payoff Tables

- Given the three decision alternatives and the two state of nature, which complex size should PDC choose?
- To answer this question, PDC will need to know the consequence associated with each decision alternatives and each state of nature.
- In decision analysis, we refer to the consequence resulting from a specific combination of a decision alternatives and a state of nature as Payoff.

Payoff Table for the PDC cond. Project (Payoffs in \$ Million)

Decision Alternatives	State of Nature	
	Strong Demand S1	Weak Demand S2
Small complex d1	8	7
Medium Demand d2	14	5
Large complex d3	20	-9

## Decision Trees and Expected Value

A **decision tree** is a means of determining the best course of action when there are several possible decision choices under a condition of risk.

- In words, the expected value of a decision alternative is the sum of weighted payoffs for the decision alternative. The weight for a payoff is the probability of the associated state of nature and therefore the probability that the payoff will occur. Let us return to the PDC problem to see how the expected value approach can be applied.
- PDC is optimistic about the potential for the luxury high-rise condominium complex.
- suppose that this optimism leads to an initial subjective probability assessment of 0.8 that demand will be strong (s1) and a corresponding probability of 0.2 that demand will be weak (s2).
- Thus,  $P(s1) = 0.8$  and  $P(s2) = 0.2$ . Using the payoff values in Table 4.1 and equation (4.4), we compute the expected value for each of the three decision alternatives as follows:  
 $EV(d1) = 0.8(8) + 0.2(7) = 7.8$   
 $EV(d2) = 0.8(14) + 0.2(5) = 12.2$   
 $EV(d3) = 0.8(20) + 0.2(-9) = 14.2$
- Thus, using the expected value approach, we find that the large condominium complex, with an expected value of \$14.2 million, is the recommended decision.
- The calculations required to identify the decision alternative with the best expected value can be conveniently carried out on a decision tree. Figure 4.3 shows the decision tree for the PDC problem with state-of-nature branch probabilities. Working backward through the decision tree, we first compute the expected value at each chance node. That is, at each chance node, we weight each possible payoff by its probability of occurrence. By doing so, we obtain the expected values for nodes 2, 3, and 4, as shown in Figure 4.4.

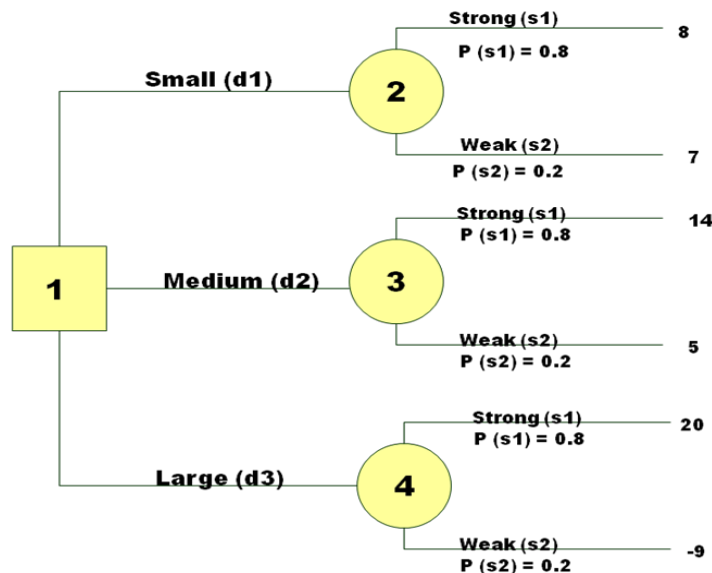

- Because the decision maker controls the branch leaving decision node 1 and because we are trying to maximize the expected profit, the best decision alternative at node 1 is  $d_3$ .

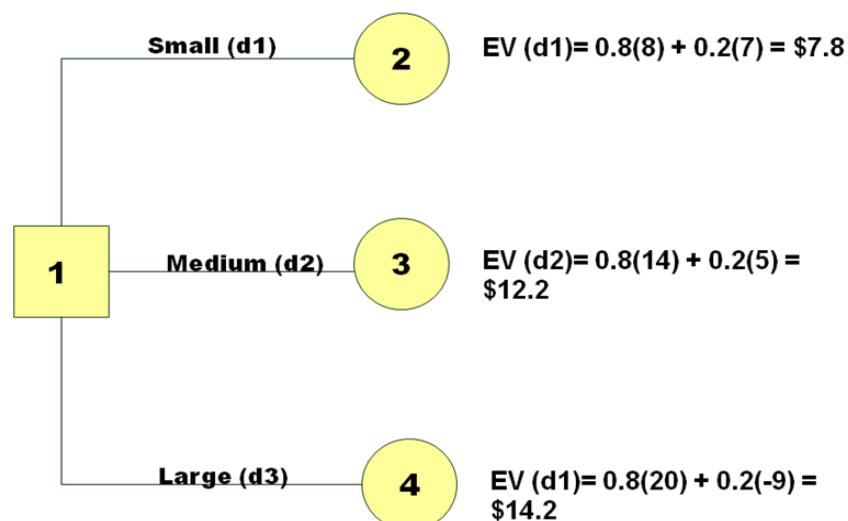

- Thus, the decision tree analysis leads to a recommendation of  $d_3$  with an expected value of \$14.2 million. Note that this recommendation is also obtained with the expected value approach in conjunction with the payoff table.

- Other decision problems may be substantially more complex than the PDC problem, but if a reasonable number of decision alternatives and states of nature are present, you can use the decision tree approach outlined here. First, draw a decision tree consisting of decision nodes, chance nodes, and branches that describe the sequential nature of the problem.
- If you use the expected value approach, the next step is to determine the probabilities for each of the states of nature and compute the expected value at each chance node. Then select the decision branch leading to the chance node with the best expected value. The decision alternative associated with this branch is the recommended decision.

➤ Figure 4.3 PDC DECISION TREE WITH STATE-OF-NATURE BRANCH PROBABILITIES

➤ Figure 4.4 APPLYING THE EXPECTED VALUE APPROACH USING DECISION TREES

**Expected Value of Perfect Information**

Suppose that PDC has the opportunity to conduct a market research study that would help evaluate buyer interest in the condominium project and provide information that management could use to improve the probability assessments for the states of nature. To determine the potential value of this information, we begin by supposing that the study could provide **perfect information** regarding the states of nature; that is, we assume for the moment that PDC could determine with certainty, prior to making a decision, which state of nature is going to occur.

To make use of this perfect information, we will develop a decision strategy that PDC should follow once it knows which state of nature will occur. A decision strategy is simply a decision rule that specifies the decision alternative to be selected after new information becomes available.

To help determine the decision strategy for PDC, we have reproduced PDC's payoff table as Table 4.6.

Note that, if PDC knew for sure that state of nature S1) would occur, the best decision alternative would be  $d_3$ , with a payoff of \$20 million.

Similarly, if PDC knew for sure that state of nature S2 would occur, the best decision alternative would be  $d_1$ , with a payoff of \$7 million.

- Thus, we can state PDC's optimal decision strategy when the perfect information becomes available as follows:

If  $s_1$ , select  $d_3$  and receive a payoff of \$20 million.

If  $s_2$ , select  $d_1$  and receive a payoff of \$7 million.

- What is the expected value for this decision strategy? To compute the expected value with we return to the original probabilities for the states of nature :

➤  $P(s_1)=0.8$ , and  $P(s_2) = 0.2$ .

- Thus, there is a 0.8 probability that the perfect information will indicate state of nature  $s_1$  and the resulting decision alternative  $d_3$  will provide a \$20 million profit. Similarly, with a 0.2 probability for state of nature  $s_2$ , the optimal decision alternative  $d_1$  will provide a \$7 million profit. Thus, from equation (4.4), the expected value of the decision strategy that uses perfect information is

$$0.8(20) + 0.2(7) = 17.4$$

- We refer to the expected value of \$17.4 million as the *expected value with perfect information (EVwPI)*.

- Earlier in this section we showed that the recommended decision using the expected value approach is decision alternative  $d_3$ , with an expected value of \$14.2 million. Because this decision recommendation and expected value computation were made without the benefit of perfect information, \$14.2 million is referred to as the *expected value without perfect information (EVwoPI)*.

**The expected value of the perfect information (EVPI)**

- The expected value with perfect information is \$17.4 million, and the expected value without perfect information is \$14.2; therefore, the expected value of the perfect information (EVPI) is  $\$17.4 - \$14.2 = \$3.2$  million.

- In other words, \$3.2 million represents the, additional expected value that can be obtained if perfect information were available about the states of nature.

- Generally speaking, a market research study will not provide "perfect" information; however, if the market research study is a good one, the information gathered might be worth a sizable portion of the \$3.2 million. Given the EVPI of \$3.2 million, PDC should seriously consider the market survey as a way to obtain more information about the states of nature.

#### F.4.6 : PAYOFF TABLE FOR THE PDC CONDOMINIUM PROJECT (\$ MILLION)

Decision Alternative	State of Nature	
	Strong Demand $s_1$	Weak Demand $s_2$
Small complex, $d_1$	8	7
Medium complex, $d_2$	14	5
Large complex, $d_3$	20	-9

In general, the expected value of perfect information is computed as follows:

$$EVPI = IEVwPI - EVwoPI$$

where

EVPI = expected value of perfect information

EVwPI = expected value *with* perfect information about the states of nature

EVwoPI = expected value *without* perfect information about the states of nature

Sensitivity analysis is especially useful and significant when probabilities of states of nature and decision payoffs are derived subjectively rather than by using objectively quantifiable information

## Sensitivity (Postoptimality) Analysis

### Definition

Sensitivity analysis. A what-if technique that managers use to calculate how an outcome will change if the original predicted data are not achieved or if an underlying assumption changes.

It is particularly helpful when there is a great deal of uncertainty about the various Inputs to a decision model.

## Typical Application of Sensitivity (Postoptimality) Analysis

### Budgeting

Sensitivity analysis adds an extra dimension to budgeting. It enables managers to examine how budgeted amounts change with changes in the underlying assumptions. This assists managers in monitoring those assumptions that are most critical to a company in attaining its budget and allows them to make timely adjustments to plans when appropriate.

### Linear programming

In linear programming problems, sensitivity is the range within which a constraint value, such as a cost coefficient or any other variable, may be changed without changing the optimal solution.

Shadow price is the synonym for sensitivity in that context.

Sensitivity analysis is the study of how changes in the coefficients of a linear programming problem affect the optimal solutions.

### Discounted cash flow methods

In the application of discounted cash flow methods (e.g., net present value), a sensitivity analysis might be performed to ascertain the effects of variability of the discount rate or periodic cash flows.

### Financial planning models

Financial planning models, including those for cash flows and capital budgeting, are other significant applications of sensitivity analysis. For example, changes in selling prices or resource costs may affect available cash and require more or less short-term borrowing.

### **CVP analysis**

The calculation of the margin of safety in a CVP analysis.

Other uses for sensitivity analysis are "What-if" analysis to determine the effect on a project if one variable changes.

## **THE IMPORTANCE OF SENSITIVITY ANALYSIS**

One of the primary advantages of conducting sensitivity analysis is the ability to isolate risks associated with particular components of operations and to develop contingency plans for dealing with these risks

- ➔ Sensitivity analysis is important to decision makers because real world problems exist in a changing environment. Prices of raw material change, product demand change , and so on. If a leaner programming model has been used in such an environment, we can expect some of the coefficients in the model to change over time.
  - ✓ e.g., economic conditions, is a type of the decision variables outside the control of the decision maker, so it called "Exogenous variables".
- ➔ As a result, we will want to determine how changes affect the optimal solution. Sensitivity analysis provides information needed to respond to such changes without requiring a complete solution of a revised linear programming.

### CMA Exam Retired Questions

- (1)2. The table below shows the estimated probabilities of the percent of defective units resulting from a production run.

Percent Defective	Probability
2%	30%
3%	50%
4%	20%

The expected percent defective for a production run would be

- a. 1.50%.
- b. 2.30%.
- c. 2.90%.
- d. 3.00%.

- (2)3. Reeves Inc. has developed a new production process to manufacture its product. The new process is complex and requires a high degree of technical skill. However, management believes there is a good opportunity for the employees to improve as they become more familiar with the production process. The production of the first unit requires 100 direct labor hours. If a 70% learning curve is used, the cumulative direct labor hours required to produce a total of eight units would be

- a. 196 hours.
- b. 274 hours.
- c. 392 hours.
- d. 560 hours.

- (3)4. A forecasting technique that is a combination of the last forecast and the last observed value is called

- a. Delphi.
- b. least squares.
- c. regression.
- d. exponential smoothing.

- (4)5. A large manufacturer's forecast of total sales revenues for a year is **least** likely to be influenced by

- a. the seasonal pattern of sales revenues throughout the year.
- b. anticipated interest rates and unemployment rates.
- c. expected shortages of key raw materials.
- d. input from sales personnel.

- (5)16. CSO: 1A2a LOS: 1A2c

In order to analyze sales as a function of advertising expenses, the sales manager of Smith Company developed a simple regression model. The model included the following equation, which was based on 32 monthly observations of sales and advertising expenses with a related coefficient of determination of .90.

$$S = \$10,000 + \$2.50A$$

S = sales

A = advertising expenses

If Smith Company's advertising expenses in one month amounted to \$1,000, the related point estimate of sales would be

- a. \$2,500.
- b. \$11,250.
- c. \$12,250.
- d. \$12,500.

(6)17. CSO: 1A2a LOS: 1A2a

The results of regressing Y against X are as follows.

Coefficient

Intercept (Fixed cost) 5.23

Slope(Variable cost) 1.54

When the value of X (Volume) is 10, the estimated value of Y(Total cost)is

- a. 6.78.
- b. 8.05.
- c. 20.63.
- d. 53.84.

(7)18. CSO: 1A2b LOS: 1A2d

Which one of the following techniques would **most** likely be used to analyze reductions in the time required to perform a task as experience with that task increases?

- a. Regression analysis.
- b. Learning curve analysis.
- c. Sensitivity analysis.
- d. Normal probability analysis.

(8)19. CSO: 1A2b LOS: 1A2e

Aerosub Inc. has developed a new product for spacecraft that includes the manufacturing of a complex part. The manufacturing of this part requires a high degree of technical skill. Management believes there is a good opportunity for its technical force to learn and improve as they become accustomed to the production process. The production of the first unit requires 10,000 direct labor hours. If an 80% learning curve is used and eight units are produced, the cumulative average direct labor hours required per unit of the product will be

- a. 5,120 hours.
- b. 6,400 hours.
- c. 8,000 hours.
- d. 10,000 hours.

(9)20. CSO: 1A2b LOS: 1A2d

A manufacturing firm plans to bid on a special order of 80 units that will be manufactured in lots of 10 units each. The production manager estimates that the direct labor hours per unit will decline by a constant percentage each time the cumulative quantity of units produced doubles. The quantitative technique used to capture this phenomenon and estimate the direct labor hours required for the special order is

- a. cost-profit-volume analysis.
- b. the Markov process.
- c. linear programming analysis.
- d. learning curve analysis.

(10)21. CSO: 1A2b LOS: 1A2e

A manufacturing company has the opportunity to submit a bid for 20 units of a product on which it has already produced two 10-unit lots. The production manager believes that the learning experience observed on the first two lots will continue for at least the next two lots. The direct labor required on the first two lots was as follows.

- 5,000 direct labor hours for the first lot of 10 units
- 3,000 additional direct labor hours for the second lot of 10 units

The learning rate experienced by the company on the first two lots of this product is

- a. 40.0%.
- b. 60.0%.
- c. 62.5%.
- d. 80.0%.

## SELF-STUDY PROBLEMS

### 1. MASTER BUDGET

1. Hansell Company's management wants to prepare budgets for one of its products, duraflex, for July 2002. The firm sells the product for \$40 per unit and has the following expected sales units for these months in 2002:

	April	May	June	July	Aug.	Sep.
	5,000	5,400	5,500	6,000	7,000	8,000

- The production process requires 4 pounds of dura-I000 and 2 pounds of flexplas.
- The firm's policy is to maintain a minimum of 100 units of duraflex on hand at all times with no fewer than 10 percent of units on hand at the end of a period to meet the expected sales for the following month.
- All materials inventories are to be maintained at 5 percent of the production needs for the next month, but not to exceed 1000 pounds.
- The firm expects all inventories at the end of June to be within the guidelines. The purchase department expects the materials to cost \$1.25 per pound and \$5.00 per pound of dura-I000 and flexplas, respectively.
- The production process requires direct labor at two skill levels.
  - The rate for labor at the K102 level is \$50 per hour and for the K175 level is \$20 per hour. The K102 level can process one batch of duraflex per hour; each batch consists of 100 units.
  - The manufacturing of duraflex also requires one-tenth of an hour of K175 workers' time for each unit manufactured.
- Manufactured overhead is allocated at the rate of \$200 per batch and \$30 per direct labor-hour.

**Required** On the basis of the preceding data and projections, prepare the following budgets for **July** 2002:

- a. Sales budget (in dollars).
- b. Production budget (in units).
- c. Production budget for **August** (in units).
- d. Direct materials purchase budget (in pounds).
- e. Direct materials purchase budget (in dollars).
- f. Direct manufacturing labor budget (in dollars).

.....  
g. define the role of sales budget in the development of the annual profit plan and identity the factors that should be considered when preparing a sales forecast and evaluate the feasibility of the sales forecast based on business and economic information provided.

h. explain the relationship between the sales budget and the production budget and identity the role that inventory levels play in the preparation of a production budget and define other factors that should be considered when preparing a production budget.

i. identify the relationship between the direct materials budget, the direct labor budget, and the production budget

j. explain how inventory levels and procurement policies affect the direct materials budget

k. identify and describe alternative ways of allocating employee benefit expense.

l. Identify the components of the selling and administrative budget and explain how specific components of the selling and administrative budget may affect the contribution margin.

m. define the purposes of the cash budget and describe the relationship between the cash budget and all other budgets and identify the relationship between credit policies and purchasing (payables) policies and the cash budget.

n. define the purpose of a pro forma income statement, a pro forma statement of financial position, and a pro forma cash flow statement and identify the relationship among these statements and all other budgets ( evaluate whether a company has achieved strategic objectives based on pro forma income statements).

o. Outline the budgeting process.

THE AMERICAN UNIVERSITY IN CAIRO  
School of Continuing Education

1. Master Budget

Sales Budget (in dollars).

HANSEII COMPANY  
Sales Budget  
For July 2002

Budgeted sales in units	6,000
Budgeted selling price per unit	\$ 40
Budgeted sales	\$ 240,000

b.

HANSEII COMPANY  
Production Budget (in units)  
For July 2002

Desired ending inventory (July 31)		
(The higher of 100 and $7,000 \times 0.1$ )		700
Budgeted sales for July 2002	+	6,000
Total units needed for July 2002		6700
Beginning inventory (July 1)	-	
(The higher of 100 and $6,000 \times 0.1$ )		600
Units to manufacture in July		6100

c.

HANSEII COMPANY  
Production Budget (in units)  
For August 2002

Desired ending inventory ( $8,000 \times 0.1$ )		800
Budgeted sales	+	7,000
Total units needed		7800
Beginning inventory	-	700
Units to manufacture in August		7100

d.

HANSEII COMPANY  
Direct Materials Purchases Budget (in  
pounds)  
For July 2002

**THE AMERICAN UNIVERSITY IN CAIRO**  
**School of Continuing Education**

	Dura-1000 (4lb. each)	Direct Materials Flexplas (2lb. each)
Materials required for budgeted production (6,100 units of duraflex)	24400	12200
Add: Target inventories (lower of 1,000 or 5 percent of August production needs)	1000	710
Total materials requirements	25400	12910
Less: Expected beginning inventories (lower of 1,000 or 5 percent)	1000	610
Direct materials to be purchased	24400	12300

HANSEIL COMPANY Direct Materials Purchases Budget (in dollars)			
e.	For July 2002		
	Budgeted Purchases (Pounds)	Expected Purchase Price per Unit	Total
Dura-1000	24400	1.25	30,500
Flexplas	12300	5	61,500
<b>Budgeted purchases</b>			<b>92,000</b>

HANSEIL COMPANY Direct Manufacturing labor Budget For July 2002					
	Direct Labor-Hours per Batch	Number of Batches	Total Hours	Rate per Hour	
K102 Hours	1	61		61	50 \$ 3,050
K175Hours	10	61		610	20 \$ 12,200
Total				671	\$ 15,250

**g. define the role of sales budget in the development of the annual profit plan.**

Normally, the preparation of a sales budget is the first step in the comprehensive budget process. Once sales have been determined, related budgets can be prepared, e.g., the production budget, expense budgets, and pro forma financial statements.

A **sales budget** shows expected sales in units at their expected selling prices. Preparation of the sales budget for a period usually starts with the firm's forecasted sales level, production capacity, and long-term and short-term objectives.

A sales budget is the *cornerstone* of budget preparation because a firm can complete the plan for other activities only after it identifies the expected sales level. A manufacturing firm cannot complete its production schedule without knowing the number of units it must produce, and the number of units to be produced can be ascertained only after the firm knows the number of units budgeted to be sold for the period.

A sales forecast estimates future sales of the firm's products and is the starting point in preparing sales budgets for the period. An accurate sales forecast enhances the usefulness of the budget as a planning and control tool.

Sales forecasting by its nature is subjective. To reduce subjectivity in forecasts, many firms generate several independent sales forecasts as a standard procedure. A firm can, for example, have its market research unit, the manager of its business unit, and the sales department of its budget unit prepare a sales forecast. As a result, the volume of sales in the sales budget would be the one that all parties agree is the most likely prediction.

**The following are among the factors that should be considered in sales forecasting:**

- Current sales levels and sales trends of the past few years.
- General economic and industry conditions.
- Competitors' actions and operating plans.
- Pricing policies.
- Credit policies.
- Advertising and promotional activities.

For example,

- a) The company may determine that demand is highly elastic for its mature products and that growth will come only from new product introductions and from cost savings on existing products.
- b) At the same time, the company determines that a tight monetary policy on the Fed's part must cause the firm to tighten its credit standards.
- c) Simultaneously, a competitor that the firm knows is a low-cost producer is also considering moving into the markets that the budgeting company is considering.

All of these factors must be taken into account when forming expectations about product sales for the coming budget cycle.

**h. explain the relationship between the sales budget and the production budget and identify the role that inventory levels play in the preparation of a production budget and define other factors that should be considered when preparing a production budget.**

The production budget follows the sales budget. Once a firm knows its expected sales, production can be estimated. The production budget is based on assumptions appearing in the sales budget. A **production budget** is a plan for acquiring and combining the resources needed to carry out the manufacturing operations that allow the firm to satisfy its sales goals and have the desired amount of inventory at the end of the budget period. The total number of units to be produced depends on the budgeted sales, the desired amount of finished goods ending inventory, and the units of finished goods beginning inventory as described in the following:

$$\begin{array}{rclcl}
 \text{Budgeted} & & \text{Budgeted} & & \text{Desired ending} & & \text{Beginning} \\
 \text{production} & = & \text{sales} & + & \text{inventory} & - & \text{inventory} \\
 \text{(in units)} & & \text{(in units)} & & \text{(in units)} & & \text{(in units)}
 \end{array}$$

Selecting the desired ending inventory for a period requires balancing opposing goals. On one hand, a firm does not want to lose sales because of insufficient inventory. On the other hand, having an excessive amount of inventory on hand is costly.

Thus, the organization must determine how quickly it can increase production if demand warrants and then set its desired production and inventory levels accordingly.

For a firm using a just-in-time system, for example, the desired ending as well as the beginning inventory will be a small amount or zero. Other factors that affect a production budget include company policies regarding stabilizing production versus flexible production schedules that minimize finished inventories, conditions of production equipment, availability of production resources such as materials and laborers, and experience with production yield and quality.

The production manager reviews the production budget to ascertain that the firm can attain the budgeted level of production with the facilities available, keeping in mind the other activities scheduled for the same period. If the production level exceeds the maximum capacity available, management can either revise the budgeted sales level or find alternatives to satisfy the demand. If the available capacity exceeds the budgeted production level, management might want to find alternative uses for the idle capacity or schedule other activities such as preventive maintenance and trial runs of new production processes. This ability to coordinate sales -needs and production activities is another benefit of having a budget that allows firms to identify mismatches between capacity and output.

#### **i. identify the relationship between the direct materials budget, the direct labor budget, and the production budget**

All of these budgets are interrelated because a change in one budget may require a change in another budget. As production changes, the amount of labor and material will change. As the amount of labor changes, there may need to be a change in indirect materials and indirect labor. Indirect materials are materials used in the manufacturing process but their costs are not directly traceable to any particular product. Indirect labor would be the same thing. An example of indirect labor would be the wages of a janitor who cleans up the plant, since his wages cannot be traced to any one product. As these items change, there may also be a change required in the overhead budget, caused by, for example, changes in the amount of electricity the company expects to use or changes in the required amount of equipment maintenance. Because of the way that individual budgets are connected to each other, a change in one budget will almost always affect at least one other budget.

#### **j. explain how inventory levels and procurement policies affect the direct materials budget**

To minimize raw materials carrying costs and obsolescence, the purchasing of inputs is tied closely to the projections contained in the production budget.

#### **k. identify and describe alternative ways of allocating employee benefit expense.**

Consider the classification of manufacturing labor payroll fringe costs (for example, employer payments for employee benefits such as Social Security, life insurance, health insurance, and pensions). Some companies classify these costs as manufacturing overhead costs. In other companies, the fringe benefits related to direct manufacturing labor are treated as an additional direct manufacturing labor cost. The latter approach is preferable because the stated wage and the fringe costs together are a fundamental part of acquiring direct manufacturing labor services.

**I. Identify the components of the selling and administrative budget and explain how specific components of the selling and administrative budget may affect the contribution margin.**

The selling and general administrative expense budget contains all nonmanufacturing expenses expected in the budget period. Portions of selling and administrative expenses are variable while others are fixed. Selling and administrative expense budgets are prepared by various departments in a manner consistent with either planned sales volume or the fixed character of the expenses. The selling and administrative budget needs to be detailed in order that the key assumptions associated with it can be better understood.

This budget is important as a guideline for operations. However, using this budget to evaluate performance must be done carefully, because many items in it are discretionary expenditures and have mostly long-term impacts.

For example, a manager could cut expenditures for customer service from \$200,000 to \$50,000 to improve earnings and to show that he or she has good control of expenses. The manager's incentive is a reward in the form of a bonus or promotion resulting from the likely short-term result of this expenditure reduction. The customer service reduction probably will not have any immediate effect on sales but will most likely have negative consequences for the firm in the future. Hence, firms must be wary of taking a short-term perspective when preparing a selling and administrative expense budget.

Another alternative to present S,G&A budget preparation of the individual costs in the value chain activities except the production activity, in this format the firm will prepare both upstream (R&D) and downstream (marketing, distribution, customer service )cost budgets .

The variable and fixed portions of selling and administrative costs must be treated separately.

- 1) Some S&A costs vary directly and proportionately with the level of sales. As more product is sold, sales representatives must travel more miles and serve more customers.
- 2) Other S&A expenses, such as sales support staff, are fixed; they must be paid no matter the level of sales.
- 3) As the variable portion of S&A costs increases, contribution margin, i.e., the amount available for covering fixed costs, is decreased: .

Note that management can make tradeoffs among elements of selling and administrative expenses that can affect contribution margin.

- 1) For example, use of fixed advertising expense will increase contribution margin, while the same sales level might be reached using variable sales commissions, a method that would reduce contribution margin.

**m. define the purposes of the cash budget and describe the relationship between the cash budget and all other budgets and identify the relationship between credit policies and purchasing (payables) policies and the cash budget.**

The last schedule prepared before the financial statements is the cash budget. The cash budget is the most important part of a company's budget program. The cash budget is a schedule of estimated cash collections and payments. The various operating budgets and the capital budget are inputs to the cash budgeting process. A cash budget may be prepared monthly or even weekly to facilitate cash planning and control. A cash budget is an example of a feedforward control because it anticipates cash needs and allows for the provision of resources to meet those needs.

**Cash budget and financing**

Having an adequate amount of cash on hand at all times is crucial for a business's survival and capturing opportunities. A **cash budget** brings together the anticipated effects of all budgeted activities on cash. It also delineates the expected cash receipts and disbursements during the budget period. By preparing a cash budget, management can ensure having sufficient cash on hand to carry out its planned activities, arrange financing in advance to avoid the high costs of emergency borrowing, and plan investments to earn the highest possible return from any excess cash on hand. For smaller firms and those with seasonal business, the cash budget is especially critical to ensuring

smooth operations and avoiding crises. The critical importance of having adequate cash to meet all operation needs leads many firms to consider cash budgets among the most important element of their master budget. A cash budget is particularly valuable in seasonal businesses in which a few months of revenues must be matched with 12 months of costs. Because a temporary shortage of cash may drive an otherwise financially sound organization into bankruptcy, proper planning can prevent financial embarrassment.

A cash budget includes all items that affect cash flows and pulls data from almost all parts of the master budget. In preparing a cash budget, a firm reviews all budgets to identify all revenues, expenses, and other transactions that affect cash. But the cash budget should include all cash inflows and outflows during the period without regard to the accrual accounting treatment of the transactions.

### **Major sections in the cash budget**

A cash budget generally includes three major sections:

1. Cash available
2. Cash disbursements
3. Financing

#### **1. Cash available**

The cash available section details the sources of cash for operations to use. In general, an organization's two sources of cash are the cash balance at the beginning of the budget period and cash collections during that period. Cash collections include cash collected from sales and accounts and notes receivable. Factors that could affect cash sales and cash collection of accounts include the firm's sales levels, credit policy, and collection experience.

A firm can engage in nonroutine transactions that generate cash. Examples are selling operating assets such as equipment or a building, or nonoperating assets such as land purchased for the site of a factory that the firm no longer intends to build. All proceeds from such sales should be included in the cash available section.

#### **2. Cash disbursements**

The cash disbursements section lists all payments, including those for purchases of direct materials and supplies, wages and salaries, operating expenses, interest expenses, and taxes. The difference between cash available and cash disbursements is the *ending cash balance* before financing.

Credit and purchasing policies have a direct impact on the cash budget.

- a) Loose credit policies toward customers' credit result in delayed cash receipts.
- b) Taking advantage of purchase discounts results in accelerated cash outlays.

#### **3. Financing**

A firm must arrange for additional funds if its cash balance is expected to fall below the desired minimum balance set by management. On the other hand, when the firm expects to have a significant amount of excess cash, it must determine how to invest the excess. Return, liquidity, and risk must be weighed for alternative investments. Both the additional funding and planned investments are included in the financing section.

The completed cash budget can be used to plan outside financing activities. For example, if the budget shows a cash deficit at some future date, the firm can plan ahead to borrow the necessary funds or sell stock. .

Dividend policy can also be planned using the cash budget. For instance, dividend payment dates should correspond to a time when the firm has excess cash.

**n. define the purpose of a pro forma income statement, a pro forma statement of financial position, and a pro forma cash flow statement and identify the relationship among these statements and all other budgets ( evaluate whether a company has achieved strategic objectives based on pro forma income statements).**

These financial statements are key elements in helping a company plan for the future. Based on these pro forma statements, a company can: determine if it is meeting its pre-determined targets, estimate the amount of external funding needed to support its projected sales growth; and perform sensitivity analysis to identify the impacts of estimates, operating, and policy changes on selected financial ratios.

This topic traces the process of creating pro forma financial statements using the percentage of sales method, which builds a pro forma income statement and then a pro forma balance sheet, and it shows an example of creating a pro forma statement of cash flows. It describes the process of assessing anticipated performance using pro forma financial statements, including performing sensitivity analyses.

Pro forma statements represent a company's projected financial statements and they are useful in the company's planning process because these statements support four major functions. They help a company to:

1. Assess whether its anticipated performance is in line with its established targets.
2. Anticipate the amount of funding needed to achieve its forecasted sales growth.
3. Estimate the effects of changes in assumptions of key numbers by performing sensitivity analysis (i.e., what-if analysis). Sensitivity analysis helps to identify potential conditions that could lead to major problems for the company. This enables the company to plan for appropriate actions in case such an event should occur. In addition, sensitivity analysis also provides the company with the opportunity to analyze the impact of changing its operating plans.
4. Pro forma financial statements are used to determine whether the company will be able to remain in compliance with the required covenants on its long-term debt. Long-term debt usually involves requirements for the company to maintain certain ratios in its financial statements, and these requirements are called covenants. Covenants are part of most loan agreements. One example of a covenant is a requirement that the company maintain a certain current ratio, such as at least 2 : 1. If the company's current ratio falls below the required level, the company is technically in default on its debt, even though it may be making every scheduled payment. If that happens, the lender can legally demand payment of the entire loan balance immediately, which could force the company into bankruptcy. Therefore, it is very important that the company maintain compliance with its debt covenants. Some of the usual covenants include maintenance of a minimum current ratio, maintenance of a minimum debt ratio, and maintenance of a minimum interest coverage ratio. So calculation and analysis of these ratios need to be a part of the analysis of the pro forma statements.

**The debt to total assets ratio** (also called the debt ratio) The total debt ratio measures the percentage of funds provided by creditors. It determines long-term debt-payment ability and the degree to which creditors are protected from the firm's insolvency. Hence, creditors prefer this ratio to be low as a cushion against losses.

**The pro forma income statement** is used to decide whether the budgeted activities will result in an acceptable level of income. If the initial pro forma income shows a loss or an unacceptable level of income, adjustments can be made to the component parts of the master budget.

Other strategic objectives can also be observed from the pro forma income statement, such as desired rates of return, debt ratio, and the interest coverage ratio (times interest earned). The adequacy of earnings per share can also be observed from the pro forma income statement.

Once the company's dividend policy has been factored in to determine the amount of dividends to be paid, the amount of projected retained earnings will then be added to its current balance sheet to create the pro forma balance sheet, information from the company's capital expenditure budget and cash budget will also be used to help formulate the pro forma balance sheet, Once the pro forma income statement and balance sheet are compiled, the information can then be used to create the pro forma statement of cash flows.

### **Earnings Per Share.**

Complete the Income statement. Interest expense is subtracted from EBIT to calculate EBT. We then subtract tax at a given tax rate to calculate net Income before preferred dividends; and then we subtract preferred dividends to calculate net Income available to common shareholders. Net Income available to common shareholders divided by the number of shares of common stock will give us **Earnings Per Share**. (For forecasting purposes, we do not distinguish between Basic Earnings Per Share and Diluted Earnings Per Share.) Common dividends per share multiplied by the number of common shares equals the total dividends paid on common stock. The forecasted addition to retained earnings is net Income available to common stockholders minus total common dividends. (Note that this is the same as net Income minus preferred dividends minus common dividends.)

**The pro forma balance sheet** is prepared using the cash and capital budgets and the pro forma income statement.

- 1) The pro forma balance sheet is the beginning-of-the-period balance sheet updated for projected changes in cash, receivables, payables, inventory, etc.
- 2) If the balance sheet indicates that a contractual agreement may be violated, the budgeting process must be repeated.
  - a) For example, some loan agreements require that owners' equity be maintained at some percentage of total debt or that current assets be maintained at a given multiple of current liabilities.

**The pro forma statement of cash flows** classifies cash receipts and disbursements depending on whether they are from operating, investing, or financing activities.

- 1) The direct presentation reports the major classes of gross cash operating receipts and 'payments and the difference between them.
- 2) The indirect presentation reconciles net income with net operating cash flow.

Under GAAP, this reconciliation must be disclosed whichever presentation is chosen.

- a) The reconciliation requires balance sheet data, such as the changes in accounts receivable, accounts payable, and inventory, as well as net income.
- d. All the pro forma statements are interrelated (articulated), e.g., the pro forma cash flow statement will include anticipated borrowing. The interest on this borrowing will appear in the pro forma income statement.

### **o. Outline the budgeting process.**

The traditional budgeting process can range from the informal simple processes small firms use that take only days or weeks to complete to elaborate, lengthy procedures large firms or governments employ that span months from start to final approval. The process usually includes the formation of a budget committee; determination of the budget period; specification of budget guidelines; preparation of the initial budget proposal; budget negotiation, review, and approval; and budget revision.

### **Budget Committee**

The budget committee oversees all budget matters and often is the highest authority in an organization for all matters related to the budget. The committee sets and approves the overall budget goals for all major business units, coordinates budget preparation, resolves conflicts and differences that may arise during budget preparation, approves the final budget, monitors operations as the year unfolds, and reviews the operating results at the end of the period. The budget committee also approves major revisions of the budget during the period. A typical budget committee includes the chief executive officer (CEO) or one or more vice presidents, heads of strategic business units, and the chief financial officer (CFO).

## Budget Period

A budget usually is prepared for a set time, most commonly for the fiscal year with subperiod budgets for each of the constituent quarters or months. Synchronizing the budget period with the organization's fiscal period for external financial reporting eases budget preparation and facilitates comparisons and reconciliation of actual results with the budgeted amounts.

In practice, firms seldom have budgets for only one year. The budgets for the years beyond the coming year, however, usually contain only essential operating data. For example, Johnson & Johnson has only skeleton budgets for its 5- and 10-year budgets. Having a long-term budget in parallel with the master budget allows alignment of strategic goals and short-term operations.

## Budget Guidelines

In a traditional budgeting process the budget committee is responsible for providing initial budget guidelines that set the tone for the budget and govern its preparation. The committee issues budget guidelines after careful considerations on the general outlook of the economy and the market; the organization's strategic goals, long-term plan, strategic projects, and expected operating result of the current period; specific corporate decisions or policies such as mandates for downsizing, reengineering, pollution control, and special promotions; and short-term objectives. All responsibility centers (or budget units) follow the budget guidelines in preparing their budgets.

## Initial Budget Proposal

Each responsibility center prepares its initial budget proposal based on the budget guidelines. In addition, budget units need to consider a number of internal factors in preparing their budget proposals, including:

- Changes in availability of equipment or facilities.
- Adoption of new or improved operating processes and planned efficiency gains.
- Changes in product and/or service design and mix of offerings.
- Introduction of new products and services.
- Consumption rates of activities and their resources for the recurring volume and mix of products and services.
- Changes in expectations or operating processes of other budget units that the budget unit relies on for its input materials or other operating factors.
- Changes in other operating factors or in the expectations or operating processes in those other budget units that rely on the budget unit to supply them components. Inevitably, external factors have effects on operations and a budget cannot be completed without careful examination of important external factors such as:
  - The industry's outlook for the near term.
  - Competitors' actions.
  - Threat to entry.
  - Substitute products.
  - Bargaining power of customers.
  - Bargaining power (availability and price) of input suppliers (raw materials, components, and labor).

## Negotiation, Review, and Approval

The executives of budget units examine initial budget proposals. The examination includes determining adherence to the budget guidelines, verifying that the budget goals can be reasonably attained and are in line with the goals of the immediately higher organizational unit, and assuring that the budgeted operations are consistent with those of other budget units.

As budget units complete their budgets within the units, the budgets go through successively higher levels of the organization until they reach the top level and the combined unit budgets become the organization's budget. The budget committee reviews the budget for consistency with the budget guidelines, attainment of the desired short-term goals and strategic objectives of the organization. The budget committee gives final approval, and the CEO then approves the entire budget and submits it to the board of directors.

## Revision

No budget is ever cast in stone. As operations unveil, newly learned internal factors or external situations may make it necessary to revise the budget. Procedures for budget revisions vary among organizations. For organizations that allow budget revisions only under special circumstances, obtaining approval to modify a budget can be difficult. Not all events, however, unfold as predicted in a budget. Strictly implementing a budget as prescribed, even when the actual events differ significantly from those expected, certainly is not a desirable behavior. In such cases, managers should be encouraged not to rely on the budget as the absolute guideline in operations.

# Glossary

(based on ICMA suggested reading list)

**Activity-based budgeting (ABB).** Budgeting approach that focuses on the budgeted cost of the activities necessary to produce and sell products and services.

**activity-based budgeting (ABB)** A budgeting process that is based on activities and associated activity costs to support production and sales

**authoritative standard** A standard determined solely or primarily by management

**Benchmarking.** The continuous process of comparing the levels of performance in producing products and services and executing activities against the best levels of performance in competing companies or in companies having similar processes. (244)

**benchmarking** A process by which a firm identifies its critical success factors, studies the best practices of other firms (or other business units within a firm) for achieving these critical success factors, and then implements improvements in the firm's processes to match or beat the performance of those competitors

**Benchmarking** A systematic approach to identifying the activities with the greatest potential for improvement.

**Breakeven point (BEP).** Quantity of output sold at which total revenues equal total costs, that is where the operating income is zero.

**Break-even point** The level of sales at which profit is zero.

**breakeven point** The point at which revenues equal total costs and profit is zero

**Budget.** Quantitative expression of a proposed plan of action by management for a specified period and an aid to coordinating what needs to be done to implement that plan.

**budget** A detailed plan for the acquisition and use of financial and other resources over a specified period of time—typically a fiscal year

**Budget** A detailed plan for the future, usually expressed in formal quantitative terms

**Budget** A quantitative plan for acquiring and using resources over a specified time period.

**Budgetary slack.** The practice of underestimating budgeted revenues, or overestimating budgeted costs, to make budgeted targets more easily achievable.

**budgetary slack** The “cushion” managers intentionally build into budgets to help ensure success in meeting the budget

**budgeted capacity utilization** The planned (forecasted) output for the coming period, usually a year

**Budgeted cost.** Predicted or forecasted cost (future cost) as distinguished from an actual or historical cost.

**Budget committee** A group of key managers who are responsible for overall budgeting policy and for coordinating the preparation of the budget.

**budgeting** The process of projecting continuing operations and projects and then reflecting their financial impact

**Budgeted indirect-cost rate.** Budgeted annual indirect costs in a cost pool divided by the budgeted annual quantity of the cost allocation base.

**Budgeted performance.** Expected performance or a point of reference to compare actual results.

**capital budget** A listing of approved investment projects for a given accounting period

**Capital budgeting** The process of planning significant investments in projects that have long term implications such as the purchase of new equipment or the introduction of a new product.

**Cash budget.** Schedule of expected cash receipts and disbursements.

**cash budget** A schedule depicting the effects on cash of all budgeted activities

**Cash budget** A detailed plan showing how cash resources will be acquired and used over a specific time period.

**Chief Financial Officer (CFO)** The member of the top management team who is responsible for providing timely and relevant data to support planning and control activities and for preparing financial statements for external users.

**Coefficient of determination ( $r^2$ ).** Measures the percentage of variation in a dependent variable explained by one or more independent variables.

**$R^2$**  A measure of goodness of fit in least-squares regression analysis. It is the percentage of the variation in the dependent variable that is explained by variation in the independent variable.

**R-squared** A number between zero and one. Often it is described as a measure of the explanatory power of the regression; that is, the degree to which changes in the dependent variable can be predicted by changes in the independent variable

**Constant.** The component of total cost that, within the relevant range, does not vary with changes in the level of the activity. Also called *intercept*.

**Continuous budget.** See *rolling budget*.

**Continuous budget** A 12-month budget that rolls forward one month as the current month is completed.

**continuous improvement** (The Japanese word is *kaizen*.) A management technique in which managers and workers commit to a program of continuous improvement in quality and other critical success factors

**continuous-improvement standard** A standard that gets progressively tighter over time

**Control.** Taking actions that implement the planning decisions, deciding how to evaluate performance, and providing feedback and learning that will help future decision making.

**control** The set of procedures, tools, and systems that organizations use to reach their goals

**Control** The process of instituting procedures and then obtaining feedback to ensure that all parts of the organization are functioning effectively and moving toward overall company goals.

**Control** Those steps taken by management to increase the likelihood that all parts of the organization are working together to achieve the goals set down at the planning stage.

**Controlling** Actions taken to help ensure that the plan is being followed and is appropriately modified as circumstances change.

**Controllability.** Degree of influence that a specific manager has over costs, revenues, or related items for which he or she is responsible.

**Controllable cost.** Any cost that is primarily subject to the influence of a given responsibility center manager for a given period.

**controllable cost** A cost that a manager or employee has discretion in choosing to incur or can significantly influence the amount of within a given, usually short, period of time

**Controller.** The financial executive primarily responsible for management accounting and financial accounting. Also called *chief accounting officer*.

**Controller** The member of the top management team who is responsible for providing relevant and timely data to managers and for preparing financial statements for external users. The controller reports to the CFO.

**correlation** A given variable tends to change predictably in the same or opposite direction for a given change in the other, correlated variable

**cost leadership** A strategy in which a firm outperforms competitors by producing products or services at the lowest cost

**Cost-volume-profit (CVP) analysis.** Examines the behavior of total revenues, total costs, and operating income as changes occur in the units sold, the selling price, the variable cost per unit, or the fixed costs of a product.

**cost-volume-profit (CVP) analysis** A method for analyzing how various operating decisions and marketing decisions will affect net income

**Cost-volume-profit (CVP) graph** A graphical representation of the relationships between an organization's revenues, costs, and profits on the one hand and its sales volume on the other hand.

**Cumulative average-time learning model.** Learning curve model in which the cumulative average time per unit declines by a constant percentage each time the cumulative quantity of units produced doubles.

**currently attainable standard** A level of performance that workers with proper training and experience can attain most of the time without extraordinary effort

**Degree of operating leverage** A measure, at a given level of sales, of how a percentage change in sales will affect profits. The degree of operating leverage is computed by dividing contribution margin by net operating income.

**Dependent variable.** The cost to be predicted.

**dependent variable** The cost to be estimated

**Dependent variable** A variable that responds to some causal factor; total cost is the dependent variable, as represented by the letter  $Y$ , in the equation  $Y = a + bX$ .

**design analysis** A common form of value engineering in which the design team prepares several possible designs of the product, each having similar features with different levels of performance and different costs

**differentiation** A competitive strategy in which a firm succeeds by developing and maintaining a unique value for the product (or service) as perceived by consumers

**Directing and motivating** Mobilizing people to carry out plans and run routine operations.

**Dysfunctional decision making.** See *suboptimal decision making*.

**Expected monetary value.** See *expected value*.

**Expected value.** Weighted average of the outcomes of a decision with the probability of each outcome serving as the weight. Also called *expected monetary value*.

**expected value of perfect information (EVPI)** The maximum amount that a rational decision maker would be willing to pay for "perfect information"

**Feedback** Accounting and other reports that help managers monitor performance and focus on problems and/or opportunities that might otherwise go unnoticed.

**Financial budget.** Part of the master budget that focuses on how operations and planned capital outlays affect cash. It is made up of the capital expenditures budget, the cash budget, the budgeted balance sheet, and the budgeted statement of cash flows.

**Financial planning models.** Mathematical representations of the relationships among operating activities, financial activities, and other factors that affect the master budget.

**financial budgets** A plan that identifies sources and uses of funds for budgeted operations and capital expenditures for the coming period

**Flexible budget.** Budget developed using budgeted revenues and budgeted costs based on the actual output in the budget period.

**flexible budget** A budget that adjusts revenues and costs to the actual output level achieved

**Flexible budget** A report showing estimates of what revenues and costs should have been, given the actual level of activity for the period.

**goal congruence** The consistency between the goals of the firm and the goals of its employees. It is achieved when the manager acts independently in such a way as to simultaneously achieve top management's objectives

**Goal congruence.** Exists when individuals and groups work toward achieving the organization's goals. Managers working in their own best interest take actions that align with the overall goals of top management.

**High-low method.** Method used to estimate a cost function that uses only the highest and lowest observed values of the cost driver within the relevant range and their respective costs.

**high-low method** A method using algebra to determine a *unique* estimation line between representative high and low points in a given data set

**High-low method** A method of separating a mixed cost into its fixed and variable elements by analyzing the change in cost between the high and low activity levels.

**ideal standard** A standard that reflects perfect implementation and maximum efficiency in every aspect of the operation

**Ideal standards** Standards that assume peak efficiency at all times.

**Incongruent decision making.** See *suboptimal decision making*.

**Independent variable.** Level of activity or cost driver used to predict the dependent variable (costs) in a cost estimation or prediction model.

**independent variable** The cost driver used to estimate the value of the dependent variable

**Independent variable** A variable that acts as a causal factor; activity is the independent variable, as represented by the letter  $X$ , in the equation  $Y = a + bX$ .

**Intercept.** See *constant*.

**internal rate of return (IRR)** An estimate of the true (i.e., economic) rate of return on an investment

**Kaizen budgeting.** Budgetary approach that explicitly incorporates continuous improvement anticipated during the budget period into the budget numbers.

**kaizen budgeting** A budgeting approach that incorporates continuous improvement expectations in the budget

**Learning.** Involves managers examining past performance and systematically exploring alternative ways to make better informed decisions and plans in the future.

**Learning curve.** Function that measures how labor-hours per unit decline as units of production increase because workers are learning and becoming better at their jobs.

**learning curve analysis** A systematic method for estimating costs when learning is present

**learning rate** The percentage by which average time (or total time) falls from previous levels, as output doubles

**least squares regression** One of the most effective methods for estimating costs, found by minimizing the sum of the squares of the estimation errors

**Least-squares regression method** A method of separating a mixed cost into its fixed and variable elements by fitting a regression line that minimizes the sum of the squared errors.

**Life-cycle budgeting.** Budget that estimates the revenues and business function costs of the value chain attributable to each product from initial R&D to final customer service and support.

**Linear programming (LP).** Optimization technique used to maximize an objective function (for example, contribution margin of a mix of products), when there are multiple constraints.

**linear programming** A mathematical technique that can be used to solve for the best product mix

**long-range plan** A plan that identifies actions required during the 5- to 10-year period covered by the plan to attain the firm's strategic goals

**Manufacturing overhead budget** A detailed plan showing the production costs, other than direct materials and direct labor, that will be incurred over a specified time period.

**Master budget.** Expression of management's operating and financial plans for a specified period (usually a fiscal year) including a set of budgeted financial statements. Also called *pro forma statements*.

**Master budget** A number of separate but interdependent budgets that formally lay out the company's sales, production, and financial goals and that culminates in a cash budget, budgeted income statement, and budgeted balance sheet.

**master budget** A comprehensive plan of operations for the upcoming period; it translates short-term objectives into action steps; set of financial and operational budgets

**merchandise purchases budget** A plan that shows the amount of merchandise the firm needs to purchase during the budget period

**Multiple regression.** Regression model that estimates the relationship between the dependent variable and two or more independent variables.

**Multiple regression** An analytical method required when variations in a dependent variable are caused by more than one factor.

**multiple linear regression** Used to describe regression applications having two or more independent variables.

**operating budgets** Plans that identify resources needed to support operating activities and the acquisition of these resources

**Operating budget.** Budgeted income statement and its supporting budget schedules.

**Operating income.** Total revenues from operations minus cost of goods sold and operating costs (excluding interest expense and income taxes).

**Operating leverage** A measure of how sensitive net operating income is to a given percentage change in dollar sales.

**outliers** Unusual data points that strongly influence a regression analysis

**participative standards** Active participation throughout the standard-setting process by employees affected by the standards

**Participative budget** See *Self-imposed budget*.

**Perpetual budget** See *Continuous budget*.

**planning and decision making** Budgeting and profit planning, cash flow management, and other decisions related to operations

**Planning.** Selecting organization goals, predicting results under various alternative ways of achieving those goals, deciding how to attain the desired goals, and communicating the goals and how to attain them to the entire organization.

**Planning** Selecting a course of action and specifying how the action will be implemented.

**Planning** Developing goals and preparing budgets to achieve those goals.

**Planning budget** A budget created at the beginning of the budgeting period that is valid only for the planned level of activity.

**Planning and control cycle** The flow of management activities through planning, directing and motivating, and controlling, and then back to planning again.

**Practical standards** Standards that allow for normal machine downtime and other work interruptions and that can be attained through reasonable, though highly efficient, efforts by the average worker.

**Production budget** A detailed plan showing the number of units that must be produced during a period in order to satisfy both sales and inventory needs.

**Pro forma statements.** Budgeted financial statements.

**Probability.** Likelihood or chance that an event will occur.

**Probability distribution.** Describes the likelihood (or the probability) that each of the mutually exclusive and collectively exhaustive set of events will occur.

**Production.** Acquiring, coordinating, and assembling resources to produce a product or deliver a service.

**production budget** A budget showing planned output (production) for an upcoming period

**regression analysis** A statistical method for obtaining the unique cost-estimating equation that best fits a set of data points

**Regression analysis.** Statistical method that measures the average amount of change in the dependent variable associated with a unit change in one or more independent variables.

**Rolling budget.** Budget or plan that is always available for a specified future period by adding a period (month, quarter, or year) to the period that just ended. Also called *continuous budget*.

**sales budget** A schedule showing forecasted sales in units and at expected selling prices

**Sales budget** A detailed schedule showing expected sales expressed in both dollars and units.

**Self-imposed budget** A method of preparing budgets in which managers prepare their own budgets. These budgets are then reviewed by higher-level managers, and any issues are resolved by mutual agreement.

**Selling and administrative expense budget** A detailed schedule of planned expenses that will be incurred in areas other than manufacturing during a budget period.

**Sensitivity analysis.** A what-if technique that managers use to calculate how an outcome will change if the original predicted data are not achieved or if an underlying assumption changes.

**sensitivity analysis** The process of selectively varying a key input variable, for example, the discount rate, to identify the range over which a capital-budgeting decision is valid

**simple linear regression** Used to describe regression applications having a single independent variable

**Slope coefficient.** Coefficient term in a cost estimation model that indicates the amount by which total cost changes when a one-unit change occurs in the level of activity within the relevant range.

**Standard.** A carefully determined price, cost, or quantity that is used as a benchmark for judging performance. It is usually expressed on a per unit basis.

**Standard error of the estimated coefficient.** Regression statistic that indicates how much the estimated value of the coefficient is likely to be affected by random factors.

**Standard error of the regression.** Statistic that measures the variance of residuals in a regression analysis.

**standard error of the estimate (SE)** A measure of the accuracy of the regression's estimates

**Statement of cash flows** A financial statement that highlights the major activities that directly and indirectly impact cash flows and hence affect the overall cash balance.

**Static budget.** Budget based on the level of output planned at the start of the budget period.

**strategy** A plan for using resources to achieve sustainable goals within a competitive environment

**Strategy** A “game plan” that enables a company to attract customers by distinguishing itself from competitors.

**Strategy.** Specifies how an organization matches its own capabilities with the opportunities in the marketplace to accomplish its objectives.

**Strategy map.** A diagram that describes how an organization creates value by connecting strategic objectives in explicit cause-and-effect relationships with each other in the financial, customer, internal business process, and learning and growth perspectives.

**Suboptimal decision making.** Decisions in which the benefit to one subunit is more than offset by the costs or loss of benefits to the organization as a whole. Also called *incongruent decision making* or *dysfunctional decision making*.

**SWOT analysis** A systematic procedure for identifying a firm’s critical success factors: its internal strengths and weaknesses, and its external opportunities and threats

**time-series regression** The application of regression analysis to predict future amounts, using prior periods’ data

**trend variable** A variable that takes on values of 1, 2, 3, . . . for each period in sequence

**t-value** A measure of the reliability of each of the independent variables; that is, the degree to which an independent variable has a valid, stable, long-term relationship with the dependent variable

**Uncertainty.** The possibility that an actual amount will deviate from an expected amount.

**what-if analysis** The calculation of an amount given different levels for a factor that influences that amount

**zero-base budgeting (ZBB)** A budgeting process that requires managers to prepare budgets each period from a base of zero

**[1] Gleim #: 5.4.42 -- Source: CMA 1291 4-27**

Automite Company is an automobile replacement parts dealer in a large metropolitan community. Automite is preparing its sales forecast for the coming year. Data regarding both Automite's and industry sales of replacement parts as well as both the used and new automobile sales in the community for the last 10 years have been accumulated. If Automite wants to determine whether its sales of replacement parts are dependent upon the industry sales of replacement parts or upon the sales of used and new automobiles, the company should employ

- A. Simulation techniques.
- B. Correlation and regression analysis.
- C. Statistical sampling.
- D. Time series analysis.

- Answer (A) is **incorrect**. Simulation is a means of experimenting with logical or mathematical models using a computer.
- Answer (B) is **correct**. Correlation and regression analysis can be used to determine whether a relationship exists among two or more variables. The degree of that relationship is assessed by means of correlation analysis. Thus, regressing sales (the dependent variable) on both sales of replacement parts and sales of automobiles (independent variables) determines the extent of the dependence.
- Answer (C) is **incorrect**. Statistical sampling is a means of choosing and analyzing a sample to estimate population characteristics.
- Answer (D) is **incorrect**. Time series or trend analysis regresses the dependent variable on time (the independent variable).

**[2] Gleim #: 5.4.43 -- Source: CMA 0408 1-137**

A company has accumulated data for the last 24 months in order to determine if there is an independent variable that could be used to estimate shipping costs. Three possible independent variables being considered are packages shipped, miles shipped, and pounds shipped. The quantitative technique that should be used to determine whether any of these independent variables might provide a good estimate for shipping costs is

- A. Flexible budgeting.
- B. Linear programming.
- C. Linear regression.
- D. Variable costing.

- Answer (A) is **incorrect**. Flexible budgeting is the calculation of the quantity and cost of inputs that should have been consumed given the achieved level of production.
- Answer (B) is **incorrect**. Linear programming is a mathematical technique used to optimize a linear function subject to certain constraints.
- Answer (C) is **correct**. Regression analysis, also called least-squares analysis, is the process of deriving the linear equation that describes the relationship between two (or more) variables with a nonzero coefficient of correlation.
- Answer (D) is **incorrect**. Variable costing is a costing technique that treats only variable manufacturing costs as product costs.

**[3] Gleim #: 5.4.44 -- Source: CMA 1285 5-27**

The correlation coefficient that indicates the weakest linear association between two variables is

- A. -0.73
- B. -0.11
- C. 0.12
- D. 0.35

- Answer (A) is **incorrect**. This figure signifies a strong negative correlation.
- Answer (B) is **correct**. The correlation coefficient can vary from  $-1$  to  $+1$ . A  $-1$  relationship indicates a perfect negative correlation, and a  $+1$  relationship indicates a perfect positive correlation. A zero correlation coefficient would indicate no linear association between the variables. Thus, the correlation coefficient that is nearest to zero indicates the weakest linear association. Of the options given in the question, the correlation coefficient that is nearest to zero is  $-0.11$ .
- Answer (C) is **incorrect**. This figure indicates a slightly stronger correlation than the weakest linear association.
- Answer (D) is **incorrect**. This figure indicates a considerably stronger correlation.

**[4] Gleim #: 5.4.45 -- Source: CMA 1289 5-14**

Correlation is a term frequently used in conjunction with regression analysis and is measured by the value of the coefficient of correlation,  $r$ . The best explanation of the value  $r$  is that it

- A. Is always positive.
  - B. Interprets variances in terms of the independent variable.
  - C. Ranges in size from negative infinity to positive infinity.
  - D. Is a measure of the relative relationship between two variables.
- Answer (A) is **incorrect**. The coefficient is negative if the relationship between the variables is inverse.
  - Answer (B) is **incorrect**. The coefficient relates the two variables to each other.
  - Answer (C) is **incorrect**. The size of the coefficient varies between  $-1.0$  and  $+1.0$ .
  - Answer (D) is **correct**. The coefficient of correlation ( $r$ ) measures the strength of the linear relationship between the dependent and independent variables. The magnitude of  $r$  is independent of the scales of measurement of  $x$  and  $y$ . The coefficient lies between  $-1.0$  and  $+1.0$ . A value of zero indicates no linear relationship between the  $x$  and  $y$  variables. A value of  $+1.0$  indicates a perfectly direct relationship, and a value of  $-1.0$  indicates a perfectly inverse relationship.

**[5] Gleim #: 5.4.46 -- Source: CMA 697 4-26**

A regression equation

- A. Estimates the dependent variables.
  - B. Encompasses factors outside the relevant range.
  - C. Is based on objective and constraint functions.
  - D. Estimates the independent variable.
- Answer (A) is **correct**. Regression analysis is used to find an equation for the linear relationship among variables. The behavior of the dependent variable is explained in terms of one or more independent variables. Regression analysis is often used to estimate a dependent variable (such as cost) given a known independent variable (such as production).
  - Answer (B) is **incorrect**. Regression results are limited to observations within the relevant range.
  - Answer (C) is **incorrect**. Regression analysis does not use constraint functions.

- Answer (D) is **incorrect**. The dependent variable is estimated using regression analysis.

**[7] Gleim #: 5.4.48 -- Source: CMA 1289 4-11**

All of the following are assumptions underlying the validity of linear regression output **except**

- A. The errors are normally distributed.
- B. The mean of the errors is zero.
- C. Certainty.
- D. The standard deviation of the errors is constant.

- Answer (A) is **incorrect**. It is an assumption of the regression model.
- Answer (B) is **incorrect**. It is an assumption of the regression model.
- Answer (C) is **correct**. Linear regression is based on several assumptions; for example, that there is no change in the environment, that errors in the values of the dependent variables are normally distributed with a mean of zero, that the standard deviation of these errors is constant, that the values of the dependent variables are statistically independent of each other, and that the independent variables are not correlated with each other. However, regression is only a means of predicting the future; it cannot provide certainty.
- Answer (D) is **incorrect**. It is an assumption of the regression model.

**[8] Gleim #: 5.4.49 -- Source: CMA 1290 4-27**

In the standard regression equation  $y = a + bx$ , the letter  $b$  is best described as a(n)

- A. Independent variable.
- B. Dependent variable.
- C. Constant coefficient.
- D. Variable coefficient.

- Answer (A) is **incorrect**. The independent variable is  $x$ .
- Answer (B) is **incorrect**. The dependent variable is  $y$ .
- Answer (C) is **incorrect**. The constant coefficient is  $a$ .
- Answer (D) is **correct**. In the standard regression equation,  $b$  represents the variable coefficient. For example, in a cost determination regression,  $y$  equals total costs,  $b$  is the variable cost per unit,  $x$  is the number of units produced, and  $a$  is fixed cost.

**[Fact Pattern #1]**

In preparing the annual profit plan for the coming year, Wilkens Company wants to determine the cost behavior pattern of the maintenance costs. Wilkens has decided to use linear regression by employing the equation  $y = a + bx$  for maintenance costs. The prior year's data regarding maintenance hours and costs, and the results of the regression analysis, are given below and in the opposite column.

		Hours of Activity	Maintenance Costs
	January	480	\$ 4,200
	February	320	3,000
	March	400	3,600
	April	300	2,820
	May	500	4,350
	June	310	2,960
	July	320	3,030
	August	520	4,470
	September	490	4,260
Average cost per hour	\$9.00	October	4,050
$a$	684.65	November	3,300
$b$	7.2884	December	3,160
Standard error of $a$	49.515	Sum	<u>43,200</u>

**[9] Gleim #: 5.4.50 -- Source: CMA 1290 4-29**

(Refers to Fact Pattern #1)

Based upon the data derived from the regression analysis, 420 maintenance hours in a month would mean that Wilkens Co.'s maintenance costs (rounded to the nearest dollar) would be budgeted at

- A. \$3,780
- B. \$3,600
- C. \$3,790
- D. \$3,746

- Answer (A) is **incorrect**. The budgeted maintenance costs are \$3,746.
- Answer (B) is **incorrect**. The budgeted maintenance costs are \$3,746.
- Answer (C) is **incorrect**. The budgeted maintenance costs are \$3,746.

- Answer (D) is **correct**. Substituting the given data into the regression equation results in a budgeted cost of \$3,746 (rounded to the nearest dollar).

$$y = a + bx$$

$$y = 684.65 + 7.2884(420)$$

$$y = \$3,746$$

**[10] Gleim #: 5.4.51 -- Source: CMA 1290 4-30**

(Refers to Fact Pattern #1)

The percentage of Wilkens Co.'s total variance that can be explained by the regression equation is

- A. 99.724%
- B. 69.613%
- C. 80.982%
- D. 99.862%

- Answer (A) is **correct**. The coefficient of determination ( $r^2$ ) measures the percentage of the total variance in cost that can be explained by the regression equation. If the coefficient of determination is .99724, 99.724% of the variance is explained by the regression equation. Thus, the values in the regression equation explain virtually the entire amount of total cost.
- Answer (B) is **incorrect**. The percentage of the total variance explained by the regression equation is 99.724%, which corresponds to the coefficient of determination ( $r^2$ ), or .99724.
- Answer (C) is **incorrect**. The percentage of the total variance explained by the regression equation is 99.724%, which corresponds to the coefficient of determination ( $r^2$ ), or .99724.
- Answer (D) is **incorrect**. The percentage of the total variance explained by the regression equation is 99.724%, which corresponds to the coefficient of determination ( $r^2$ ), or .99724.

**[11] Gleim #: 5.4.52 -- Source: CMA 1290 4-28**

The letter  $x$  in the standard regression equation is best described as a(n)

- A. Independent variable.
- B. Dependent variable.
- C. Constant coefficient.
- D. Coefficient of determination.

- Answer (A) is **correct**. The letter  $x$  in the standard regression equation is the independent variable. For example, in a regression to determine the total cost of production,  $x$  equals units produced.
- Answer (B) is **incorrect**. The dependent variable is  $y$ .
- Answer (C) is **incorrect**. The constant coefficient is  $a$ .
- Answer (D) is **incorrect**. The variable  $r^2$  is the coefficient of determination.

[18] Gleim #: 5.4.59 -- Source: CMA 1292 3-3

In determining cost behavior in business, the cost function is often expressed as  $y = a + bx$ . Which one of the following cost estimation methods should **not** be used in estimating fixed and variable costs for the equation?

- A. Graphic method.
- B. Simple regression.
- C. High and low point method.
- D. Multiple regression.

- Answer (A) is **incorrect**. The graphic approach can be used to estimate a linear function.
- Answer (B) is **incorrect**. Simple regression, which is based on one independent variable, is the best means of expressing a linear cost function.
- Answer (C) is **incorrect**. The high-low method, although unsophisticated, can often give a good approximation of a linear cost function.
- Answer (D) is **correct**. Regression analysis can be used to find an equation for the linear relationship among variables. However, multiple regression is not used to generate an equation of the type  $y = a + bx$  because multiple regression has more than one independent variable. In other words, a multiple regression equation would take the form  $y = a + b_1x_1 + b_2x_2 + b_3x_3 + \dots$ .

[19] Gleim #: 5.4.60 -- Source: CMA 0408 1-136

For cost estimation, simple regression differs from multiple regression in that simple regression uses only

- A. One dependent variable, while multiple regression uses all available data to estimate the cost function.
  - B. Dependent variables, while multiple regression can use both dependent and independent variables.
  - C. One independent variable, while multiple regression uses more than one independent variable.
  - D. One dependent variable, while multiple regression uses more than one dependent variable.
- Answer (A) is **incorrect**. Simple regression uses the algebraic formula for a straight line,  $y = a + bx$ , where  $x$  is the independent variable. Multiple regression is used when there is more than one independent variable. Multiple regression allows a firm to identify many factors (independent variables) and to weight each one according to its influences on the overall outcome ( $y = a + b_1x_1 + b_2x_2 + b_3x_3 + \text{etc.}$ ).
  - Answer (B) is **incorrect**. Simple regression uses the algebraic formula for a straight line,  $y = a + bx$ , where  $x$  is the independent variable. Multiple regression is used when there is more than one independent variable. Multiple regression allows a firm to identify many factors (independent variables) and to weight each one according to its influences on the overall outcome ( $y = a + b_1x_1 + b_2x_2 + b_3x_3 + \text{etc.}$ ).
  - Answer (C) is **correct**. Simple regression uses the algebraic formula for a straight line,  $y = a + bx$ , where  $x$  is the independent variable. Multiple regression is used when there is more than one independent variable. Multiple regression allows a firm to identify many factors (independent variables) and to weight each one according to its influences on the overall outcome ( $y = a + b_1x_1 + b_2x_2 + b_3x_3 + \text{etc.}$ ).
  - Answer (D) is **incorrect**. Simple regression uses the algebraic formula for a straight line,  $y = a + bx$ , where  $x$  is the independent variable. Multiple regression is used when there is more than one independent variable. Multiple regression allows a firm to identify many factors (independent variables) and to weight each one according to its influences on the overall outcome ( $y = a + b_1x_1 + b_2x_2 + b_3x_3 + \text{etc.}$ ). Both methods use only one dependent variable.

**[20] Gleim #: 5.4.61 -- Source: CMA 0408 1-138**

Slawford Manufacturing developed the following multiple regression equation, utilizing many years of data, and uses it to model, or estimate, the cost of its product.

$$\text{Cost} = \text{FC} + (a \times L) + (b \times M)$$

Where: FC = fixed costs

L = labor rate per hour

M = material cost per pound

Which one of the following changes would have the greatest impact on invalidating the results of this model?

- A. A significant reduction in factory overheads, which are a component of fixed costs.
- B. Renegotiation of the union contract calling for much higher wage rates.
- C. A large drop in material costs, as a result of purchasing the material from a foreign source.
- D. A significant change in labor productivity.

- Answer (A) is **incorrect**. Fixed cost is one of the variables, and a difference between expected and actual value for the variables is an integral part of multiple regression.
- Answer (B) is **incorrect**. The wage rate is one of the variables, and a difference between expected and actual value for the variables is an integral part of multiple regression.
- Answer (C) is **incorrect**. Materials cost is one of the variables, and a difference between expected and actual value for the variables is an integral part of multiple regression.
- Answer (D) is **correct**. In multiple regression, a large difference between the expected value and the actual value of one of the coefficients has the most impact in rendering the model invalid. A change in costs would be incorporated into the equation automatically, but a change in productivity per hour would not.

**[21] Gleim #: 5.4.62 -- Source: CMA 0408 1-139**

In order to analyze sales as a function of advertising expenses, the sales manager of Smith Company developed a simple regression model. The model included the following equation, which was based on 32 monthly observations of sales and advertising expenses with a related coefficient of determination of .90.

$$\text{Sales} = \$10,000 + (2.5 \times \text{Advertising expenses})$$

If Smith Company's advertising expenses in one month amounted to \$1,000, the related point estimate of sales would be

- A. \$2,500
- B. \$11,250
- C. \$12,250
- D. \$12,500

- Answer (A) is **incorrect**. The amount of \$2,500 includes only the advertising expense.
- Answer (B) is **incorrect**. The amount of \$11,250 results from improperly multiplying the answer by the coefficient of determination.
- Answer (C) is **incorrect**. The amount of \$12,250 results from improperly applying the coefficient of determination to the advertising expense.
- Answer (D) is **correct**. The simple regression equation can be solved as follows:

$$\begin{aligned}\text{Sales} &= \$10,000 + (2.5 \times \text{Advertising expenses}) \\ &= \$10,000 + (2.5 \times \$1,000) \\ &= \$10,000 + \$2,500 \\ &= \$12,500\end{aligned}$$

[22] Gleim #: 5.4.63 -- Source: CMA 0408 1-140

The results of regressing Y against X are as follows:

	<u>Coefficient</u>
Intercept	5.23
Slope	1.54

When the value of X is 10, the estimated value of Y is

- A. 6.77
- B. 8.05
- C. 20.63
- D. 53.84

- Answer (A) is **incorrect**. The figure 6.77 results from simply adding the intercept and slope.
- Answer (B) is **incorrect**. The figure 8.05 results from simply multiplying the intercept and slope.
- Answer (C) is **correct**. A simple regression can be calculated using the formula for a straight line:

$$y = a + bx$$

Where: y = the dependent variable

a = the Y-axis intercept

b = the slope of the regression line

x = the independent variable

Solving with the information given yields the following results:

$$\begin{aligned} y &= a + bx \\ &= 5.23 + (1.54 \times 10) \\ &= 5.23 + 15.4 \\ &= 20.63 \end{aligned}$$

- Answer (D) is **incorrect**. The figure 53.84 results from transposing the intercept and slope.

[1] Gleim #: 5.5.64 -- Source: CMA 697 4-25

Corrigan Industries is preparing a bid for a special project requiring the production of 35,000 units. The engineering personnel have advised that the units can be produced in groups with the first group consisting of 1,000 units. A review of prior experience indicates that the direct labor time needed per unit will be progressively smaller by a constant percentage rate as experience is gained in the production process. The quantitative method that would best estimate Corrigan's total cost for the project is

- A. Linear programming.
- B. Dynamic programming.
- C. Learning curve analysis.
- D. Time series analysis.

- Answer (A) is **incorrect**. Linear programming is an optimizing model used to determine a minimum or maximum, e.g., of a cost or revenue function, given certain constraints on resources.
- Answer (B) is **incorrect**. Dynamic programming is an approach to solving problems, not a particular algorithm. It divides a large mathematical model into smaller, more manageable pieces in such a way that, once the smaller problems have been solved, the result is the optimal solution to the overall model.
- Answer (C) is **correct**. Learning curves reflect the increased rate at which people perform tasks as they gain experience. Thus, the time required to perform a given task becomes progressively shorter. Ordinarily, the learning curve is expressed as a percentage of reduced time to complete a task for each doubling of cumulative production.
- Answer (D) is **incorrect**. Time series analysis applies to data gathered at successive moments in time. It is a forecasting technique in which the dependent variable is regressed on time.

[2] Gleim #: 5.5.65 -- Source: CMA 1293 4-24

The average labor cost per unit for the first batch produced by a new process is \$120. The cumulative average labor cost after the second batch is \$72 per product. Using a batch size of 100 and assuming the learning curve continues, the total labor cost of four batches will be

- A. \$4,320
- B. \$10,368
- C. \$2,592
- D. \$17,280

- Answer (A) is **incorrect**. The cost of the items in the fourth batch equals \$4,320.
- Answer (B) is **incorrect**. The amount of \$10,368 is based on the assumption that the cumulative average unit labor cost is reduced by the learning curve percentage with each batch, not each doubling of output.
- Answer (C) is **incorrect**. The amount of \$2,592 represents the labor cost of 100 units at the unit rate expected after another doubling of production to eight batches.
- Answer (D) is **correct**. The learning curve reflects the increased rate at which people perform tasks as they gain experience. The time required to perform a given task becomes progressively shorter. Ordinarily, the curve is expressed in a percentage of reduced time to complete a task for each doubling of cumulative production. One common assumption in a learning curve model is that the cumulative average time (and labor cost) per unit is reduced by a certain percentage each time production doubles. Given a \$120 cost per unit for the first 100 units and a \$72 cost per unit when cumulative production doubled to 200 units, the learning curve percentage must be 60% ( $\$72 \div \$120$ ). If production is again doubled to 400 units (four batches), the average unit labor cost should be \$43.20 ( $\$72 \times 60\%$ ). Hence, total labor cost for 400 units is estimated to be \$17,280 ( $400 \text{ units} \times \$43.20$ ).

---

**[Fact Pattern #1]**

Moss Point Manufacturing recently completed and sold an order of 50 units that had costs as shown in the next column.

Direct materials	\$ 1,500
Direct labor ( $\$8.50 \times 1,000$ hours)	8,500
Variable overhead ( $1,000 \text{ hours} \times \$4.00$ )*	4,000
Fixed overhead**	<u>1,400</u>
	<u><u>\$15,400</u></u>

The company has now been requested to prepare a bid for 150 units of the same product.

\*Applied on the basis of direct labor hours.

\*\*Applied at the rate of 10% of variable cost.

---

[3] Gleim #: 5.5.66 -- Source: CMA 1288 5-19

(Refers to Fact Pattern #1)

If an 80% learning curve is applicable, Moss Point's total cost on this order would be estimated at

- A. \$26,400
- B. \$32,000
- C. \$38,000
- D. \$41,800

- Answer (A) is **correct**. Assuming that the cumulative average time model applies, an 80% learning curve means that the cumulative average time per unit (and labor cost, given a constant labor rate) declines by 20% each time unit output doubles in the early stages of production. The first lot size was 50 units, which was produced at a total cost of \$15,400 (\$1,500 for materials and \$13,900 for labor and overhead). Materials costs are strictly variable and should remain proportional to production. The labor (\$8,500) and variable overhead (\$4,000) costs (labor-related), however, will be affected by the learning curve. The average cost per lot for labor and variable overhead after 100 units have been produced should be 80% of the costs of the first lot of 50 units. Thus, the average labor and variable overhead cost per 50-unit lot will be \$10,000 ( $\$12,500 \times 80\%$ ). If production doubles again (to a total production of 200 units or four lots of 50 each), the cumulative average cost for labor and variable overhead will be \$8,000 per lot ( $\$10,000 \times 80\%$ ). Given four lots of 50 each, at an average cost of \$8,000 per lot, the total cost for labor and variable overhead must be \$32,000. Adding \$6,000 for raw materials (\$1,500 per 50-unit lot) gives a total variable cost of \$38,000 for 200 units. Fixed overhead is 10% of total variable cost, so total cost is \$41,800. The total cost for the last 150 units is \$26,400 ( $\$41,800 - \$15,400$ ).
- Answer (B) is **incorrect**. The amount of \$32,000 is the total cost for labor and variable overhead for 200 units.
- Answer (C) is **incorrect**. The amount of \$38,000 is the total variable cost for 200 units.
- Answer (D) is **incorrect**. The amount of \$41,800 is the total cost for 200 units.

[4] Gleim #: 5.5.67 -- Source: CMA 1288 5-20

(Refers to Fact Pattern #1)

If Moss Point had experienced a 70% learning curve, the bid for the 150 units would

- A. Show a 30% reduction in the total direct labor hours required with no learning curve.
  - B. Include increased fixed overhead costs.
  - C. Be 10% lower than the total bid at an 80% learning curve.
  - D. Include 6.40 direct labor hours per unit at \$8.50 per hour.
- Answer (A) is **incorrect**. With no learning curve effect, estimated total hours would be 4,000 instead of 1,960, a change of more than 50%.
  - Answer (B) is **incorrect**. Fixed costs applied per lot would decline because they are based on labor hours, which are declining.
  - Answer (C) is **incorrect**. Due to the cumulative nature of a learning curve, a 10% change in the learning curve does not result in a 10% change in direct labor costs. Given an 80% learning curve, estimated total hours would be 2,560 instead of 1,960.
  - Answer (D) is **correct**. The sum of the direct labor hours for the initial lot of 50 units was 1,000. A second lot of 50 would reduce the cumulative hours per lot to 700 (70%  $\times$  1,000 hours). A doubling to four lots would reduce the cumulative hours per lot to 490 (70%  $\times$  700 hours). Thus, for an output of 200 units, the total hours worked would be 1,960 (4 lots  $\times$  490 hours). Subtracting the 1,000 hours required for the first 50 units from the 1,960-hour total gives 960 hours for the last 150 units. Dividing 960 hours by 150 units produces a per-unit time of 6.4 hours.

[5] Gleim #: 5.5.68 -- Source: CMA 692 4-5

Lake Corporation manufactures specialty components for the electronics industry in a highly labor intensive environment. Arc Electronics has asked Lake to bid on a component that Lake made for Arc last month. The previous order was for 80 units and required 120 hours of direct labor to manufacture. Arc would now like 240 additional components. Lake experiences an 80% learning curve on all of its jobs. The number of direct labor hours needed for Lake to complete the 240 additional components is

- A. 360.0
  - B. 187.2
  - C. 307.2
  - D. 256.0
- Answer (A) is **incorrect**. Assuming no learning curve effect results in 360 hours.

- Answer (B) is **correct**. One common assumption made in a learning curve model is that the cumulative average time per unit is reduced by a certain percentage each time production doubles. An 80% learning curve results in the following performance for the lots shown:

Units	Cumulative Average Hours
80	1.5 hours ( $120 \div 80$ )
160	1.2 hours ( $1.5 \times .8$ )
320	.96 hours ( $1.2 \times .8$ )

Thus, to produce 320 units, total production time will be 307.2 hours ( $320 \times .96$ ). The total time for the last 240 units will be 187.2 hours ( $307.2 - 120$ ).

- Answer (C) is **incorrect**. The total time for completing 320 units is 307.2 hours.
- Answer (D) is **incorrect**. The figure of 256 hours is a nonsense answer.

**[11] Gleim #: 5.5.74 -- Source: CMA 696 4-7**

It is estimated that a particular manufacturing job is subject to an 80% learning curve. The first unit required 50 labor hours to complete. What is the cumulative average time per unit after completing four units?

- A. 50.0 hours.
- B. 40.0 hours.
- C. 32.0 hours.
- D. 30.0 hours.

- Answer (A) is **incorrect**. The time for the first unit is 50 hours.
- Answer (B) is **incorrect**. The cumulative average completion time for two units is 40 hours.
- Answer (C) is **correct**. Learning curve models reflect the increased rate at which people perform tasks as they gain experience. One common assumption is that the cumulative average time per unit is reduced by a certain percentage when production doubles during the early stages of production. An 80% learning curve indicates that a doubling of production reduces the time required by 20%. For example, if the first unit requires 50 hours, the cumulative average completion time is 40 hours ( $80\% \times 50$  hours) for two units and 32 hours ( $80\% \times 40$  hours) for four units.
- Answer (D) is **incorrect**. The time necessary to complete the second unit is 30 hours.

**[12] Gleim #: 5.5.75 -- Source: CMA 1291 4-22**

A company plans to bid on a special project that calls for a total of 24,000 units. The units will be produced in lots, with the first lot consisting of 750 units. Based on prior experience, the direct labor time needed per unit of product will be progressively smaller by a constant percentage rate as experience is gained in the manufacturing process. The quantitative method that would best estimate the company's total cost for the project is

- A. Learning curve techniques.
- B. Differential calculus.
- C. Discounted cash flow techniques.
- D. Linear programming.

- Answer (A) is **correct**. Learning curves reflect the increased rate at which people perform as they gain experience at a new task. Because the time to perform the task becomes progressively shorter in the early stages of a new activity, the direct labor costs involved decline. The curve is often expressed as a percentage reduction in time for each doubling of cumulative production. Two models are in common use. One assumes that the cumulative average time per unit declines by a constant percentage each time cumulative production doubles. The other assumes that the time required for the last unit declines by a constant percentage when cumulative production doubles.
- Answer (B) is **incorrect**. Differential calculus is used primarily to identify the maxima or minima of curvilinear functions.
- Answer (C) is **incorrect**. Discounted cash flow techniques are used to evaluate capital investment decisions.
- Answer (D) is **incorrect**. Linear programming is a tool for optimizing a cost or profit function given scarce resources and specified restraints.

**[13] Gleim #: 5.5.76 -- Source: CMA 1294 4-28**

Seacraft, Inc., received a request for a competitive bid for the sale of one of its unique boating products with a desired modification. Seacraft is now in the process of manufacturing this product but with a slightly different modification for another customer. These unique products are labor intensive and both will have long production runs. Which one of the following methods should Seacraft use to estimate the cost of the new competitive bid?

- A. Expected value analysis.
- B. Learning curve analysis.
- C. Regression analysis.
- D. Continuous probability simulation.

- Answer (A) is **incorrect**. Expected value analysis selects the best alternative for decisions involving risk by multiplying the probability of each outcome by its payoff, and summing the products.
- Answer (B) is **correct**. Learning curves reflect the increased rate at which people perform tasks as they gain experience. The time required to perform a given task becomes progressively shorter as the workers better learn their jobs. Ordinarily, the curve is expressed as a percentage of reduced time to complete a task for each doubling of cumulative production. This methodology is appropriate when submitting a bid for a product for which the firm already has experience. The experience should lead to shorter production time and lower costs.
- Answer (C) is **incorrect**. Regression analysis is used to find an equation for the linear relationships among variables.
- Answer (D) is **incorrect**. Simulation would not be appropriate when a single project is being bid upon.

**[14] Gleim #: 5.5.77 -- Source: CMA 1289 4-7**

The technique used to predict the change in direct labor hours as a new process stabilizes is

- A. Simple regression.
- B. Multiple regression.
- C. Time series analysis.
- D. Learning curve analysis.

- Answer (A) is **incorrect**. Regression analysis explains the correlation of a dependent variable with one or more independent variables. It is based on the linearity of costs, an assumption not required in learning curve analysis.
- Answer (B) is **incorrect**. Multiple regression is used when many causal factors affect the outcome.
- Answer (C) is **incorrect**. Time series analysis is a forecasting method that uses historical data to determine the future values of a variable. A moving average is a simple example. The variation within this data can be accounted for in various ways.

- Answer (D) is **correct**. Learning curves reflect the increased rate at which people perform tasks as they gain experience. The time to perform a given task becomes progressively shorter during the early stages of production. The curve is expressed as a percentage reduction in time to complete a task for each doubling of cumulative production. A learning curve percentage of 80% is common. One model assumes that the cumulative average time per unit for all production is reduced by a constant percentage. Another assumes that the average time to produce the last unit is reduced by a constant percentage.

---

**[Fact Pattern #2]**

LCB, Inc., is preparing a bid to the Department of the Navy to produce engines for rescue boats. The company has manufactured these engines for the Navy for the past 3 years on an exclusive contract and has experienced the following costs:

Cumulative Units Produced	Total Cumulative Costs	
	Materials	Labor
10	\$ 60,000	\$120,000
20	120,000	192,000
40	240,000	307,200

At LCB, variable overhead is applied on the basis of \$1.00 per direct labor dollar. Based on historical costs, LCB knows that the production of 40 engines will incur \$100,000 of fixed overhead costs. The bid request is for an additional 40 units; all companies submitting bids are allowed to charge a maximum of 25% above full cost for each order.

---

**[15] Gleim #: 5.5.78 -- Source: CMA 688 5-9**

(Refers to Fact Pattern #2)

In order to ensure that the company would **not** lose money on the project, LCB's minimum bid for the 40 units would be

- A. \$760,800
- B. \$608,640
- C. \$885,800
- D. \$708,640

- Answer (A) is **incorrect**. The amount of \$760,800 equals 125% times \$608,640, which is the full cost without including the fixed cost.

- Answer (B) is **correct**. The company is permitted to bid 25% above full cost (including fixed overhead). Given a learning curve of 80% and a cumulative average unit labor cost for 40 units of \$7,680 ( $\$307,200 \div 40$ ), the additional labor costs for the next 40 units can be determined. Cumulative average unit labor cost for 80 units is estimated to be \$6,144 ( $\$7,680 \times 80\%$ ). Estimated total labor cost for 80 units is \$491,520 (80 units  $\times$  \$6,144). Thus, the incremental labor cost of the last 40 units is expected to be \$184,320 ( $\$491,520 - \$307,200$ ). Variable overhead is \$1 per direct labor dollar, or \$184,320. Adding \$240,000 for materials and \$100,000 for fixed overhead results in a full cost of \$708,640 ( $\$184,320 \text{ DL} + \$184,320 \text{ VOH} + \$240,000 \text{ DM} + \$100,000 \text{ FOH}$ ). However, that amount includes \$100,000 of fixed overhead that would presumably not increase as a result of the production. Thus, if the company obtains the contract at a price of \$608,640 ( $\$708,640 - \$100,000$ ), it will break even. The minimum bid is therefore \$608,640: the incremental cost of labor, variable overhead, and raw materials.
- Answer (C) is **incorrect**. The amount of \$885,800 equals the maximum bid.
- Answer (D) is **incorrect**. The amount of \$708,640 includes \$100,000 of fixed costs.

**[16] Gleim #: 5.5.79 -- Source: CMA 688 5-7**

(Refers to Fact Pattern #2)

LCB's rate of learning on the 3-year engine contract is

- A. 75.5%
- B. 79.0%
- C. 80.0%
- D. 62.6%

- Answer (A) is **incorrect**. The rate of learning should be determined by calculating the cumulative average unit labor cost for each doubling of production.
- Answer (B) is **incorrect**. The rate of learning should be determined by calculating the cumulative average unit labor cost for each doubling of production.
- Answer (C) is **correct**. The learning curve reflects a percentage reduction in time to complete a task for each doubling of cumulative production. An analysis of the materials costs shows that these costs are strictly variable. However, the labor costs are not strictly variable because the cumulative amount at the end of the second year (for which production is double that of the first year) is not exactly double that for Year One. The same is true of the second- and third-year labor costs. The cumulative average unit labor cost for 10 units was \$12,000 ( $\$120,000 \div 10$ ). The cumulative average unit labor cost for 20 units (representing a doubling of production) was \$9,600 ( $\$192,000 \div 20$ ). The cumulative unit average for the next doubling was \$7,680 ( $\$307,200 \div 40$ ). Since \$9,600 is 80% of \$12,000 and \$7,680 is 80% of \$9,600, an 80% rate of learning occurred.

- Answer (D) is **incorrect**. The rate of learning should be determined by calculating the cumulative average unit labor cost for each doubling of production.

**[17] Gleim #: 5.5.80 -- Source: CMA 688 5-8**

(Refers to Fact Pattern #2)

The maximum bid price that LCB, Inc., could submit to the Department of the Navy for the 40 units is

- A. \$760,800
- B. \$608,640
- C. \$885,800
- D. \$708,640

- Answer (A) is **incorrect**. The amount of \$760,800 equals 125% times \$608,640, which is full cost without including \$100,000 fixed overhead.
- Answer (B) is **incorrect**. The amount of \$608,640 is full cost without including \$100,000 fixed overhead.
- Answer (C) is **correct**. The company is permitted to bid 25% above full cost (including fixed overhead). Given a learning curve of 80% and a cumulative average unit labor cost for 40 units of \$7,680 ( $\$307,200 \div 40$ ), the additional labor costs for the next 40 units can be determined. Cumulative average unit labor cost for 80 units is estimated to be \$6,144 ( $\$7,680 \times 80\%$ ). Estimated total labor cost for 80 units is \$491,520 ( $80 \text{ units} \times \$6,144$ ). Thus, the incremental labor cost of the last 40 units is expected to be \$184,320 ( $\$491,520 - \$307,200$ ). Variable overhead is \$1 per direct labor dollar, or \$184,320. Adding \$240,000 for materials and \$100,000 for fixed overhead results in a full cost of \$708,640 ( $\$184,320 \text{ DL} + \$184,320 \text{ VOH} + \$240,000 \text{ DM} + \$100,000 \text{ FOH}$ ). Consequently, the bid price should be \$885,800 ( $\$708,640 \text{ full cost} \times 125\%$ ).
- Answer (D) is **incorrect**. The amount of \$708,640 equals full cost. The maximum bid price equals full cost times 125%.

**[25] Gleim #: 5.5.88 -- Source: CMA 1289 4-10**

Learning curves are best used to predict

- A. Unit material costs.
- B. Overhead variances.
- C. Total unit costs.
- D. Unit direct labor costs.

- Answer (A) is **incorrect**. Unit material costs typically do not decline as workers learn their jobs.
- Answer (B) is **incorrect**. Variances are by definition unpredictable. Otherwise, the standards would be changed to avoid the variance.
- Answer (C) is **incorrect**. Learning curves apply only to labor efficiency and are not effective predictors of total unit costs or unit variable costs.
- Answer (D) is **correct**. Learning curves reflect the increased rate at which people perform tasks as they gain experience. Thus, they are useful in predicting unit direct labor costs.

---

**[Fact Pattern #3]**

Aerosub, Inc., has developed a new product for spacecraft that includes the production of a complex part. The manufacture of this part requires a high degree of technical skill. Management believes there is a good opportunity for its technical force to learn and improve as they become accustomed to the production process. The production of the first unit requires 10,000 direct labor hours. Management projects an 80% learning curve and wants to produce a total of eight units.

---

**[26] Gleim #: 5.5.89 -- Source: CMA 0408 1-142**

(Refers to Fact Pattern #3)

Upon completion of the eighth unit, Aerosub's cumulative average direct labor hours required per unit of the product will be

- A. 5,120 hours.
- B. 6,400 hours.
- C. 8,000 hours.
- D. 10,000 hours.

- Answer (A) is **correct**. The underlying assumption of learning curve analysis is that workers gain productivity at a predictable rate as they gain experience with a new process. A common assumption is that the number of hours required for each doubling of output will be 80% of the hours required for the previous doubling. The effects of Aerosub's projected learning curve on this product can be calculated as follows:

Batch	Cumulative Units Produced	Cumulative Average Labor Hours
1	1	10,000
2	2	8,000 (10,000 × 80%)
3	4	6,400 (8,000 × 80%)
4	8	5,120 (6,400 × 80%)

- Answer (B) is **incorrect**. The projected number of hours after four units is 6,400.
- Answer (C) is **incorrect**. The projected number of hours after two units is 8,000.
- Answer (D) is **incorrect**. The number 10,000 results from failing to take the learning curve effect into account at all.

**[27] Gleim #: 5.5.90 -- Source: CMA 0408 1-145**

(Refers to Fact Pattern #3)

Upon completion of the eighth unit, Aerosub's cumulative direct labor hours will be

- A. 29,520 hours.
- B. 40,960 hours.
- C. 64,000 hours.
- D. 80,000 hours.

- Answer (A) is **incorrect**. The figure of 29,520 results from improperly summing the cumulative average labor hour figures.

- Answer (B) is **correct**. The underlying assumption of learning curve analysis is that workers gain productivity at a predictable rate as they gain experience with a new process. A common assumption is that the number of hours required for each doubling of output will be 80% of the hours required for the previous doubling. The effects of Aerosub's projected learning curve on this product can be calculated as follows:

<u>Batch</u>	<u>Cumulative Units Produced</u>	<u>Cumulative Average Labor Hours</u>	<u>Cumulative Total Labor Hours</u>
1	1	10,000	10,000
2	2	8,000 (10,000 × 80%)	16,000
3	4	6,400 (8,000 × 80%)	25,600
4	8	5,120 (6,400 × 80%)	40,960

- Answer (C) is **incorrect**. The figure of 64,000 results from improperly multiplying the cumulative number of units produced by the 10,000 hours spent on the first batch, then multiplying by the learning curve percentage.
- Answer (D) is **incorrect**. The figure of 80,000 results from improperly multiplying the cumulative number of units produced by the 10,000 hours spent on the first batch.

**[28] Gleim #: 5.5.91 -- Source: CMA 0408 1-149**

(Refers to Fact Pattern #3)

After completing the first unit, the estimated total direct labor hours Aerosub will require to produce the seven additional units will be

- A. 30,960 hours.
- B. 40,960 hours.
- C. 56,000 hours.
- D. 70,000 hours.

- Answer (A) is **correct**. The cumulative total hours spent on the units can be calculated as follows:

<u>Batch</u>	<u>Cumulative Units Produced</u>	<u>Cumulative Average Labor Hours</u>	<u>Cumulative Total Labor Hours</u>
1	1	10,000	10,000
2	2	8,000 (10,000 × 80%)	16,000
3	4	6,400 (8,000 × 80%)	25,600
4	8	5,120 (6,400 × 80%)	40,960

Since it took a total of 40,960 hours to complete all eight units and 10,000 to complete the first one, units 2 through 8 took 30,960 hours (40,960 – 10,000).

- Answer (B) is **incorrect**. The figure 40,960 is the number of hours to complete all eight units.
- Answer (C) is **incorrect**. The figure 56,000 results from improperly multiplying the seven units by the 8,000 average labor hours consumed in producing the second batch.
- Answer (D) is **incorrect**. The figure 70,000 results from improperly multiplying the seven units by the 10,000 average labor hours consumed in producing the first unit.

**[29] Gleim #: 5.5.92 -- Source: CMA 0408 1-144**

A manufacturing company has the opportunity to submit a bid for 20 units of a product on which it has already produced two 10-unit lots. The production manager believes that the learning experience observed on the first two lots will continue for at least the next two lots. The direct labor required on the first two lots was as follows:

- 5,000 direct labor hours for the first lot of 10 units
- 3,000 additional direct labor hours for the second lot of 10 units

The learning rate experienced by the company on the first two lots of this product is

- A. 40.0%
- B. 60.0%
- C. 62.5%
- D. 80.0%

- Answer (A) is **incorrect**. This percentage results from improperly dividing the 3,000 hours spent on the second lot by the 5,000 hours spent on the first lot and taking the complement.

- Answer (B) is **incorrect**. This percentage results from improperly dividing the 3,000 hours spent on the second lot by the 5,000 hours spent on the first lot.
- Answer (C) is **incorrect**. This percentage results from improperly dividing the 5,000 hours spent on the first lot by the 8,000 total hours spent on both lots.
- Answer (D) is **correct**. Learning curve analysis is used to project productivity gains resulting from the increased rate at which people perform tasks as they gain experience. The underlying assumption of learning curve analysis is that workers gain productivity at a predictable rate as they gain experience with a new process. For this company, a total of 8,000 hours was spent to complete two lots of product. The cumulative average spent on the two lots was therefore 4,000 hours per lot ( $8,000 \div 2$ ). This cumulative average of 4,000 is 80% of the 5,000 hours that were spent on the first lot. The learning curve is therefore 80%.

---

**[Fact Pattern #4]**

Proper Propeller, Inc., plans to manufacture a newly designed high-technology propeller for airplanes. Proper Propeller forecasts that as workers gain experience, they will need less time to complete the job. Based on prior experience, Proper Propeller estimates a 70% cumulative learning curve and has projected the following costs:

Cumulative Number of Units Produced	Manufacturing Projections	
	Average Cost per Unit	Total Costs
1	\$20,000	\$20,000
2	14,000	28,000

---

**[30] Gleim #: 5.5.93 -- Source: CMA 0408 1-148**

(Refers to Fact Pattern #4)

If Proper Propeller produces eight units, the average manufacturing cost per unit will be

- A. \$1,647
- B. \$6,860
- C. \$9,800
- D. \$14,000

- Answer (A) is **incorrect**. The amount of \$1,647 is the cumulative average after eight batches, not eight units.

- Answer (B) is **correct**. Learning curve analysis is used to project productivity gains resulting from the increased rate at which people perform tasks as they gain experience. The underlying assumption of learning curve analysis is that workers gain productivity at a predictable rate as they gain experience with a new process. In this situation, the company is assuming that the total costs required for each doubling of output will be 70% of the costs required for the previous doubling. The effects of Proper Propeller's projected learning curve can be calculated as follows:

Batch	Cumulative Units Produced	Cumulative Average Cost
1	1	\$20,000
2	2	\$14,000 ( $\$20,000 \times 70\%$ )
3	4	\$ 9,800 ( $\$14,000 \times 70\%$ )
4	8	\$ 6,860 ( $\$9,800 \times 70\%$ )

- Answer (C) is **incorrect**. The amount of \$9,800 is the cumulative average cost after four units.
- Answer (D) is **incorrect**. The amount of \$14,000 is the cumulative average cost after two units.

**[31] Gleim #: 5.5.94 -- Source: CMA 0408 1-146**

(Refers to Fact Pattern #4)

If Proper Propeller produces eight units, the total manufacturing cost will be

- A. \$50,660
- B. \$54,880
- C. \$62,643
- D. \$112,000

- Answer (A) is **incorrect**. The amount of \$50,660 results from improperly summing the cumulative average cost figures.

- Answer (B) is **correct**. Learning curve analysis is used to project productivity gains resulting from the increased rate at which people perform tasks as they gain experience. The underlying assumption of learning curve analysis is that workers gain productivity at a predictable rate as they gain experience with a new process. In this situation, the company is assuming that the total costs required for each doubling of output will be 70% of the costs required for the previous doubling. The effects of Proper Propeller's projected learning curve can be calculated as follows:

Batch	Cumulative Units Produced	Cumulative Average Cost	Cumulative Total Cost
1	1	\$20,000	\$20,000
2	2	\$14,000 ( $\$20,000 \times 70\%$ )	28,000
3	4	\$9,800 ( $\$14,000 \times 70\%$ )	39,200
4	8	\$6,860 ( $\$9,800 \times 70\%$ )	54,880

- Answer (C) is **incorrect**. The amount of \$62,643 results from using an incorrect learning curve.
- Answer (D) is **incorrect**. The amount of \$112,000 results from ignoring the learning curve after the second unit.

**[32] Gleim #: 5.5.95 -- Source: CMA 0408 1-151**

(Refers to Fact Pattern #4)

After completing production of the first propeller, the estimated cost for Proper Propeller to fill an order for seven additional propellers is

- A. \$34,880
- B. \$54,880
- C. \$92,000
- D. \$98,000

- Answer (A) is **correct**. The effects of Proper Propeller's projected learning curve can be calculated as follows:

Batch	Cumulative Units Produced	Cumulative Average Cost	Cumulative Total Cost
1	1	\$20,000	\$20,000
2	2	\$14,000 ( $\$20,000 \times 70\%$ )	28,000
3	4	\$9,800 ( $\$14,000 \times 70\%$ )	39,200
4	8	\$6,860 ( $\$9,800 \times 70\%$ )	54,880

Since eight propellers require \$54,880 and the first one off the assembly line cost \$20,000, the cost of units 2 through 8 will be \$34,880 ( $\$54,880 - \$20,000$ ).

- Answer (B) is **incorrect**. The amount of \$54,880 is the cost of all eight propellers.
- Answer (C) is **incorrect**. The amount of \$92,000 results from assuming no learning curve after the second unit.
- Answer (D) is **incorrect**. The amount of \$98,000 results from ignoring the effect of the learning curve.

**[33] Gleim #: 5.5.96 -- Source: CMA 0408 1-147**

Martin Fabricating uses a cumulative average-time learning curve model to monitor labor costs. Data regarding two recently completed batches of a part that is used in tractor-trailer rigs is as follows:

Batch Number	Number of Units	Cumulative Average Hours Per Unit
1	50	20
2	50	16

If the same rate of learning continues for the next several batches produced, which of the following best describes (1) the type (i.e., degree) of learning curve that the firm is experiencing and (2) the average hours per unit for units included in the 201-400 range of units produced (i.e., the last 200 units)?

	Type (Degree) of Learning Curve	Average Hours Per Unit for Units 201-400
A.	20%	10.24
B.	80%	10.24
C.	80%	7.68
D.	20%	3.84

- Answer (A) is **incorrect**. Twenty percent is the complement of the learning curve, and 10.24 is the cumulative average number of hours for all units after the 4th batch, not the time spent on the units in the 4th batch.
- Answer (B) is **incorrect**. The number 10.24 is the cumulative average number of hours after the 4th batch, not the average spent on the units in the batch.
- Answer (C) is **correct**. The learning curve percentage is determined by noting the hours used in producing the first doubling of output as a percentage of the hours used in the original batch. Since 16 is 80% of 20, Martin is experiencing an 80% learning curve. The average hours used to produce the 4th batch of output (units 201 – 400) can be calculated as follows:

Batch	Units in Batch	Cumulative Units Produced	Cumulative Average Labor Hours	Cumulative Total Time	Time Spent on Batch	Time Spent on Units in Batch
1	50	50	20	1,000	1,000	20
2	50	100	16	1,600	600	12
3	100	200	12.8	2,560	960	9.6
4	200	400	10.24	4,096	1,536	7.68

- Answer (D) is **incorrect**. Twenty percent is the complement of the learning curve, and improperly halving the time spent on the units in the 4th batch.

**[34] Gleim #: 5.5.97 -- Source: CMA 0408 1-150**

A manufacturing company required 800 direct labor hours to produce the first lot of four units of a new motor. Management believes that a 90% learning curve will be experienced over four lots of production. How many direct labor hours will be required to manufacture the next 12 units?

- A. 1,792
- B. 1,944
- C. 2,016
- D. 2,160

- Answer (A) is **correct**. With a 90% learning curve, the cumulative production times would be as follows:

Batch	Average Time	Cumulative Time
1	800	800
2	720 (800 × 90%)	1,440
4	648 (720 × 90%)	2,592

Subtracting the 800 hours spent on the first batch from the cumulative time for four batches leaves 1,792 hours for the last three batches (12 units).

- Answer (B) is **incorrect**. A 90% learning curve produces an incremental production time of 1,792.
- Answer (C) is **incorrect**. A 90% learning curve produces an incremental production time of 1,792.
- Answer (D) is **incorrect**. A 90% learning curve produces an incremental production time of 1,792.

**[35] Gleim #: 5.5.98 -- Source: CMA 0408 2-023**

Which one of the following will allow a better use of standard costs and variance analysis to help improve managerial decision-making?

- A. Company A does not differentiate between variable and fixed overhead in calculating its overhead variances.
- B. Company B uses the prior year's average actual cost as the current year's standard.
- C. Company C investigates only negative variances.
- D. Company D constantly revises standards to reflect learning curves.

- Answer (A) is **incorrect**. Not distinguishing variable from fixed overhead will lead to poor decision making.
- Answer (B) is **incorrect**. Simply using figures from a previous period is an unsatisfactory means of establishing a budget.
- Answer (C) is **incorrect**. Positive variances can be a sign of reduced quality or other concerns.
- Answer (D) is **correct**. Learning curves are an established phenomenon. Workers learn a new task at a predictable rate and the resulting improvements in productivity should be factored into standard setting and variance analysis.

**[36] Gleim #: 5.5.99 -- Source: CMA 0408 1-141**

Which one of the following techniques would most likely be used to analyze reductions in the time required to perform a task as experience with that task increases?

- A. Regression analysis.
- B. Learning curve analysis.
- C. Sensitivity analysis.
- D. Normal probability analysis.

- Answer (A) is **incorrect**. Regression analysis, also called least-squares analysis, is the process of deriving the linear equation that describes the relationship between two (or more) variables with a nonzero coefficient of correlation.
- Answer (B) is **correct**. Learning curve analysis is used to project productivity gains resulting from the increased rate at which people perform tasks as they gain experience.
- Answer (C) is **incorrect**. Sensitivity analysis is used to reveal how sensitive expected value calculations are to the accuracy of the initial estimates.

- Answer (D) is **incorrect**. Normal probability analysis is used to determinate whether the distribution of a set of data is statistically normal.

**[37] Gleim #: 5.5.100 -- Source: CMA 0408 1-143**

A manufacturing firm plans to bid on a special order of 80 units that will be manufactured in lots of 10 units each. The production manager estimates that the direct labor hours per unit will decline by a constant percentage each time the cumulative quantity of units produced doubles. The quantitative technique used to capture this phenomenon and estimate the direct labor hours required for the special order is

- A. Cost-profit-volume analysis.
- B. The Markov process.
- C. Linear programming analysis.
- D. Learning curve analysis.

- Answer (A) is **incorrect**. Cost-volume-profit analysis is a tool for understanding the interaction of revenues with fixed and variable costs.
- Answer (B) is **incorrect**. The Markov process is used in decision problems in which the probability of the occurrence of a future state depends only on the current state.
- Answer (C) is **incorrect**. Linear programming is a mathematical technique used to optimize a linear function subject to certain constraints.
- Answer (D) is **correct**. Learning curve analysis is used to project productivity gains resulting from the increased rate at which people perform tasks as they gain experience.

[1] Gleim #: 5.6.101 -- Source: CMA 1294 3-12

Which one of the following is a sales forecasting technique that can be utilized in preparing the annual profit plan?

- A. Linear programming.
- B. Exponential smoothing.
- C. Queuing theory.
- D. Program Evaluation and Review Technique (PERT).

- Answer (A) is **incorrect**. Linear programming is used to minimize a cost function or maximize a revenue or profit function, subject to constraints.
- Answer (B) is **correct**. Exponential smoothing is a sales forecasting technique used to level or smooth variations encountered in a forecast. It also adapts the forecast to changes as they occur. The simplest form of smoothing is the moving average, in which each forecast is based on a fixed number of prior observations. Exponential smoothing is similar to the moving average, but the term "exponential" means that greater weight is placed on the most recent data, with the weights of all data falling off exponentially as the data age.
- Answer (C) is **incorrect**. Queuing is used to minimize the cost of waiting lines.
- Answer (D) is **incorrect**. PERT is used to monitor the progress of large multi-step projects, such as construction of a building.

[2] Gleim #: 5.6.102 -- Source: CMA 1293 4-25

The four components of time series data are secular trend, cyclical variation, seasonality, and random variation. The seasonality in the data can be removed by

- A. Multiplying the data by a seasonality factor.
- B. Ignoring it.
- C. Taking the weighted average over four time periods.
- D. Subtracting a seasonality factor from the data.

- Answer (A) is **incorrect**. Adding a seasonality factor to, or subtracting it from, a forecast based on trend analysis is a means of adjusting for seasonality.
- Answer (B) is **incorrect**. Seasonality factors cannot be ignored; they are reflected in the data and must be considered for a model to be accurate.

- Answer (C) is **correct**. Time series analysis relies on past experience. Changes in the value of a variable may have several possible components including secular trends, cyclical variation, seasonality, and random variation. Seasonal variations are common in many businesses. A variety of methods exist for including seasonal variations in a forecasting model, but most methods use a seasonal index. Alternatively, seasonal variations can be removed from data by using a weighted average of several time periods instead of data from individual periods.
- Answer (D) is **incorrect**. The seasonality adjustment for a single season's data may be an increase or a decrease.

**[3] Gleim #: 5.6.103 -- Source: CMA 0205**

A forecasting technique that is a combination of the last forecast and the last observed value is called

- A. Delphi.
- B. Least squares.
- C. Regression.
- D. Exponential smoothing.

- Answer (A) is **incorrect**. Delphi is a decision-making approach in which the manager solicits opinions on a problem from experts in the field, summarizes the opinions, and feeds the summaries back to the experts; the process is then reiterated. This method is an attempt to avoid groupthink.
- Answer (B) is **incorrect**. Least squares is the process of using calculus to match a set of data to a straight line; it is used in regression analysis.
- Answer (C) is **incorrect**. Regression analysis is the process of deriving the linear equation that describes the relationship between two variables.
- Answer (D) is **correct**. Exponential smoothing is a widespread technique for making projections because it requires less data be kept on hand than the moving average methods. The technique involves weighting the actual result for the previous period by a smoothing factor, weighting the forecast for the previous period by the smoothing factor's complement, and combining the two.

**[4] Gleim #: 5.6.104 -- Source: CIA 594 II-38**

As part of a risk analysis, an auditor wishes to forecast the percentage growth in next month's sales for a particular plant using the past 30 months' sales results. Significant changes in the organization affecting sales volumes were made within the last 9 months. The most effective analysis technique to use would be

- A. Unweighted moving average.
- B. Exponential smoothing.
- C. Queuing theory.
- D. Linear regression analysis.

- Answer (A) is **incorrect**. An unweighted average will not give more importance to more recent data.
- Answer (B) is **correct**. Under exponential smoothing, each forecast equals the sum of the last observation times the smoothing constant, plus the last forecast times one minus the constant. Thus, exponential means that greater weight is placed on the most recent data, with the weights of all data falling off exponentially as the data age. This feature is important because of the organizational changes that affected sales volume.
- Answer (C) is **incorrect**. Queuing theory is used to minimize the cost of waiting lines.
- Answer (D) is **incorrect**. Linear regression analysis determines the equation for the relationship among variables. It does not give more importance to more recent data.

**[8] Gleim #: 5.6.108 -- Source: CMA 0408 1-152**

Sales of big-screen televisions have grown steadily during the past 5 years. A dealer predicted that the demand for February would be 148 televisions. Actual demand in February was 158 televisions. If the smoothing constant ( ) is 0.3, the demand forecast for March, using the exponential smoothing model, will be

- A. 148 televisions.
- B. 151 televisions.
- C. 155 televisions.
- D. 158 televisions.

- Answer (A) is **incorrect**. Exponential smoothing involves more than simply using one month's forecast as the forecast for the following month.

- Answer (B) is **correct**. Exponential smoothing is a widespread technique for making projections because it requires less data be kept on hand than the moving average methods. Mathematically, a forecast is arrived at with exponential smoothing according to the following formula:

$$\begin{aligned}\text{Forecast} &= (\text{Smoothing factor} \times \text{Previous month result}) + \\ &\quad (\text{Smoothing factor complement} \times \text{Previous month forecast}) \\ &= (0.3 \times 158) + (0.7 \times 148) \\ &= 47.4 + 103.6 \\ &= 151\end{aligned}$$

- Answer (C) is **incorrect**. This number results from reversing the smoothing factor and smoothing factor complement.
- Answer (D) is **incorrect**. Exponential smoothing involves more than simply using one month's actual demand as the forecast for the following month.

[1] Gleim #: 5.7.109 -- Source: CMA 697 4-22

Philip Enterprises, distributor of video discs, is developing its budgeted cost of goods sold for next year. Philip has developed the following range of sales estimates and associated probabilities for the year:

<u>Sales Estimate</u>	<u>Probability</u>
\$ 60,000	25%
85,000	40
100,000	35

Philip's cost of goods sold averages 80% of sales. What is the expected value of Philip's budgeted cost of goods sold?

- A. \$85,000
- B. \$84,000
- C. \$68,000
- D. \$67,200

- Answer (A) is **incorrect**. The amount of \$85,000 is the sales estimate with the highest probability.
- Answer (B) is **incorrect**. The amount of \$84,000 is the expected value of sales.
- Answer (C) is **incorrect**. The amount of \$68,000 is 80% of the sales estimate with the highest probability.
- Answer (D) is **correct**. The expected value is calculated by weighting each sales estimate by the probability of its occurrence. Consequently, the expected value of sales is \$84,000 [ $\$60,000 \times .25$ ] + [ $\$85,000 \times .40$ ] + [ $\$100,000 \times .35$ ]. Cost of goods sold is therefore \$67,200 ( $\$84,000 \times .80$ ).

**[2] Gleim #: 5.7.110 -- Source: CMA 1293 4-26**

The expected value of perfect information is the

- A. Same as the expected profit under certainty.
  - B. Sum of the conditional profit (loss) for the best event of each act times the probability of each event occurring.
  - C. Difference between the expected profit under certainty and the expected opportunity loss.
  - D. Difference between the expected profit under certainty and the expected monetary value of the best act under uncertainty.
- Answer (A) is **incorrect**. The expected value of perfect information is the difference between the expected profit under certainty and the profit from the best decision under uncertainty.
  - Answer (B) is **incorrect**. The expected value of perfect information is the excess of the total conditional profits under certainty over the profit from the best decision under uncertainty.
  - Answer (C) is **incorrect**. There is no expected opportunity loss under conditions of certainty.
  - Answer (D) is **correct**. Perfect information permits certainty that a future state of nature will occur. The expected value of perfect information determines the maximum amount a decision maker is willing to pay for information. It is the difference between the expected value without perfect information, that is, the expected value of the best action under uncertainty and the expected value under certainty. Under certainty, a decision maker knows in each case which state of nature will occur and can act accordingly.

**[5] Gleim #: 5.7.113 -- Source: CMA 690 5-25**

In decision making under conditions of uncertainty, expected value refers to the

- A. Likely outcome of a proposed action.
  - B. Present value of alternative actions.
  - C. Probability of a given outcome from a proposed action.
  - D. Weighted average of probable outcomes of an action.
- Answer (A) is **incorrect**. The expected value is a long-range average; it is likely that the expected value will never be exactly achieved for a particular event.
  - Answer (B) is **incorrect**. Expected value does not consider present values.
  - Answer (C) is **incorrect**. Probability is only one component of expected value.

- Answer (D) is **correct**. The expected value of an action is found by multiplying the probability of each possible outcome by its payoff and summing the products. It represents the long-term average payoff for repeated trials. In other words, expected value is the weighted average of probable outcomes.

---

**[Fact Pattern #1]**

A beverage stand can sell either soft drinks or coffee on any given day. If the stand sells soft drinks and the weather is hot, it will make \$2,500; if the weather is cold, the profit will be \$1,000. If the stand sells coffee and the weather is hot, it will make \$1,900; if the weather is cold, the profit will be \$2,000. The probability of cold weather on a given day at this time is 60%.

---

**[6] Gleim #: 5.7.114 -- Source: CMA 1292 4-21**

(Refers to Fact Pattern #1)

The expected payoff for selling coffee is

- A. \$1,360
- B. \$2,200
- C. \$3,900
- D. \$1,960

- Answer (A) is **incorrect**. The least the company can make by selling coffee is \$1,900.
- Answer (B) is **incorrect**. The most the company can make by selling coffee is \$2,000.
- Answer (C) is **incorrect**. The most the company can make by selling coffee is \$2,000.
- Answer (D) is **correct**. The expected payoff calculation for coffee is

$$\begin{aligned}\text{Expected payoff} &= \text{Prob. hot (Payoff hot)} + \text{Prob. cold (Payoff cold)} \\ &= .4(\$1,900) + .6(\$2,000) \\ &= \$1,960\end{aligned}$$

[7] Gleim #: 5.7.115 -- Source: CMA 1292 4-22

(Refers to Fact Pattern #1)

The expected payoff if the vendor has perfect information is

- A. \$3,900
- B. \$2,200
- C. \$1,360
- D. \$1,960

- Answer (A) is **incorrect**. The most the vendor can make is \$2,500 per day.
- Answer (B) is **correct**. The vendor would like to sell coffee on cold days (\$2,000) and soft drinks on hot days (\$2,500). Hot days are expected 40% of the time. Hence, the probability is 40% of making \$2,500 by selling soft drinks. The chance of making \$2,000 by selling coffee is 60%. The payoff equation is:

$$\begin{aligned}\text{Exp. payoff with perf. info.} &= \text{Prob. hot (Payoff soft drinks)} + \\ &\quad \text{Prob. cold (Payoff coffee)} \\ &= .4(\$2,500) + .6(\$2,000) \\ &= \$2,200\end{aligned}$$

- Answer (C) is **incorrect**. The least the vendor could make by having perfect information is \$2,000 on cold days.
- Answer (D) is **incorrect**. The least the vendor could make by having perfect information is \$2,000 on cold days.

[8] Gleim #: 5.7.116 -- Source: CMA 1292 4-23

(Refers to Fact Pattern #1)

If the probability of hot weather, given a hot weather forecast, is 50%, how much would the vendor be willing to pay for the forecast?

- A. \$600
- B. \$300
- C. \$1,000
- D. \$500

- Answer (A) is **incorrect**. The vendor would pay \$600 for perfect information, but the forecasts are only 50% accurate.

- Answer (B) is **correct**. If the weather is hot and coffee is served, the vendor earns \$1,900. If the vendor knows the weather will be hot, (s)he would sell soft drinks and make \$2,500, a \$600 increase. Thus, the vendor should be willing to pay up to \$600 for perfect information regarding hot weather. However, if the forecasts are only 50% accurate, the information is not perfect. Accordingly, the vendor should be willing to pay only \$300 (the \$600 potential increase in profits  $\times$  50%) for the sometimes accurate forecasts.
- Answer (C) is **incorrect**. The most the vendor could profit from perfect information on hot days would be \$600 (\$2,500 – \$1,900).
- Answer (D) is **incorrect**. Perfect information is worth \$600, but information that is 50% accurate warrants only a \$300 payment.

**[Fact Pattern #2]**

Butler and Burnside are projecting market conditions for the upcoming month. They have prepared the following payoff table:

Supply in Units	Demand in Units			
	0	2	4	6
	Probability of Demand			
	0.1	0.3	0.4	0.2
0	\$ 0	\$ 0	\$ 0	\$ 0
2	(80)	40	40	40
4	(160)	(40)	80	80
6	(240)	(120)	0	120

**[9] Gleim #: 5.7.117 -- Source: CMA 689 5-28**

(Refers to Fact Pattern #2)

Butler and Burnside's expected profit when supply equals 4 units is

- A. \$(40)
- B. \$80
- C. \$20
- D. \$120

- Answer (A) is **incorrect**. This figure is the payoff amount when demand is 2 units.
- Answer (B) is **incorrect**. This figure is the payoff amount when demand is 4 or 6 units.

- Answer (C) is **correct**. The approach to the solution is to weight (multiply) the probabilities for each level of demand by the payoff for that level of demand.

<u>Demand</u>	<u>Payoff</u>		<u>Probability</u>		<u>Weighted Payoffs</u>
0	\$(160)	×	.1	=	\$(16)
2	(40)	×	.3	=	(12)
4	80	×	.4	=	32
6	80	×	.2	=	<u>16</u>
Expected Profit					<u><u>\$ 20</u></u>

- Answer (D) is **incorrect**. This figure is calculated by adding the amounts in the column for a demand of 4 units.

**[10] Gleim #: 5.7.118 -- Source: CMA 689 5-29**

(Refers to Fact Pattern #2)

Butler and Burnside's expected profit with perfect information is

- A. \$28
- B. \$20
- C. \$(36)
- D. \$68

- Answer (A) is **incorrect**. With perfect information, the seller could order the inventory each day to meet the exact demand. The total profit can be calculated by weighting the payoff from each best option.
- Answer (B) is **incorrect**. With perfect information, the seller could order the inventory each day to meet the exact demand. The total profit can be calculated by weighting the payoff from each best option.
- Answer (C) is **incorrect**. With perfect information, the seller could order the inventory each day to meet the exact demand. The total profit can be calculated by weighting the payoff from each best option.

- Answer (D) is **correct**. With perfect information, the seller could order the inventory each day to meet the exact demand. For example, if demand were zero, supply would be zero and the seller would not lose any money. If demand were 2 units, the seller would acquire an equal supply and make a profit of \$40. The total profit can be calculated by weighting the payoff from each best option.

<u>Demand</u>	<u>Payoff</u>		<u>Probability</u>		<u>Weighted Payoffs</u>
0	\$ 0	×	.1	=	\$ 0
2	40	×	.3	=	12
4	80	×	.4	=	32
6	120	×	.2	=	<u>24</u>
Expected Profit					<u><u>\$68</u></u>

**[11] Gleim #: 5.7.119 -- Source: CMA 689 5-30**

(Refers to Fact Pattern #2)

The price Butler and Burnside are willing to pay for perfect information is

- A. \$68
- B. \$40
- C. \$48
- D. \$104

- Answer (A) is **incorrect**. This figure is the amount of profit with perfect information.

- Answer (B) is **correct**. The maximum amount the seller should pay for perfect information is the difference between the expected profit with perfect information and the expected profit if demand is not known. With perfect information, supply is the correct amount of units to maximize profit at each level of demand. Thus, the expected profit with perfect information is computed as follows:  $(.1 \times \$0) + (.3 \times \$40) + (.4 \times \$80) + (.2 \times \$120) = \$68$ . Without perfect information, the seller should purchase the supply that will result in the maximum long-run profit. Using the information given, it can be determined that the profit will be \$20 when the supply is 4 units. It is also evident that the profit is zero when the supply is zero. The expected profit must also be calculated for supply levels of 2 and 6 units. For a supply of 2 units, the expected profit is

$$.1(-\$80) + .3(\$40) + .4(\$40) + .2(\$40) = \$28$$

For a supply of 6 units, the expected loss is

$$.1(-\$240) + .3(-\$120) + .4(\$0) + .2(\$120) = \$(36)$$

Thus, without perfect information, profits are maximized at \$28 when the supply is 2 units. However, with perfect information, profits will be \$68. Thus, a rational seller should therefore be willing to pay up to \$40 (\$68 – \$28).

- Answer (C) is **incorrect**. The price paid for perfect information equals the difference between profits expected with perfect information and profits without perfect information.
- Answer (D) is **incorrect**. The price paid for perfect information equals the difference between profits expected with perfect information and profits without perfect information.

**[Fact Pattern #3]**

The College Honor Society sells hot pretzels at the home football games. The pretzels are sold for \$1.00 each, and the cost per pretzel is \$.30. Any unsold pretzels are discarded because they will be stale before the next home game.

The frequency distribution of the demand for pretzels per game is presented as follows:

<u>Unit Sales Volume</u>	<u>Probability</u>
2,000 pretzels	.10
3,000 pretzels	.15
4,000 pretzels	.20
5,000 pretzels	.35
6,000 pretzels	.20

**[15] Gleim #: 5.7.123 -- Source: CMA 1289 5-20**

(Refers to Fact Pattern #3)

The estimated demand for pretzels at the next home football game using an expected value approach is

- A. 4,000 pretzels.
- B. 4,400 pretzels.
- C. 5,000 pretzels.
- D. Some amount other than those given.

- Answer (A) is **incorrect**. The figure of 4,000 pretzels assumes each outcome is equally likely.
- Answer (B) is **correct**. The calculation using an expected value approach weights each possible sales volume by its probability. Thus, the estimated demand is 4,400 pretzels.

<u>Volume</u>		<u>Probability</u>		<u>Result</u>
2,000	×	.10	=	200
3,000	×	.15	=	450
4,000	×	.20	=	800
5,000	×	.35	=	1,750
6,000	×	.20	=	1,200
Expected value				<u><u>4,400</u></u>

- Answer (C) is **incorrect**. The estimated demand using a deterministic approach based on the most likely outcome is 5,000 pretzels.
- Answer (D) is **incorrect**. The figure of 4,400 pretzels is among the responses given.

**[16] Gleim #: 5.7.124 -- Source: CMA 1289 5-21**

(Refers to Fact Pattern #3)

The estimated demand for pretzels at the next home football game using a deterministic approach based on the most likely outcome is

- A. 4,000 pretzels.
- B. 4,400 pretzels.
- C. 5,000 pretzels.
- D. 6,000 pretzels.

- Answer (A) is **incorrect**. The figure of 4,000 pretzels assumes each outcome is equally likely.
- Answer (B) is **incorrect**. The estimated demand using an expected value approach is 4,400 pretzels.
- Answer (C) is **correct**. A deterministic approach assumes that a value is known with certainty. If that value is deemed to be the most likely outcome, assumed demand will be 5,000 pretzels, the volume with the highest probability (35%).
- Answer (D) is **incorrect**. The figure of 6,000 pretzels is merely the greatest demand.

**[17] Gleim #: 5.7.125 -- Source: CMA 1289 5-22**

(Refers to Fact Pattern #3)

The conditional profit per game of having 4,000 pretzels available but only selling 3,000 pretzels is

- A. \$1,800
- B. \$2,100
- C. \$2,800
- D. Some amount other than those given.

- Answer (A) is **correct**. Each pretzel costs \$.30. Thus, the cost of 4,000 pretzels is \$1,200 ( $4,000 \times \$.30$ ). Selling 3,000 pretzels at \$1 each produces revenue of \$3,000. Subtracting the \$1,200 of costs from the \$3,000 of revenue results in a conditional profit of \$1,800.

- Answer (B) is **incorrect**. The amount of \$2,100 assumes 3,000 are available and 3,000 are sold.
- Answer (C) is **incorrect**. The conditional profit given that 4,800 are sold is \$2,800.
- Answer (D) is **incorrect**. The amount of \$1,800 is among the responses given.

**[18] Gleim #: 5.7.126 -- Source: CMA 1289 5-23**

(Refers to Fact Pattern #3)

The conditional profit per game of having 4,000 pretzels available and selling all 4,000 pretzels is

- A. \$1,200
- B. \$2,100
- C. \$2,800
- D. \$800

- Answer (A) is **incorrect**. The cost of 4,000 pretzels is \$1,200.
- Answer (B) is **incorrect**. The amount of \$2,100 assumes 3,000 are available and 3,000 are sold.
- Answer (C) is **correct**. Each pretzel costs \$.30. Thus, the cost of 4,000 pretzels is \$1,200 ( $4,000 \times \$.30$ ). Selling 4,000 pretzels at \$1 each produces revenue of \$4,000. Subtracting the \$1,200 of costs from the \$4,000 of revenue results in a conditional profit of \$2,800.
- Answer (D) is **incorrect**. The amount of \$800 assumes 2,000 are sold.

**[19] Gleim #: 5.7.127 -- Source: CMA 690 5-19**

Alsen Company is in the process of preparing its budget. As part of the process, the company has prepared sales estimates and estimated the probability associated with each sales estimate. Which one of the following techniques should be used by Alsen to determine sales for budgeting purposes?

- A. Linear programming.
- B. Minimax regret criteria.
- C. Expected value analysis.
- D. Monte Carlo simulation.

- Answer (A) is **incorrect**. Linear programming is used to optimize a function, such as profits or costs, given certain constraints.

- Answer (B) is **incorrect**. The minimax regret criterion is a decision rule developed in game theory. It chooses the option with the set of outcomes that includes the lowest maximum opportunity cost.
- Answer (C) is **correct**. The expected value of an action is found by multiplying the probability of each possible outcome by its payoff and summing the products. It represents the long-term average payoff for repeated trials. If estimates of sales and probabilities are known, expected value analysis can be used to determine budgeted sales.
- Answer (D) is **incorrect**. Monte Carlo simulation involves adding random numbers to otherwise deterministic models to simulate the uncertainty inherent in real-world situations.

**[20] Gleim #: 5.7.128 -- Source: CMA 692 4-4**

The expected monetary value of an event

- A. Is equal to the conditional value or profit of the event.
  - B. Is equal to the payoff of the event times the probability the event will occur.
  - C. Is the profit forgone by not choosing the best alternative.
  - D. Is the absolute profit from a particular event.
- Answer (A) is **incorrect**. The conditional value is the return given a certain condition or state of nature.
  - Answer (B) is **correct**. For decisions involving risk, the concept of expected value provides a rational means for selecting the best alternative. The expected value of a decision is found by multiplying the probability of each outcome by its payoff, and summing the products. The result is the long-term average payoff for repeated trials.
  - Answer (C) is **incorrect**. The profit forgone by not choosing the best alternative is the opportunity cost.
  - Answer (D) is **incorrect**. Expected value represents the long-run average profit from an event.

**[21] Gleim #: 5.7.129 -- Source: CMA 1286 5-3**

Expected value in decision analysis is

- A. A standard deviation using the probabilities as weights.
- B. An arithmetic mean using the probabilities as weights.
- C. The square root of the squared deviations.
- D. A measure of the difference between the best possible outcome and the outcome of the original decision.

- Answer (A) is **incorrect**. The standard deviation is a measure of dispersion of a population.
- Answer (B) is **correct**. Expected value analysis is an estimate of future monetary value based on forecasts and their related probabilities of occurrence. The expected value is found by multiplying the probability of each outcome by its payoff and summing the products. Expected value is thus an arithmetic mean using probabilities as weights.
- Answer (C) is **incorrect**. This is a nonsense answer.
- Answer (D) is **incorrect**. Expected value is a prospective measure.

**[22] Gleim #: 5.7.130 -- Source: CMA 688 5-20**

The following table contains the profit outcomes for each state of nature and decision combination for a firm:

	States of Nature		
	S1	S2	S3
Decision 1	\$ 24	\$14	\$ (6)
Decision 2	\$ 20	\$10	\$ 5
Decision 3	\$(20)	\$ 8	\$15
Probabilities	0.10	0.50	0.40

The expected value of perfect information for this firm in this case is

- A. \$6.40
- B. \$8.40
- C. \$9.00
- D. \$8.60

- Answer (A) is **correct**. The first step is to determine the expected value without perfect information by formulating a payoff matrix. For example, the expected payoff for the combination of State of Nature S1 and Decision 1 is \$2.40 (10% probability  $\times$  \$24 outcome). The entire payoff matrix is

	<u>S1</u>	<u>S2</u>	<u>S3</u>	<u>Total</u>
Decision 1	\$ 2.40	\$7.00	\$(2.40)	\$7.00
Decision 2	2.00	5.00	2.00	9.00
Decision 3	(2.00)	4.00	6.00	8.00

Thus, the best decision under conditions of uncertainty is Decision 2 (expected value = \$9). If the decision maker knew exactly when each state of nature would occur, the decision would correspond to the maximum profit opportunity for that state of nature. For instance, if S1 is certain, the most profitable decision is Decision 1 (\$24). Thus, the expected payoff given perfect information is \$15.40.

<u>State of Nature</u>	<u>Profit</u>	<u>Probability</u>	<u>Payoff</u>
1	\$24	10%	\$2.40
2	14	50	7.00
3	15	40	6.00

The expected value of perfect information is therefore \$6.40 (\$15.40 – \$9.00).

- Answer (B) is **incorrect**. The payoffs from Decisions 1 and 3 equal \$8.40 (\$2.40 + \$6.00).
- Answer (C) is **incorrect**. The best decision under conditions of uncertainty is \$9.00.
- Answer (D) is **incorrect**. The expected value of perfect information is the difference between the expected payoff with perfect information and the expected payoff without perfect information.

**[23] Gleim #: 5.7.131 -- Source: CMA 691 4-1**

The expected monetary value of an act is the

- Sum of the conditional profit (loss) for each event.
  - Sum of the conditional profit (loss) for each event times the probability of each event's occurrence.
  - Conditional profit (loss) for the best event times the probability of each event's occurrence.
  - Revenue minus the costs for the act.
- Answer (A) is **incorrect**. The conditional profit or loss must be weighted by the probability of each event's occurrence.

- Answer (B) is **correct**. Expected value analysis estimates future monetary value based on forecasts and their related probabilities of occurrence. The expected value under uncertainty is found by multiplying the probability of each outcome (event) by its payoff (conditional profit or loss) and summing the products.
- Answer (C) is **incorrect**. The best event will not occur every time; less desirable events will also occur and must enter into the calculation.
- Answer (D) is **incorrect**. Each event must be weighted by the probability of its occurrence.

**[24] Gleim #: 5.7.132 -- Source: CMA 691 4-3**

The expected value of perfect information is the

- A. Same as the expected profit under certainty.
  - B. Sum of the conditional profit (loss) for the best event of each act times the probability of each event's occurring.
  - C. Difference between the expected profit under uncertainty and conditional profit for the best act under certainty.
  - D. Difference between the expected profit under certainty and the expected monetary value of the best act under uncertainty.
- 
- Answer (A) is **incorrect**. The value of perfect information is limited to the excess of the profit under certainty over the best return without perfect information.
  - Answer (B) is **incorrect**. The value of perfect information is limited to the excess of the profit under certainty over the best return without perfect information.
  - Answer (C) is **incorrect**. It may not be the best act under certainty that is considered; the value of perfect information is based on the event that is known will happen, whether that event is the best or the worst.
  - Answer (D) is **correct**. The expected value under uncertainty is found by multiplying the probability of each outcome (event) by its payoff (conditional profit or loss) and summing the products. Perfect information is the knowledge that a future state of nature will occur with certainty. The expected value of perfect information is the difference between the expected value under certainty and the expected value of the optimal decision under uncertainty. The expected value under certainty equals the sum of the products of the profit maximizing payoffs of perfect forecasts and the related probabilities.

---

**[Fact Pattern #4]**

The Booster Club at Blair College sells hot dogs at home basketball games. The group has a frequency distribution of the demand for hot dogs per game and plans to apply the expected value decision rule to determine the number of hot dogs to stock.

---

**[26] Gleim #: 5.7.134 -- Source: CMA 691 4-2**

(Refers to Fact Pattern #4)

The Booster Club should select the demand level that

- A. Is closest to the expected demand.
- B. Has the greatest probability of occurring.
- C. Has the greatest expected opportunity cost.
- D. Has the greatest expected monetary value.

- Answer (A) is **incorrect**. Stocking an amount equal to expected demand (the sum of the products of the possible amounts demanded and their respective probabilities) does not necessarily maximize expected profits.
- Answer (B) is **incorrect**. The number of bags to stock is not necessarily the same as the amount demanded with the highest probability. The inventory decision should be based on the relation of the probability distribution to the monetary outcomes.
- Answer (C) is **incorrect**. The greatest opportunity cost is not factored into the expected value analysis.
- Answer (D) is **correct**. The Booster Club should select the demand level that maximizes profits, that is, the level with the greatest expected monetary value. This level may not include the event with the highest conditional profit because this profit may be accompanied by a low probability of occurrence. Alternatively, the event with the highest probability of occurrence may not be selected because it does not offer a high conditional profit.

---

**[Fact Pattern #5]**

A company is considering three alternative machines to produce a new product. The cost structures (unit variable costs plus avoidable fixed costs) for the three machines are shown as follows. The selling price is unaffected by the machine used.

Single purpose machine	$$.60x + \$20,000$
Semiautomatic machine	$$.40x + \$50,000$
Automatic machine	$$.20x + \$120,000$

The demand for units of the new product is described by the following probability distribution.

<u>Demand</u>	<u>Probability</u>
200,000	0.4
300,000	0.3
400,000	0.2
500,000	0.1

---

**[27] Gleim #: 5.7.135 -- Source: CMA 689 5-26**

(Refers to Fact Pattern #5)

Ignoring the time value of money, the expected cost of using the semiautomatic machine is

- A. \$170,000
- B. \$130,000
- C. \$210,000
- D. \$250,000

- Answer (A) is **correct**. The expected demand is 300,000 units  $[(.4 \times 200,000) + (.3 \times 300,000) + (.2 \times 400,000) + (.1 \times 500,000)]$ . Total expected cost is therefore \$170,000 [\$50,000 fixed cost +  $(.40 \times 300,000)$  variable cost].
- Answer (B) is **incorrect**. The amount of \$130,000 is calculated by using demand of 200,000 units.
- Answer (C) is **incorrect**. The amount of \$210,000 is calculated by using demand of 400,000 units.
- Answer (D) is **incorrect**. The amount of \$250,000 is calculated by using demand of 500,000 units.

**[28] Gleim #: 5.7.136 -- Source: CMA 689 5-27**

(Refers to Fact Pattern #5)

Using the expected value criterion,

- A. The single purpose machine should be used because of the low expected demand.
  - B. The automatic machine should be used because of the high expected demand.
  - C. The semiautomatic machine should be used because it has the lowest expected cost.
  - D. The automatic machine has the lowest expected cost.
- Answer (A) is **incorrect**. The single purpose machine is not the best choice based on the expected demand level.
  - Answer (B) is **incorrect**. The automatic machine is not the best choice based on the expected demand level.
  - Answer (C) is **correct**. The semiautomatic machine has an expected cost of \$170,000 based on an expected demand of 300,000 units  $[(.4 \times 200,000) + (.3 \times 300,000) + (.2 \times 400,000) + (.1 \times 500,000)]$ . The single purpose machine has an expected cost of \$200,000  $[(.60 \times 300,000) + \$20,000]$ . The automatic machine has an expected cost of \$180,000  $[(.20 \times 300,000) + \$120,000]$ . Hence, the semiautomatic machine has the lowest expected cost at the expected level of demand.
  - Answer (D) is **incorrect**. The automatic machine has the second lowest expected cost.

**[Fact Pattern #6]**

Stan Berry is considering selling peanuts at the Keefer High School football games. The peanuts would cost \$.50 per bag and could be sold for \$1.50 per bag. No other costs would be incurred to sell the peanuts. All unsold bags can be returned to the supplier for \$.30 each. Berry estimated the demand for peanuts at each football game and constructed the payoff table that follows.

Demand (Bags)	Probability of Demand	Action (Bags to Stock)			
		20	30	40	50
20	.2	\$20	\$18	\$16	\$14
30	.4	\$20	\$30	\$28	\$26
40	.3	\$20	\$30	\$40	\$38
50	.1	\$20	\$30	\$40	\$50

**[29] Gleim #: 5.7.137 -- Source: CMA 690 5-17**

(Refers to Fact Pattern #6)

The optimum number of bags of peanuts for Stan Berry to stock is

- A. 20
- B. 30
- C. 40
- D. 50

- Answer (A) is **incorrect**. The figure of 20 units does not have the greatest expected value.
- Answer (B) is **incorrect**. The figure of 30 units does not have the greatest expected value.
- Answer (C) is **correct**. Expected value analysis is a means of selecting the best option when decisions involve risk. The expected value equals the sum of the products of the various payoffs and their respective probabilities. Stan Berry can calculate the expected value of each of his four possible actions as follows:

Bags Stocked		Expected Value
20	$.2(\$20) + .4(\$20) + .3(\$20) + .1(\$20)$	= \$20.00
30	$.2(\$18) + .4(\$30) + .3(\$30) + .1(\$30)$	= 27.60
40	$.2(\$16) + .4(\$28) + .3(\$40) + .1(\$40)$	= 30.40
50	$.2(\$14) + .4(\$26) + .3(\$38) + .1(\$50)$	= 29.60

The action with the highest expected payoff is to stock 40 bags.

- Answer (D) is **incorrect**. The figure of 50 units does not have the greatest expected value.

**[30] Gleim #: 5.7.138 -- Source: CMA 690 5-18**

(Refers to Fact Pattern #6)

The maximum that Stan Berry should pay for perfect information so that he could always stock the correct number of bags of peanuts is

- A. \$.80
- B. \$2.60
- C. \$10.40
- D. \$30.00

- Answer (A) is **incorrect**. The most Stan would pay for perfect information is the difference between expected profit with perfect information and expected profit without perfect information.
- Answer (B) is **correct**. Expected value analysis estimates future monetary value based on forecasts and their related probabilities of occurrence. The expected value is found by multiplying the probability of each outcome by its payoff and summing the products. The expected value of perfect information is the difference between the expected value under certainty and the expected value of the optimal decision under uncertainty. The expected value under certainty equals the sum of the products of the profit maximizing payoffs of perfect forecasts and the related probabilities.

20% × \$20 =	\$ 4.00
40% × \$30 =	12.00
30% × \$40 =	12.00
10% × \$50 =	<u>5.00</u>
Expected payoff with perfect info.	<u><u>\$33.00</u></u>

Thus, with perfect information, the proprietor could achieve an average profit of \$33 per game. Without perfect information, the expected value is only \$30.40. Accordingly, up to \$2.60 could be paid for perfect information (\$33 - \$30.40).

- Answer (C) is **incorrect**. The most Stan would pay for perfect information is the difference between expected profit with perfect information and expected profit without perfect information.
- Answer (D) is **incorrect**. The most Stan would pay for perfect information is the difference between expected profit with perfect information and expected profit without perfect information.

**[31] Gleim #: 5.7.139 -- Source: CMA 0205**

Carson Products sell sweatshirts and is preparing for a World Cup Soccer match. The cost per sweatshirt varies with the quantity purchased as follows.

<u>Quantity</u>	<u>Unit Cost</u>
4,000	\$14.00
5,000	13.50
6,000	13.00
7,000	12.50

Carson must purchase the sweatshirts one month before the game and has analyzed the market and estimated sales levels as follows.

Unit sales	4,000	5,000	6,000	7,000
Probability	15%	20%	35%	30%

The estimated selling price is \$25 for sales made before and during game day. Any sweatshirts remaining after game day can be sold at wholesale to a local discount store for \$10.

The expected profit if Carson purchased 6,000 shirts is

- A. \$64,500
- B. \$66,000
- C. \$69,000
- D. \$72,000

- Answer (A) is **correct**. An expected value for each level of demand is derived by weighting the profit for that level by the probability of its occurrence. The cost of goods is the same in every case because 6,000 sweatshirts are being purchased without certain knowledge of what demand will be. Also, the gameday revenue for the 7,000 demand level is the same as for 6,000 since Carson only has 6,000 sweatshirts available for sale.

		Demand Level				Total
		4,000	5,000	6,000	7,000	
Gameday revenue @ \$25 ea.		\$100,000	\$125,000	\$150,000	\$150,000	
Cost of goods (6,000 @ \$13 ea.)		(78,000)	(78,000)	(78,000)	(78,000)	
Remainder revenue	(2,000 @ \$10 ea.)	20,000				
	(1,000 @ \$10 ea.)		10,000			
	(0 @ \$10 ea.)			0	0	
Total profit		\$42,000	\$57,000	\$72,000	\$72,000	
Probability		× 15%	× 20%	× 35%	× 30%	
Expected value		<u>\$6,300</u>	<u>\$11,400</u>	<u>\$25,200</u>	<u>\$21,600</u>	<u>\$64,500</u>

- Answer (B) is **incorrect**. Improperly using a unit cost of \$14.00 for all units and failing to weight the total profits results in \$66,000.
- Answer (C) is **incorrect**. Improperly using a unit cost of \$13.50 for all units and failing to weight the total profits results in \$69,000.
- Answer (D) is **incorrect**. Improperly using 7,000 unit sales at the 7,000 demand level (only 6,000 shirts are available for sale) results in \$72,000.

---

**[Fact Pattern #7]**

A computer store sells four computer models designated as P104, X104, A104, and S104. The store manager has made random number assignments to represent customer choices based on past sales data. The assignments are shown below.

<u>Model</u>	<u>Random Numbers</u>
P104	0-1
X104	2-6
A104	7-8
S104	9

---

**[32] Gleim #: 5.7.140 -- Source: CMA 688 5-25**

(Refers to Fact Pattern #7)

The probability that a customer will select model P104 is

- A. 10%
  - B. 20%
  - C. 50%
  - D. Some percentage other than those given.
- Answer (A) is **incorrect**. This percentage is the probability of selecting S104.
  - Answer (B) is **correct**. Ten random numbers have been assigned. Of these, two (0 and 1) have been assigned to model P104. Thus, there are two chances out of ten, or 20%, that a customer will select that model.
  - Answer (C) is **incorrect**. The probability of selecting X104 is 50%.
  - Answer (D) is **incorrect**. The correct percentage is among the responses given.

**[33] Gleim #: 5.7.141 -- Source: CMA 688 5-26**

(Refers to Fact Pattern #7)

In running a simulation of the computer demand, the following numbers are drawn in sequence: 2, 8, and 6. The simulation indicates that the third customer will purchase.

- A. Model P104.
- B. Model X104.
- C. Model A104.
- D. Model S104.

- Answer (A) is **incorrect**. Model P104 corresponds to numbers 0 and 1.
- Answer (B) is **correct**. The third customer is simulated by the third number drawn. Therefore, the third customer's purchase is represented by the number 6. The numbers 2 through 6 correspond to model X104. Thus, the third customer is expected to purchase model X104.
- Answer (C) is **incorrect**. Model A104 corresponds to numbers 7 and 8.
- Answer (D) is **incorrect**. Model S104 corresponds to number 9.

**[34] Gleim #: 5.7.142 -- Source: CMA 683 5-8**

A company is simulating the actions of a government agency in which 50% of the time a recall of a product is required, 40% of the time only notification of the buyer about a potential defect is required, and 10% of the time no action on its part is required. Random numbers of 1 to 100 are being used. An appropriate assignment of random numbers for the recall category would be

- A. 1-40
- B. 40-90
- C. 61-100
- D. 11-60

- Answer (A) is **incorrect**. The assignment of 1-40 is an appropriate assignment of random numbers for the notification category.
- Answer (B) is **incorrect**. The assignment of 40-90 includes 51 numbers.
- Answer (C) is **incorrect**. The assignment of 61-100 is an appropriate assignment of random numbers for the notification category.
- Answer (D) is **correct**. Given a 50% chance of a recall, 50 different numbers should be assigned to that alternative. The answer (11-60) is the only alternative with 50 numbers.

[35] Gleim #: 5.7.143 -- Source: CMA 0408 1-176

Johnson Software has developed a new software package. Johnson's sales manager has prepared the following probability distribution describing the relative likelihood of monthly sales levels and relative income (loss) for the company's new software package.

Monthly Sales In Units	Probability	Income(Loss)
10,000	.2	\$(4,000)
20,000	.3	10,000
30,000	.3	30,000
40,000	.2	60,000

If Johnson decides to market its new software package, the expected value of additional monthly income will be

- A. \$23,200
- B. \$24,000
- C. \$24,800
- D. \$25,000

- Answer (A) is **correct**. Expected value is a means of associating a dollar amount with each of the possible outcomes of a probability distribution. The outcome yielding the highest expected value (which may or may not be the most likely one) is the optimal alternative. The expected value of each outcome, and of the project as a whole, can be determined through the preparation of a payoff table, as follows:

Monthly Sales In Units	Probability		Income (Loss)		Expected Value
10,000	.2	×	\$(4,000)	=	\$ (800)
20,000	.3	×	10,000	=	3,000
30,000	.3	×	30,000	=	9,000
40,000	.2	×	60,000	=	12,000
					<u>\$23,200</u>

- Answer (B) is **incorrect**. The amount of \$24,000 results from failing to account for the \$4,000 loss at the 10,000-unit sales level.
- Answer (C) is **incorrect**. The amount of \$24,800 results from improperly treating the \$4,000 from the 10,000-unit level as income rather than as a loss.

- Answer (D) is **incorrect**. The amount of \$25,000 results from improperly weighting the monthly sales units, rather than the income and loss figures, by the probabilities.

**[36] Gleim #: 5.7.144 -- Source: CMA 0408 1-177**

According to recent focus sessions, Norton Corporation has a “can’t miss” consumer product on its hands. Sales forecasts indicate either excellent or good results, with Norton’s sales manager assigning a probability of .6 to a good results outcome. The company is now studying various sales compensation plans for the product and has determined the following contribution margin data:

	<u>Contribution Margin</u>
If sales are excellent and	
Plan 1 is adopted	\$300,000
Plan 2 is adopted	370,000
If sales are good and	
Plan 1 is adopted	240,000
Plan 2 is adopted	180,000

On the basis of this information, which of the following statements is correct?

- A. Plan 2 should be adopted because it is \$10,000 more attractive than Plan 1.
  - B. Plan 1 should be adopted because it is \$8,000 more attractive than Plan 2.
  - C. Plan 1 should be adopted because of the sales manager’s higher confidence in good results.
  - D. Either Plan should be adopted, the decision being dependent on the probability of excellent sales results.
- Answer (A) is **incorrect**. The expected value of Plan 2 exceeds that of Plan 1 by \$10,000 only after merely summing the unweighted contribution margins.

- Answer (B) is **correct**. When monetary outcomes and probabilities can be reasonably estimated, a payoff table can be constructed to determine the best course of action:

<u>Decision Alternative</u>	<u>State of Nature</u>	<u>Contribution Margin</u>		<u>Probability</u>		<u>Expected Value</u>
Plan 1	Excellent	\$300,000	×	0.4	=	\$120,000
	Good	240,000	×	0.6	=	<u>144,000</u>
						<u><u>\$264,000</u></u>
Plan 2	Excellent	\$370,000	×	0.4	=	\$148,000
	Good	180,000	×	0.6	=	<u>108,000</u>
						<u><u>\$256,000</u></u>

After weighting the possible monetary outcomes by their respective probabilities, the expected value of Plan 1 is \$8,000 higher than the expected value of Plan 2.

- Answer (C) is **incorrect**. The purpose of expected value computation is to take all possible outcomes into account, not just the most likely.
- Answer (D) is **incorrect**. The plan must be adopted before the actual outcome is known.

**[37] Gleim #: 5.7.145 -- Source: CMA 0408 1-178**

Denton, Inc., manufactures industrial machinery and requires 100,000 switches per year in its assembly process. When switches are received from a vendor they are installed in the specific machine and tested. If the switches fail, they are scrapped and the associated labor cost of \$25 is considered lost productivity. Denton purchases “off the shelf” switches as opposed to custom-made switches and experiences quality problems with some vendors’ products. A decision must be made as to which vendor to buy from during the next year based on the following information.

<u>Vendor</u>	<u>Price per Switch</u>	<u>Percentage Expected to Pass the Test</u>
P	\$35	90%
Q	37	94%
R	39	97%
S	40	99%

Which vendor should Denton’s controller recommend to management?

- A. Vendor P.
- B. Vendor Q.
- C. Vendor R.
- D. Vendor S.

- Answer (A) is **incorrect**. The total cost of using Vendor P (\$4,100,000) is greater than that of Vendor S (\$4,065,000)
- Answer (B) is **incorrect**. The total cost of using Vendor Q (\$4,072,000) is greater than that of Vendor S (\$4,065,000).
- Answer (C) is **incorrect**. The total cost of using Vendor R (\$4,092,000) is greater than that of Vendor S (\$4,065,000).

- Answer (D) is **correct**. The total cost of buying from each vendor consists of three components: purchase price, cost of scrapping, and replacement cost. Total purchase price is calculated as follows:

<u>Vendor</u>	<u>Annual Quantity Purchased</u>		<u>Unit Price</u>		<u>Total Purchase Price</u>
P	100,000	×	\$35	=	\$3,500,000
Q	100,000	×	37	=	3,700,000
R	100,000	×	39	=	3,900,000
S	100,000	×	40	=	4,000,000

The number of rejected units is calculated like so:

<u>Vendor</u>	<u>Annual Quantity Purchased</u>		<u>% Unusable</u>		<u>Quantity Unusable</u>
P	100,000	×	10%	=	10,000
Q	100,000	×	6%	=	6,000
R	100,000	×	3%	=	3,000
S	100,000	×	1%	=	1,000

These are used to determine the cost of scrapping and replacing the defective switches:

<u>Vendor</u>	<u>Quantity Unusable</u>		<u>Cost of Scrapping</u>		<u>Total Cost of Scrapping</u>
P	10,000	×	\$25	=	\$250,000
Q	6,000	×	25	=	150,000
R	3,000	×	25	=	75,000
S	1,000	×	25	=	25,000

<u>Vendor</u>	<u>Quantity Unusable</u>		<u>Unit Replacement Cost</u>		<u>Total Replacement Cost</u>
P	10,000	×	\$35	=	\$350,000
Q	6,000	×	37	=	222,000
R	3,000	×	39	=	117,000
S	1,000	×	40	=	40,000

The three costs are combined to arrive at the total cost for each vendor:

[38] Gleim #: 5.7.146 -- Source: CMA 0408 1-179

Scarf Corporation's controller has decided to use a decision model to cope with uncertainty. With a particular proposal, currently under consideration, Scarf has two possible actions, invest or not invest in a joint venture with an international firm. The controller has determined the following:

Action: Invest in the Joint Venture

Events and Probabilities:

Probability of success	= 60%
Cost of investment	= \$9.5 million
Cash flow if investment is successful	= \$15.0 million
Cash flow if investment is unsuccessful	= \$2.0 million
Additional costs to be paid	= \$0
Costs incurred up to this point	= \$650,000

Action: Do Not Invest in the Joint Venture

Events:

Costs incurred up to this point	= \$650,000
Additional costs to be paid	= \$100,000

Which one of the following alternatives correctly reflects the respective expected values of investing versus not investing?

- A. \$300,000 and \$(750,000).
- B. \$(350,000) and \$(100,000).
- C. \$300,000 and \$(100,000).
- D. \$(350,000) and \$(750,000).

- Answer (A) is **incorrect**. The amount of \$(750,000) results from improperly treating sunk costs as relevant when calculating the expected value of not investing.
- Answer (B) is **incorrect**. The amount of \$(350,000) results from improperly treating sunk costs as relevant when calculating the expected value of investing.

- Answer (C) is **correct**. When monetary outcomes and probabilities can be reasonably estimated, a payoff table can be constructed to determine the best course of action:

Decision Alternative	State of Nature	Cash Inflow	Probability	Expected Value
Invest	Success	\$15,000,000 ×	0.6	= \$ 9,000,000
	No success	2,000,000 ×	0.4	= 800,000
			Cost of investment	(9,500,000)
			Additional costs	<u>0</u>
			Net expected value	<u>\$ 300,000</u>
Do Not Invest	Success	\$ 0 ×	0.6	= \$ 0
	No success	0 ×	0.4	= 0
			Cost of investment	0
			Additional costs	<u>(100,000)</u>
			Net expected value	<u>\$ (100,000)</u>

- Answer (D) is **incorrect**. The amounts of \$(350,000) and \$(750,000) result from improperly treating sunk costs as relevant.

**[39] Gleim #: 5.7.147 -- Source: CMA 0408 1-180**

Allbee Company has three possible investment opportunities. The controller calculated the payoffs and probabilities as follows:

Payoffs	Probabilities		
	Investment A	Investment B	Investment C
\$(20,000)	.3	.2	.3
(10,000)	.1	.2	.1
30,000	.3	.2	.2
70,000	.2	.2	.3
100,000	.1	.2	.1

The cost of investments A, B, and C are the same. Using the expected-value criterion, which one of the following rankings of these investments, from highest payoff to lowest payoff, is correct?

- A. A, B, C.
- B. B, A, C.
- C. C, A, B.
- D. B, C, A.

- Answer (A) is **incorrect**. Investment B has a higher expected value than Investment A.
- Answer (B) is **incorrect**. Investment C has a higher expected value than Investment A.
- Answer (C) is **incorrect**. Investment B has a higher expected value than both Investment C and Investment A.
- Answer (D) is **correct**. When monetary outcomes and probabilities can be reasonably estimated, a payoff table can be constructed to determine the best course of action:

Investment A			Investment B		
Payoffs	Probability	Expected Value	Payoffs	Probability	Expected Value
\$(20,000)	0.3	\$ (6,000)	\$(20,000)	0.2	\$ (4,000)
(10,000)	0.1	(1,000)	(10,000)	0.2	(2,000)
30,000	0.3	9,000	30,000	0.2	6,000
70,000	0.2	14,000	70,000	0.2	14,000
100,000	0.1	<u>10,000</u>	100,000	0.2	<u>20,000</u>
Total		<u>\$26,000</u>	Total		<u>\$34,000</u>

Investment C		
Payoffs	Probability	Expected Value
\$(20,000)	0.3	\$ (6,000)
(10,000)	0.1	(1,000)
30,000	0.2	6,000
70,000	0.3	21,000
100,000	0.1	<u>10,000</u>
Total		<u>\$30,000</u>

[40] Gleim #: 5.7.148 -- Source: CMA 0408 1-181

The sales manager of Serito Doll Company has suggested that an expanded advertising campaign costing \$40,000 would increase the sales and profits of the company. He has developed the following probability distribution for the effect of the advertising campaign on company sales:

<u>Sales Increase (Units)</u>	<u>Probability</u>
15,000	.10
30,000	.35
45,000	.10
60,000	.25
75,000	.20

The company sells the dolls at \$5.20 each. The cost of each doll is \$3.20. Serito's expected incremental profit, if the advertising campaign is adopted, is

- A. \$6,500
- B. \$46,500
- C. \$53,000
- D. \$93,000

- Answer (A) is **incorrect**. The amount of \$6,500 results from treating the expected unit increases as expected profit amounts.
- Answer (B) is **incorrect**. The amount of \$46,500 results from treating the expected unit increases as expected profit amounts and failing to take the cost of advertising into account.

- Answer (C) is **correct**. When monetary outcomes and probabilities can be reasonably estimated, a payoff table can be constructed to determine the best course of action [Serito's incremental profit on each doll sold is \$2.00 (\$5.20 – \$3.20)]:

Unit Sales Increase		Probability		Expected Unit Increase		Incr. Profit		Expected Profit
15,000	×	0.10	=	1,500	×	\$2	=	\$ 3,000
30,000	×	0.35	=	10,500	×	\$2	=	21,000
45,000	×	0.10	=	4,500	×	\$2	=	9,000
60,000	×	0.25	=	15,000	×	\$2	=	30,000
75,000	×	0.20	=	15,000	×	\$2	=	30,000
Expected gross profit								\$93,000
Cost of advertising								<u>(40,000)</u>
Expected net profit								<u><u>\$53,000</u></u>

- Answer (D) is **incorrect**. The amount of \$93,000 results from failing to take the cost of advertising into account.

**[41] Gleim #: 5.7.149 -- Source: CMA 0408 1-182**

Stock X has the following probability distribution of expected future returns:

Probability	Expected Return
.1	–20%
.2	5%
.4	15%
.2	20%
.1	30%

The expected rate of return on Stock X is

- A. 10%
- B. 12%
- C. 16%
- D. 19%

- Answer (A) is **incorrect**. This percentage results from improperly summing the expected rates of return and dividing by the number of occurrences.

- Answer (B) is **correct**. Expected value computation can be applied to rates of return as well as to dollar amounts.

<u>Probability</u>	<u>Expected Return</u>	<u>Weighted Expected Return</u>
0.1	–20%	–2%
0.2	5%	1%
0.4	15%	6%
0.2	20%	4%
0.1	30%	<u>3%</u>
		<u>12%</u>

- Answer (C) is **incorrect**. This percentage results from failing to treat the –20% return figure as a reduction.
- Answer (D) is **incorrect**. This percentage results from overstating the returns at the higher expected returns.

**[42] Gleim #: 5.7.150 -- Source: CMA 0408 1-183**

Which one of the following four probability distributions provides the highest expected monetary value?

Alternative #1		Alternative #2	
Prob	Cash Inflows	Prob	Cash Inflows
10%	\$ 50,000	10%	\$ 50,000
20%	75,000	20%	75,000
40%	100,000	45%	100,000
30%	150,000	25%	150,000

Alternative #3		Alternative #4	
Prob	Cash Inflows	Prob	Cash Inflows
10%	\$ 50,000	10%	\$150,000
20%	75,000	20%	100,000
40%	100,000	40%	75,000
30%	125,000	30%	50,000

- A. Alternative #1.
- B. Alternative #2.
- C. Alternative #3.
- D. Alternative #4.

- Answer (A) is **correct**. When monetary outcomes and probabilities can be reasonably estimated, a payoff table can be constructed to determine the best course of action:

Alternative #1			Alternative #2		
Probability	Payoffs	Expected Value	Probability	Payoffs	Expected Value
10%	\$ 50,000	\$ 5,000	10%	\$ 50,000	\$ 5,000
20%	75,000	15,000	20%	75,000	15,000
40%	100,000	40,000	45%	100,000	45,000
30%	150,000	45,000	25%	150,000	37,500
Total		<u>\$105,000</u>	Total		<u>\$102,500</u>

Alternative #3			Alternative #4		
Probability	Payoffs	Expected Value	Probability	Payoffs	Expected Value
10%	\$ 50,000	\$ 5,000	10%	\$150,000	\$15,000
20%	75,000	75,000	20%	100,000	20,000
40%	100,000	40,000	40%	75,000	30,000
30%	125,000	37,500	30%	50,000	15,000
Total		<u>\$97,500</u>	Total		<u>\$80,000</u>

- Answer (B) is **incorrect**. The expected value of Alternative #2 is only \$102,500.
- Answer (C) is **incorrect**. The expected value of Alternative #3 is only \$97,500.
- Answer (D) is **incorrect**. The expected value of Alternative #4 is only \$80,000.

**[43] Gleim #: 5.7.151 -- Source: CMA 1294 4-30**

Sweivel Company is preparing its budget and, taking into consideration the recent pace of economic recovery, has developed several sales forecasts and the estimated probability associated with each sales forecast. To determine the sales forecast to be used for budgeting purposes, which one of the following techniques should Sweivel use?

- Expected value analysis.
- Continuous probability simulation.
- Exponential distribution analysis.
- Sensitivity analysis.

- Answer (A) is **correct**. Expected value analysis provides a rational means for selecting the best alternative in decisions involving risk. The expected value of an alternative is found by multiplying the probability of each outcome by its payoff and summing the products. It represents the long-term average payoff for repeated trials.
- Answer (B) is **incorrect**. Simulation is not necessary. Several estimates are known.
- Answer (C) is **incorrect**. The exponential distribution is the probability of zero occurrences in a specified time period.
- Answer (D) is **incorrect**. Sensitivity analysis involves making several estimates of key variables and recalculating results based on the alternative estimates; the objective is to determine how sensitive a solution is to changes in estimates.

**[Fact Pattern #8]**

Gleason Co. has two products, a frozen dessert and ready-to-bake breakfast rolls, ready for introduction. However, plant capacity is limited, and only one product can be introduced at present. Therefore, Gleason has conducted a market study, at a cost of \$26,000, to determine which product will be more profitable. The results of the study follow.

<u>Sales of Desserts at \$1.80/unit</u>		<u>Sales of Rolls at \$1.20/unit</u>	
<u>Volume</u>	<u>Probability</u>	<u>Volume</u>	<u>Probability</u>
250,000	.30	200,000	.20
300,000	.40	250,000	.50
350,000	.20	300,000	.20
400,000	.10	350,000	.10

The costs associated with the two products have been estimated by Gleason's cost accounting department and are as follows:

	<u>Dessert</u>	<u>Rolls</u>
Ingredients per unit	\$ .40	\$ .25
Direct labor per unit	.35	.30
Variable overhead per unit	.40	.20
Production tooling*	48,000	25,000
Advertising	30,000	20,000

\*Gleason treats production tooling as a current operating expense rather than capitalizing it as a fixed asset.

[44] Gleim #: 5.7.152 -- Source: CMA 687 5-21

(Refers to Fact Pattern #8)

According to Gleason's market study, the expected value of the sales volume of the breakfast rolls is

- A. 125,000 units.
- B. 260,000 units.
- C. 275,000 units.
- D. Some amount other than those given.

- Answer (A) is **incorrect**. This number of units is the 250,000 volume times the probability of 50%.
- Answer (B) is **correct**. The expected value is found by multiplying the probability of each possibility by the potential volumes:

200,000 × .20	=	40,000
250,000 × .50	=	125,000
300,000 × .20	=	60,000
350,000 × .10	=	<u>35,000</u>
Total units		<u><u>260,000</u></u>

- Answer (C) is **incorrect**. This number of units is a simple average of the volume sales of rolls.
- Answer (D) is **incorrect**. The expected value is 260,000 units.

[45] Gleim #: 5.7.153 -- Source: CMA 687 5-22

(Refers to Fact Pattern #8)

Applying a deterministic approach, Gleason's revenue from sales of frozen desserts would be

- A. \$549,000
- B. \$540,000
- C. \$216,000
- D. Some amount other than those given.

- Answer (A) is **incorrect**. Multiplying the volume times the probability times \$1.80 for each possibility and then totaling results in \$549,000. This is the total revenue.

- Answer (B) is **correct**. The word deterministic is used to characterize processes that are not probabilistic. Such an approach uses the most likely value. In this case, sales of desserts would most likely be 300,000 units. At \$1.80 each, total revenue would be \$540,000.
- Answer (C) is **incorrect**. Multiplying 300,000 units times .40 probability times \$1.80 results in \$216,000. The probability should not be used in the formula. It should be used to select the most likely possibility.
- Answer (D) is **incorrect**. The revenue would be \$540,000.

**[46] Gleim #: 5.7.154 -- Source: CMA 687 5-23**

(Refers to Fact Pattern #8)

The expected value of Gleason's operating profit directly traceable to the sale of frozen desserts is

- A. \$198,250
- B. \$150,250
- C. \$120,250
- D. Some amount other than those given.

- Answer (A) is **incorrect**. This amount does not subtract the fixed costs of \$78,000.
- Answer (B) is **incorrect**. This amount does not subtract the advertising costs of \$30,000.
- Answer (C) is **correct**. The expected volume for sales of frozen desserts is 305,000  $[(250,000 \times .30) + (300,000 \times .40) + (350,000 \times .20) + (400,000 \times .10)]$ . At \$1.80 each, the total revenue from 305,000 units would be \$549,000. Variable costs would total \$1.15 each (\$.40 + \$.35 + \$.40), or \$350,750 for 305,000 units. Fixed costs total \$78,000 (\$48,000 + \$30,000). Thus, operating profit would be \$120,250 (\$549,000 – \$350,750 – \$78,000).
- Answer (D) is **incorrect**. The expected value would be \$120,250.

**[1] Gleim #: 5.8.155 -- Source: CMA 689 5-17**

A quantitative technique useful in projecting a firm's sales and profits is

- A. Probability distribution theory.
- B. Gantt charting.
- C. Learning curves.
- D. Queuing theory.

- Answer (A) is **correct**. Probability distribution theory can be used to project sales. It is a mathematical method for making decisions about the likelihood of future events (such as sales) in the face of uncertainty. Various estimates of sales (generated from the sales force) can be weighted with different probabilities.
- Answer (B) is **incorrect**. A Gantt chart is a bar chart used to measure progress toward a goal.
- Answer (C) is **incorrect**. A learning curve measures the benefit of experience in the early stages of a new task.
- Answer (D) is **incorrect**. Queuing (waiting-line) theory is used to determine the optimum balance between the cost of providing service to reduce waiting lines and the cost of allowing waiting lines to exist when items in the queue arrive at random.

**[2] Gleim #: 5.8.156 -- Source: CMA 696 4-20**

A widely used approach that managers use to recognize uncertainty about individual items and to obtain an immediate financial estimate of the consequences of possible prediction errors is

- A. Expected value analysis.
- B. Learning curve analysis.
- C. Sensitivity analysis.
- D. Regression analysis.

- Answer (A) is **incorrect**. Expected value is the probabilistically weighted average of the outcomes of an action.
- Answer (B) is **incorrect**. Learning curve analysis quantifies how labor costs decline as employees learn their jobs through repetition.

- Answer (C) is **correct**. Sensitivity analysis determines how a result varies with changes in a given variable or parameter in a mathematical decision model. For example, in a present value analysis, a manager might first calculate the net present value or internal rate of return assuming that a new asset has a 10-year life. The NPV or IRR can then be recalculated using a 5-year life to determine how sensitive the result is to the change in the assumption.
- Answer (D) is **incorrect**. Regression, or least squares, analysis determines the average change in the dependent variable given a unit change in one or more independent variables.

**[3] Gleim #: 5.8.157 -- Source: CMA 690 5-21**

Through the use of decision models, managers thoroughly analyze many alternatives and decide on the best alternative for the company. Often, the actual results achieved from a particular decision are not what was expected when the decision was made. In addition, an alternative that was not selected would have actually been the best decision for the company. The appropriate technique to analyze the alternatives by using expected inputs and altering them before a decision is made is

- A. Expected value analysis.
- B. Linear programming.
- C. Program Evaluation Review Technique (PERT).
- D. Sensitivity analysis.

- Answer (A) is **incorrect**. Expected value analysis is used to determine an anticipated return or cost based upon probabilities of events and their related outcomes.
- Answer (B) is **incorrect**. Linear programming optimizes a function given certain constraints.
- Answer (C) is **incorrect**. PERT is a network technique used to plan and control large projects.
- Answer (D) is **correct**. Sensitivity modeling can be used to determine the outcome of a variety of decisions. A trial-and-error method may be adopted, usually in a computer model, to calculate the sensitivity of the solution (variability of outcomes) to changes in a variable.

**[4] Gleim #: 5.8.158 -- Source: CMA 1283 5-19**

The process of evaluating the effect of changes in variables such as sales price or wage rates on the optimum solution in a linear programming application is called

- A. Iterative analysis.
- B. Regression analysis.
- C. Sensitivity analysis.
- D. Matrix analysis.

- Answer (A) is **incorrect**. Both the simplex method and iterative analysis are ways of working a linear programming problem by hand.
- Answer (B) is **incorrect**. Regression analysis is a means of finding the relationship between two or more variables.
- Answer (C) is **correct**. Sensitivity analysis is a process to determine how sensitive the final result (solution) is to changes in variables. It is often used in capital budgeting decisions to incorporate various levels of risk.
- Answer (D) is **incorrect**. Matrix analysis is another mathematical tool used to solve a variety of problem types.

**[5] Gleim #: 5.8.159 -- Source: CMA 0408 1-187**

Susan Hines has developed an estimate of the earnings per share for her firm for the next year using the following parameters.

Sales	\$20 million
Cost of goods sold	70% of sales
General & administrative expenses	\$300,000
Selling expense	\$100,000 plus 10% of sales
Debt outstanding	\$5 million @ 8% interest rate
Effective tax rate	35%
Common shares outstanding	2 million

She is now interested in the sensitivity of earnings per share to sales forecast changes. A 10% sales increase would increase earnings per share by

- A. 7.0 cents per share.
- B. 10.4 cents per share.
- C. 13.0 cents per share.
- D. 20.0 cents per share.

- Answer (A) is **incorrect**. The amount of 7.0 cents per share results from assuming an increase in fixed selling costs.
- Answer (B) is **incorrect**. The amount of 10.4 cents per share results from incorrectly assuming an increase in interest expense.
- Answer (C) is **correct**. Sensitivity analysis reveals how sensitive expected value calculations are to the accuracy of the initial estimates. Sensitivity analysis is thus useful in determining whether expending additional resources to obtain better forecasts is justified.

	Original Projection	10% Increase
Sales	\$20,000,000	\$22,000,000
Cost of goods sold	(14,000,000)	(15,400,000)
Gross profit	\$ 6,000,000	\$ 6,600,000
Selling expenses	(2,100,000)	(2,300,000)
G&A expenses	(300,000)	(300,000)
Operating income	\$ 3,600,000	\$ 4,000,000
Interest expense	(400,000)	(400,000)
Earnings before taxes	\$ 3,200,000	\$ 3,600,000
Income taxes	(1,120,000)	(1,260,000)
Net income	<u>\$ 2,080,000</u>	<u>\$ 2,340,000</u>
Earnings per share	\$ 1.04	\$ 1.17

- Answer (D) is **incorrect**. The amount of 20.0 cents per share results from failing to take the variable portion of selling expenses into account or failing to deduct the extra income taxes.

## CMA MCQ Strategic Planning

### [1] Gleim #: 1.1 -- Source: CMA 1291 3-19

A distinction between forecasting and planning

- A. Is not valid because they are synonyms.
- B. Arises because forecasting covers the short term and planning does not.
- C. Is that forecasts are used in planning.
- D. Is that forecasting is a management activity, whereas planning is a technical activity.

Answer (A) is incorrect because forecasting is a basis for planning.

Answer (B) is incorrect because forecasting and planning may be short or long term.

Answer (C) is **correct**. Planning is the determination of what is to be done, and of how, when, where, and by whom it is to be done. Plans serve to direct the activities that all organizational members must undertake to move the organization from where it is to where it wants to be. Forecasting is the basis of planning because it projects the future. A variety of quantitative methods are used in forecasting.

Answer (D) is incorrect because forecasting is often more technical than planning. It can involve a variety of mathematical models.

### [2] Gleim #: 1.2 -- Source: CMA 692 3-12

Strategy is a broad term that usually means the selection of overall objectives. Strategic analysis ordinarily excludes the

- A. Trends that will affect the entity's markets.
- B. Target product mix and production schedule to be maintained during the year.
- C. Forms of organizational structure that would best serve the entity.
- D. Best ways to invest in research, design, production, distribution, marketing, and administrative activities.

Answer (A) is incorrect because strategic analysis includes examining marketing trends.

Answer (B) is **correct**. Strategic analysis is the process of long-range planning. It includes identifying organizational objectives, evaluating the strengths and weaknesses of the organization, assessing risk levels, and forecasting the future direction and influences of factors relevant to the organization, such as market trends, changes in technology, international competition, and social change. The final step is to derive the best strategy for reaching the objectives. Setting the target product mix and production schedule for the current year is not a concern of strategic analysis because it is a short-term activity.

Answer (C) is incorrect because strategic analysis evaluates organizational structure.

Answer (D) is incorrect because strategic analysis includes evaluation of the best ways to invest in research, design, etc.

### [3] Gleim #: 1.3 -- Source: CMA 695 3-13

Strategic planning, as practiced by most modern organizations, includes all of the following except

- A. Top-level management participation.
- B. A long-term focus.
- C. Strategies that will help in achieving long-range goals.
- D. Analysis of the current month's actual variances from budget.

Answer (A) is incorrect because top-level management participation, a long-term focus, strategies that will help in achieving long-range goals, and identification of long-term key variables including external influences are elements of strategic planning.

Answer (B) is incorrect because top-level management participation, a long-term focus, strategies that will help in achieving long-range goals, and identification of long-term key variables including external influences are elements of strategic planning.

Answer (C) is incorrect because top-level management participation, a long-term focus, strategies that will help in achieving long-range goals, and identification of long-term key variables including external influences are elements of strategic planning.

Answer (D) is **correct**. Strategic planning is the process of setting overall organizational objectives and goals. It is a longterm process aimed at charting the future course of the organization. Strategic planning is based on assessing risk levels, evaluating the strengths and weaknesses of the organization, and forecasting the future direction and influences of factors relevant to the organization such as market trends, changes in technology, international competition, and social change. Analysis of the current month's budget variances is not an aspect of strategic planning.

**[4] Gleim #: 1.4 -- Source: CMA 1296 3-11**

Which one of the following reasons is not a significant reason for planning in an organization?

- A. Promoting coordination among operating units.
- B. Forcing managers to consider expected future trends and conditions.
- C. Developing a basis for controlling operations.
- D. Monitoring profitable operations.

Answer (A) is incorrect because planning helps to ensure goal congruence.

Answer (B) is incorrect because, by definition, planning is forward looking. It compels managers to determine their objectives, the methods of achieving those objectives, and the resources required.

Answer (C) is incorrect because plans are the criteria with which results are compared during the planning-control cycle to determine whether objectives are being achieved.

Answer (D) is **correct**. Monitoring profitable operations is not a significant reason for planning. Monitoring is a control function, whereas planning has a control purpose that precedes control in the planning-control cycle. Planning establishes standards against which the control function compares preliminary or final results.

**[5] Gleim #: 1.5 -- Source: CMA 693 3-6**

Certain phases of the planning process should be formalized for all of the following reasons except that

- A. Informal plans and goals lack the necessary precision, understanding, and consistency.
- B. Formal plans can act as a constraint on the decision-making freedom of managers and supervisors.
- C. Formalization requires the establishment and observance of deadlines for decision making and planning.
- D. Formalization provides a logical basis for rational flexibility in planning.

Answer (A) is incorrect because formal planning compels managers to establish specific goals and avoid pursuit of contradictory objectives. It also requires managers to think carefully about what the organization should accomplish and how goals are to be met.

Answer (B) is **correct**. A formal plan is a prescription for organizational behavior and a set of goals. Management decision making is therefore necessarily constrained by the limitations established in the plan.

Answer (C) is incorrect because plans entail commitment to achieving specified results within a given future time frame. Hence, deadlines are an essential part of formal planning.

Answer (D) is incorrect because formal plans should be the product of a disciplined, objective process of gathering evidence and reasoning. It recognizes that assumptions must be made about future conditions and that plans must be flexible enough to allow for changes in those assumptions.

**[6] Gleim #: 1.6 -- Source: CMA 1294 3-14**

All of the following are characteristics of the strategic planning process except the

- A. Emphasis on the long run.
- B. Analysis of external economic factors.
- C. Review of the attributes and behavior of the organization's competition.
- D. Analysis and review of departmental budgets.

Answer (A) is incorrect because emphasis on the long run, analysis of external economic factors, consideration of competitive factors, and analysis of consumer demand are all aspects of strategic planning.

Answer (B) is incorrect because emphasis on the long run, analysis of external economic factors, consideration of competitive factors, and analysis of consumer demand are all aspects of strategic planning.

Answer (C) is incorrect because emphasis on the long run, analysis of external economic factors, consideration of competitive factors, and analysis of consumer demand are all aspects of strategic planning.

Answer (D) is **correct**. Strategic planning is the process of setting the overall organizational objectives and goals, and involves the drafting of strategic plans. Long-range (strategic) planning is based on identifying and specifying organizational goals and objectives, evaluating the strengths and weaknesses of the organization, assessing risk levels, forecasting the future direction and influences of factors relevant to the organization (such as market trends, changes in technology, international competition, and social change), and deriving the best strategy for reaching the objectives given the organization's strengths and weaknesses and the relevant future trends. Analyzing and reviewing departmental budgets is an aspect of operational management and not a part of strategic planning.

**[7] Gleim #: 1.7 -- Source: CMA 696 3-13**

The first step in the sales planning process is to

- A. Assemble all the data that are relevant in developing a comprehensive sales plan.
- B. Develop management guidelines specific to sales planning, including the sales planning process and planning responsibilities.
- C. Prepare a sales forecast consistent with specified forecasting guidelines, including assumptions.
- D. Secure managerial commitment to attain the goals specified in the comprehensive sales plan.

Answer (A) is incorrect because top management must develop guidelines and outline planning responsibilities before assembling data.

Answer (B) is **correct**. Sales planning is a starting point for many other plans. The resources required, revenues to be earned, and costs to be incurred depend on sales. The sales plan of an operating unit should include as much specific information from that unit's management as possible, but it must conform to the strategic plans of corporate management. Thus, top management must provide a context within which operational managers can prepare their plans. Corporate support might include economic forecasts, overall market sales forecasts, and capital budgets.

Answer (C) is incorrect because top management must develop guidelines and outline planning responsibilities before preparing a forecast.

Answer (D) is incorrect because top management must develop guidelines and outline planning responsibilities before securing managerial commitment.

**[31] Gleim #: 1.31 -- Source: CMA 694 3-14**

Which one of the following management considerations is usually addressed first in strategic planning?

- A. Outsourcing.
- B. Overall objectives of the firm.
- C. Organizational structure.
- D. Recent annual budgets.

Answer (A) is incorrect because outsourcing is an operating decision of a more short-term nature.

Answer (B) is **correct**. Strategic planning is the process of setting overall organizational objectives and drafting strategic plans. It is a process of long-term planning. Setting ultimate objectives for the firm is a necessary prelude to developing strategies for achieving those objectives. Plans and budgets are then needed to implement those strategies.

Answer (C) is incorrect because organizational structure, although important in strategic planning, is based upon the firm's overall objectives.

Answer (D) is incorrect because recent annual budgets are a basis for short-term planning.

**[32] Gleim #: 1.32 -- Source: CMA 693 3-9**

A firm's statement of broad objectives or mission statement should accomplish all of the following except

- A. Outlining strategies for technological development, market expansion, and product differentiation.
- B. Defining the purpose of the company.
- C. Providing an overall guide to those in high-level, decision-making positions.
- D. Stating the moral and ethical principles that guide the actions of the firm.

Answer (A) is **correct**. The determination of organizational objectives is the first step in the planning process. A mission statement is a formal, written document that defines the organization's purpose in society, for example, to produce and distribute certain goods of high quality in a manner beneficial to the public, employees, shareholders, and other constituencies. Thus, a mission statement does not announce specific operating plans. It does not describe strategies for technological development, market expansion, or product differentiation because these are tasks for operating management.

Answer (B) is incorrect because a mission statement defines the purpose of the company (some writers differentiate between purpose and mission).

Answer (C) is incorrect because broad objectives provide guidance to those in high-level positions who are responsible for long-range planning.

Answer (D) is incorrect because mission statements increasingly are concerned with ethical principles.

**[38] Gleim #: 1.38 -- Source: CMA 697 3-16**

After the goals of the company have been established and communicated, the next step in the planning process is development of the

- A. Production budget.
- B. Direct materials budget.
- C. Selling and administrative budget.
- D. Sales budget.

Answer (A) is incorrect because the production budget depends on the sales budget, and the direct materials, direct labor, factory overhead, and cost of goods sold budgets depend on the production budget.

Answer (B) is incorrect because the production budget depends on the sales budget, and the direct materials, direct labor, factory overhead, and cost of goods sold budgets depend on the production budget.

Answer (C) is incorrect because selling and administrative costs are dependent on projected sales.

Answer (D) is **correct**. The sales budget is the first step in the operating budget process because it is needed to prepare all of the other budgets. For example, the production budget cannot be prepared until the sales department has determined how many units are needed.

**[40] Gleim #: 1.40 -- Source: CMA 696 3-11**

In planning and controlling capital expenditures, the most logical sequence is to begin with

- A. Analyzing capital addition proposals.
- B. Making capital expenditure decisions.
- C. Analyzing and evaluating all promising alternatives.
- D. Identifying capital addition projects and other capital needs.

Answer (A) is incorrect because analyzing capital addition proposals is a step subsequent to identifying capital addition projects and other capital needs.

Answer (B) is incorrect because making capital expenditure decisions is a step subsequent to identifying capital addition projects and other capital needs.

Answer (C) is incorrect because analyzing and evaluating all promising alternatives is a step subsequent to identifying capital addition projects and other capital needs.

Answer (D) is **correct**. Capital budgeting is a long-term planning process for investments. This process begins with the identification of capital needs, that is, of projects required to achieve organizational goals. The next step is to search for specific investments. The third step is to acquire and analyze information about the potential choices. The fourth step is to select specific investments after considering both qualitative and quantitative factors. The fifth step is to finance the undertakings. The final step is implementation and monitoring.

**[51] Gleim #: 1.51 -- Source: CMA Sample Q3-9**

Which one of the following planning techniques is most likely to be used to determine which business units will receive additional capital and which will be divested?

- A. Competitive strategies model.
- B. Portfolio matrix analysis.
- C. Scenario development.
- D. Situational analysis.

Answer (A) is incorrect because Michael Porter's model of competitive strategies has two variables: competitive advantage and competitive scope. The strategy adopted depends on whether the advantage sought is based on lower cost or product differentiation, and on whether the scope is broad or narrow.

Answer (B) is **correct**. Business units may be treated as elements of an investment portfolio. A portfolio should be efficient in balancing the risk with the rate of return on the portfolio. The expected rate of return of a portfolio is the weighted average of the expected returns of the individual assets in the portfolio. The variability (risk) of a portfolio's return is determined by the correlation of the returns of individual portfolio assets. To the extent the returns are not perfectly positively correlated, variability is decreased. Thus, business units should be selected that increase returns and diversify and reduce risk.

Answer (C) is incorrect because scenario development is a qualitative forecasting method that involves preparing conceptual scenarios of future events, given carefully defined assumptions. It entails writing multiple alternative but equally likely descriptions of future states. A longitudinal scenario indicates how the current circumstances may develop, and a cross-sectional scenario describes possible future states at a designated time.

Answer (D) is incorrect because situational analysis is a method of determining an organization's direction by systematically matching its strengths and weaknesses with its environmental opportunities and threats (referred to as a SWOT analysis).

**[9] Gleim #: 1.9 -- Source: CMA 695 3-17**

The capital budget is a(n)

- A. Plan to ensure that sufficient funds are available for the operating needs of the company.
- B. Exercise that sets the long-range goals of the company including the consideration of external influences.
- C. Plan that coordinates and communicates a company's plan for the coming year to all departments and divisions.
- D. Plan that assesses the long-term needs of the company for plant and equipment purchases.

Answer (A) is incorrect because capital budgeting involves long-term investment needs, not immediate operating needs.

Answer (B) is incorrect because strategic planning establishes long-term goals in the context of relevant factors in the firm's environment.

Answer (C) is incorrect because an operating budget communicates a company's plan for the coming year to all departments.

Answer (D) is **correct**. Capital budgeting is the process of planning expenditures for long-lived assets. It involves choosing among investment proposals using a ranking procedure. Evaluations are based on various measures involving rate of return on investment.

**[10] Gleim #: 1.10 -- Source: CMA 693 4-19**

Capital budgeting techniques are least likely to be used in evaluating the

- A. Acquisition of new aircraft by a cargo company.
- B. Design and implementation of a major advertising program.
- C. Adoption of a new method of allocating nontraceable costs to product lines.
- D. Sale by a conglomerate of an unprofitable division.

Answer (A) is incorrect because new aircraft represent a long-term investment in capital goods.

Answer (B) is incorrect because a major advertising program is a high-cost investment with long-term effects.

Answer (C) is **correct**. Capital budgeting is the process of planning expenditures for investments that are expected to generate returns over a period of more than one year. Thus, capital budgeting concerns the acquisition or disposal of long-term assets and the financing ramifications of such decisions. The adoption of a new method of allocating nontraceable costs to product lines has no effect on a company's cash flows, does not relate to the acquisition of long-term assets, and is not concerned with financing. Hence, capital budgeting is irrelevant to such a decision.

Answer (D) is incorrect because disinvestment decisions should be approached with long-term planning methods applicable to investments.

**[11] Gleim #: 1.11 -- Source: CMA 1294 4-25**

The capital budgeting model that is ordinarily considered the best model for long-range decision making is the

- A. Payback model.
- B. Accounting rate of return model.
- C. Unadjusted rate of return model.
- D. Discounted cash flow model.

Answer (A) is incorrect because the payback method gives no consideration to the time value of money or to returns after the payback period.

Answer (B) is incorrect because the accounting rate of return does not consider the time value of money.

Answer (C) is incorrect because the unadjusted rate of return does not consider the time value of money.

Answer (D) is **correct**. The capital budgeting methods that are generally considered the best for long-range decision making are the internal rate of return and net present value methods. These are both discounted cash flow methods.

[1] Gleim #: 5.1.1 -- Source: CMA 0408 2-001

All of the following are advantages of the use of budgets in a management control system **except** that budgets

- A. Force management planning.
- B. Provide performance criteria.
- C. Promote communication and coordination within the organization.
- D. Limit unauthorized expenditures.

- Answer (A) is **incorrect**. Forcing management planning is an advantage of using budgets.
- Answer (B) is **incorrect**. Providing performance criteria is an advantage of using budgets.
- Answer (C) is **incorrect**. Promoting communication and coordination within the organization is an advantage of using budgets.
- Answer (D) is **correct**. Budgets serve many roles. They force management to plan ahead, communicate organizational goals throughout the organization, and provide criteria for future performance evaluations.

[2] Gleim #: 5.1.2 -- Source: CMA 0205

In the budgeting and planning process for a firm, which one of the following should be completed first?

- A. Sales budget.
- B. Financial budget.
- C. Cost management plan.
- D. Strategic plan.

- Answer (A) is **incorrect**. The sales budget cannot be started until the strategic plan is finished.
- Answer (B) is **incorrect**. The financial budget is a cluster of budgets that cannot be started until the cluster of budgets referred to as the operating budget is finished.
- Answer (C) is **incorrect**. A cost management plan is independent of the firm's stated budget.
- Answer (D) is **correct**. An organization must complete its strategic plan before any specific budgeting can begin. The strategic plan lays out the means by which a firm expects to fulfill its stated mission.

[3] Gleim #: 5.1.3 -- Source: CMA 691 3-2

Each organization plans and budgets its operations for slightly different reasons. Which one of the following is **not** a significant reason for planning?

- A. Providing a basis for controlling operations.
  - B. Forcing managers to consider expected future trends and conditions.
  - C. Ensuring profitable operations.
  - D. Checking progress toward the objectives of the organization.
- Answer (A) is **incorrect**. Control of operations is a goal of planning.
  - Answer (B) is **incorrect**. Forcing managers to consider expected future trends and conditions is a goal of planning.
  - Answer (C) is **correct**. This question is apparently directed toward budgeting. A budget is a realistic plan for the future that is expressed in quantitative terms. It is a planning, control, motivational, and communications tool. A budget promotes goal congruence and coordination among operating units. Unfortunately, a budget does not ensure profitable operations.
  - Answer (D) is **incorrect**. Checking progress toward objectives is a goal of planning.

[4] Gleim #: 5.1.4 -- Source: CMA 692 3-7

The budget that describes the long-term position, goals, and objectives of an entity within its environment is the

- A. Capital budget.
  - B. Operating budget.
  - C. Cash management budget.
  - D. Strategic budget.
- Answer (A) is **incorrect**. Capital budgeting involves evaluating specific long-term investment decisions.
  - Answer (B) is **incorrect**. The operating budget is a short-range management tool.
  - Answer (C) is **incorrect**. Cash management is a short-range consideration related to liquidity.

- Answer (D) is **correct**. Strategic budgeting is a form of long-range planning based on identifying and specifying organizational goals and objectives. The strengths and weaknesses of the organization are evaluated and risk levels are assessed. The influences of environmental factors are forecast to derive the best strategy for reaching the organization's objectives.

**[5] Gleim #: 5.1.5 -- Source: CMA 697 3-20**

Which one of the following best describes the role of top management in the budgeting process? Top management

- A. Should be involved only in the approval process.
- B. Lacks the detailed knowledge of the daily operations and should limit their involvement.
- C. Needs to be involved, including using the budget process to communicate goals.
- D. Needs to separate the budgeting process and the business planning process into two separate processes.

- Answer (A) is **incorrect**. Top managers can use the budget for motivational and communication purposes; they should do more than merely sign off on the finished document.
- Answer (B) is **incorrect**. Top managers should be involved in the budget process even though they lack detailed knowledge of daily operations; the budget can still communicate company objectives and goals.
- Answer (C) is **correct**. Among other things, the budget is a tool by which management can communicate goals to lower-level employees. It is also a tool for motivating employees to reach those goals. For the budget to function in these communication and motivating roles, top management must be involved in the process. This involvement does not extend to dictating the exact numerical contents of the budget since top management lacks a detailed knowledge of daily operations.
- Answer (D) is **incorrect**. The budget process is a part of the overall planning process.

**[6] Gleim #: 5.1.6 -- Source: CMA 692 3-11**

Which one of the following is usually **not** cited as being an advantage of a formal budgetary process?

- A. Forces management to evaluate the reasonableness of assumptions used and goals identified in the budgetary process.
  - B. Ensures improved cost control within the organization and prevents inefficiencies.
  - C. Provides a formal benchmark to be used for feedback and performance evaluation.
  - D. Serves as a coordination and communication device between management and subordinates.
- 
- Answer (A) is **incorrect**. Evaluation of assumptions and identification of goals is one of the planning advantages of budgeting.
  - Answer (B) is **correct**. A budget is a realistic plan for the future expressed in quantitative terms. It is useful for planning, control, motivation, communication, and achieving goal congruence. As a planning tool, a budget forces management to evaluate the reasonableness of assumptions used and goals identified in the budgetary process. As a control tool, the budget provides a formal benchmark to be used for feedback and performance evaluation. As a communication tool, a budget serves to coordinate activities between management and subordinates and provides management with a means of dealing with uncertainty. Despite its advantages, a budget neither ensures improved cost control nor prevents inefficiencies.
  - Answer (C) is **incorrect**. A budget provides a benchmark for feedback and performance evaluation.
  - Answer (D) is **incorrect**. A budget serves communicating and coordinating functions.

**[10] Gleim #: 5.1.10 -- Source: CMA 1292 3-13**

When comparing performance report information for top management with that for lower-level management,

- A. Top management reports are more detailed.
  - B. Lower-level management reports are typically for longer time periods.
  - C. Top management reports show control over fewer costs.
  - D. Lower-level management reports are likely to contain more quantitative data and less financial data.
- 
- Answer (A) is **incorrect**. Top management reports are less detailed. Top management usually practices management by exception.

- Answer (B) is **incorrect**. Lower-level reports are typically more timely. Rapid feedback is necessary to solve operating problems.
- Answer (C) is **incorrect**. Top management is responsible for all costs incurred within the organization, including those incurred in lower level departments.
- Answer (D) is **correct**. Information sent to top management is ordinarily more highly aggregated and less timely than that communicated to managers at operational levels. Top managers are concerned with the organization's overall financial results and long-term prospects and are responsible for the strategic planning function. Lower-level reports contain more quantitative information of an operational nature, e.g., production data.

**[1] Gleim #: 5.2.14 -- Source: CMA 1291 3-21**

A planning calendar in budgeting is the

- A. Calendar period covered by the budget.
  - B. Schedule of activities for the development and adoption of the budget.
  - C. Calendar period covered by the annual budget and the long-range plan.
  - D. Sales forecast by months in the annual budget period.
- Answer (A) is **incorrect**. The period covered by the budget precedes the events in the planning calendar.
  - Answer (B) is **correct**. The budget planning calendar is the schedule of activities for the development and adoption of the budget. It should include a list of dates indicating when specific information is to be provided by each information source to others. The preparation of a master budget usually takes several months. For instance, many firms start the budget for the next calendar year some time in September in hopes of having it completed by December 1. Because all of the individual departmental budgets are based on forecasts prepared by others and the budgets of other departments, it is essential to have a planning calendar to ensure the proper integration of the entire process.
  - Answer (C) is **incorrect**. The period covered by the budget precedes the events in the planning calendar.
  - Answer (D) is **incorrect**. The planning calendar is not associated with sales.

**[2] Gleim #: 5.2.15 -- Source: CMA 1292 3-8**

A budget manual, which enhances the operation of a budget system, is most likely to include

- A. A chart of accounts.
  - B. Distribution instructions for budget schedules.
  - C. Employee hiring policies.
  - D. Documentation of the accounting system software.
- Answer (A) is **incorrect**. A chart of accounts is included in the accounting manual.

- Answer (B) is **correct**. A budget manual describes how a budget is to be prepared. Items usually included in a budget manual are a planning calendar and distribution instructions for all budget schedules. Distribution instructions are important because, once a schedule is prepared, other departments within the organization will use the schedule to prepare their own budgets. Without distribution instructions, someone who needs a particular schedule may be overlooked.
- Answer (C) is **incorrect**. Employee hiring policies are not needed for budget preparation. They are already available in the human resources manual.
- Answer (D) is **incorrect**. Software documentation is not needed in the budget preparation process.

**[3] Gleim #: 5.2.16 -- Source: CMA 0408 2-007**

In developing the budget for the next year, which one of the following approaches would produce the greatest amount of positive motivation and goal congruence?

- A. Permit the divisional manager to develop the goal for the division that in the manager's view will generate the greatest amount of profits.
  - B. Have senior management develop the overall goals and permit the divisional manager to determine how these goals will be met.
  - C. Have the divisional and senior management jointly develop goals and objectives while constructing the corporation's overall plan of operation.
  - D. Have the divisional and senior management jointly develop goals and the divisional manager develop the implementation plan.
- Answer (A) is **incorrect**. Using division managers to develop their goals does nothing for goal congruence.
  - Answer (B) is **incorrect**. Having senior management set goals would not be as conducive to motivation as would having input from divisions.
  - Answer (C) is **incorrect**. Senior management may not be in a position to develop an implementation plan.
  - Answer (D) is **correct**. Joint development of goals is more conducive to motivation, as is allowing divisional managers to develop the implementation plan. Goal congruence is enhanced when senior management is involved in the budgeting process along with division managers.

[4] Gleim #: 5.2.17 -- Source: CMA 0408 2-008

Which one of the following is **not** an advantage of a participatory budgeting process?

- A. Coordination between departments.
- B. Communication between departments.
- C. Goal congruence.
- D. Control of uncertainties.

- Answer (A) is **incorrect**. Participatory budgeting involves extensive coordination between departments.
- Answer (B) is **incorrect**. Participatory budgeting involves extensive communication between departments.
- Answer (C) is **incorrect**. Goal congruence is one of the advantages of participatory budgeting.
- Answer (D) is **correct**. Uncertainties can be prepared for, but they cannot be subjected to human control through any budget process.

[5] Gleim #: 5.2.18 -- Source: CMA 0408 2-010

Which one of the following statements concerning approaches for the budget development process is correct?

- A. The top-down approach to budgeting will ensure adherence to strategic organizational goals.
- B. To prevent ambiguity, once departmental budgeted goals have been developed, they should remain fixed even if the sales forecast upon which they are based proves to be wrong in the middle of the fiscal year.
- C. With the information technology available, the role of budgets as an organizational communication device has declined.
- D. Since department managers have the most detailed knowledge about organizational operations, they should use this information as the building blocks of the operating budget.

- Answer (A) is **incorrect**. While a top-down approach can help make strategic goals more consistent, it cannot ensure adherence.
- Answer (B) is **incorrect**. Any budget should be adapted to changing circumstances.
- Answer (C) is **incorrect**. Information technology makes budgeting easier, not less relevant as a means of organizational communication.

- Answer (D) is **correct**. Since department managers have the most detailed knowledge about organizational operations, they should use this information as the building blocks of the operating budget.

**[7] Gleim #: 5.2.20 -- Source: CMA 697 3-11**

When developing a budget, an external factor to consider in the planning process is

- A. A change to a decentralized management system.
- B. The implementation of a new bonus program.
- C. New product development.
- D. The merger of two competitors.

- Answer (A) is **incorrect**. Changes in management is an internal factor.
- Answer (B) is **incorrect**. Employee compensation is an internal factor.
- Answer (C) is **incorrect**. A new product line is an internal factor.
- Answer (D) is **correct**. Several planning assumptions should be made at the beginning of the budget process. Some of these assumptions are internal factors; others are external to the company. External factors include general economic conditions and their expected trend, governmental regulatory measures, the labor market in the locale of the company's facilities, and activities of competitors, including the effects of mergers.

**[9] Gleim #: 5.2.22 -- Source: CMA 683 4-2**

The primary role of the budget director and the budgeting department is to

- A. Settle disputes among operating executives during the development of the annual operating plan.
  - B. Develop the annual profit plan by selecting the alternatives to be adopted from the suggestions submitted by the various operating segments.
  - C. Justify the budget to the executive committee of the board of directors.
  - D. Compile the budget and manage the budget process.
- Answer (A) is **incorrect**. The budget director has staff, not line, authority. (S)he has a technical and advisory role. The final decision-making responsibility rests with line management.
  - Answer (B) is **incorrect**. The budget director has staff, not line, authority. (S)he has a technical and advisory role. The final decision-making responsibility rests with line management.

- Answer (C) is **incorrect**. The budget director has staff, not line, authority. (S)he has a technical and advisory role. The final decision-making responsibility rests with line management.
- Answer (D) is **correct**. The budget department is responsible for compiling the budget and managing the budget process. The budget director and department are not responsible for actually developing the estimates on which the budget is based. This role is performed by those to whom the resulting budget will be applicable. The budget director has staff, not line, authority. (S)he has a technical and advisory role. The final decision-making responsibility rests with line management.

**[10] Gleim #: 5.2.23 -- Source: CMA 693 3-22**

Which one of the following is **not** considered to be a benefit of participative budgeting?

- A. Individuals at all organizational levels are recognized as being part of the team; this results in greater support of the organization.
- B. The budget estimates are prepared by those in direct contact with various activities.
- C. Managers are more motivated to reach the budget objectives since they participated in setting them.
- D. When managers set the final targets for the budget, senior management need not be concerned with the overall profitability of current operations.

- Answer (A) is **incorrect**. Participative budgeting promotes teamwork.
- Answer (B) is **incorrect**. A participative budget involves those most directly affected.
- Answer (C) is **incorrect**. A participative budget is a powerful motivator.
- Answer (D) is **correct**. One of the behavioral considerations of budgeting is the extent of participation in the process by managers at all levels within the organization. Managers are more motivated to achieve budgeted goals when they are involved in budget preparation. A broad level of participation usually leads to greater support for the budget and the entity as a whole, as well as a greater understanding of what is to be accomplished. Advantages of a participative budget include greater accuracy of budget estimates. Managers with immediate operational responsibility for activities have a better understanding of what results can be achieved and at what costs. Also, managers cannot blame unrealistic objectives as an excuse for not achieving budget expectations when they have helped to establish those objectives. Despite the involvement of lower level managers, senior management must still participate in the budget process to ensure that the combined objectives of the various departments are consistent with profitability objectives of the company.

**[11] Gleim #: 5.2.24 -- Source: CMA 1292 3-23**

The budgeting technique that is most likely to motivate managers is

- A. Top-down budgeting.
- B. Zero-based budgeting.
- C. Program budgeting and review technique.
- D. Bottom-up budgeting.

- Answer (A) is **incorrect**. A top-down budget is less likely to motivate lower level managers who have not participated in its formation.
- Answer (B) is **incorrect**. Zero-based budgeting is a means of adding objectivity to the budget process; employee motivation is not a particular goal.
- Answer (C) is **incorrect**. Program budgets are formulated by objective rather than function.
- Answer (D) is **correct**. Bottom-up budgeting is the best way of motivating managers to meet budget estimates because it permits participation in the budget process. Lower level managers who take part in budgeting decisions are more likely to support the result and less likely to feel that the budget has been imposed from above.

**[12] Gleim #: 5.2.25 -- Source: CMA 0205**

Which one of the following is most important to a successful budgeting effort?

- A. Experienced analysts.
- B. Integrated budget software.
- C. Reliable forecasts and trend analyses.
- D. Top management support.

- Answer (A) is **incorrect**. Experienced analysts are not crucial to success of a budget; “knowing your business” is as important as training in budget preparation.
- Answer (B) is **incorrect**. Integrated budget software is not the most important factor in budget success; fairly large and sophisticated budgets can be prepared with ordinary spreadsheets.
- Answer (C) is **incorrect**. While they are important, reliable forecasts and trend analyses are not the most important factor; a budget must be flexible enough to adapt to changing circumstances.

- Answer (D) is **correct**. An organizational budget requires a significant commitment of internal resources. The single most important factor in assuring its success is for upper management to demonstrate that they take the project seriously and consider it vital to the organization's future.

**[14] Gleim #: 5.2.27 -- Source: CMA 0408 2-003**

All of the following are criticisms of the traditional budgeting process **except** that it

- A. Makes across-the-board cuts when early budget iterations show that planned expenses are too high.
  - B. Incorporates non-financial measures as well as financial measures into its output.
  - C. Overemphasizes a fixed time horizon, such as one year.
  - D. Is not used until the end of the budget period to evaluate performance.
- Answer (A) is **incorrect**. Across-the-board cuts are an easily available solution when traditional budgeting is used.
  - Answer (B) is **correct**. Traditional budgeting focuses strictly on financial measures.
  - Answer (C) is **incorrect**. Traditional budgeting is heavily focused on a fixed time horizon.
  - Answer (D) is **incorrect**. Traditional budgeting is difficult to use throughout the budget period for performance measurement.

**[15] Gleim #: 5.2.28 -- Source: CMA 0408 2-005**

The following sequence of steps is employed by a company to develop its annual profit plan:

- Planning guidelines are disseminated downward by top management after receiving input from all levels of management.
- A sales budget is prepared by individual sales units reflecting the sales targets of the various segments. This provides the basis for departmental production budgets and other related components by the various operating units. Communication is primarily lateral with some upward communication possible.
- A profit plan is submitted to top management for coordination and review. Top management's recommendations and revisions are acted upon by middle management. A revised profit plan is resubmitted for further review to top management.
- Top management grants final approval and distributes the formal plan downward to the various operating units.

This outline of steps best describes which one of the following approaches to budget development?

- A. Imposed budgeting by top management.
- B. Bottom-up approach.
- C. Top-down approach.
- D. Total justification of all activities by operating units.

- Answer (A) is **incorrect**. Top management has received extensive input and cooperation from lower levels through performing these steps.
- Answer (B) is **correct**. A bottom-up approach is characterized by general guidance from the highest levels of management, followed by extensive input from middle and lower management. This sequence of steps aptly describes this process.
- Answer (C) is **incorrect**. These steps describe the opposite of a top-down approach.
- Answer (D) is **incorrect**. Top management is not demanding justification of all activities in the steps described; such a demand would be consistent with a system known as zero-based budgeting.

[16] Gleim #: 5.2.29 -- Source: CMA 0408 2-006

All of the following are advantages of top-down budgeting as opposed to participatory budgeting, **except** that it

- A. Increases coordination of divisional objectives.
  - B. Reduces the time required for budgeting.
  - C. May limit the acceptance of proposed goals and objectives.
  - D. Facilitates implementation of strategic plans.
- Answer (A) is **incorrect**. Since a top-down budget is imposed by upper management, coordinating the objectives of separate divisions is simplified.
  - Answer (B) is **incorrect**. Since a top-down budget is coordinated from above, it is less time-consuming than obtaining lower-level input.
  - Answer (C) is **correct**. Since a top-down budget is imposed by upper management, it has less chance of acceptance (also called buy-in) by those on whom the budget is imposed.
  - Answer (D) is **incorrect**. Since a top-down budget is coordinated from above, the implementation of strategic plans is centralized and thus simplified.

[17] Gleim #: 5.2.30 -- Source: CMA 0408 2-012

Marietta Thomas, Amador Corporation's vice president of planning, has seen and heard it all. She has told the corporate controller that she is "...very upset with the degree of slack that veteran managers use when preparing their budgets." Thomas has considered implementing some of the following activities during the budgeting process.

1. Develop the budgets by top management and issue them to lower-level operating units.
2. Study the actual revenues and expenses of previous periods in detail.
3. Have the budgets developed by operating units and accept them as submitted by a company-wide budget committee.
4. Share the budgets with all employees as a means to reach company goals and objectives.
5. Use an iterative budgeting process that has several "rounds" of changes initiated by operating units and/or senior managers.

Which one of these activities should Amador implement in order to best remedy Thomas' concerns, help eliminate the problems experienced by Amador, and motivate personnel?

- A. 1 only.
- B. 2 and 3.
- C. 2 and 4.
- D. 2, 4, and 5.

- Answer (A) is **incorrect**. A budget imposed from the top is more likely to encounter resistance.
- Answer (B) is **incorrect**. Operating units will tend to consider only their own interests when preparing budgets.
- Answer (C) is **incorrect**. While studying previous periods and sharing the budget with all employees are important steps to correcting Amador's problems, incrementally improving the budget through an iterative process is also crucial.
- Answer (D) is **correct**. Steps 2, 4, and 5 are appropriate for alleviating Amador's budget problems. Step 1 should not be performed because a budget imposed from the top is more likely to encounter resistance. Step 3 should not be performed because operating units will tend to consider only their own interests when preparing budgets.

**[18] Gleim #: 5.2.31 -- Source: CMA 0408 2-013**

Budgeting problems where departmental managers are repeatedly achieving easy goals or failing to achieve demanding goals can be best minimized by establishing

- A. Preventive controls.
- B. A policy that allows managers to build slack into the budget.
- C. Participative budgeting where managers pursue objectives consistent with those set by top management.
- D. Better communication whereby managers discuss budget matters daily with their superiors.

- Answer (A) is **incorrect**. Preventive controls is much too vague a term in this circumstance.
- Answer (B) is **incorrect**. A policy allowing budgetary slack would make the problem worse.
- Answer (C) is **correct**. Participative budgeting is a practical means of setting realistic, achievable budget goals.
- Answer (D) is **incorrect**. Simply discussing budget matters more often does not inject discipline into the process.

**[19] Gleim #: 5.2.32 -- Source: CMA 0408 2-015**

Which one of the following items would most likely cause the planning and budgeting system to fail? The lack of

- A. Historical financial data.
- B. Input from several levels of management.
- C. Top management support.
- D. Adherence to rigid budgets during the year.

- Answer (A) is **incorrect**. The lack of historical data is not fatal to an adequate planning and budgeting process.
- Answer (B) is **incorrect**. Input from several levels of management is helpful, but not the most essential element of successful budgeting.
- Answer (C) is **correct**. Top management's belief in and support of the planning and budgeting process is the single most important element in its success.
- Answer (D) is **incorrect**. Willingness to adapt to changing circumstances is crucial to the success of any planning and budget system.

[20] Gleim #: 5.2.33 -- Source: CMA 0408 2-016

All of the following are disadvantages of top-down budgeting as opposed to participatory budgeting, **except** that it

- A. May result in a budget that is not possible to achieve.
  - B. May limit the acceptance of proposed goals and objectives.
  - C. Reduces the communication between employees and management.
  - D. Reduces the time required for budgeting.
- Answer (A) is **incorrect**. A budget established without lower-level input may contain unrealistic goals.
  - Answer (B) is **incorrect**. Since a top-down budget is imposed by upper management, it has less chance of acceptance (also called buy-in) by those on whom the budget is imposed.
  - Answer (C) is **incorrect**. Reduced communication between employees and management is a disadvantage of top-down budgeting.
  - Answer (D) is **correct**. Since a top-down budget is coordinated from above, it is less time-consuming than obtaining lower-level input.

[21] Gleim #: 5.2.34 -- Source: CMA 0408 2-017

Suboptimal decision making is **not** likely to occur when

- A. There is little congruence among the overall organization goals, the subunit goals, and the individual goals of decision makers.
  - B. Goals and standards of performance are set by the top management.
  - C. Guidance is given to subunit managers about how standards and goals affect them.
  - D. The subunits in the organization compete with each other for the same input factors or for the same customers.
- Answer (A) is **incorrect**. Low congruence among the overall organization goals, the subunit goals, and the individual goals of decision makers increases the chances of suboptimal decision making.
  - Answer (B) is **incorrect**. When goals and standards are dictated by the top management, the chances of suboptimal decision making are increased.
  - Answer (C) is **correct**. Suboptimal decision making is not likely to occur when guidance is given to subunit managers about how standards and goals affect them.

- Answer (D) is **incorrect**. When the subunits in the organization compete with each other for the same input factors or for the same customers, the chances of suboptimal decision making are increased.

**[22] Gleim #: 5.2.35 -- Source: CMA 691 3-6**

The budgeting process should be one that motivates managers and employees to work toward organizational goals. Which one of the following is **least** likely to motivate managers?

- A. Setting budget targets at attainable levels.
- B. Participation by subordinates in the budgetary process.
- C. Use of management by exception.
- D. Having top management set budget levels.

- Answer (A) is **incorrect**. Setting budget targets at attainable levels is a means of increasing employee motivation.
- Answer (B) is **incorrect**. Participation by subordinates in the budgetary process is a means of increasing employee motivation.
- Answer (C) is **incorrect**. Use of management by exception is a means of increasing employee motivation.
- Answer (D) is **correct**. A budget is potentially a good motivational tool. If lower-level managers have participated in preparing the budget, instead of simply receiving a budget imposed by top management, they are more likely to understand and share the goals of top management and to work to keep costs within the budget. Participation and understanding are also likely to result in budgets that are reasonably attainable and viewed as realistic. However, a budget is also a motivator in the sense that managers are accountable for variances in controllable costs but are rewarded for good performance. Moreover, budgeting coupled with analysis of variances tends to improve motivation by allowing upper-level managers to concentrate on problems (exceptions) rather than engaging in routine supervision of subordinates, which may be viewed as unnecessarily intrusive and unwelcome.

[1] Gleim #: 5.3.36 -- Source: CMA 0408 2-022

Jura Corporation is developing standards for the next year. Currently XZ-26, one of the material components, is being purchased for \$36.45 per unit. It is expected that the component's cost will increase by approximately 10% next year and the price could range from \$38.75 to \$44.18 per unit, depending on the quantity purchased. The appropriate standard for XZ-26 for next year should be set at the

- A. Current actual cost plus the forecasted 10% price increase.
  - B. Lowest purchase price in the anticipated range to keep pressure on purchasing to always buy in the lowest price range.
  - C. Highest price in the anticipated range to ensure that there are only favorable purchase price variances.
  - D. Price agreed upon by the purchasing manager and the appropriate level of company management.
- Answer (A) is **incorrect**. The actual cost could be more or less depending in the quantity purchased.
  - Answer (B) is **incorrect**. The lowest price may not always be in the company's best interests if the quantity required to obtain the lowest price would lead to much higher carrying costs.
  - Answer (C) is **incorrect**. Standards should be set tightly enough to provide motivation to purchasing management.
  - Answer (D) is **correct**. Standard prices are designed for internal performance measurement. Standards should be attainable, but not so easily as to not provide motivation. Management should decide its objectives and set a standard that will achieve that objective when the standard is met. For example, the lowest price might not be selected if the company is using a JIT system, for which the primary objective is the minimization of inventories.

**[2] Gleim #: 5.3.37 -- Source: CMA 0408 2-024**

After performing a thorough study of Michigan Company's operations, an independent consultant determined that the firm's labor standards were probably too tight. Which one of the following facts would be inconsistent with the consultant's conclusion?

- A. A review of performance reports revealed the presence of many unfavorable efficiency variances.
  - B. Michigan's budgeting process was well-defined and based on a bottom-up philosophy.
  - C. Management noted that minimal incentive bonuses have been paid in recent periods.
  - D. Production supervisors found several significant fluctuations in manufacturing volume, with short-term increases on output being followed by rapid, sustained declines.
- Answer (A) is **incorrect**. Many unfavorable efficiency variances would be an indicator of too-tight standards.
  - Answer (B) is **correct**. It is highly unlikely that workers familiar with their own processes would set too-tight standards.
  - Answer (C) is **incorrect**. The widespread failure for expected bonuses to be earned would be an indicator of too-tight standards.
  - Answer (D) is **incorrect**. The situation described is indicative of rush jobs being too common, which is a result of poor production planning, not tight labor standards.

**[3] Gleim #: 5.3.38 -- Source: CMA 0408 2-020**

When compared with ideal standards, practical standards

- A. Produce lower per-unit product costs.
  - B. Result in a less desirable basis for the development of budgets.
  - C. Incorporate very generous allowance for spoilage and worker inefficiencies.
  - D. Serve as a better motivating target for manufacturing personnel.
- Answer (A) is **incorrect**. The effect of one type of standard over another cannot guarantee lower costs.
  - Answer (B) is **incorrect**. Practical standards are more appropriate in most cases than ideal standards in the development of budgets.
  - Answer (C) is **incorrect**. An acceptance of high levels of spoilage and worker inefficiencies cannot be overcome through the use of standards.

- Answer (D) is **correct**. Practical standards, also called attainable standards, are more likely to meet with worker acceptance than standards based on an unachievable ideal.

**[4] Gleim #: 5.3.39 -- Source: CMA 0408 2-021**

Diana Stinson, Cherry Valley, Inc.'s factory manager, had lost her patience. Six months ago, she appointed a team from the production and service departments to finalize the allocation of costs and setting of standard costs. They were still feuding, so she hired Brennan and Rose, a large consulting firm, to resolve the matter.

All of the following are potential consequences of having the standards set by Brennan and Rose **except** that

- A. Brennan and Rose may not fully understand Cherry Valley's manufacturing process, resulting in suboptimal performance.
  - B. Employees could react negatively since they did not participate in setting the standards.
  - C. There could be dissatisfaction if the standards contain costs that are not controllable by the unit held responsible.
  - D. The standards may appear to lack management support.
- Answer (A) is **incorrect**. Brennan and Rose may not fully understand Cherry Valley's manufacturing process, resulting in suboptimal performance.
  - Answer (B) is **incorrect**. Employees could react negatively since they did not participate in setting the standards.
  - Answer (C) is **incorrect**. There could be dissatisfaction if the standards contain costs that are not controllable by the unit held responsible.
  - Answer (D) is **correct**. Of the choices listed, this one is not a potential consequence of having an outside consultant set standards. Since management did the hiring, the consultant's work product would naturally appear to have management support.

**[5] Gleim #: 5.3.40 -- Source: CMA 0408 2-018**

All of the following statements concerning standard costs are correct **except** that

- A. Time and motion studies are often used to determine standard costs.
- B. Standard costs are usually set for one year.
- C. Standard costs can be used in costing inventory accounts.
- D. Standard costs are usually stated in total, while budgeted costs are usually stated on a per-unit basis.

- Answer (A) is **incorrect**. Time and motion studies are often used to determine standard costs.
- Answer (B) is **incorrect**. Standard costs are usually set for one year.
- Answer (C) is **incorrect**. Standard costs can be used in costing inventory accounts.
- Answer (D) is **correct**. Standard costs can be used at the per-unit level and any level of aggregation above.

**[6] Gleim #: 5.3.41 -- Source: CMA 0408 2-019**

One approach for developing standard costs incorporates communication, bargaining, and interaction among product line managers; the immediate supervisors for whom the standards are being developed; and the accountants and engineers before the standards are accepted by top management. This approach would best be characterized as a(n)

- A. Imposed approach.
- B. Centralized top-down approach.
- C. Engineering approach.
- D. Team development approach.

- Answer (A) is **incorrect**. The approach described is the opposite of an imposed approach.
- Answer (B) is **incorrect**. A centralized top-down approach involves standards being dictated by upper management.
- Answer (C) is **incorrect**. An engineering approach involves only engineers.
- Answer (D) is **correct**. A team development approach to standard setting involves interaction among various groups or individuals, including product line managers, the departments for which the standards are being developed, accountants, and industrial engineers.

**[1] Gleim #: 6.1.1 -- Source: CMA 0205**

In an organization that plans by using comprehensive budgeting, the master budget is

- A. A compilation of all the separate operational and financial budget schedules of the organization.
- B. The booklet containing budget guidelines, policies, and forms to use in the budgeting process.
- C. The current budget updated for operations for part of the current year.
- D. A budget of a not-for-profit organization after it is approved by the appropriate authoritative body.

- Answer (A) is **correct**. A company's overall budget, often called the master or comprehensive budget, encompasses the organization's operating and financial plans for a specified period, ordinarily a year. Thus, all other budgets are subsets of the master budget. In the operating budget, the emphasis is on obtaining and using current resources. In the financial budget, the emphasis is on obtaining the funds needed to purchase operating assets.
- Answer (B) is **incorrect**. The booklet containing budget guidelines, policies, and forms to use in the budgeting process is the budget manual.
- Answer (C) is **incorrect**. The current budget updated for operations for part of the current year is a continuous budget.
- Answer (D) is **incorrect**. A master budget may be prepared by a for-profit entity.

**[3] Gleim #: 6.1.3 -- Source: CMA 0205 2-3**

In preparing a corporate master budget, which one of the following is most likely to be prepared last?

- A. Sales budget.
- B. Cash budget.
- C. Production budget.
- D. Cost of goods sold budget.

- Answer (A) is **incorrect**. The sales budget precedes the cash budget.

- Answer (B) is **correct**. The cash budget is the lynchpin of the financial budget. It combines the results of the operating budget with the cash collection and disbursement schedules to produce a comprehensive picture of where the company's cash flows are expected to come from and where they are expected to go. All the other budgets listed feed the cash budget in one way or another.
- Answer (C) is **incorrect**. The production budget is the second step in the master budget, immediately following the sales budget.
- Answer (D) is **incorrect**. The cost of goods sold budget is completed well before the cash budget in the budgeting process.

**[4] Gleim #: 6.1.4 -- Source: CMA 694 3-11**

The master budget process usually begins with the

- A. Production budget.
- B. Operating budget.
- C. Financial budget.
- D. Sales budget.

- Answer (A) is **incorrect**. The production budget normally cannot be prepared until the expected sales are known.
- Answer (B) is **incorrect**. The operating budget is another term for the budget used on a day-to-day basis for managing operations. It cannot be prepared until after the sales budget is prepared.
- Answer (C) is **incorrect**. Preparation of the sales budget is the first step in the overall budgeting process.
- Answer (D) is **correct**. The starting point for the annual budget is the sales forecast. All other aspects of the budget, including production, costs, and inventory levels, rely on projected sales figures.

**[5] Gleim #: 6.1.5 -- Source: CMA 1295 3-18**

All of the following are considered operating budgets **except** the

- A. Sales budget.
- B. Materials budget.
- C. Production budget.
- D. Capital budget.

- Answer (A) is **incorrect**. It is considered an operating budget.
- Answer (B) is **incorrect**. It is considered an operating budget.
- Answer (C) is **incorrect**. It is considered an operating budget.
- Answer (D) is **correct**. The operating budget consists of all budgets that concern normal operating activities, including the sales budget, production budget, materials budget, direct labor budget, and factory overhead budget. The capital expenditures budget, which outlines needs for new capital investment, is not a part of normal operations. The capital expenditures budget is sometimes prepared more than a year in advance to allow sufficient time to secure financing for these major expenditures.

**[6] Gleim #: 6.1.6 -- Source: CMA 1296 3-15**

Which one of the following items is the last schedule to be prepared in the normal budget preparation process?

- A. Cash budget.
- B. Cost of goods sold budget.
- C. Manufacturing overhead budget.
- D. Selling expense budget.

- Answer (A) is **correct**. The last schedule prepared before the financial statements is the cash budget. The cash budget is a schedule of estimated cash collections and payments. The various operating budgets and the capital budget are inputs to the cash budgeting process.
- Answer (B) is **incorrect**. The cost of goods sold budget provides information necessary to prepare the cash budget.
- Answer (C) is **incorrect**. The manufacturing overhead budget provides information necessary to prepare the cash budget.
- Answer (D) is **incorrect**. The selling expense budget provides information necessary to prepare the cash budget.

**[7] Gleim #: 6.1.7 -- Source: CMA 1292 3-10**

Pro forma financial statements are part of the budgeting process. Normally, the last pro forma statement prepared is the

- A. Capital expenditure plan.
- B. Income statement.
- C. Statement of cost of goods sold.
- D. Statement of cash flows.

- Answer (A) is **incorrect**. The capital expenditure plan must be prepared before the cash budget. Cash may be needed to pay for capital purchases.
- Answer (B) is **incorrect**. The income statement must be prepared before the statement of cash flows, which reconciles net income and net operating cash flows.
- Answer (C) is **incorrect**. Cost of goods sold is included in the income statement, which is an input to the statement of cash flows.
- Answer (D) is **correct**. The statement of cash flows is usually the last of the listed items prepared. All other elements of the budget process must be completed before it can be developed.

**[8] Gleim #: 6.1.8 -- Source: CIA 1190 IV-17**

The master budget

- A. Shows forecasted and actual results.
- B. Reflects controllable costs only.
- C. Can be used to determine manufacturing cost variances.
- D. Contains the operating budget.

- Answer (A) is **incorrect**. The master budget does not contain actual results.
- Answer (B) is **incorrect**. The master budget reflects all applicable expected costs, whether or not controllable by individual managers.
- Answer (C) is **incorrect**. The master budget is not structured to allow determination of manufacturing cost variances, which requires using the flexible budget and actual results.
- Answer (D) is **correct**. All other budgets are subsets of the master budget. Thus, quantified estimates by management from all functional areas are contained in the master budget. These results are then combined in a formal quantitative model recognizing the organization's objectives, inputs, and outputs.

**[9] Gleim #: 6.1.9 -- Source: CMA 692 3-9**

The preparation of a comprehensive master budget culminates with the preparation of the

- A. Production budget.
- B. Capital investment budget.
- C. Cash management and working capital budget.
- D. Strategic budget.

- Answer (A) is **incorrect**. The production budget must precede the capital investment and cash budgets.
- Answer (B) is **incorrect**. A capital investment budget is prepared before a cash budget.
- Answer (C) is **correct**. The comprehensive master budget begins with the preparation of the sales budget and proceeds to the production budget.
- Answer (D) is **incorrect**. A strategic budget is a long-range planning tool that is prepared before the master budget.

**[10] Gleim #: 6.1.10 -- Source: CMA 691 3-1**

Wilson Company uses a comprehensive planning and budgeting system. The proper order for Wilson to prepare certain budget schedules would be

- A. Cost of goods sold, balance sheet, income statement, and statement of cash flows.
- B. Income statement, balance sheet, statement of cash flows, and cost of goods sold.
- C. Statement of cash flows, cost of goods sold, income statement, and balance sheet.
- D. Cost of goods sold, income statement, balance sheet, and statement of cash flows.

- Answer (A) is **incorrect**. The balance sheet should not precede the income statement.
- Answer (B) is **incorrect**. The income statement cannot precede cost of goods sold.
- Answer (C) is **incorrect**. The statement of cash flows cannot precede the cost of goods sold. The latter is an input of the former.
- Answer (D) is **correct**. The pro forma cost of goods sold must be prepared before the pro forma income statement because it is a component of the income statement. Also, the income statement must be prepared before the pro forma balance sheet because net income is a necessary part of preparing the stockholders' equity section of the balance sheet. In turn, the income statement and the balance sheet are necessary for estimating cash flows. If the statement of cash flows is prepared using the indirect method, balance sheet data, e.g., the changes in accounts receivable, inventory, and accounts payable, must be available to determine the adjustments needed to reconcile net income to net cash flow.

[11] Gleim #: 6.1.11 -- Source: CMA 692 3-10

Which one of the following may be considered an independent item in the preparation of the master budget?

- A. Ending inventory budget.
- B. Capital investment budget.
- C. Pro forma income statement.
- D. Pro forma statement of financial position.

- Answer (A) is **incorrect**. The ending inventory budget is based on the current production budget.
- Answer (B) is **correct**. The capital investment budget may be prepared more than a year in advance, unlike the other elements of the master budget. Because of the long-term commitments that must be made for some types of capital investments, planning must be done far in advance and is based on needs in future years as opposed to the current year's needs.
- Answer (C) is **incorrect**. The pro forma income statement is based on the sales budget, expense budgets, and all other elements of the current master budget.
- Answer (D) is **incorrect**. The pro forma balance sheet is based on the other elements of the current master budget.

[12] Gleim #: 6.1.12 -- Source: CMA 697 3-21

The Yummy Dog Bone Company is anticipating that a major supplier might experience a strike this year. Because of the nature of the product and emphasis on quality, extra production cannot be stored as finished goods inventory. When developing a contingency budget that would anticipate a direct materials buildup, the two most significant items that will be affected are

- A. Production volume and direct material.
- B. Sales and ending inventory.
- C. Production and cash flow.
- D. Direct materials and cash flow.

- Answer (A) is **incorrect**. The nature of the product prevents an increase in production volume to augment finished goods inventory.

- Answer (B) is **incorrect**. Sales are dependent on demand, a factor not affected by the strike. Sales may decrease, however, if the company suffers a stockout. Furthermore, ending finished goods inventory cannot increase because of the nature of the product.
- Answer (C) is **incorrect**. The nature of the product prevents an increase in production volume to augment finished goods inventory.
- Answer (D) is **correct**. The most significant items are those that will vary between the contingency budget and the regular budget. The company cannot increase its finished goods inventory, but it can increase its inventory of the direct materials provided by the supplier. Thus, the items most affected will be direct materials and cash. The cash budget will be affected because of the need to pay for direct materials prior to their usage.

**[13] Gleim #: 6.1.13 -- Source: CMA 0408 2-031**

Many companies use comprehensive budgeting in planning for the next year's activities. When both an operating budget and a financial budget are prepared, which one of the following is correct concerning the financial budget?

	<u>Included in the Financial Budget</u>		
	Capital Budget	Pro-forma Balance Sheet	Cash Budget
A.	Yes	No	Yes
B.	No	Yes	No
C.	Yes	Yes	Yes
D.	No	No	No

- Answer (A) is **incorrect**. The pro forma balance sheet is part of the financial budget.
- Answer (B) is **incorrect**. The capital budget and cash budget are part of the financial budget.
- Answer (C) is **correct**. In the financial budget, the emphasis is on obtaining the funds needed to purchase operating assets. It contains the capital budget, projected cash disbursement schedule, projected cash collection schedule, cash budget, pro forma balance sheet, and pro forma statement of cash flows.
- Answer (D) is **incorrect**. All three of these items are part of the financial budget.

**[14] Gleim #: 6.1.14 -- Source: CMA 0205 2-7**

The starting point for creating a master budget for a proprietary secretarial school would be

- A. Estimating salaries of the instructors.
- B. Forecasting enrollment.
- C. Preparing a capital expenditure budget.
- D. Preparing the student recruiting budget.

- Answer (A) is **incorrect**. Instructor salaries will be addressed in the direct labor budget.
- Answer (B) is **correct**. The sales forecast drives all the other components of the operating budget. How much revenue the firm expects to bring in affects every other decision.
- Answer (C) is **incorrect**. Since the capital budget spans multiple budget periods, it must be prepared outside the operating budget cycle and often must be approved by the board of directors.
- Answer (D) is **incorrect**. The student recruiting budget is part of the marketing budget, which is prepared near the end of the operating budget process.

**[16] Gleim #: 6.1.16 -- Source: CMA 694 3-10**

The financial budget process includes

- A. The cash budget.
- B. The capital budget.
- C. The budgeted statement of cash flows.
- D. All of the answers are correct.

- Answer (A) is **incorrect**. All of the listed budgets are elements of the financial budget process.
- Answer (B) is **incorrect**. All of the listed budgets are elements of the financial budget process.
- Answer (C) is **incorrect**. All of the listed budgets are elements of the financial budget process.
- Answer (D) is **correct**. The financial budget normally includes the capital budget, the cash budget, the budgeted balance sheet, and the budgeted statement of cash flows.

[1] Gleim #: 6.5.50 -- Source: CMA 1289 4-8

The foundation of a profit plan is the

- A. Capital budget.
- B. Sales forecast.
- C. Cost and expense budget.
- D. Production plan.

- Answer (A) is **incorrect**. A capital budget is only concerned with capital expenditures and cannot be prepared until it is known whether new equipment or facilities will be needed to service the expected sales for the upcoming period.
- Answer (B) is **correct**. The starting point for the annual budget is the sales forecast. All other aspects of the budget, including production, costs, and inventory levels, rely on projected sales figures.
- Answer (C) is **incorrect**. This aspect of the budget cannot be prepared until sales have been estimated.
- Answer (D) is **incorrect**. Sales must be estimated before a production plan can be prepared.

[2] Gleim #: 6.5.51 -- Source: CMA 1289 4-9

A production plan should be based on

- A. A sales forecast adjusted for projected inventory levels.
- B. Economic order quantities and reorder points.
- C. Exponential smoothing.
- D. Linear regression.

- Answer (A) is **correct**. A production plan depends on the sales budget and anticipated inventory levels. Inventory serves to balance seasonal fluctuations in sales with the need for stable and efficient use of productive resources.
- Answer (B) is **incorrect**. EOQs and reorder points are considered only after it has decided how many units are needed.
- Answer (C) is **incorrect**. Exponential smoothing is a technique used to level or smooth variations encountered in a forecast. A production plan should be based on the variations expected.
- Answer (D) is **incorrect**. Regression analysis explains the correlation of a dependent variable with one or more independent variables. It is based on linearity of costs.

[3] Gleim #: 6.5.52 -- Source: CMA 1290 3-17

The operating budget process usually begins with the

- A. Financial budget.
- B. Balance sheet.
- C. Income statement.
- D. Sales budget.

- Answer (A) is **incorrect**. A financial budget cannot be prepared until after the sales budget has been completed.
- Answer (B) is **incorrect**. A balance sheet cannot be prepared until after the sales budget has been completed.
- Answer (C) is **incorrect**. An income statement cannot be prepared until after the sales budget has been completed.
- Answer (D) is **correct**. The starting point for the annual budget is the sales forecast. All other aspects of the budget, including production, costs, and inventory levels, rely on projected sales figures.

[4] Gleim #: 6.5.53 -- Source: CMA 691 3-3

Adams Manufacturing, Inc., produces farm tractors. The details of its budgeted cost of goods manufactured schedule should come from which of the following schedules?

- A. Cost of goods sold plus or minus the change planned in finished goods.
- B. Direct materials used, direct labor, manufacturing overhead, and work-in-process.
- C. Purchases, direct labor, manufacturing overhead, finished goods, and work-in-process.
- D. Purchases, raw material, work-in-process, and finished goods.

- Answer (A) is **incorrect**. Cost of goods sold equals the cost of goods manufactured adjusted for the change in finished goods. Also, finished goods are not a part of the cost of goods manufactured calculation.
- Answer (B) is **correct**. Cost of goods manufactured equals all manufacturing costs incurred during the period, plus beginning work-in-process inventory, minus ending work-in-process inventory. The cost of goods manufactured schedule therefore includes direct materials, direct labor, factory overhead, and changes in work-in-process inventories.
- Answer (C) is **incorrect**. Purchases is a component of the raw materials budget, not the cost of goods sold schedule, and finished goods are not included in CGM.

- Answer (D) is **incorrect**. CGM includes direct materials used, not purchases or finished goods.

**[5] Gleim #: 6.5.54 -- Source: CMA 691 3-9**

In developing a comprehensive budget for a manufacturing company, which one of the following items should be done first?

- A. Development of a sales plan.
- B. Determination of manufacturing capacity.
- C. Development of the capital budget.
- D. Determination of the advertising budget.

- Answer (A) is **correct**. The starting point for the annual budget is the sales forecast. All other aspects of the budget, including production, costs, and inventory levels, rely on projected sales figures.
- Answer (B) is **incorrect**. The level of manufacturing (production) capacity is fixed in the short run. In the long run, it may be adjusted in accordance with projected sales.
- Answer (C) is **incorrect**. A capital budget cannot be prepared without a sales plan.
- Answer (D) is **incorrect**. Expense budgets are not prepared until the level of operating activity is known.

**[6] Gleim #: 6.5.55 -- Source: CMA 691 3-11**

When budgeting, the items to be considered by a manufacturing firm in going from a sales quantity budget to a production budget would be the

- A. Expected change in the quantity of work-in-process inventories.
- B. Expected change in the quantity of finished goods and work-in-process inventories.
- C. Expected change in the quantity of finished goods and raw material inventories.
- D. Expected change in the availability of raw material without regard to inventory levels.

- Answer (A) is **incorrect**. Finished goods inventories cannot be ignored.
- Answer (B) is **correct**. Production quantities are not identical to sales because of changes in inventory levels. Both finished goods and work-in-process inventories may change during a period, thus necessitating an analysis of both inventory levels before the production budget can be set.
- Answer (C) is **incorrect**. Work-in-process inventory should be considered.

- Answer (D) is **incorrect**. Existing inventories determine production levels.

**[7] Gleim #: 6.5.56 -- Source: CMA 691 3-15**

Which one of the following schedules would be the last item to be prepared in the normal budget preparation process?

- A. Direct labor budget.
- B. Cash budget.
- C. Cost of goods sold budget.
- D. Manufacturing overhead budget.

- Answer (A) is **incorrect**. A direct labor budget must be prepared before the cash budget.
- Answer (B) is **correct**. The budget process begins with the sales budget, proceeds to the production and expense budgets, and eventually the cash budget. The cash budget cannot be prepared until the end of the process because all other budgets provide inputs to the cash budget.
- Answer (C) is **incorrect**. A cost of goods sold budget must be prepared before the cash budget.
- Answer (D) is **incorrect**. A manufacturing overhead budget must be prepared before the cash budget.

**[8] Gleim #: 6.5.57 -- Source: CMA 697 3-16**

After the goals of the company have been established and communicated, the next step in the planning process is development of the

- A. Production budget.
- B. Direct materials budget.
- C. Selling and administrative budget.
- D. Sales budget.

- Answer (A) is **incorrect**. The production budget depends on the sales budget.
- Answer (B) is **incorrect**. The direct materials budget depends on the production budget.
- Answer (C) is **incorrect**. Selling and administrative costs are dependent on projected sales.
- Answer (D) is **correct**. The sales budget is the first step in the operating budget process because it is needed to prepare all of the other budgets. For example, the production budget cannot be prepared until the sales department has determined how many units are needed.

**[9] Gleim #: 6.5.58 -- Source: CMA 694 3-12**

The production budget process usually begins with the

- A. Direct labor budget.
- B. Direct materials budget.
- C. Manufacturing overhead budget.
- D. Sales budget.

- Answer (A) is **incorrect**. The direct labor budget cannot be prepared until after unit production figures have been compiled.
- Answer (B) is **incorrect**. The direct materials budget cannot be prepared until after the unit production figures have been compiled.
- Answer (C) is **incorrect**. The manufacturing overhead budget cannot be prepared until after the unit production figures have been compiled.
- Answer (D) is **correct**. Neither a master budget nor a production budget can be prepared until after the sales budget has been completed. Once a firm knows its expected sales, production can be estimated. The production budget is based on assumptions appearing in the sales budget; thus, the sales budget is the first step in the preparation of a production budget.

**[10] Gleim #: 6.5.59 -- Source: CMA 1295 3-9**

Individual budget schedules are prepared to develop an annual comprehensive or master budget. The budget schedule that would provide the necessary input data for the direct labor budget would be the

- A. Sales forecast.
- B. Raw materials purchases budget.
- C. Schedule of cash receipts and disbursements.
- D. Production budget.

- Answer (A) is **incorrect**. The sales forecast is insufficient for completion of the direct labor budget.
- Answer (B) is **incorrect**. The raw material purchases budget is not needed to prepare a direct labor budget.
- Answer (C) is **incorrect**. The schedule of cash receipts and disbursements cannot be prepared until after the direct labor budget has been completed.

- Answer (D) is **correct**. Once the production budget has been completed, the next step is to prepare the direct labor, raw material, and overhead budgets. Thus, the production budget provides the data for the completion of the direct labor budget.

**[11] Gleim #: 6.5.60 -- Source: CMA 1292 3-9**

The information contained in a cost of goods manufactured budget most directly relates to the

- A. Materials used, direct labor, overhead applied, and ending work-in-process budgets.
- B. Materials used, direct labor, overhead applied, and work-in-process inventories budgets.
- C. Materials used, direct labor, overhead applied, work-in-process inventories, and finished goods inventories budgets.
- D. Materials used, direct labor, overhead applied, and finished goods inventories budgets.

- Answer (A) is **incorrect**. Both beginning and ending work-in-process must be included.
- Answer (B) is **correct**. Cost of goods manufactured equals all manufacturing costs incurred during the period, plus beginning work-in-process inventory, minus ending work-in-process. The cost of goods manufactured schedule therefore includes direct materials, direct labor, factory overhead, and changes in work-in-process inventories.
- Answer (C) is **incorrect**. Finished goods are excluded. They are the end product of the manufacturing process.
- Answer (D) is **incorrect**. Finished goods are excluded. They are the end product of the manufacturing process.

**[12] Gleim #: 6.5.61 -- Source: CMA 1296 3-13**

Which one of the following items should be done first when developing a comprehensive budget for a manufacturing company?

- A. Determination of the advertising budget.
- B. Development of a sales budget.
- C. Development of the capital budget.
- D. Preparation of a pro forma income statement.

- Answer (A) is **incorrect**. The amount of advertising cost depends on the desired level of sales.

- Answer (B) is **correct**. The sales budget is the first to be prepared because all other elements of a comprehensive budget depend on projected sales. For example, the production budget is based on an estimate of unit sales and desired inventory levels. Thus, sales volume affects purchasing levels, operating expenses, and cash flow.
- Answer (C) is **incorrect**. Expenditures for productive capacity are a function of long-term estimates of demand for the firm's products.
- Answer (D) is **incorrect**. Preparation of a pro forma income statement is one of the final steps in the budgetary process. It cannot be prepared until after all sales, production, and expense budgets are finished.

**[13] Gleim #: 6.5.62 -- Source: CMA 695 3-18**

There are various budgets within the master budget cycle. One of these budgets is the production budget. Which one of the following best describes the production budget?

- A. It summarizes all discretionary costs.
  - B. It includes required direct labor hours.
  - C. It includes required material purchases.
  - D. It is calculated from the desired ending inventory and the sales forecast.
- Answer (A) is **incorrect**. A production budget is usually prepared in terms of units of output rather than costs.
  - Answer (B) is **incorrect**. The direct labor budget is prepared after the production budget.
  - Answer (C) is **incorrect**. The materials purchases budget is prepared after the production budget.
  - Answer (D) is **correct**. A production budget is based on sales forecasts, in units, with adjustments for beginning and ending inventories. It is used to plan when items will be produced. After the production budget has been completed, it is used to prepare materials purchases, direct labor, and factory overhead budgets.

**[14] Gleim #: 6.5.63 -- Source: CMA 692 3-8**

The budget that is usually the most difficult to forecast is the

- A. Production budget.
- B. Expense budget.
- C. Sales budget.
- D. Manufacturing overhead budget.

- Answer (A) is **incorrect**. The production budget is based on the sales budget.
- Answer (B) is **incorrect**. Expense budgets are based on sales and production budgets.
- Answer (C) is **correct**. Following the preparation of the sales budget, all other budgets are prepared based on the assumptions used in the sales budget. For this reason, the sales budget is the most difficult to prepare because there are no internal figures to use as a guide. Sales are based on the desires of consumers and the current business climate.
- Answer (D) is **incorrect**. The manufacturing overhead budget is based on the production budget.

**[15] Gleim #: 6.5.64 -- Source: CMA 689 4-27**

When sales volume is seasonal in nature, certain items in the budget must be coordinated. The three most significant items to coordinate in budgeting seasonal sales volume are

- A. Direct labor hours, work-in-process inventory, and sales volume.
  - B. Production volume, finished goods inventory, and sales volume.
  - C. Raw material inventory, direct labor hours, and manufacturing overhead costs.
  - D. Raw material inventory, work-in-process inventory, and production volume.
- Answer (A) is **incorrect**. Direct labor and work-in-process are less directly significant to the desired coordination.
  - Answer (B) is **correct**. The most important items that need to be coordinated in a seasonal business are sales volume and production. The sales budget is the basis for other budgets. The sales projection determines how much needs to be purchased and produced. In turn, projected sales and production (or purchases) must be coordinated with existing quantities on hand (inventory) and with amounts to be held in the future. If a manufacturer faces sharp variations in demand, this coordination becomes especially crucial.
  - Answer (C) is **incorrect**. Direct labor, raw materials, and overhead are less directly significant to the desired coordination.
  - Answer (D) is **incorrect**. Raw materials and work-in-process are less directly significant to the desired coordination.

**[16] Gleim #: 6.5.65 -- Source: CMA 0205**

Maximilian Computer Company uses a comprehensive budgeting system in planning its annual operations. Which of the following best describes the information needed to determine the budgeted cost of circuit boards to be purchased for use in building its laptop computer? Assume one circuit board is used in each laptop.

- A. Begin with budgeted laptop sales in units, add the desired ending inventory of circuit boards, deduct the expected beginning inventory of circuit boards, and multiply the resulting amount by the budgeted purchase cost per circuit board.
- B. Begin with budgeted laptop sales in units, deduct the desired ending inventory of circuit boards, add the expected beginning inventory of circuit boards, and multiply the resulting amount by the purchase cost per circuit board.
- C. Begin with budgeted laptop production in units, deduct the desired ending inventory of circuit boards, add the expected beginning inventory of circuit boards, and multiply the resulting amount by the purchase cost per circuit board.
- D. Begin with budgeted laptop production in units, add the desired ending inventory of circuit boards, deduct the expected beginning inventory of circuit boards, and multiply the resulting amount by the budgeted purchase cost per circuit board.

- Answer (A) is **incorrect**. Sales is an improper figure to begin with for calculating a raw materials budget.
- Answer (B) is **incorrect**. A raw materials budget must begin with the number of materials expected to be consumed, not final goods sold.
- Answer (C) is **incorrect**. Ending inventory should be added, and beginning inventory should be subtracted.
- Answer (D) is **correct**. Since each laptop requires exactly one circuit board, the beginning figure of the calculation equals the number of finished products to be produced:

Units needed for production	X,XXX
Add: desired ending inventory	XXX
Less: beginning inventory	<u>(XXX)</u>
Raw materials to be purchased	X,XXX
Times: per-unit purchase price	<u>× \$ X.XX</u>
Total raw materials cost	<u><u>\$X,XXX</u></u>

**[17] Gleim #: 6.5.66 -- Source: CMA 0408 2-032**

Which one of the combinations listed correctly depicts the chronological order of preparation for the following budgets?

- I. Cost of goods sold budget
- II. Production budget
- III. Purchases budget
- IV. Administrative budget

- A. I, II, III, IV.
- B. III, II, IV, I.
- C. IV, II, III, I.
- D. II, III, I, IV.

- Answer (A) is **incorrect**. The cost of goods sold budget cannot be prepared until the purchases budget is complete.
- Answer (B) is **incorrect**. The purchases budget cannot be prepared until the production budget is complete.
- Answer (C) is **incorrect**. The administrative budget is the last of the four listed to be prepared.
- Answer (D) is **correct**. The components of the operating budget are prepared in the following order: sales budget, production budget, direct materials budget, direct labor budget, manufacturing overhead budget, ending finished goods inventory budget, cost of goods sold budget, and nonmanufacturing budget. This last budget consists of the research and development budget, design budget, marketing budget, distribution budget, customer service budget, and administrative budget.

**[18] Gleim #: 6.5.67 -- Source: CMA 0408 2-034**

Which one of the following best describes the order in which budgets should be prepared when developing the annual master operating budget?

- A. Production budget, direct material budget, revenue budget.
- B. Production budget, revenue budget, direct material budget.
- C. Revenue budget, production budget, direct material budget.
- D. Revenue budget, direct material budget, production budget.

- Answer (A) is **incorrect**. The revenue budget must be completed before the other two can be prepared.

- Answer (B) is **incorrect**. The revenue budget must be completed before the production budget can be prepared.
- Answer (C) is **correct**. The components of the operating budget are prepared in the following order: sales (revenue) budget, production budget, direct materials budget, direct labor budget, manufacturing overhead budget, ending finished goods inventory budget, cost of goods sold budget, and nonmanufacturing budget.
- Answer (D) is **incorrect**. The production budget must be completed before the direct material budget can be prepared.

**[20] Gleim #: 6.5.69 -- Source: CMA 1295 3-17**

When preparing the series of annual operating budgets, management usually starts the process with the

- A. Cash budget.
- B. Balance sheet.
- C. Capital budget.
- D. Sales budget.

- Answer (A) is **incorrect**. It cannot be prepared until the sales budget has been determined.
- Answer (B) is **incorrect**. It cannot be prepared until the sales budget has been determined.
- Answer (C) is **incorrect**. It cannot be prepared until the sales budget has been determined.
- Answer (D) is **correct**. The budgeting process begins with the sales budget and then proceeds to the production budget. Once the production budget is complete, then the raw materials, direct labor, overhead, and cash budgets can be prepared. The capital budget is prepared outside the operating budget process, followed by a cash budget.

[1] Gleim #: 6.3.26 -- Source: CMA 1292 3-12

Barnes Corporation expected to sell 150,000 board games during the month of November, and the company's master budget contained the following data related to the sale and production of these games:

Revenue	\$2,400,000
Cost of goods sold:	
Direct materials	675,000
Direct labor	300,000
Variable overhead	<u>450,000</u>
Contribution margin	\$ 975,000
Fixed overhead	250,000
Fixed selling and administration	<u>500,000</u>
Operating income	<u><u>\$ 225,000</u></u>

Actual sales during November were 180,000 games. Using a flexible budget, the company expects the operating income for the month of November to be

- A. \$225,000
- B. \$270,000
- C. \$420,000
- D. \$510,000

- Answer (A) is **incorrect**. The net income before the increase in sales is \$225,000.
- Answer (B) is **incorrect**. Net income was originally \$1.50 per game. The \$270,000 figure simply extrapolates that amount to sales of 180,000 games.
- Answer (C) is **correct**. Revenue of \$2,400,000 reflects a unit selling price of \$16 ( $\$2,400,000 \div 150,000$  games). The contribution margin is \$975,000, or \$6.50 per game ( $\$975,000 \div 150,000$  games). Increasing sales will result in an increased contribution margin of \$195,000 ( $30,000$  games  $\times$  \$6.50). Since fixed costs are, by their nature, unchanging across the relevant range, net income will increase to \$420,000 ( $\$225,000$  originally reported + \$195,000).
- Answer (D) is **incorrect**. Treating variable overhead as a fixed cost results in \$510,000. Variable overhead is a \$3 component ( $\$450,000 \div 150,000$  units) of unit variable cost.

**[2] Gleim #: 6.3.27 -- Source: CMA 686 4-23**

Simson Company's master budget shows straight-line depreciation on factory equipment of \$258,000. The master budget was prepared at an annual production volume of 103,200 units of product. This production volume is expected to occur uniformly throughout the year. During September, Simson produced 8,170 units of product, and the accounts reflected actual depreciation on factory machinery of \$20,500. Simson controls manufacturing costs with a flexible budget. The flexible budget amount for depreciation on factory machinery for September would be

- A. \$19,475
- B. \$20,425
- C. \$20,500
- D. \$21,500

- Answer (A) is **incorrect**. Depreciation is a fixed cost that will be the same each month regardless of production. The budget for September would show depreciation of \$21,500 ( $\$258,000 \times 1/12$ ).
- Answer (B) is **incorrect**. The amount of \$20,425 is based on the units-of-production method.
- Answer (C) is **incorrect**. The amount shown in the accounts is \$20,500.
- Answer (D) is **correct**. Since depreciation is a fixed cost, that cost will be the same each month regardless of production. Therefore, the budget for September would show depreciation of \$21,500 ( $\$258,000 \text{ annual depreciation} \times 1/12$ ).

**[3] Gleim #: 6.3.28 -- Source: CMA 679 4-8**

A static budget

- A. Drops the current month or quarter and adds a future month or a future quarter as the current month or quarter is completed.
  - B. Presents a statement of expectations for a period but does not present a firm commitment.
  - C. Presents the plan for only one level of activity and does not adjust to changes in the level of activity.
  - D. Presents the plan for a range of activity so that the plan can be adjusted for changes in activity.
- Answer (A) is **incorrect**. Budgets dropping the current month or quarter and adding a future month or quarter as the current month or quarter is completed are known as continuous budgets.

- Answer (B) is **incorrect**. A statement of expectations for a period without a firm commitment is a forecast.
- Answer (C) is **correct**. A static budget plans for only one level of activity and does not provide for changed levels of activity.
- Answer (D) is **incorrect**. A budget planning for a range of activities so the plan can be adjusted for a change in activity level is known as a flexible budget.

**[4] Gleim #: 6.3.29 -- Source: CMA 1292 3-14**

When preparing a performance report for a cost center using flexible budgeting techniques, the planned cost column should be based on the

- A. Budgeted amount in the original budget prepared before the beginning of the year.
- B. Actual amount for the same period in the preceding year.
- C. Budget adjusted to the actual level of activity for the period being reported.
- D. Budget adjusted to the planned level of activity for the period being reported.

- Answer (A) is **incorrect**. The static budget amount is not useful for comparison purposes. The budget for the actual activity level achieved is more important.
- Answer (B) is **incorrect**. Prior-year figures are not useful if activity levels are different.
- Answer (C) is **correct**. If a report is to be used for performance evaluation, the planned cost column should be based on the actual level of activity for the period. The ability to adjust amounts for varying activity levels is the primary advantage of flexible budgeting.
- Answer (D) is **incorrect**. A budget based on planned activity level is not as meaningful as one based on actual activity level.

**[5] Gleim #: 6.3.30 -- Source: CMA 1295 3-10**

Which one of the following statements regarding the difference between a flexible budget and a static budget is true?

- A. A flexible budget primarily is prepared for planning purposes, while a static budget is prepared for performance evaluation.
- B. A flexible budget provides cost allowances for different levels of activity, whereas a static budget provides costs for one level of activity.
- C. A flexible budget includes only variable costs, whereas a static budget includes only fixed costs.
- D. A flexible budget is established by operating management, while a static budget is determined by top management.

- Answer (A) is **incorrect**. Both budgets are prepared for both planning and performance evaluation purposes.
- Answer (B) is **correct**. A flexible budget provides cost allowances for different levels of activity, but a static budget provides costs for only one level of activity. Both budgets show the same types of costs. In a sense, a flexible budget is a series of budgets prepared for many different levels of activity. A flexible budget allows adjustment of the budget to the actual level of activity before comparing the budgeted activity with actual results.
- Answer (C) is **incorrect**. Both budgets include both fixed and variable costs.
- Answer (D) is **incorrect**. Either budget can be established by any level of management.

**[6] Gleim #: 6.3.31 -- Source: CMA 1291 3-13**

A flexible budget is appropriate for

- A. Control of fixed factory overhead but not direct materials and direct labor.
- B. Control of direct materials and direct labor but not selling and administrative expenses.
- C. Any level of activity.
- D. Control of direct labor and direct materials but not fixed factory overhead.

- Answer (A) is **incorrect**. A flexible budget is not necessary for control of costs that will be the same at all levels of activity.
- Answer (B) is **incorrect**. Flexible budgets are useful for controlling variable costs, including variable selling and administrative costs.
- Answer (C) is **incorrect**. A flexible budget is prepared for a specific range of activity levels.
- Answer (D) is **correct**. A flexible budget is actually a series of several budgets prepared for many levels of operating activity. A flexible budget is designed to allow adjustment of the budget to the actual level of activity before comparing the budgeted activity with actual results. This flexibility is important if costs vary with the activity level. Thus, a flexible budget is particularly appropriate for control of direct labor and direct materials (both variable costs), but is not necessary for control of fixed factory overhead. By definition, overhead costs do not change as activity levels change.

**[7] Gleim #: 6.3.32 -- Source: CMA 687 4-17**

Selo Imports uses flexible budgeting for the control of costs. The company's annual master budget includes \$324,000 for fixed production supervisory salaries at a volume of 180,000 units. Supervisory salaries are expected to be incurred uniformly throughout the year. During the month of September, 15,750 units were produced, and production supervisory salaries incurred were \$28,000. A performance report for September would reflect a budget variance of

- A. \$350 favorable.
- B. \$350 unfavorable.
- C. \$1,000 unfavorable.
- D. \$1,000 favorable.

- Answer (A) is **incorrect**. The amount of \$350 results from calculating supervisory salaries on the basis of volume rather than as fixed costs  $\{[(15,750 \text{ units}) \times \$324,000 \div 180,000 \text{ units}] - \$28,000\}$ .
- Answer (B) is **incorrect**. The amount of \$350 results from calculating supervisory salaries on the basis of volume rather than as fixed costs  $\{[15,750 \text{ units} \times (\$324,000 \div 180,000 \text{ units})] - \$28,000\}$ .
- Answer (C) is **correct**. The \$324,000 for supervisory salaries is a fixed cost, at a rate of \$27,000 per month. Since these costs are fixed, volume is irrelevant. Thus, the variance is the difference between actual costs of \$28,000 and the budgeted costs of \$27,000, which equals \$1,000 unfavorable.
- Answer (D) is **incorrect**. The variance is \$1,000 unfavorable. Actual costs are greater than budgeted costs.

**[8] Gleim #: 6.3.33 -- Source: CMA 687 4-18**

Baxter Corporation's master budget calls for the production of 5,000 units of product monthly. The master budget includes indirect labor of \$144,000 annually; Baxter considers indirect labor to be a variable cost. During the month of April, 4,500 units of product were produced, and indirect labor costs of \$10,100 were incurred. A performance report utilizing flexible budgeting would report a budget variance for indirect labor of

- A. \$1,900 unfavorable.
- B. \$700 favorable.
- C. \$1,900 favorable.
- D. \$700 unfavorable.

- Answer (A) is **incorrect**. The amount of \$1,900 is calculated using 5,000 units produced instead of the actual 4,500.
- Answer (B) is **correct**. The \$144,000 annual amount equals \$12,000 per month. Since volume is expected to be 5,000 units per month, and the \$12,000 is considered a variable cost, budgeted cost per unit is \$2.40 ( $\$12,000 \div 5,000$  units). If 4,500 units are produced, the total variable costs should be \$10,800 ( $4,500 \text{ units} \times \$2.40$ ). Subtracting the \$10,100 of actual costs from the budgeted figure results in a favorable variance of \$700.
- Answer (C) is **incorrect**. The \$144,000 annual amount equals \$12,000 per month. Since volume is expected to be 5,000 units per month, and the \$12,000 is considered a variable cost, budgeted cost per unit is \$2.40 ( $\$12,000 \div 5,000$  units). If 4,500 units are produced, the total variable costs should be \$10,800 ( $4,500 \text{ units} \times \$2.40$ ). Subtracting the \$10,100 of actual costs from the budgeted figure results in a favorable variance of \$700.
- Answer (D) is **incorrect**. The \$700 variance is favorable.

**[9] Gleim #: 6.3.34 -- Source: CMA 1291 3-26**

RedRock Company uses flexible budgeting for cost control. RedRock produced 10,800 units of product during October, incurring indirect materials costs of \$13,000. Its master budget for the year reflected indirect materials costs of \$180,000 at a production volume of 144,000 units. A flexible budget for October production would reflect indirect materials costs of

- A. \$13,000
- B. \$13,500
- C. \$13,975
- D. \$11,700

- Answer (A) is **incorrect**. The actual cost of indirect materials in October is \$13,000.
- Answer (B) is **correct**. The cost of indirect materials for 144,000 units was expected to be \$180,000. Consequently, the budgeted unit cost of indirect materials is \$1.25 ( $\$180,000 \div 144,000$ ). Multiplying the \$1.25 unit cost times the 10,800 units actually produced results in an expected total indirect materials cost of \$13,500.
- Answer (C) is **incorrect**. The amount of \$13,975 is not the flexible budget cost for indirect materials.
- Answer (D) is **incorrect**. The amount of \$11,700 is not the flexible budget cost for indirect materials.

**[10] Gleim #: 6.3.35 -- Source: CMA 1296 3-14**

Flexible budgets

- A. Provide for external factors affecting company profitability.
  - B. Are used to evaluate capacity use.
  - C. Are budgets that project costs based on anticipated future improvements.
  - D. Accommodate changes in activity levels.
- Answer (A) is **incorrect**. Flexible budgets address external factors only to the extent that activity is affected.
  - Answer (B) is **incorrect**. A flexible budget essentially restates variable costs for different activity levels within the relevant range. Hence, a flexible budget variance does not address capacity use. An output level (production volume) variance is a fixed cost variance.
  - Answer (C) is **incorrect**. By definition, flexible budgets address differences in activity levels only within the relevant range.
  - Answer (D) is **correct**. A flexible budget is actually a series of budgets prepared for various levels of activity. A flexible budget adjusts the master budget for changes in activity so that actual results can be compared with meaningful budget amounts.

**[12] Gleim #: 6.3.37 -- Source: CMA 0408 2-002**

When compared to static budgets, flexible budgets

- A. Offer managers a more realistic comparison of budget and actual fixed cost items under their control.
  - B. Provide a better understanding of the capacity variances during the period being evaluated.
  - C. Encourage managers to use fewer fixed cost items and more variable cost items that are under their control.
  - D. Offer managers a more realistic comparison of budget and actual revenue and cost items under their control.
- Answer (A) is **incorrect**. The use of fixed costs is a decision involving leverage; flexible budgeting is not relevant.
  - Answer (B) is **incorrect**. While flexible budgeting can provide more useful variances than static budgeting, a better understanding of the variances can only proceed from knowing the business.
  - Answer (C) is **incorrect**. The choice to employ variable costs in preference to fixed costs is a decision involving the degree of leverage; flexible budgeting is not relevant.

- Answer (D) is **correct**. A flexible budget provides managers with the revenues and costs that “should” have been earned and incurred given the actual level of production achieved. This information is far more useful than the static budget prepared before the fiscal period began when the production level was uncertain.

**[13] Gleim #: 6.3.38 -- Source: CMA 691 3-12**

Flexible budgets

- A. Accommodate changes in the inflation rate.
  - B. Are used to evaluate capacity use.
  - C. Are static budgets that have been revised for changes in prices.
  - D. Accommodate changes in activity levels.
- Answer (A) is **incorrect**. Changes in the inflation rate are not addressed any differently in a flexible budget than in a fixed budget.
  - Answer (B) is **incorrect**. The purpose of the flexible budget is to provide plans for different levels of activity.
  - Answer (C) is **incorrect**. A flexible budget is actually a series of static budgets for different operating activity levels.
  - Answer (D) is **correct**. A flexible budget is essentially a series of budgets prepared for various levels of operating activity. A flexible budget facilitates comparison of actual results with budget figures. The purpose is to have a usable budget even though activity may differ from the level originally planned at the time the budget was prepared.

**[2] Gleim #: 6.2.18 -- Source: CMA 0205 2-4**

Which one of the following is **not** an advantage of activity-based budgeting?

- A. Better identification of resource needs.
- B. Linking of costs to outputs.
- C. Identification of budgetary slack.
- D. Reduction of planning uncertainty.

- Answer (A) is **incorrect**. Better identification of resource needs is an advantage of any kind of budgeting.
- Answer (B) is **incorrect**. Linking costs to outputs is a feature of a cost accumulation system, such as job-order or process costing.
- Answer (C) is **incorrect**. Identification of budgetary slack can be built into any budget system, not just an activity-based one.
- Answer (D) is **correct**. Activity-based budgeting applies activity-based costing principles to budgeting. It focuses on the numerous activities necessary to produce and market goods and services and requires analysis of cost drivers. Activity-based budgeting cannot reduce the level of uncertainty to which any large organization is subject.

**[3] Gleim #: 6.2.19 -- Source: CMA 1296 3-1**

An advantage of incremental budgeting when compared with zero-based budgeting is that incremental budgeting

- A. Encourages adopting new projects quickly.
- B. Accepts the existing base as being satisfactory.
- C. Eliminates functions and duties that have outlived their usefulness.
- D. Eliminates the need to review all functions periodically to obtain optimum use of resources.

- Answer (A) is **incorrect**. Both types of budgets treat new projects in the same manner.
- Answer (B) is **correct**. Incremental budgeting simply adjusts the current year's budget to allow for changes planned for the coming year; a manager is not asked to justify the base portion of the budget. ZBB, however, requires a manager to justify the entire budget for each year. Incremental budgeting offers to managers the advantage of requiring less managerial effort to justify changes in the budget.
- Answer (C) is **incorrect**. Reexamining functions and duties that may have outlived their usefulness is an advantage of ZBB.

- Answer (D) is **incorrect**. Periodic review of functions is essential regardless of the budgetary system used.

**[5] Gleim #: 6.2.21 -- Source: CMA 1291 3-22**

A systemized approach known as zero-based budgeting (ZBB)

- A. Presents the plan for only one level of activity and does not adjust to changes in the level of activity.
- B. Presents a statement of expectations for a period of time but does not present a firm commitment.
- C. Divides the activities of individual responsibility centers into a series of packages that are prioritized.
- D. Classifies budget requests by activity and estimates the benefits arising from each activity.

- Answer (A) is **incorrect**. A static budget does not adjust for changes in activity levels.
- Answer (B) is **incorrect**. ZBB does present a firm commitment.
- Answer (C) is **correct**. Zero-based budgeting is a planning process in which each manager must justify a department's entire budget every year (or period). Different levels of service (work effort) are evaluated for each activity, measures of work and performance are established, and activities are ranked (prioritized) according to their importance to the entity. For each budgetary unit, decision packages are prepared that describe various levels of service that may be provided, including at least one level lower than the current one.
- Answer (D) is **incorrect**. Each activity is prepared as a series of packages.

**[7] Gleim #: 6.2.23 -- Source: CMA 1291 3-20**

A continuous profit plan

- A. Is a plan that is revised monthly or quarterly.
- B. Is an annual plan that is part of a 5-year plan.
- C. Is a plan devised by a full-time planning staff.
- D. Works best for a company that can reliably forecast events a year or more into the future.

- Answer (A) is **correct**. A continuous, or rolling, budget (profit plan) is one that is revised on a regular or continuous basis. Typically, a company that uses continuous budgeting extends the budget for another month or quarter in accordance with new data as the current month or quarter ends. For example, if the budget is for 12 months, a budget for the next year will always be available at the end of each interim period. Continuous budgeting encourages a longer-term perspective regardless of how little time remains in the company's current fiscal year.
- Answer (B) is **incorrect**. A continuous profit plan is one that is revised and extended as available information changes.
- Answer (C) is **incorrect**. A continuous plan can be prepared by either a full-time or part-time staff.
- Answer (D) is **incorrect**. It is the lack of reliable long-range information that makes the continuous profit plan so worthwhile.

[8] Gleim #: 6.2.24 -- Source: CMA 694 3-13

A continuous (rolling) budget

- A. Presents the plan for only one level of activity and does not adjust to changes in the level of activity.
  - B. Presents the plan for a range of activity so the plan can be adjusted for changes in activity.
  - C. Is a plan that is revised monthly or quarterly, dropping one period and adding another.
  - D. Is one of the budgets that is part of a long-range strategic plan, unchanged unless the strategy of the company changes.
- Answer (A) is **incorrect**. A continuous budget can be for any level of activity. It need not be a static budget.
  - Answer (B) is **incorrect**. A flexible budget approach is not unique to a continuous budget.
  - Answer (C) is **correct**. A continuous, or rolling, budget is one that is revised monthly or quarterly by dropping one period and adding a new one. Thus, a company desiring a 1-year budget cycle will always have a budget for the next 12 months, regardless of the time of year.
  - Answer (D) is **incorrect**. A continuous budget is frequently revised.

[1] Gleim #: 6.4.39 -- Source: CMA 0205 2-5

The type of budget that is available on a continuous basis for a specified future period -- by adding a month, quarter, or year in the future as the month, quarter, or year just ended is dropped -- is called a(n)

- A. Rolling budget.
- B. Kaizen budget.
- C. Activity-based budget.
- D. Flexible budget.

- Answer (A) is **correct**. A continuous (rolling) budget is one that is revised on a regular (continuous) basis. Typically, a company continuously extends such a budget for an additional month or quarter in accordance with new data as the current month or quarter ends. For example, if the budget cycle is 1 year, a budget for the next 12 months will be available continuously as each month ends. The principal advantage of a rolling budget is that it requires managers always to be thinking ahead.
- Answer (B) is **incorrect**. A kaizen budget is one that assumes the continuous improvement of products and processes.
- Answer (C) is **incorrect**. An activity-based budget is one that applies activity-based costing principles to budgeting.
- Answer (D) is **incorrect**. A flexible budget consists of a series of budgets prepared for many levels of activity.

[2] Gleim #: 6.4.40 -- Source: CMA 1290 3-19

The use of the master budget throughout the year as a constant comparison with actual results signifies that the master budget is also a

- A. Flexible budget.
- B. Capital budget.
- C. Zero-base budget.
- D. Static budget.

- Answer (A) is **incorrect**. A flexible budget can be used in conjunction with standard costs to provide budgets for different activity levels.
- Answer (B) is **incorrect**. A capital budget concerns only long-term investments.
- Answer (C) is **incorrect**. A zero-base budget is one that requires its preparer to fully justify every item in the budget for each period.

- Answer (D) is **correct**. If an unchanged master budget is used continuously throughout the year for comparison with actual results, it must be a static budget, that is, one prepared for just one level of activity.

**[3] Gleim #: 6.4.41 -- Source: CMA 697 3-12**

Which one of the following budgeting methodologies would be most appropriate for a firm facing a significant level of uncertainty in unit sales volumes for next year?

- A. Top-down budgeting.
- B. Life-cycle budgeting.
- C. Static budgeting.
- D. Flexible budgeting.

- Answer (A) is **incorrect**. Top-down budgeting entails imposition of a budget by top management on lower-level employees. It is the antithesis of participatory budgeting.
- Answer (B) is **incorrect**. Life-cycle budgeting estimates a product's revenues and costs for each link in the value chain from R&D and design to production, marketing, distribution, and customer service. The product life cycle ends when customer service is withdrawn.
- Answer (C) is **incorrect**. A static budget is for only one level of activity.
- Answer (D) is **correct**. With flexible budgeting, the firm prepares a series of budgets for many levels of sales and production. At the end of the period, management can compare actual sales performance with the appropriate budgeted level in the flexible budget.

**[4] Gleim #: 6.4.42 -- Source: CMA 695 3-19**

A plan that is created using budgeted revenue and costs but is based on the actual units of output is known as a

- A. Continuous budget.
- B. Flexible budget.
- C. Strategic plan.
- D. Static budget.

- Answer (A) is **incorrect**. A continuous budget is revised on a regular (continuous) basis by extending it for another month or quarter in accordance with new data as the current month or quarter ends.

- Answer (B) is **correct**. A flexible budget is a series of several budgets prepared for many levels of sales and production. A flexible budget is designed to allow adjustment of the budget to the actual level of activity before comparing the budgeted activity with actual results.
- Answer (C) is **incorrect**. A strategic plan is a long-term planning device.
- Answer (D) is **incorrect**. A static (fixed) budget is prepared for only one level of output. That level will probably not be the level of actual operations.

**[5] Gleim #: 6.4.43 -- Source: CMA 694 3-15**

A method of budgeting in which the cost of each program must be justified, starting with the one most vital to the company, is

- A. Flexible budgeting.
- B. Zero-based budgeting.
- C. Continuous budgeting.
- D. Probabilistic budgeting.

- Answer (A) is **incorrect**. Flexible budgeting prepares budgets for varying levels of productivity.
- Answer (B) is **correct**. Zero-based budgeting is an effective means of bringing objective thinking to the budgeting process. The principal advantage of this approach is that managers are forced to review each program in its entirety at the beginning of every budget period, rather than merely extrapolate historical figures.
- Answer (C) is **incorrect**. Continuous budgeting extends budget estimates at interim dates so that a budget for a specified period, usually 12 months, is always available.
- Answer (D) is **incorrect**. Probabilistic budgeting bases budgets on the most likely levels of activity.

**[6] Gleim #: 6.4.44 -- Source: CMA 696 3-14**

Comparing actual results with a budget based on achieved volume is possible with the use of a

- A. Monthly budget.
- B. Master budget.
- C. Rolling budget.
- D. Flexible budget.

- Answer (A) is **incorrect**. Comparing results using a monthly budget is no easier than using a budget of any other duration.
- Answer (B) is **incorrect**. A master budget is the overall budget. It will not facilitate comparisons unless it is also a flexible budget.
- Answer (C) is **incorrect**. A rolling (or continuous) budget is revised on a regular (continuous) basis. It will not facilitate comparisons unless it is also a flexible budget.
- Answer (D) is **correct**. A flexible budget is essentially a series of several budgets prepared for various levels of sales and production. At the end of the period, management can compare actual costs or performance with the appropriate budgeted level in the flexible budget. A flexible budget is designed to allow adjustment of the budget to the actual level of activity before comparing the budgeted activity with actual results.

**[7] Gleim #: 6.4.45 -- Source: CMA 1293 3-18**

The use of standard costs in the budgeting process signifies that an organization has most likely implemented a

- A. Flexible budget.
- B. Capital budget.
- C. Zero-based budget.
- D. Static budget.

- Answer (A) is **correct**. A flexible budget is a series of budgets prepared for various levels of sales and production. Another view is that it is based on cost formulas, or standard costs. Thus, the cost formulas are fed into the computerized budget program along with the actual level of sales or production. The result is a budget created for the actual level of activity.
- Answer (B) is **incorrect**. A capital budget is a means of evaluating long-term investments and has nothing to do with standard costs.
- Answer (C) is **incorrect**. A zero-based budget is a planning process in which each manager must justify a department's entire budget each year. The budget is built from the base of zero each year.
- Answer (D) is **incorrect**. A static budget is for one level of activity. It can be based on expected actual or standard costs.

**[8] Gleim #: 6.4.46 -- Source: CIA 587 III-16**

A manufacturing firm has certain peak seasons; namely the Christmas season, the summer season, and the last 2 weeks of February. During these periods of increased output, the firm leases additional production equipment and hires additional temporary employees. Which of the following budget techniques would best fit this firm's needs?

- A. Flexible budgeting.
- B. Static budgeting.
- C. Zero-based budgeting.
- D. Project budgeting.

- Answer (A) is **correct**. A flexible budget is a series of several budgets prepared for various levels of sales and production. It is designed to allow adjustment of the budget to the actual level of activity before comparing the budgeted activity with actual results. A firm with peak seasons may prefer flexible budgeting because of its difficulties in predicting the activity level.
- Answer (B) is **incorrect**. A static budget is prepared for only one level of sales or production and is appropriate for a firm with little periodic variation in activity.
- Answer (C) is **incorrect**. Zero-based budgeting is a process by which each manager must justify his/her entire budget every period.
- Answer (D) is **incorrect**. Project or program budgeting is used for special projects or programs, not ongoing activities.

**[9] Gleim #: 6.4.47 -- Source: CMA 0408 2-004**

Rainbow, Inc., recently appointed Margaret Joyce as vice president of finance and asked her to design a new budgeting system. Joyce has changed to a monthly budgeting system by dividing the company's annual budget by 12. Joyce then prepared monthly budgets for each department and asked the managers to submit monthly reports comparing actual to budget. A sample monthly report for Department A is shown below.

Rainbow, Inc. Monthly Report for Department A			
	<u>Actual</u>	<u>Budget</u>	<u>Variance</u>
Units	1,000	900	100 F
Variable production costs:			
Direct material	\$ 2,800	\$ 2,700	\$ 100 U
Direct labor	4,800	4,500	300 U
Variable factory overhead	4,250	4,050	200 U
Fixed costs:			
Depreciation	3,000	2,700	300 U
Taxes	1,000	900	100 U
Insurance	1,500	1,350	150 U
Administration	1,100	990	110 U
Marketing	1,000	900	100 U
Total costs	<u>\$19,450</u>	<u>\$18,090</u>	<u>\$1,360 U</u>

This monthly budget has been imposed from the top and will create behavior problems. All of the following are causes of such problems **except**

- A. The use of a flexible budget rather than a fixed budget.
  - B. Top management authoritarian attitude toward the budget process.
  - C. The inclusion of noncontrollable costs, such as depreciation.
  - D. The lack of consideration for factors, such as seasonality.
- Answer (A) is **correct**. A flexible budget, which to an extent adapts automatically to changing circumstances, is much more likely to meet with acceptance than an unchanging budget prepared before the period begins.
  - Answer (B) is **incorrect**. A budget imposed from above is likely to lead to undesirable behavior on the part of staff and middle management.
  - Answer (C) is **incorrect**. All costs are controllable at some level of management and thus must be factored into any organization's budget.

- Answer (D) is **incorrect**. Any budget that does not reflect the reality of seasonal activity will meet with resistance by those responsible for generating revenues.

**[10] Gleim #: 6.4.48 -- Source: CMA 0408 2-026**

Country Ovens is a family restaurant chain. Due to an unexpected road construction project, traffic passing by the Country Ovens restaurant in Newtown has significantly increased. As a result, restaurant volume has similarly increased well beyond the level expected. Which type of budget would be most appropriate in helping the restaurant manager plan for restaurant labor costs?

- A. Zero-based budget.
- B. Rolling budget.
- C. Activity-based budget.
- D. Flexible budget.

- Answer (A) is **incorrect**. The purpose of a zero-based budget is to force managers to justify all their anticipated expenses for a period.
- Answer (B) is **incorrect**. The purpose of a rolling budget is to keep a manager's attention focused on the long-term.
- Answer (C) is **incorrect**. The purpose of activity-based budgeting is to appropriately assign indirect costs that would otherwise have to be arbitrarily allocated.
- Answer (D) is **correct**. A flexible budget is adaptable to unanticipated levels of production. Flexible budgeting enables an organization to compute the levels of cost that "should" have been incurred given the level of output actually achieved.

**[11] Gleim #: 6.4.49 -- Source: CMA 0408 2-028**

A budgeting approach that requires a manager to justify the entire budget for each budget period is known as

- A. Performance budgeting.
- B. Program budgeting.
- C. Zero-based budgeting.
- D. Incremental budgeting.

- Answer (A) is **incorrect**. Performance budgeting refers to the way a budget is used, and not how it is developed.

- Answer (B) is **incorrect**. A program budget is a budget that lists budget items by program rather than by type of expense; it could be either zero-based or incremental.
- Answer (C) is **correct**. Zero-based budgeting (ZBB) is a budget and planning process in which each manager must justify his/her department's entire budget every budget cycle. ZBB differs from the traditional concept of incremental budgeting, in which the current year's budget is simply adjusted to allow for changes planned for the coming year.
- Answer (D) is **incorrect**. Incremental budgeting is the traditional budgeting method in which the current year's budget is simply adjusted to allow for changes planned for the coming year.

---

[Fact Pattern #1]

Daffy Tunes manufactures a toy rabbit with moving parts and a built-in voice box. Projected sales in units for the next 5 months are as follows:

<u>Month</u>	<u>Projected Sales in Units</u>
January	30,000
February	36,000
March	33,000
April	40,000
May	29,000

Each rabbit requires basic materials that Daffy purchases from a single supplier at \$3.50 per rabbit. Voice boxes are purchased from another supplier at \$1.00 each. Assembly labor cost is \$2.00 per rabbit, and variable overhead cost is \$.50 per rabbit. Fixed manufacturing overhead applicable to rabbit production is \$12,000 per month. Daffy's policy is to manufacture 1.5 times the coming month's projected sales every other month, starting with January (i.e., odd-numbered months) for February sales, and to manufacture 0.5 times the coming month's projected sales in alternate months (i.e., even-numbered months). This allows Daffy to allocate limited manufacturing resources to other products as needed during the even-numbered months.

---

[1] Gleim #: 6.6.71 -- Source: CMA 1296 3-4

(Refers to Fact Pattern #1)

Daffy Tunes' unit production budget for toy rabbits for January is

- A. 45,000 units.
- B. 16,500 units.
- C. 54,000 units.
- D. 14,500 units.

- Answer (A) is **incorrect**. The figure of 45,000 is based on January sales.
- Answer (B) is **incorrect**. Budgeted production for February is 16,500 units.
- Answer (C) is **correct**. The production budget for January is 54,000 units (36,000 projected February sales  $\times$  1.5).
- Answer (D) is **incorrect**. Budgeted production for April is 14,500 units.

[2] Gleim #: 6.6.72 -- Source: CMA 1296 3-5

(Refers to Fact Pattern #1)

Daffy Tunes' dollar production budget for toy rabbits for February is

- A. \$327,000
- B. \$390,000
- C. \$113,500
- D. \$127,500

- Answer (A) is **incorrect**. The amount of \$327,000 is based on January sales.
- Answer (B) is **incorrect**. The production budget for January is \$390,000.
- Answer (C) is **incorrect**. The production budget for April is \$113,500.
- Answer (D) is **correct**. The units to be produced in February equal 50% of March sales, or 16,500 units ( $33,000 \times .5$ ). The unit variable cost is \$7.00 ( $\$3.50 + \$1.00 + \$2.00 + \$5.00$ ), so total variable costs are \$115,500 ( $16,500 \times \$7$ ). Thus, the dollar production budget for February is \$127,500 (\$115,500 variable + \$12,000 fixed).

[6] Gleim #: 6.6.76 -- Source: CMA 694 3-7

Zohar Company's budget contains the following information:

Zohar Company	
	<u>Units</u>
Beginning finished goods inventory	85
Beginning work-in-process in equivalent units	10
Desired ending finished goods inventory	100
Desired ending work-in-process in equivalent units	40
Projected sales	1,800

How many equivalent units should Zohar plan to produce?

- A. 1,800
- B. 1,565
- C. 1,815
- D. 1,845

- Answer (A) is **incorrect**. The figure of 1,800 equals projected unit sales.

- Answer (B) is **incorrect**. Units needed for sales minus all inventory amounts equals 1,565.
- Answer (C) is **incorrect**. Finished units needed equals 1,815.
- Answer (D) is **correct**. The finished units needed are calculated as follows:

Needed for sales	1,800
Needed for ending inventory	<u>100</u>
Total finished units needed	1,900
Less: Beginning inventory	<u>(85)</u>
Finished units needed	<u><u>1,815</u></u>

The units to be produced are calculated as follows:

Finished units needed	1,815
Needed for ending inventory	<u>40</u>
Total units in process	1,855
Less: Beginning WIP inventory	<u>(10)</u>
Units to be produced	<u><u>1,845</u></u>

---

**[Fact Pattern #2]**

Jordan Auto has developed the following production plan:

<u>Month</u>	<u>Units</u>
January	10,000
February	8,000
March	9,000
April	12,000

Each unit contains 3 pounds of direct materials. The desired direct materials ending inventory each month is 120% of the next month's production, plus 500 pounds. (The beginning inventory meets this requirement.) Jordan has developed the following direct labor standards for production of these units:

	<u>Department 1</u>	<u>Department 2</u>
Hours per unit	2.0	0.5
Hourly rate	\$7.25	\$12.00

---

**[7] Gleim #: 6.6.77 -- Source: CMA 697 3-14**

(Refers to Fact Pattern #2)

How much direct materials should Jordan Auto purchase in March?

- A. 27,000 pounds.
- B. 32,900 pounds.
- C. 36,000 pounds.
- D. 37,800 pounds.

- Answer (A) is **incorrect**. The usage for March is 27,000 pounds.
- Answer (B) is **incorrect**. The beginning inventory is 32,900 pounds.
- Answer (C) is **incorrect**. The usage for April is 36,000 pounds.
- Answer (D) is **correct**. Jordan needs 27,000 pounds ( $3 \times 9,000$  units) of materials for March production. It also needs 43,700 pounds  $\{[(3 \times 12,000 \text{ units to be produced in April}) \times 120\%] + 500\}$  for ending inventory. Given a beginning inventory of 32,900 pounds  $\{[(3 \times 9,000 \text{ units to be produced in March}) \times 120\%] + 500\}$ , required purchases equal 37,800 pounds (27,000 pounds + 43,700 pounds – 32,900 pounds).

**[8] Gleim #: 6.6.78 -- Source: CMA 1287 4-29**

The Jung Corporation's budget calls for the following production:

- Qtr 1 -- 45,000 units
- Qtr 2 -- 38,000 units
- Qtr 3 -- 34,000 units
- Qtr 4 -- 48,000 units

Each unit of product requires three pounds of direct material. The company's policy is to begin each quarter with an inventory of direct materials equal to 30% of that quarter's direct material requirements. Budgeted direct materials purchases for the third quarter would be

- A. 114,600 pounds.
- B. 43,200 pounds.
- C. 38,200 pounds.
- D. 30,600 pounds.

- Answer (A) is **correct**. Beginning inventory should be 30,600 pounds (34,000 units of budgeted sales  $\times$  3 pounds  $\times$  30%). Ending inventory should be 43,200 pounds (48,000 units of budgeted sales for Quarter 4  $\times$  3 pounds  $\times$  30%). Since BI plus purchases minus EI equals Quarter 3 budgeted sales, purchases must be 114,600.

$$\begin{aligned} 30,600 + X - 43,200 &= 3 \times 34,000 \\ X - 12,600 &= 102,000 \\ X &= 114,600 \end{aligned}$$

- Answer (B) is **incorrect**. The ending inventory required for the third quarter is 43,200 pounds.
- Answer (C) is **incorrect**. The figure of 38,200 is calculated without taking into account that each unit of product requires 3 pounds of direct materials.
- Answer (D) is **incorrect**. The beginning inventory required for the third quarter is 30,600 pounds.

**[9] Gleim #: 6.6.79 -- Source: CMA 1294 3-19**

Superior Industries' sales budget shows quarterly sales for the next year as follows:

<u>Quarter</u>	<u>Units</u>
1	10,000
2	8,000
3	12,000
4	14,000

Company policy is to have a finished goods inventory at the end of each quarter equal to 20% of the next quarter's sales. Budgeted production for the second quarter of the next year would be

- A. 7,200 units.
  - B. 8,000 units.
  - C. 8,800 units.
  - D. 8,400 units.
- Answer (A) is **incorrect**. Subtracting the beginning inventory twice results in 7,200 units.
  - Answer (B) is **incorrect**. Assuming no change in inventory results in 8,000 units.

- Answer (C) is **correct**. The finished units needed for sales (8,000), plus the units desired for ending inventory (12,000 units to be sold in the third quarter  $\times$  20% = 2,400), minus the units in beginning inventory (8,000 units to be sold in the second quarter  $\times$  20% = 1,600), equals budgeted production for the second quarter of 8,800 units.
- Answer (D) is **incorrect**. Including the beginning inventory for the first quarter, not the second quarter, in the calculation results in 8,400 units.

---

**[Fact Pattern #3]**

Superflite expects April sales of its deluxe model airplane, the C-14, to be 402,000 units at \$11 each. Each C-14 requires three purchased components shown below.

	<u>Purchase Cost</u>	<u>Number Needed for Each C-14 Unit</u>
A-9	\$ .50	1
B-6	.25	2
D-28	1.00	3

Factory direct labor and variable overhead per unit of C-14 totals \$3.00. Fixed factory overhead is \$1.00 per unit at a production level of 500,000 units. Superflite plans the following beginning and ending inventories for the month of April and uses standard absorption costing for valuing inventory.

<u>Part No.</u>	<u>Units at April 1</u>	<u>Units at April 30</u>
C-14	12,000	10,000
A-9	21,000	9,000
B-6	32,000	10,000
D-28	14,000	6,000

---

**[10] Gleim #: 6.6.80 -- Source: CMA 1293 3-10**

(Refers to Fact Pattern #3)

Superflite's C-14 production budget for April should be based on the manufacture of

- A. 390,000 units.
- B. 400,000 units.
- C. 402,000 units.
- D. 424,000 units.

- Answer (A) is **incorrect**. Not considering the need to produce for ending inventory results in 390,000 units.
- Answer (B) is **correct**. Sales are expected to be 402,000 units in April. The beginning inventory is 12,000 units, and the ending inventory is expected to be 10,000 units, a decline in inventory of 2,000 units. Thus, the budget should be based on production of 400,000 units (402,000 units to be sold – 12,000 units BI + 10,000 units EI).
- Answer (C) is **incorrect**. Sales for the month equals 402,000 units; a portion of these sales will come from the beginning inventory.
- Answer (D) is **incorrect**. The sum of sales and beginning and ending inventories is 424,000 units.

**[11] Gleim #: 6.6.81 -- Source: CMA 1293 3-11**

(Refers to Fact Pattern #3)

Assume Superflite plans to manufacture 400,000 units in April. Superflite's April budget for the purchase of A-9 should be

- A. 379,000 units.
- B. 388,000 units.
- C. 402,000 units.
- D. 412,000 units.

- Answer (A) is **incorrect**. The number of 379,000 units fails to consider the 9,000 units in the ending inventory.
- Answer (B) is **correct**. Each of the 400,000 units to be produced in April will require one unit of A-9, a total requirement of 400,000 units. In addition, ending inventory is expected to be 9,000 units. Hence, 409,000 units must be supplied during the month. Of these, 21,000 are available in the beginning inventory. Subtracting the 21,000 beginning inventory from 409,000 leaves 388,000 to be purchased.
- Answer (C) is **incorrect**. Sales for the month equals 402,000 units.
- Answer (D) is **incorrect**. Adding the decline in inventory of 12,000 to production needs instead of subtracting it results in 412,000.

---

**[Fact Pattern #4]**

Simpson, Inc., is in the process of preparing its annual budget. The following beginning and ending inventory levels (in units) are planned for the year ending December 31.

	<u>Beginning Inventory</u>	<u>Ending Inventory</u>
Raw material*	40,000	50,000
Work-in-process	10,000	10,000
Finished goods	80,000	50,000

\*Two units of raw material are needed to produce each unit of finished product.

---

**[12] Gleim #: 6.6.82 -- Source: CMA 1294 3-17**

(Refers to Fact Pattern #4)

If Simpson plans to sell 480,000 units during the year, the number of units it would have to manufacture during the year would be

- A. 440,000 units.
- B. 480,000 units.
- C. 510,000 units.
- D. 450,000 units.

- Answer (A) is **incorrect**. Treating beginning work-in-process as beginning finished goods results in 440,000 units.
- Answer (B) is **incorrect**. The figure of 480,000 units assumes no change in finished goods inventory.
- Answer (C) is **incorrect**. Reversing the beginning and ending inventories results in 510,000 units.
- Answer (D) is **correct**. The finished units needed for sales (480,000), plus the units desired for ending inventory (50,000), minus beginning inventory (80,000), equals the necessary production of 450,000 units.

**[13] Gleim #: 6.6.83 -- Source: CMA 1294 3-18**

(Refers to Fact Pattern #4)

If 500,000 finished units were to be manufactured for the year by Simpson, the units of raw material that must be purchased would be

- A. 1,000,000 units.
- B. 1,020,000 units.
- C. 1,010,000 units.
- D. 990,000 units.

- Answer (A) is **incorrect**. Raw material needed for 1995 production only equals 1,000,000 units.
- Answer (B) is **incorrect**. The figure of 1,020,000 units is based on an erroneous doubling of the difference between beginning and ending inventory of raw material.
- Answer (C) is **correct**. The 500,000 finished units to be manufactured require 1,000,000 units of raw material ( $2 \times 500,000$ ). In addition, the inventory of raw material is planned to increase by 10,000 units. Consequently, 1,010,000 units of raw material should be purchased.
- Answer (D) is **incorrect**. Reversing the beginning and ending inventories results in 990,000 units.

---

**[Fact Pattern #5]**

Paradise Company budgets on an annual basis for its fiscal year. The following beginning and ending inventory levels (in units) are planned for the fiscal year of July 1 through June 30:

	<u>July 1</u>	<u>June 30</u>
Raw material*	40,000	50,000
Work-in-process	10,000	20,000
Finished goods	80,000	50,000

\* Two (2) units of raw material are needed to produce each unit of finished product.

---

**[14] Gleim #: 6.6.84 -- Source: CMA 692 3-29**

(Refers to Fact Pattern #5)

If Paradise Company plans to sell 480,000 units during the fiscal year, the number of units it will have to manufacture during the year is

- A. 440,000 units.
- B. 480,000 units.
- C. 510,000 units.
- D. 450,000 units.

- Answer (A) is **incorrect**. The calculation need not be adjusted for the change in work-in-process. Only finished goods are being discussed.
- Answer (B) is **incorrect**. The amount to be sold is 480,000 units.
- Answer (C) is **incorrect**. The number of 510,000 units equals sales, plus beginning inventory, minus ending inventory.
- Answer (D) is **correct**. If the company sells 480,000 units with an ending finished goods inventory of 50,000 units, 530,000 units must be available. Given 80,000 units are in beginning inventory, production will have to be 450,000 units (530,000 – 80,000).

**[15] Gleim #: 6.6.85 -- Source: CMA 692 3-30**

(Refers to Fact Pattern #5)

If 500,000 complete units were to be manufactured during the fiscal year by Paradise Company, the number of units of raw materials to be purchased is

- A. 1,000,000 units.
- B. 1,020,000 units.
- C. 1,010,000 units.
- D. 990,000 units.

- Answer (A) is **incorrect**. The total needed for production is 1,000,000 units.
- Answer (B) is **incorrect**. The number of units in raw materials is not doubled.
- Answer (C) is **correct**. The total raw materials needed for production will be 1,000,000 units (500,000 units  $\times$  2 units of raw materials). In addition, raw materials inventory is expected to increase by 10,000 units. Thus, raw materials purchases will be 1,010,000.
- Answer (D) is **incorrect**. The number of 990,000 units is less than the amount used in production.

**[Fact Pattern #6]**

Wellfleet Company manufactures recreational equipment and prepares annual operational budgets for each department. The Purchasing Department is finalizing plans for the fiscal year ending June 30, Year 2, and has gathered the information regarding two of the components used in both tricycles and bicycles. Wellfleet uses the first-in, first-out inventory method.

	<u>A19</u>	<u>B12</u>	<u>Tricycles</u>	<u>Bicycles</u>
Beginning inventory, July 1, Year 1	3,500	1,200	800	2,150
Ending inventory, June 30, Year 2	2,000	1,800	1,000	900
Unit cost	\$1.20	\$4.50	\$54.50	\$89.60
Projected fiscal year unit sales	--	--	96,000	130,000
Component usage:				
Tricycles	2/unit	1/unit	--	--
Bicycles	2/unit	4/unit	--	--

**[18] Gleim #: 6.6.88 -- Source: CMA 693 3-7**

(Refers to Fact Pattern #6)

The budgeted dollar value of Wellfleet Company's purchases of component A19 for the fiscal year ending June 30, Year 2 is

- A. \$309,000
- B. \$538,080
- C. \$540,600
- D. \$2,017,800

- Answer (A) is **incorrect**. The cost of the units of A19 needed for bicycle production is \$309,000.
- Answer (B) is **correct**. The inventory of tricycles is expected to increase from 800 units to 1,000 units, an increase of 200 units. Adding this 200-unit inventory increase to the projected sales of 96,000 results in total production of tricycles of 96,200 units. The inventory of bicycles is expected to decline from 2,150 to 900, a decrease of 1,250 units. Subtracting this inventory decline from the 130,000 units of projected sales results in expected production of 128,750 units. Given that each tricycle and bicycle requires two units of A19, the necessary units of the component can be calculated by adding the 96,200 tricycles to the 128,750 bicycles, a total production of 224,950. Multiplying this total production level times the two components required results in a total of 449,900 components. Combining the 449,900 units of A19 needed for production with the desired inventory decrease of 1,500 units (3,500 – 2,000) indicates that 448,400 components must be purchased. At \$1.20 per unit, the total cost of 448,400 units is \$538,080.

- Answer (C) is **incorrect**. The amount of \$540,600 ignores the change in the inventory levels of finished units of tricycles and bicycles.
- Answer (D) is **incorrect**. The amount of \$2,017,800 is based on the price of B12 (\$4.50).

**[19] Gleim #: 6.6.89 -- Source: CMA 693 3-8**

(Refers to Fact Pattern #6)

If the economic order quantity of Component B12 is 70,000 units, the number of times that Wellfleet Company should purchase this component during the fiscal year ended June 30, Year 2, is

- A. Four times.
- B. Five times.
- C. Eight times.
- D. Nine times.

- Answer (A) is **incorrect**. Ordering four times will meet the need for tricycle but not bicycle production.
- Answer (B) is **incorrect**. Ordering five times will meet the need for tricycle but not bicycle production.
- Answer (C) is **incorrect**. Eight orders will suffice only for the bicycles.
- Answer (D) is **correct**. The number of tricycles to be produced is 96,200. Each requires one unit of B12. The number of bicycles to be produced is 128,750. Each requires four units of B12, a total of 515,000. Combining the 96,200 units needed for tricycles with the 515,000 units needed for bicycles results in a total demand of 611,200 units. An additional 600 units (1,800 – 1,200) will have to be ordered to permit the increase in the inventory of B12. Dividing the annual requirement of 611,800 units by the 70,000-unit EOQ results in 8.74 orders per year. Because partial orders are not possible, nine orders will have to be placed.

**[20] Gleim #: 6.6.90 -- Source: CMA 0205 2-6**

A large manufacturer's forecast of total sales revenues for a year is **least** likely to be influenced by

- A. The seasonal pattern of sales revenues throughout the year.
- B. Anticipated interest rates and unemployment rates.
- C. Expected shortages of key raw materials.
- D. Input from sales personnel.

- Answer (A) is **correct**. A large manufacturing firm will be well familiar with the seasonal patterns to which demand for its products is subject. The forecast is being prepared for an entire year, so the cyclical effects of varying demand will be taken into account.
- Answer (B) is **incorrect**. Interest rates and unemployment levels will have a direct impact on a manufacturer's operating and financing budgets.
- Answer (C) is **incorrect**. If shortages of key raw materials are expected, this will have a major impact on a manufacturer's budgeting process.
- Answer (D) is **incorrect**. Input from all levels of the organization is important to a successful budget.

---

**[Fact Pattern #7]**

Berol Company plans to sell 200,000 units of finished product in July and anticipates a growth rate in sales of 5% per month. The desired monthly ending inventory in units of finished product is 80% of the next month's estimated sales. There are 150,000 finished units in inventory on June 30. Each unit of finished product requires 4 pounds of direct materials at a cost of \$1.20 per pound. There are 800,000 pounds of direct materials in inventory on June 30.

---

**[21] Gleim #: 6.6.91 -- Source: CMA 692 3-25**

(Refers to Fact Pattern #7)

Berol Company's production requirement in units of finished product for the 3-month period ending September 30 is

- A. 712,025 units.
  - B. 630,500 units.
  - C. 638,000 units.
  - D. 665,720 units.
- Answer (A) is **incorrect**. The total estimated sales for the next 4 months, minus beginning inventory for July, equals 712,025 units.
  - Answer (B) is **incorrect**. The total sales for 3 months equals 630,500 units.
  - Answer (C) is **incorrect**. The number of 638,000 units assumes that each succeeding month's sales are 105% of July's.

- Answer (D) is **correct**. Sales are expected to increase at the rate of 5% per month. Given that July sales are estimated to be 200,000 units, August, September, and October sales are expected to be 210,000 units ( $200,000 \times 1.05$ ), 220,500 units ( $210,000 \times 1.05$ ), and 231,525 units ( $220,500 \times 1.05$ ), respectively. Moreover, September ending inventory must be 80% of October's estimated sales, or 185,220 units ( $231,525 \times 80\%$ ). Consequently, the production requirement for the 3-month period is 665,720 units ( $200,000 + 210,000 + 220,500 + 185,220$  September EI – 150,000 July BI).

**[22] Gleim #: 6.6.92 -- Source: CMA 692 3-26**

(Refers to Fact Pattern #7)

Assume Berol Company plans to produce 600,000 units of finished product in the 3-month period ending September 30, and to have direct materials inventory on hand at the end of the 3-month period equal to 25% of the use in that period. The estimated cost of direct materials purchases for the 3-month period ending September 30 is

- A. \$2,200,000
- B. \$2,400,000
- C. \$2,640,000
- D. \$2,880,000

- Answer (A) is **incorrect**. The number of pounds needed to be purchased is 2,200,000.
- Answer (B) is **incorrect**. The number of pounds that will be used is 2,400,000.
- Answer (C) is **correct**. Production of 600,000 units will require 2,400,000 pounds of direct materials ( $600,000 \text{ units} \times 4 \text{ lbs.}$ ). In addition, ending inventory will be 25% of the period's usage, or 600,000 pounds ( $2,400,000 \times 25\%$ ). Thus, 3,000,000 total pounds will be needed. However, given 800,000 pounds in inventory, purchases will be only 2,200,000 pounds. At \$1.20 per pound, the cost will be \$2,640,000.
- Answer (D) is **incorrect**. The \$2,880,000 is obtained by multiplying the total usage times the cost per pound, without considering the change in inventory.

**[24] Gleim #: 6.6.94 -- Source: CMA 0408 2-039**

Hannon Retailing Company prices its products by adding 30% to its cost. Hannon anticipates sales of \$715,000 in July, \$728,000 in August, and \$624,000 in September. Hannon's policy is to have on hand enough inventory at the end of the month to cover 25% of the next month's sales. What will be the cost of the inventory that Hannon should budget for purchase in August?

- A. \$509,600
- B. \$540,000
- C. \$560,000
- D. \$680,000

- Answer (A) is **incorrect**. The amount of \$509,600 results from treating gross profit as 30% of sales rather than as 30% of cost.
- Answer (B) is **correct**. The first step is to determine the cost of goods sold for each month. Since sales are 130% of cost, cost of goods sold can be calculated as follows:

July:	$\$715,000 \div 130\% =$	\$550,000
August:	$728,000 \div 130\% =$	560,000
September:	$624,000 \div 130\% =$	480,000

Purchases for August can now be calculated as follows:

Projected sales at cost	\$560,000
Add: required ending inventory ( $\$480,000 \times 25\%$ )	<u>120,000</u>
Total goods needed	\$680,000
Less: beginning inventory	<u>(140,000)</u>
Purchases	<u><u>\$540,000</u></u>

- Answer (C) is **incorrect**. The amount of \$560,000 results from failing to consider the changes in inventories.
- Answer (D) is **incorrect**. The amount of \$680,000 results from failing to subtract beginning inventory.

---

**[Fact Pattern #8]**

Streeter Company produces plastic microwave turntables. Sales for the next year are expected to be 65,000 units in the first quarter, 72,000 units in the second quarter, 84,000 units in the third quarter, and 66,000 units in the fourth quarter. Streeter usually maintains a finished goods inventory at the end of each quarter equal to one half of the units expected to be sold in the next quarter.

---

**[25] Gleim #: 6.6.95 -- Source: CMA 0408 2-040**

(Refers to Fact Pattern #8)

How many units should Streeter produce in the second quarter?

- A. 72,000
- B. 75,000
- C. 78,000
- D. 84,000

- Answer (A) is **incorrect**. The figure 72,000 is the level of sales, not production, for the second quarter.
- Answer (B) is **incorrect**. The figure 75,000 is merely the average expected production for the following two quarters.
- Answer (C) is **correct**. Streeter's required production for the second quarter can be calculated as follows:

Sales for quarter	72,000
Add: buffer for next quarter ( $84,000 \times 50\%$ )	42,000
Less: buffer from previous quarter ( $72,000 \times 50\%$ )	<u>(36,000)</u>
Required production	<u><u>78,000</u></u>

- Answer (D) is **incorrect**. The figure 84,000 is the total sales for the third quarter.

[26] Gleim #: 6.6.96 -- Source: CMA 0408 2-044

(Refers to Fact Pattern #8)

Due to a work stoppage, the finished goods inventory at the end of the first quarter is 8,000 units less than it should be. How many units should Streeter produce in the second quarter?

- A. 75,000
- B. 78,000
- C. 80,000
- D. 86,000

- Answer (A) is **incorrect**. The figure 75,000 results from assuming that the discrepancy in beginning inventory occurs in both quarters.
- Answer (B) is **incorrect**. The figure 78,000 fails to account for the shortfall in the buffer from the previous month.
- Answer (C) is **incorrect**. The figure 80,000 is based on the 72,000 level of sales for the quarter instead of the desired production level of 78,000.
- Answer (D) is **correct**. Streeter's required production for the second quarter can be calculated as follows:

Sales for quarter	72,000
Add: buffer for next quarter ( $84,000 \times 50\%$ )	42,000
Less: buffer from previous quarter ( $72,000 \times 50\%$ )	<u>(36,000)</u>
Projected production	78,000
Add: shortfall from previous month buffer	<u>8,000</u>
Revised required production	<u><u>86,000</u></u>

**[27] Gleim #: 6.6.97 -- Source: CMA 0408 2-041**

Tyler Company produces one product and budgeted 220,000 units for the month of August with the following budgeted manufacturing costs:

	<u>Total Costs</u>	<u>Cost Per Unit</u>
Variable costs	\$1,408,000	\$ 6.40
Batch set-up cost	880,000	4.00
Fixed costs	<u>1,210,000</u>	<u>5.50</u>
Total	<u><u>\$3,498,000</u></u>	<u><u>\$15.90</u></u>

The variable cost per unit and the total fixed costs are unchanged within a production range of 200,000 to 300,000 units per month. The total for the batch set-up cost in any month depends on the number of production batches that Tyler runs. A normal batch consists of 50,000 units unless production requires less volume. In the prior year, Tyler experienced a mixture of monthly batch sizes of 42,000 units, 45,000 units, and 50,000 units. Tyler consistently plans production each month in order to minimize the number of batches. For the month of September, Tyler plans to manufacture 260,000 units. What will be Tyler's total budgeted production costs for September?

- A. \$3,754,000
- B. \$3,930,000
- C. \$3,974,000
- D. \$4,134,000

- Answer (A) is **incorrect**. The amount of \$3,754,000 results from failing to account for the setup cost of an additional batch.
- Answer (B) is **correct**. Since variable costs are constant across the relevant range, the total variable cost for September will be \$1,664,000 (260,000 units  $\times$  \$6.40). Since the normal production run is 50,000 units, and no indication is given that Tyler's machinery can handle a larger run, we can conclude that five batches were needed in August (220,000 units total production  $\div$  50,000 units per batch = 4.4 batches). The setup cost for a batch must therefore be \$176,000 (\$880,000  $\div$  5 setups). Six setups will be required for September (260,000 units total production  $\div$  50,000 units per batch = 5.2 batches), for a total of \$1,056,000 in setup costs (\$176,000  $\times$  6 setups). Fixed costs of \$1,210,000 are unchanging within the relevant range. Total budgeted production costs for September are therefore:

Variable costs	\$1,664,000
Batch set-up cost	1,056,000
Fixed costs	<u>1,210,000</u>
Total	<u><u>\$3,930,000</u></u>

- Answer (C) is **incorrect**. The amount of \$3,974,000 results from using only four batches in August and five batches in September.
- Answer (D) is **incorrect**. The amount of \$4,134,000 is based on the \$15.90 average total cost for the preceding month, which is irrelevant because both set-up costs and fixed costs per unit will change in September.

**[28] Gleim #: 6.6.98 -- Source: CMA 0408 2-042**

Ming Company has budgeted sales at 6,300 units for the next fiscal year and desires to have 590 good units on hand at the end of that year. Beginning inventory is 470 units. Ming has found from past experience that 10% of all units produced do not pass final inspection and therefore must be destroyed. How many units should Ming plan to produce in the next fiscal year?

- A. 6,890
- B. 7,062
- C. 7,133
- D. 7,186

- Answer (A) is **incorrect**. The figure 6,890 is simply the sum of projected sales and ending inventory without taking account of the 10% spoilage.
- Answer (B) is **incorrect**. The figure 7,062 results from merely adding the projected sales and end-of-year buffer and subtracting ending inventory and multiplying the result by 110%; the 110% does not apply to the 470 units in beginning inventory because that number is after the spoiled units were deducted in the previous period.
- Answer (C) is **correct**. Ming's required production for the year can be calculated as follows:

Projected sales	6,300
Add: projected ending inventory	590
Less: beginning inventory	<u>(470)</u>
Production	<u><u>6,420</u></u>

Since 10% of all units produced do not pass inspection, Ming must produce 7,133 units ( $6,420 \div 90\%$ ).

- Answer (D) is **incorrect**. The figure 7,186 results from dividing projected sales and projected ending inventory by 90% before calculating desired production.

**[29] Gleim #: 6.6.99 -- Source: CMA 0408 2-043**

Savior Corporation assembles backup tape drive systems for home microcomputers. For the first quarter, the budget for sales is 67,500 units. Savior will finish the fourth quarter of last year with an inventory of 3,500 units, of which 200 are obsolete. The target ending inventory is 10 days of sales (based upon 360 days). What is the budgeted production for the first quarter?

- A. 75,000
- B. 71,700
- C. 71,500
- D. 64,350

- Answer (A) is **incorrect**. The figure 75,000 results from ignoring the units available in beginning inventory.
- Answer (B) is **correct**. The 67,500 of sales for the quarter average 750 per day for 90 days. Thus, production for the quarter can be calculated as follows:

Budgeted sales	67,500
Add: required ending inventory ( $750 \times 10$ days)	<u>7,500</u>
Total units needed	75,000
Less: beginning inventory (3,500 – 200)	<u>(3,300)</u>
Budgeted production	<u><u>71,700</u></u>

- Answer (C) is **incorrect**. The figure 71,500 results from failing to subtract the obsolete units in beginning inventory.
- Answer (D) is **incorrect**. The figure 64,350 results from miscalculating the average sales per day.

[30] Gleim #: 6.6.100 -- Source: CMA 0408 2-045

Data regarding Rombo Company's budget are shown below.

Planned sales	4,000 units
Material cost	\$2.50 per pound
Direct labor	3 hours per unit
Direct labor rate	\$7 per hour
Finished goods beginning inventory	900 units
Finished goods ending inventory	600 units
Direct materials beginning inventory	4,300 units
Direct materials ending inventory	4,500 units
Materials used per unit	6 pounds

Rombo Company's production budget will show total units to be produced of

- A. 3,700
- B. 4,000
- C. 4,300
- D. 4,600

- Answer (A) is **correct**. Rombo's required production for the year can be calculated as follows:

Sales for year	4,000
Add: ending finished goods inventory	600
Less: beginning finished goods inventory	<u>(900)</u>
Required production	<u><u>3,700</u></u>

- Answer (B) is **incorrect**. This number represents the level of unit sales, not production, for the year.
- Answer (C) is **incorrect**. This number of units results from improperly adding beginning finished goods and subtracting ending finished goods.
- Answer (D) is **incorrect**. This number of units results from failing to subtract the beginning finished goods inventory.

**[31] Gleim #: 6.6.101 -- Source: CMA 0408 2-046**

Krouse Company is in the process of developing its operating budget for the coming year. Given below are selected data regarding the company's two products, laminated putter heads and forged putter heads, that are sold through specialty golf shops.

	Putter Heads	
	Forged	Laminated
Raw materials:		
Steel	2 lbs. @ \$5/lb.	1 lb. @ \$5/lb.
Copper	None	1 lb. @ \$15/lb.
Direct labor	1/4 hr. @ \$20/hr.	1 hr. @ \$22/hr.
Expected sales (units)	8,200	2,000
Selling price per unit	\$30	\$80
Ending inventory target (units)	100	60
Beginning inventory (units)	300	60
Beginning inventory (cost)	\$5,250	\$3,120

Manufacturing overhead is applied to units produced on the basis of direct labor hours. Variable manufacturing overhead is projected to be \$25,000, and fixed manufacturing overhead is expected to be \$15,000.

The estimated cost to produce one unit of the laminated putter head is

- A. \$42
- B. \$46
- C. \$52
- D. \$62

- Answer (A) is **incorrect**. The amount of \$42 results from failing to include overhead costs.
- Answer (B) is **incorrect**. The amount of \$46 results from including only fixed overhead costs.

- Answer (C) is **correct**. The costs of direct materials and direct labor are given. Determining per-unit overhead costs involves computing the total number of direct labor hours projected for the month (for both products).

	<u>Forged</u>	<u>Laminated</u>
Budgeted sales	8,200	2,000
Less: beginning inventory	(300)	(60)
Add: ending inventory target	<u>100</u>	<u>60</u>
Budgeted production	8,000	2,000
Times: DL hours	<u>× 0.25</u>	<u>× 1.00</u>
Budgeted DL hours	<u><u>2,000</u></u>	<u><u>2,000</u></u>

Total direct labor hours for the month are therefore 4,000 (2,000 + 2,000). Per-unit overhead costs can now be calculated:

Variable overhead costs	\$25,000
Fixed overhead costs	<u>15,000</u>
Total projected overhead	\$40,000
Divided by: DL hours	<u>÷ 4,000</u>
Per-unit overhead cost	<u><u>\$ 10.00</u></u>

Total per-unit cost for a laminated putter head can now be calculated as follows:

Direct materials -- steel	\$ 5
Direct materials -- copper	15
Direct labor	22
Manufacturing overhead	<u>10</u>
Total per-unit cost	<u><u>\$52</u></u>

- Answer (D) is **incorrect**. The amount of \$62 results from improperly assigning all fixed costs to the laminated units.

---

**[Fact Pattern #9]**

Tidwell Corporation sells a single product for \$20 per unit. All sales are on account, with 60% collected in the month of sale and 40% collected in the following month. A partial schedule of cash collections for January through March of the coming year reveals the following receipts for the period:

	Cash Receipts		
	January	February	March
December receivables	\$32,000		
From January sales	54,000	\$36,000	
From February sales		66,000	\$44,000

Other information includes the following:

- Inventories are maintained at 30% of the following month's sales.
- Tidwell desires to keep a minimum cash balance of \$15,000. Total payments in January are expected to be \$106,500, which excludes \$12,000 of depreciation expense. Any required borrowings are in multiples of \$1,000.
- The December 31 balance sheet for the preceding year revealed a cash balance of \$24,900.

---

**[32] Gleim #: 6.6.102 -- Source: CMA 0408 2-047**

(Refers to Fact Pattern #9)

March sales total \$150,000. The number of units Tidwell must purchase in February is

- A. 3,850
- B. 4,900
- C. 6,100
- D. 7,750

- Answer (A) is **incorrect**. The figure of 3,850 units results from failing to include 30% of March sales.
- Answer (B) is **incorrect**. The figure of 4,900 results from reversing the effects of beginning and ending inventory.

- Answer (C) is **correct**. Projected sales for February total \$110,000 (\$66,000 + \$44,000). Unit sales are thus expected to be 5,500 (\$110,000 ÷ \$20). March unit sales are projected at 7,500 (\$150,000 ÷ \$20). February purchases can thus be calculated as follows:

Needed for February sales	5,500
Add: 30% of March sales	<u>2,250</u>
Total units needed	7,750
Less: beginning inventory	<u>(1,650)</u>
February purchases	<u><u>6,100</u></u>

- Answer (D) is **incorrect**. The figure of 7,750 results from failing to subtract beginning inventory.

**[33] Gleim #: 6.6.103 -- Source: CMA 0408 2-076**

(Refers to Fact Pattern #9)

Ignoring income taxes, the financing Tidwell will need in January to maintain the firm's minimum cash balance is

- A. \$8,000
- B. \$10,600
- C. \$11,000
- D. \$23,000

- Answer (A) is **incorrect**. The ending cash balance is \$4,400.
- Answer (B) is **incorrect**. The figure \$10,600 is the actual amount of cash needed; loan must be in multiples of \$1,000.
- Answer (C) is **correct**. Tidwell's ending cash balance for January is calculated as follows:

Beginning balance of cash	\$ 24,900
Add: cash receipts	<u>86,000</u>
Cash available	\$110,900
Less: payments	<u>(106,500)</u>
Ending cash before borrowing	<u><u>\$ 4,400</u></u>

To reach the minimum acceptable cash balance of \$15,000, the company will need to borrow at least \$10,600. Since loans are in multiples of \$1,000, the borrowing must be rounded up to \$11,000.

- Answer (D) is **incorrect**. The amount of \$23,000 results from treating the non-cash depreciation expense as a cash payment.

**[35] Gleim #: 6.6.105 -- Source: CMA 0408 2-051**

Swan Company is a maker of men's slacks. The company would like to maintain 20,000 yards of fabric in ending inventory. The beginning fabric inventory is expected to contain 25,000 yards. The expected yards of fabric needed for sales is 90,000. Compute the yards of fabric that Swan needs to purchase.

- A. 85,000
- B. 90,000
- C. 95,000
- D. 135,000

- Answer (A) is **correct**. Swan's fabric purchase requirements can be calculated as follows:

Needed for sales	90,000
Add: ending inventory	20,000
Less: beginning inventory	<u>(25,000)</u>
Total purchases	<u>85,000</u>

- Answer (B) is **incorrect**. The figure of 90,000 yards is only the amount needed for current sales.
- Answer (C) is **incorrect**. The figure of 95,000 yards results from improperly subtracting ending inventory and adding beginning inventory.
- Answer (D) is **incorrect**. The figure of 135,000 yards results from improperly adding beginning inventory.

**[36] Gleim #: 6.6.106 -- Source: CMA 0408 2-052**

Manoli Gift Shop maintains a 35% gross profit percentage on sales and carries an ending inventory balance each month sufficient to support 30% of the next month's expected sales. Anticipated sales for the fourth quarter are as follows:

October	\$42,000
November	58,000
December	74,000

What amount of goods should Manoli Gift Shop plan to purchase during the month of November?

- A. \$40,820
- B. \$51,220
- C. \$52,130
- D. \$62,800

- Answer (A) is **correct**. Manoli's sales and ending inventory requirements at cost can be calculated as follows:

	Projected Sales		Cost %		Sales At Cost
October:	\$42,000	×	65%	=	\$27,300
November:	58,000	×	65%	=	37,700
December:	74,000	×	65%	=	48,100

November's purchase requirements can now be determined:

Needed for sales	\$37,700
Add: required ending inventory (\$48,100 × 30%)	14,430
Less: projected beginning inventory (\$37,700 × 30%)	<u>(11,310)</u>
Total purchases	<u><u>\$40,820</u></u>

- Answer (B) is **incorrect**. The amount of \$51,220 is based on selling prices instead of cost.
- Answer (C) is **incorrect**. The amount of \$52,130 results from failing to deduct the inventory already on hand.
- Answer (D) is **incorrect**. The amount of \$62,800 is based on selling prices instead of cost.

**[37] Gleim #: 6.6.107 -- Source: CMA 0408 2-053**

In preparing the direct material purchases budget for next quarter, the plant controller has the following information available:

Budgeted unit sales	2,000
Pounds of materials per unit	4
Cost of materials per pound	\$3
Pounds of materials on hand	400
Finished units on hand	250
Target ending units inventory	325
Target ending inventory of pounds of materials	800

How many pounds of materials must be purchased?

- A. 2,475
- B. 7,900
- C. 8,700
- D. 9,300

- Answer (A) is **incorrect**. The figure of 2,475 results from using unit sales rather than pounds of raw material.
- Answer (B) is **incorrect**. The figure of 7,900 results from failing to account for the 800 pounds of target ending raw materials inventory.
- Answer (C) is **correct**. The calculation of pounds of raw material needed to be purchased is as follows:

Budgeted unit sales	2,000
Add: required finished goods ending inventory	325
Less: beginning finished goods inventory	<u>(250)</u>
Required production	2,075
Times: pounds per unit	<u>× 4</u>
Pounds required for production	8,300
Add: target ending raw materials inventory	800
Less: beginning raw materials inventory	<u>(400)</u>
Pounds to be purchased	<u><u>8,700</u></u>

- Answer (D) is **incorrect**. The figure of 9,300 results from reversing the finished goods beginning and ending inventories.

**[38] Gleim #: 6.6.108 -- Source: CMA 0408 2-054**

Playtime Toys estimates that it will sell 200,000 dolls during the coming year. The beginning inventory is 12,000 dolls; the target ending inventory is 15,000 dolls. Each doll requires two shoes, which are purchased from an outside supplier. The beginning inventory of shoes is 20,000; the target ending inventory is 18,000 shoes. The number of shoes that should be purchased during the year is

- A. 396,000
- B. 398,000
- C. 402,000
- D. 404,000

- Answer (A) is **incorrect**. The figure of 396,000 is based on sales instead of production.
- Answer (B) is **incorrect**. The figure of 398,000 fails to include the beginning and target ending inventories of shoes already on dolls.
- Answer (C) is **incorrect**. The figure of 402,000 is based on sales instead of production.
- Answer (D) is **correct**. The calculation of the number of shoes that must be purchased is as follows:

Shoes needed for dolls to be sold	400,000
Less: beginning inventory of shoes on dolls	(24,000)
Add: target ending inventory of shoes on dolls	30,000
Less: beginning inventory of shoes	(20,000)
Add: target ending inventory of shoes	<u>18,000</u>
Shoes to be purchased	<u><u>404,000</u></u>

**[39] Gleim #: 6.6.109 -- Source: CMA 0408 2-055**

Maker Distributors has a policy of maintaining inventory at 15% of the next month's forecast sales. The cost of Maker's merchandise averages 60% of the selling price. The inventory balance as of May 31 is \$63,000, and the forecast dollar sales for the last seven months of the year are as follows:

June	\$700,000
July	600,000
August	650,000
September	800,000
October	850,000
November	900,000
December	840,000

What is the budgeted dollar amount of Maker's purchases for July?

- A. \$355,500
- B. \$360,000
- C. \$364,500
- D. \$399,000

- Answer (A) is **incorrect**. The amount of \$355,500 results from adding beginning inventory and subtracting ending inventory.
- Answer (B) is **incorrect**. The amount of \$360,000 is July sales at cost without adjustment for beginning and ending inventories.

- Answer (C) is **correct**. Maker's budgeted purchases for July are calculated as follows:

Projected sales at retail		\$600,000
Times: cost percentage	× 60%	
Projected sales at cost:		\$360,000
Projected sales at cost	\$360,000	
Target percentage	× 15%	
Less: 15% of estimated sales		(54,000)
Following month projected sales	\$650,000	
Cost percentage	× 60%	
Following month sales at cost	\$390,000	
Target percentage	× 15%	
Add: 15% of following month sales		58,500
Projected purchases at cost		<u>\$364,500</u>

- Answer (D) is **incorrect**. The amount of \$399,000 is not budgeted dollar purchases for July.

---

**[Fact Pattern #10]**

Rokat Corporation is a manufacturer of tables sold to schools, restaurants, hotels, and other institutions. The table tops are manufactured by Rokat, but the table legs are purchased from an outside supplier. The Assembly Department takes a manufactured table top and attaches the four purchased table legs. It takes 20 minutes of labor to assemble a table. The company follows a policy of producing enough tables to ensure that 40% of next month's sales are in the finished goods inventory. Rokat also purchases sufficient direct materials inventory to ensure that direct materials inventory is 60% of the following month's scheduled production.

Rokat's sales budget in units for the next quarter is as follows:

July	2,300
August	2,500
September	2,100

Rokat's ending inventories in units for June 30 are

Finished goods	1,900
Direct materials (legs)	4,000

---

**[43] Gleim #: 6.6.113 -- Source: CMA 695 3-14**

(Refers to Fact Pattern #10)

The number of tables to be produced by Roket during August is

- A. 1,400 tables.
- B. 2,340 tables.
- C. 1,440 tables.
- D. 1,900 tables.

- Answer (A) is **incorrect**. The number of tables to be produced in July is 1,400.
- Answer (B) is **correct**. The company will need 2,500 finished units for August sales. In addition, 840 units ( $2,100 \text{ September unit sales} \times 40\%$ ) should be in inventory at the end of August. August sales plus the desired ending inventory equals 3,340 units. Of these units, 40% of August's sales, or 1,000 units, should be available from beginning inventory. Consequently, production in August should be 2,340 units.
- Answer (C) is **incorrect**. The figure of 1,440 tables is based on July's beginning inventory.
- Answer (D) is **incorrect**. July's beginning inventory equals 1,900 tables.

**[44] Gleim #: 6.6.114 -- Source: CMA 695 3-15**

(Refers to Fact Pattern #10)

Assume Roket's required production for August and September is 1,600 and 1,800 units, respectively, and the July 31 direct materials inventory is 4,200 units. The number of table legs to be purchased in August is

- A. 6,520 legs.
- B. 9,400 legs.
- C. 2,200 legs.
- D. 6,400 legs.

- Answer (A) is **correct**. The August production of 1,600 units will require 6,400 table legs. September's production of 1,800 units will require 7,200 table legs. Thus, inventory at the end of August should be 4,320 legs ( $7,200 \text{ legs} \times 60\%$ ). The total of legs needed during August is 10,720 ( $6,400 + 4,320$ ), of which 4,200 are available from the July 31 ending inventory. The remaining 6,520 legs must be purchased during August.
- Answer (B) is **incorrect**. The figure of 9,400 legs is based on an ending inventory of 100% of September's production.
- Answer (C) is **incorrect**. Failing to consider the legs needed for the ending inventory results in 2,200 legs.

- Answer (D) is **incorrect**. The amount needed for August production is 6,400 legs.

[1] Gleim #: 6.7.115 -- Source: CMA 697 3-17

Which one of the following statements regarding selling and administrative budgets is most accurate?

- A. Selling and administrative budgets are usually optional.
  - B. Selling and administrative budgets are fixed in nature.
  - C. Selling and administrative budgets are difficult to allocate by month and are best presented as one number for the entire year.
  - D. Selling and administrative budgets need to be detailed in order that the key assumptions can be better understood.
- Answer (A) is **incorrect**. Selling and administrative budgets are no more optional than any other component of the master budget.
  - Answer (B) is **incorrect**. Selling and administrative budgets have both variable and fixed components.
  - Answer (C) is **incorrect**. Selling and administrative budgets should be prepared on the same basis as the remainder of the budget, typically on at least a monthly basis.
  - Answer (D) is **correct**. Sales and administrative budgets are prepared after the sales budget. Like the other budgets, they constitute prospective information based on the preparer's assumptions about conditions expected to exist and actions expected to be taken.

[2] Gleim #: 6.7.116 -- Source: CMA 696 3-7

For the month of December, Crystal Clear Bottling expects to sell 12,500 cases of Cranberry Sparkling Water at \$24.80 per case and 33,100 cases of Lemon Dream Cola at \$32.00 per case. Sales personnel receive 6% commission on each case of Cranberry Sparkling Water and 8% commission on each case of Lemon Dream Cola. In order to receive a commission on a product, the sales personnel team must meet the individual product revenue quota. The sales quota for Cranberry Sparkling Water is \$500,000, and the sales quota for Lemon Dream Cola is \$1,000,000. The sales commission that should be budgeted for December is

- A. \$4,736
  - B. \$82,152
  - C. \$84,736
  - D. \$103,336
- Answer (A) is **incorrect**. The commission on \$59,200 of Lemon sales is \$4,736.

- Answer (B) is **incorrect**. The amount of \$82,152 equals 6% of all sales.
- Answer (C) is **correct**. The sale of 12,500 cases of Cranberry at \$24.80 per case produces revenue of \$310,000, an amount that does not qualify for commissions. The sale of 33,100 cases of Lemon at \$32 per case produces revenue of \$1,059,200. This amount is greater than the minimum and therefore qualifies for a commission of \$84,736 ( $\$1,059,200 \times 8\%$ ). This calculation assumes that commissions are paid on all sales if the revenue quota is met.
- Answer (D) is **incorrect**. The amount of \$103,336 assumes that a commission of \$18,600 is paid on Cranberry.

**[3] Gleim #: 6.7.117 -- Source: Publisher**

Harvin Co. pays out sales commissions to its sales team in the month the company receives cash for payment. These commissions equal 5% of total (monthly) cash inflows as a result of sales. Harvin has budgeted sales of \$300,000 for August, \$400,000 for September, and \$200,000 for October. Approximately half of all sales are on credit, and the other half are cash sales. Experience indicates that 70% of the budgeted credit sales will be collected in the month following the sale, 20% the month after that, and 10% of the sales will be uncollectible. Based on this information, what should be the total amount of sales commissions paid out by Harvin in the month of October?

- A. \$8,500
- B. \$13,500
- C. \$17,000
- D. \$22,000

- Answer (A) is **incorrect**. Failure to consider the cash sales made during October results in \$8,500.
- Answer (B) is **correct**. Cash sales for Harvin for the month of October are budgeted at \$100,000 (half of \$200,000 overall sales). Projections for collections of credit sales in August indicate that 20% will be cash inflows in October, or  $(\$150,000 \times 20\%) = \$30,000$ . Projections for collections of credit sales in September indicate that 70% will be cash inflows in October, or  $(\$200,000 \times 70\%) = \$140,000$ . Therefore, total cash inflows projected for the month of October equal  $\$100,000 + \$30,000 + \$140,000 = \$270,000$ . Because sales commissions are set at 5% of monthly cash inflows, the sales commissions for October equal  $(\$270,000 \times 5\%) = \$13,500$ .
- Answer (C) is **incorrect**. The amount of \$17,000 is based on total sales for August and September rather than credit sales.
- Answer (D) is **incorrect**. Using total sales rather than credit sales results in \$22,000.

---

**[Fact Pattern #1]**

Rokat Corporation is a manufacturer of tables sold to schools, restaurants, hotels, and other institutions. The table tops are manufactured by Rokat, but the table legs are purchased from an outside supplier. The Assembly Department takes a manufactured table top and attaches the four purchased table legs. It takes 20 minutes of labor to assemble a table. The company follows a policy of producing enough tables to ensure that 40% of next month's sales are in the finished goods inventory. Rokat also purchases sufficient direct materials inventory to ensure that direct materials inventory is 60% of the following month's scheduled production.

Rokat's sales budget in units for the next quarter is as follows:

July	2,300
August	2,500
September	2,100

Rokat's ending inventories in units for June 30 are

Finished goods	1,900
Direct materials (legs)	4,000

---

**[5] Gleim #: 6.7.119 -- Source: CMA 695 3-16**

(Refers to Fact Pattern #1)

Assume that Rokat Corporation will produce 1,800 units in the month of September. How many employees will be required for the Assembly Department? (Fractional employees are acceptable since employees can be hired on a part-time basis. Assume a 40-hour week and a 4-week month.)

- A. 15 employees.
- B. 3.75 employees.
- C. 60 employees.
- D. 600 employees.

- Answer (A) is **incorrect**. This number of employees assumes production occurs in a single 40-hour week.
- Answer (B) is **correct**. Each unit requires 20 minutes of assembly time, or 1/3 of an hour. The assembly of 1,800 units will therefore require 600 hours of labor ( $1,800 \times 1/3$ ). At 40 hours per week for 4 weeks, each employee will work 160 hours during the month. Thus, 3.75 employees ( $600 \div 160$ ) are needed.

- Answer (C) is **incorrect**. This number of employees assumes that each leg requires 20 minutes to assemble and that production occurs in a single 40-hour week.
- Answer (D) is **incorrect**. This number of employees is the number of hours needed, not the number of employees.

---

**[Fact Pattern #2]**

Jordan Auto has developed the following production plan:

<u>Month</u>	<u>Units</u>
January	10,000
February	8,000
March	9,000
April	12,000

Each unit contains 3 pounds of direct materials. The desired direct materials ending inventory each month is 120% of the next month's production, plus 500 pounds. (The beginning inventory meets this requirement.) Jordan has developed the following direct labor standards for production of these units:

	<u>Department 1</u>	<u>Department 2</u>
Hours per unit	2.0	0.5
Hourly rate	\$7.25	\$12.00

---

**[6] Gleim #: 6.7.120 -- Source: CMA 697 3-15**

(Refers to Fact Pattern #2)

Jordan Auto's total budgeted direct labor dollars for February usage should be

- A. \$164,000
- B. \$174,250
- C. \$184,500
- D. \$221,400

- Answer (A) is **correct**. The standard unit labor cost is \$20.50 [(\$7.25 × 2 hours in Department 1) + (\$12 × .5 hour in Department 2)], so the total budgeted direct labor dollars for February equal \$164,000 (8,000 units × \$20.50).
- Answer (B) is **incorrect**. The amount of \$174,250 is for 500 more units than budgeted usage.
- Answer (C) is **incorrect**. The amount for March is \$184,500.
- Answer (D) is **incorrect**. The amount of \$221,400 is for 120% of budgeted March production.

**[7] Gleim #: 6.7.121 -- Source: CMA 684 4-26**

Each unit of Product XK-46 requires three direct labor hours. Employee benefit costs are treated as direct labor costs. Data on direct labor are

Number of direct employees	25
Weekly productive hours per employee	35
Estimated weekly wages per employee	\$245
Employee benefits (related to weekly wages)	25%

The standard direct labor cost per unit of Product XK-46 is

- A. \$21.00
- B. \$26.25
- C. \$29.40
- D. \$36.75

- Answer (A) is **incorrect**. The amount of \$21.00 excludes employee benefits.
- Answer (B) is **correct**. The standard direct labor unit cost equals 3 hours times the cost per DLH. This amount is determined by adding employee benefits to weekly wages and dividing by hours per week.

Weekly wages	\$245.00
Add: benefits ( $\$245 \times .25$ )	<u>61.25</u>
Weekly total compensation	\$306.25
Divided by: hours/week	<u><math>\div</math> 35</u>
Cost per DL hour	\$ 8.75
Times: DL hours per unit	<u><math>\times</math> 3</u>
Unit DL cost	<u><u>\$ 26.25</u></u>

- Answer (C) is **incorrect**. Using employee benefits as 40%, not 25%, of weekly wages results in \$29.40.
- Answer (D) is **incorrect**. Dividing weekly wages plus benefits by 25 employees instead of 35 weekly productive hours per employee results in \$36.75.

**[8] Gleim #: 6.7.122 -- Source: Publisher**

For the month of June, Wilder Cherry Company expects to sell 12,500 cases of small cherries at \$25 per case and 33,000 cases of large cherries at \$32 per case. Sales personnel receive a 6% commission on each case of small cherries and an 8% commission on each case of large cherries. To receive a commission on a product, the sales personnel team must meet the individual product revenue quota. The sales quotas for small cherries and large cherries are \$500,000 and \$1 million, respectively. What are the sales commissions budgeted for June?

- A. \$109,440
- B. \$84,480
- C. \$82,110
- D. \$4,480

- Answer (A) is **incorrect**. The amount of \$109,440 assumes that an 8% commission was paid on all sales.
- Answer (B) is **correct**. The sale of 12,500 cases of small cherries at \$25 per case produces revenue of \$312,500. Because this amount is below the \$500,000 minimum, no commissions should be budgeted for small cherries. The sale of 33,000 cases of large cherries at \$32 per case produces revenue of \$1,056,000. This amount is greater than the \$1 million minimum and therefore qualifies for a commission of \$84,480 ( $\$1,056,000 \times 8\%$ ). The problem did not state that a commission would be paid only on amounts exceeding the minimum. Hence, all sales qualify once the minimum is reached.
- Answer (C) is **incorrect**. The amount of \$82,110 is based on a 6% commission on all sales.
- Answer (D) is **incorrect**. The commission on the \$56,000 of large cherries sales in excess of the minimum is \$4,480.

**[19] Gleim #: 6.7.133 -- Source: CMA 0408 2-049**

Peterson's Planters, Inc., budgeted the following amounts for the coming year:

Beginning inventory, finished goods	\$ 10,000
Cost of goods sold	400,000
Direct material used in production	100,000
Ending inventory, finished goods	25,000
Beginning and ending work-in-process inventory	0

Overhead is estimated to be two times the amount of direct labor dollars. The amount that should be budgeted for direct labor for the coming year is

- A. \$315,000
- B. \$210,000
- C. \$157,500
- D. \$105,000

- Answer (A) is **incorrect**. The amount of \$315,000 is labor plus overhead.
- Answer (B) is **incorrect**. The amount of \$210,000 is overhead.
- Answer (C) is **incorrect**. The amount of \$157,500 results from treating overhead as equal to labor.
- Answer (D) is **correct**. Peterson's cost of goods manufactured can be calculated as follows:

Cost of goods sold	\$400,000
Add: ending finished goods inventory	<u>25,000</u>
Goods available for sale	\$425,000
Less: beg. finished goods inventory	<u>(10,000)</u>
Cost of goods manufactured	<u><u>\$415,000</u></u>

The \$415,000 is composed of materials (\$100,000), direct labor, and overhead. Therefore, labor plus overhead equals \$315,000. Since overhead is two times labor, the calculation would be  $DL + 2DL = \$315,000$ , or  $DL = \$105,000$ .

**[20] Gleim #: 6.7.134 -- Source: CMA 0408 2-056**

The pro forma statement of employee benefit costs, a budget schedule that is prepared as part of an organization's annual profit plan, would include costs related to

- A. Employees' gross wages and salaries and the related company-paid benefits.
- B. Employees' net wages and salaries and the related company-paid benefits.
- C. All payroll-related deductions withheld from employees and company-paid benefits.
- D. Company-paid benefits and company-paid payroll taxes.

- Answer (A) is **incorrect**. Employees' gross wages are included in the direct labor budget.
- Answer (B) is **incorrect**. Employees' net wages are included in the direct labor budget.
- Answer (C) is **incorrect**. Payroll deductions withheld are forwarded to the federal government; they are not expenses of the firm.
- Answer (D) is **correct**. The pro forma statement of employee benefit costs reports those personnel-related costs that are not included in direct labor, i.e., company-paid benefits and company-paid payroll taxes.

**[21] Gleim #: 6.7.135 -- Source: CMA 0408 2-057**

A company that manufactures furniture is establishing its budget for the upcoming year. All of the following items would appear in the overhead budget **except** for the

- A. Overtime paid to the workers who perform production scheduling.
- B. Cost of glue used to secure the attachment of the legs to the tables.
- C. Fringe benefits paid to the production supervisor.
- D. Freight charges paid for the delivery of raw materials to the company.

- Answer (A) is **incorrect**. Wages paid to production scheduling personnel are a component of indirect labor.
- Answer (B) is **incorrect**. Glue is treated as an indirect material.
- Answer (C) is **incorrect**. Fringe benefits paid to the production supervisor are a component of indirect labor.
- Answer (D) is **correct**. Freight charges for raw materials delivery are included in the costs of direct materials.

**[22] Gleim #: 6.7.136 -- Source: CMA 0408 2-059**

All of the following would appear on a projected schedule of cost of goods manufactured **except** for

- A. Ending work-in-process inventory.
- B. Beginning finished goods inventory.
- C. The cost of raw materials used.
- D. Applied manufacturing overhead.

- Answer (A) is **incorrect**. Ending work-in-process inventory is a component of cost of goods manufactured.
- Answer (B) is **correct**. Beginning finished goods inventory is a component of cost of goods sold, not cost of goods manufactured.
- Answer (C) is **incorrect**. Raw materials, whether they are consumed as direct or indirect materials, are a component of cost of goods manufactured.
- Answer (D) is **incorrect**. Manufacturing overhead is a component of cost of goods manufactured.

**[23] Gleim #: 6.7.137 -- Source: CMA 0408 2-061**

Tut Company's selling and administrative costs for the month of August, when it sold 20,000 units, were as follows.

	Costs	
	Per Unit	Total
Variable costs	\$18.60	\$372,000
Step costs	4.25	85,000
Fixed costs	8.80	176,000
Total selling and administrative costs	<u>\$31.65</u>	<u>\$633,000</u>

The variable costs represent sales commissions paid at the rate of 6.2% of sales. The step costs depend on the number of salespersons employed by the company. In August there were 17 persons on the sales force. However, two members have taken early retirement effective August 31. It is anticipated that these positions will remain vacant for several months. Total fixed costs are unchanged within a relevant range of 15,000 to 30,000 units per month. Tut is planning a sales price cut of 10%, which it expects will increase sales volume to 24,000 units per month. If Tut implements the sales price reduction, the total budgeted selling and administrative costs for the month of September would be

- A. \$652,760
- B. \$679,760
- C. \$714,960
- D. \$759,600

- Answer (A) is **correct**. If the \$372,000 of variable cost is 6.2% of sales, then sales were \$6,000,000. Current unit price must be \$300 (\$6,000,000 total sales ÷ 20,000 units). A 10% price cut will lower it to \$270 (\$300 × 90%), leading to total projected sales after the price cut of \$6,480,000 (24,000 × \$270). The sales commissions on that level of sales will be \$401,760 (\$6,480,000 × 6.2%). Because two salespersons will be gone in September, the step costs will be reduced to \$75,000 [\$85,000 × (15 ÷ 17)]. Fixed costs remain at \$176,000. Total anticipated S&A costs for September are therefore \$652,760 (\$401,760 + \$75,000 + \$176,000).
- Answer (B) is **incorrect**. The amount of \$679,760 results from adding two salespersons instead of subtracting them.
- Answer (C) is **incorrect**. The amount of \$714,960 is based on the old unit figures for step costs and overhead.
- Answer (D) is **incorrect**. The amount of \$759,600 is based on the unit cost for August without considering any of the proposed changes.

**[1] Gleim #: 6.8.138 -- Source: CMA 695 3-17**

Which one of the following is the best characteristic concerning the capital budget? The capital budget is a(n)

- A. Plan to ensure that there are sufficient funds available for the operating needs of the company.
  - B. Exercise that sets the long-range goals of the company including the consideration of external influences caused by others in the market.
  - C. Plan that results in the cash requirements during the operating cycle.
  - D. Plan that assesses the long-term needs of the company for plant and equipment purchases.
- Answer (A) is **incorrect**. Capital budgeting involves long-term investment needs, not immediate operating needs.
  - Answer (B) is **incorrect**. Establishing long-term goals in the context of relevant factors in the firm's environment is strategic planning.
  - Answer (C) is **incorrect**. Cash budgeting determines operating cash flows. Capital budgeting evaluates the rate of return on specific investment alternatives.
  - Answer (D) is **correct**. Capital budgeting is the process of planning expenditures for long-lived assets. It involves choosing among investment proposals using a ranking procedure. Evaluations are based on various measures involving the rate of ROI.

**[2] Gleim #: 6.8.139 -- Source: CMA 1296 3-20**

Which one of the following items would have to be included for a company preparing a schedule of cash receipts and disbursements for calendar Year 1?

- A. A purchase order issued in December Year 1 for items to be delivered in February Year 2.
  - B. Dividends declared in November Year 1 to be paid in January Year 2 to shareholders of record as of December Year 1.
  - C. The amount of uncollectible customer accounts for Year 1.
  - D. The borrowing of funds from a bank on a note payable taken out in June Year 1 with an agreement to pay the principal and interest in June Year 2.
- Answer (A) is **incorrect**. The cash disbursement presumably will not occur until Year 2.
  - Answer (B) is **incorrect**. The cash flow will not occur until dividends are paid in Year 2.
  - Answer (C) is **incorrect**. Bad debt expense is a noncash item.

- Answer (D) is **correct**. A schedule of cash receipts and disbursements (cash budget) should include all cash inflows and outflows during the period without regard to the accrual accounting treatment of the transactions. Hence, it should include all checks written and all sources of cash, including borrowings. A borrowing from a bank in June Year 1 should appear as a cash receipt for Year 1.

**[3] Gleim #: 6.8.140 -- Source: CMA 691 3-4**

DeBerg Company has developed the following sales projections for the calendar year.

May	\$100,000
June	120,000
July	140,000
August	160,000
September	150,000
October	130,000

Normal cash collection experience has been that 50% of sales are collected during the month of sale and 45% in the month following sale. The remaining 5% of sales is never collected. DeBerg's budgeted cash collections for the third calendar quarter are

- A. \$427,500
- B. \$422,500
- C. \$414,000
- D. \$450,000

- Answer (A) is **incorrect**. The total cash expected to be collected from third calendar quarter sales is \$427,500.
- Answer (B) is **incorrect**. The budgeted cash collections for August through October, not the third calendar quarter, is \$422,500.
- Answer (C) is **correct**. If 50% of sales are collected in the month of sale and 45% in the next month, with the balance uncollectible, collections during the third quarter will be based on sales during June, July, August, and September. As calculated below, total budgeted collections are \$414,000.

June:	$\$120,000 \times 45\%$	=	\$ 54,000
July:	$140,000 \times (50\% + 45\%)$	=	133,000
August:	$160,000 \times (50\% + 45\%)$	=	152,000
September:	$150,000 \times 50\%$	=	<u>75,000</u>
Total			<u><u>\$414,000</u></u>

- Answer (D) is **incorrect**. The total budgeted sales for the third calendar quarter is \$450,000.

**[4] Gleim #: 6.8.141 -- Source: CMA 696 3-6**

The cash receipts budget includes

- A. Funded depreciation.
- B. Operating supplies.
- C. Extinguishment of debt.
- D. Loan proceeds.

- Answer (A) is **incorrect**. Funded depreciation involves cash outlays.
- Answer (B) is **incorrect**. Purchases of supplies involves cash outlays.
- Answer (C) is **incorrect**. The extinguishment of debt involves cash outlays.
- Answer (D) is **correct**. A cash budget may be prepared monthly or even weekly to facilitate cash planning and control. The purpose is to anticipate cash needs while minimizing the amount of idle cash. The cash receipts section of the budget includes all sources of cash. One such source is the proceeds of loans.

**[5] Gleim #: 6.8.142 -- Source: CMA 696 3-9**

Trumbull Company budgeted sales on account of \$120,000 for July, \$211,000 for August, and \$198,000 for September. Collection experience indicates that 60% of the budgeted sales will be collected the month after the sale, 36% will be collected the second month, and 4% will be uncollectible. The cash receipts from accounts receivable that should be budgeted for September would be

- A. \$169,800
- B. \$147,960
- C. \$197,880
- D. \$194,760

- Answer (A) is **correct**. The budgeted cash collections for September are \$169,800  $[(\$120,000 \text{ July sales} \times 36\%) + (\$211,000 \text{ August sales} \times 60\%)]$ .
- Answer (B) is **incorrect**. Reversing the percentages for July and August results in \$147,960.
- Answer (C) is **incorrect**. Using the wrong months (August and September) and reversing the percentages results in \$197,880.

- Answer (D) is **incorrect**. The amount of \$194,760 assumes collections were for August and September.

**[6] Gleim #: 6.8.143 -- Source: CMA 696 3-8**

The cash budget must be prepared before completing the

- A. Capital expenditure budget.
- B. Sales budget.
- C. Forecasted balance sheet.
- D. Production budget.

- Answer (A) is **incorrect**. The capital expenditure budget is an input necessary for the preparation of a cash budget.
- Answer (B) is **incorrect**. The sales budget is usually the first budget prepared.
- Answer (C) is **correct**. The pro forma balance sheet is the balance sheet for the beginning of the period updated for projected changes in cash, receivables, inventories, payables, etc. Accordingly, it cannot be prepared until after the cash budget is completed because cash is a current asset reported on the balance sheet.
- Answer (D) is **incorrect**. A production budget is normally prepared before the cash budget is started.

---

**[Fact Pattern #1]**

Historically, Pine Hill Wood Products has had no significant bad debt experience with its customers. Cash sales have accounted for 10% of total sales, and payments for credit sales have been received as follows:

40% of credit sales in the month of the sale  
30% of credit sales in the first subsequent month  
25% of credit sales in the second subsequent month  
5% of credit sales in the third subsequent month

The forecast for both cash and credit sales is as follows:

<u>Month</u>	<u>Sales</u>
January	\$95,000
February	65,000
March	70,000
April	80,000
May	85,000

---

**[7] Gleim #: 6.8.144 -- Source: CMA 697 3-18**

(Refers to Fact Pattern #1)

What is the forecasted cash inflow for Pine Hill Wood Products for May?

- A. \$70,875
- B. \$76,500
- C. \$79,375
- D. \$83,650

- Answer (A) is **incorrect**. The amount of \$70,875 omits May cash sales.
- Answer (B) is **incorrect**. May credit sales equals \$76,500.
- Answer (C) is **correct**. The cash inflows for May will come from May cash sales of \$8,500 ( $\$85,000 \times 10\%$ ), May credit sales of \$30,600 ( $\$85,000 \times 90\% \times 40\%$ ), April sales of \$21,600 ( $\$80,000 \times 30\% \times 90\%$ ), March sales of \$15,750 ( $\$70,000 \times 25\% \times 90\%$ ), and February sales of \$2,925 ( $\$65,000 \times 5\% \times 90\%$ ). The total is \$79,375.
- Answer (D) is **incorrect**. The amount of \$83,650 includes 5% of January's credit sales.

**[8] Gleim #: 6.8.145 -- Source: CMA 697 3-19**

(Refers to Fact Pattern #1)

Due to deteriorating economic conditions, Pine Hill Wood Products has now decided that its cash forecast should include a bad debt adjustment of 2% of credit sales, beginning with sales for the month of April. The 5% collection in the fourth month should be reduced to reflect the bad debt. Because of this policy change, the total expected cash inflow in April related to sales made in April will

- A. Be unchanged.
- B. Decrease by \$1,260.00.
- C. Decrease by \$1,440.00.
- D. Decrease by \$1,530.00.

- Answer (A) is **correct**. The estimated collections in July related to April credit sales will be reduced by \$1,440. Estimated collections in the month of the sale will be unchanged.
- Answer (B) is **incorrect**. The amount of \$1,260 is 2% of March credit sales.
- Answer (C) is **incorrect**. The collections in July related to April credit sales will be reduced by \$1,440.
- Answer (D) is **incorrect**. The amount of \$1,530 is 2% of May credit sales.

---

**[Fact Pattern #2]**

Birch Corporation has the following historical pattern on its credit sales:

- 70% collected in month of sale
- 15% collected in the first month after sale
- 10% collected in the second month after sale
- 4% collected in the third month after sale
- 1% uncollectible

The sales on open account have been budgeted for the first 6 months of the year as follows:

January	\$ 70,000
February	90,000
March	100,000
April	120,000
May	100,000
June	90,000

---

**[9] Gleim #: 6.8.146 -- Source: CMA 1289 4-24**

(Refers to Fact Pattern #2)

Birch's estimated total cash collections during April from accounts receivable are

- A. \$84,000
- B. \$110,800
- C. \$118,800
- D. \$108,000

- Answer (A) is **incorrect**. Estimated collections from April sales only equals \$84,000.
- Answer (B) is **correct**. The estimated April collections are \$110,800.

70% of April sales of \$120,000	=	\$ 84,000
15% of March sales of \$100,000	=	15,000
10% of February sales of \$90,000	=	9,000
4% of January sales of \$70,000	=	<u>2,800</u>
Total collections		<u><u>\$110,800</u></u>

- Answer (C) is **incorrect**. The amount of \$118,800 is 99% of April sales.

- Answer (D) is **incorrect**. The amount of \$108,000 does not include the estimated collections in April from January sales.

**[10] Gleim #: 6.8.147 -- Source: CMA 1289 4-25**

(Refers to Fact Pattern #2)

Birch's estimated total cash collections during the second calendar quarter from sales made on open account during the second calendar quarter are

- A. \$262,000
- B. \$288,800
- C. \$306,900
- D. \$310,000

- Answer (A) is **correct**. The second calendar quarter consists of April, May, and June. For April's sales of \$120,000, collections should be 95% (70% + 15% + 10%), or \$114,000. For May's sales of \$100,000, collections should be 85% (70% + 15%), or \$85,000. For June's sales of \$90,000, collections should be 70%, or \$63,000. The quarterly total is \$262,000 (\$114,000 + \$85,000 + \$63,000).
- Answer (B) is **incorrect**. The amount of \$288,800 includes cash collections from sales made during the first calendar quarter.
- Answer (C) is **incorrect**. The amount of \$306,900 is 99% of the total sales made during the second calendar quarter. It is the amount estimated to be collected during the calendar year, not just the second quarter.
- Answer (D) is **incorrect**. The total sales budgeted for the second calendar year is \$310,000.

**[16] Gleim #: 6.8.153 -- Source: CMA 693 3-10**

A firm develops an annual cash budget in order to

- A. Support the preparation of its cash flow statement for the annual report.
  - B. Ascertain which capital expenditure projects are feasible and which capital expenditure projects should be deferred.
  - C. Determine the opportunity costs of alternative sales and production strategies.
  - D. Avoid the opportunity costs of noninvested excess cash and minimize the cost of interim financing.
- Answer (A) is **incorrect**. The cash flow statement is based on actual results, not budgeted figures.

- Answer (B) is **incorrect**. A cash budget may facilitate decisions regarding deferral of capital projects; the budget does not ascertain which projects are feasible. The budget provides the total liquidity available for projects.
- Answer (C) is **incorrect**. Cash budgets do not determine opportunity costs.
- Answer (D) is **correct**. The cash budget is perhaps the most important part of a company's budget program. A cash budget facilitates planning for loans and other financing. Conversely, a firm should plan how to invest temporary surpluses of cash. A cash budget is particularly valuable in seasonal businesses in which a few months of revenues must be matched with 12 months of costs. Because a temporary shortage of cash may drive an otherwise financially sound organization into bankruptcy, proper planning can prevent financial embarrassment.

---

**[Fact Pattern #3]**

Super Drive, a computer disk storage and back-up company, uses accrual accounting. The company's Statement of Financial Position for the year ended November 30 is as follows:

Super Drive  
Statement of Financial Position  
as of November 30

Assets		Liabilities and Stockholders' Equity	
Cash	\$ 52,000	Accounts payable	\$ 175,000
Accounts receivable, net	150,000	Common stock	900,000
Inventory	315,000	Retained earnings	<u>442,000</u>
Property, plant, and equipment	<u>1,000,000</u>	Total liabilities and	
Total assets	<u><u>\$1,517,000</u></u>	stockholders' equity	<u><u>\$1,517,000</u></u>

Additional information regarding Super Drive's operations include the following:

- Sales are budgeted at \$520,000 for December and \$500,000 for January of the next year.
  - Collections are expected to be 60% in the month of sale and 40% in the month following the sale.
  - Eighty percent of the disk drive components are purchased in the month prior to the month of sale, and 20% are purchased in the month of sale. Purchased components are 40% of the cost of goods sold.
  - Payment for the components is made in the month following the purchase.
  - Cost of goods sold is 80% of sales.
-

[19] Gleim #: 6.8.156 -- Source: CMA 1294 3-7

(Refers to Fact Pattern #3)

Super Drive's budgeted cash collections for the month of December are

- A. \$208,000
- B. \$520,000
- C. \$402,000
- D. \$462,000

- Answer (A) is **incorrect**. The amount of \$208,000 equals 40% of December sales.
- Answer (B) is **incorrect**. Total sales are not collected in the month of sale.
- Answer (C) is **incorrect**. The amount of \$402,000 represents only 60% of receivables but 100% of receivables will be collected.
- Answer (D) is **correct**. Collections are expected to be 60% in the month of sale and 40% in the month following the sale. Thus, collections in December consist of the \$150,000 of receivables at November 30, plus 60% of December sales. Total collections are therefore \$462,000 [ $\$150,000 + (\$520,000 \times 60\%)$ ].

---

**[Fact Pattern #4]**

Kelly Company is a retail sporting goods store that uses accrual accounting for its records. Facts regarding Kelly's operations are as follows:

- Sales are budgeted at \$220,000 for December Year 1 and \$200,000 for January Year 2.
- Collections are expected to be 60% in the month of sale and 38% in the month following the sale.
- Gross margin is 25% of sales.
- A total of 80% of the merchandise held for resale is purchased in the month prior to the month of sale and 20% is purchased in the month of sale. Payment for merchandise is made in the month following the purchase.
- Other expected monthly expenses to be paid in cash are \$22,600.
- Annual depreciation is \$216,000.

Below is Kelly Company's statement of financial position at November 30, Year 1.

Assets

Cash	\$ 22,000
Accounts receivable (net of \$4,000 allowance for uncollectible accounts)	76,000
Inventory	132,000
Property, plant, and equipment (net of \$680,000 accumulated depreciation)	870,000
Total assets	<u><u>\$1,100,000</u></u>

Liabilities and Stockholders' Equity

Accounts payable	\$ 162,000
Common stock	800,000
Retained earnings	138,000
Total liabilities and stockholders' equity	<u><u>\$1,100,000</u></u>

---

**[20] Gleim #: 6.8.157 -- Source: CMA 1283 4-22**

(Refers to Fact Pattern #4)

Kelly's budgeted cash collections for December Year 1 are

- A. \$208,000
- B. \$132,000
- C. \$203,600
- D. \$212,000

- Answer (A) is **correct**. Since collections are 60% of the current month's sales and 38% of the previous month's sales, total collections should be

Accounts receivable	\$ 76,000
December sales of \$220,000 × 60%	<u>132,000</u>
Budgeted cash collections	<u><u>\$208,000</u></u>

- Answer (B) is **incorrect**. The amount of \$132,000 does not include accounts receivable.
- Answer (C) is **incorrect**. The budgeted cash collections for January Year 2 equals \$203,600.
- Answer (D) is **incorrect**. The amount of \$212,000 includes the \$4,000 allowance for uncollectible accounts.

---

**[Fact Pattern #5]**

Esplanade Company has the following historical pattern for its credit sales:

- 70% collected in month of sale
- 15% collected in the first month after sale
- 10% collected in the second month after sale
- 4% collected in the third month after sale
- 1% uncollectible

The sales on open account have been budgeted for the last 6 months of the year as shown below:

July	\$ 60,000
August	70,000
September	80,000
October	90,000
November	100,000
December	85,000

**[21] Gleim #: 6.8.158 -- Source: CMA 692 3-27**

(Refers to Fact Pattern #5)

Esplanade's estimated total cash collections during October from accounts receivable are

- A. \$63,000
- B. \$84,400
- C. \$86,700
- D. \$21,400

- Answer (A) is **incorrect**. October collections from October sales only equals \$63,000.
- Answer (B) is **correct**. During October, collections will be received from sales made in October, September, August, and July.

Month	Sales		Percentage		Collections
October	\$90,000	×	70%	=	\$63,000
September	80,000	×	15%	=	12,000
August	70,000	×	10%	=	7,000
July	60,000	×	4%	=	2,400
Total collections					<u>\$84,400</u>

- Answer (C) is **incorrect**. The estimated total cash collections during December is \$86,700.
- Answer (D) is **incorrect**. The amount of \$21,400 will be the collections from sales made in previous months.

**[22] Gleim #: 6.8.159 -- Source: CMA 692 3-28**

(Refers to Fact Pattern #5)

Esplanade's estimated total cash collections during the fourth calendar quarter from sales made on open account during the fourth calendar quarter are

- A. \$170,500
- B. \$275,000
- C. \$230,000
- D. \$251,400

- Answer (A) is **incorrect**. The collections of October and November sales equals \$170,500.
- Answer (B) is **incorrect**. The total sales for the quarter equals \$275,000.

- Answer (C) is **correct**. For October sales, collections will be 70% in October, 15% in November, and 10% in December, a total of 95%. For November sales, collections will be 70% in November and 15% in December, a total of 85%. Collections on December sales will be 70%.

<u>Month</u>	<u>Sales</u>		<u>Percentage</u>		<u>Collections</u>
October	\$90,000	×	95%	=	\$85,500
November	100,000	×	85%	=	85,000
December	85,000	×	70%	=	<u>59,500</u>
Total collections					<u><u>\$230,000</u></u>

- Answer (D) is **incorrect**. The amount of \$251,400 includes sales made prior to the 4th quarter.

**[Fact Pattern #6]**

Information pertaining to Noskey Corporation's sales revenue is presented in the following table:

	November Year 1 <u>(Actual)</u>	December Year 1 <u>(Budget)</u>	January Year 2 <u>(Budget)</u>
Cash sales	\$ 80,000	\$100,000	\$ 60,000
Credit sales	<u>240,000</u>	<u>360,000</u>	<u>180,000</u>
Total sales	<u><u>\$320,000</u></u>	<u><u>\$460,000</u></u>	<u><u>\$240,000</u></u>

Management estimates that 5% of credit sales are uncollectible. Of the credit sales that are collectible, 60% are collected in the month of sale and the remainder in the month following the sale. Purchases of inventory are equal to next month's sales, and gross profit margin is 30%. All purchases of inventory are on account; 25% are paid in the month of purchase, and the remainder are paid in the month following the purchase.

**[23] Gleim #: 6.8.160 -- Source: CMA 1291 3-23**

(Refers to Fact Pattern #6)

Noskey Corporation's budgeted cash collections in December Year 1 from November Year 1 credit sales are

- A. \$84,000
- B. \$136,800
- C. \$228,000
- D. \$91,200

- Answer (A) is **incorrect**. The amount of \$84,000 is 35% of November credit sales, which incorrectly assumes uncollectible sales are 5%, cash collected in the month of sale is 60%, and cash collected in the month following the sale is 35%.
- Answer (B) is **incorrect**. The budgeted cash collections in November from November sales is \$136,800.
- Answer (C) is **incorrect**. The total expected to be collected in November and December from November sales is \$228,000.
- Answer (D) is **correct**. November credit sales were \$240,000. Of this amount, \$12,000 ( $\$240,000 \times 5\%$ ) will likely be written off. Given that 60% of the remaining credit sales are collected in the month of sale, 40% will be collected in the following month. Thus, December's expected cash collections are \$91,200 [ $(\$240,000 - \$12,000) \times 40\%$ ].

**[24] Gleim #: 6.8.161 -- Source: CMA 1291 3-24**

(Refers to Fact Pattern #6)

Noskey Corporation's budgeted total cash receipts in January Year 2 are

- A. \$240,000
- B. \$294,000
- C. \$299,400
- D. \$239,400

- Answer (A) is **incorrect**. Total cash and credit sales for January is \$240,000.
- Answer (B) is **incorrect**. The amount of \$294,000 incorrectly assumes that uncollectible sales are 5%, cash collected in the month of sale is 60%, and cash collected in the month following the sale is 35%.

- Answer (C) is **correct**. Collections during January will consist of 40% of December's collectible credit sales, 60% of January's collectible credit sales, and cash sales for January. The January collections of December sales are expected to be \$136,800 ( $\$360,000 \times 40\% \times 95\%$ ). The January collections of January credit sales are expected to be \$102,600 ( $\$180,000 \times 60\% \times 95\%$ ). Given January cash sales of \$60,000, total budgeted cash receipts for January are \$299,400 ( $\$136,800 + \$102,600 + \$60,000$ ).
- Answer (D) is **incorrect**. The amount of \$239,400 does not include cash from January cash sales.

**[26] Gleim #: 6.8.163 -- Source: CMA 0408 2-062**

Granite Company sells products exclusively on account and has experienced the following collection pattern: 60% in the month of sale, 25% in the month after sale, and 15% in the second month after sale. Uncollectible accounts are negligible. Customers who pay in the month of sale are given a 2% discount. If sales are \$220,000 in January, \$200,000 in February, \$280,000 in March, and \$260,000 in April, Granite's accounts receivable balance on May 1 will be

- A. \$107,120
- B. \$143,920
- C. \$146,000
- D. \$204,000

- Answer (A) is **incorrect**. The amount of \$107,120 is based on the wrong percentages.
- Answer (B) is **incorrect**. The amount of \$143,920 is based on the wrong percentages.
- Answer (C) is **correct**. Granite's sales and collections activity can be calculated as follows:

	Sales	Collections			
		January	February	March	April
January	\$220,000	\$132,000	\$55,000	\$33,000	
February	200,000		120,000	50,000	\$ 30,000
March	280,000			168,000	70,000
April	260,000				156,000
	<u>\$960,000</u>	<u>\$132,000</u>	<u>\$175,000</u>	<u>\$251,000</u>	<u>\$256,000</u>

Total collections for the period were \$814,000 ( $\$132,000 + \$175,000 + \$251,000 + 256,000$ ), leaving a balance in accounts receivable on May 1 of \$146,000 ( $960,000 - \$814,000$ ). This total is composed of \$104,000 from April sales and \$42,000 (15%) of March sales.

- Answer (D) is **incorrect**. The amount of \$204,000 is based on the wrong percentages.

[27] Gleim #: 6.8.164 -- Source: CMA 0408 2-063

The controller of Nottingham Stores has asked a staff accountant to prepare detailed reports that summarize the firm's cash flows for the upcoming accounting period and cash position at the end of the period. Accordingly, the controller has requested preparation of a cash budget, a pro-forma statement of cash flows, a detailed listing of cash collections from customers, and a detailed listing of cash payments for merchandise purchases.

Which one of the following correctly identifies the first and last document to be prepared by the accountant?

	<u>First Document</u>	<u>Last Document</u>
A.	Listing of cash collections	Pro-forma statement of cash flows
B.	Listing of cash collections	Cash budget
C.	Cash budget	Either the listing of cash collections or listing of cash payments, the order of which is unimportant
D.	Listing of cash payments	Either the pro-forma statement of cash flows or the cash budget, the order of which is unimportant

- Answer (A) is **correct**. The listing of cash collections must be prepared first, since cash must be collected before it can be spent. The pro forma statement of cash flows is the culmination of the entire budgeting process.
- Answer (B) is **incorrect**. The cash budget must precede the pro forma statement of cash flows.
- Answer (C) is **incorrect**. The listings of cash collections and payments must precede the cash budget.
- Answer (D) is **incorrect**. The pro forma statement of cash flows cannot be prepared until the cash budget is complete.

**[28] Gleim #: 6.8.165 -- Source: CMA 0408 2-064**

Myers Company uses a calendar year and prepares a cash budget for each month of the year. Which one of the following items should be considered when developing July's cash budget?

- A. Federal income tax and Social Security tax withheld from employees' June paychecks to be remitted to the Internal Revenue Service in July.
  - B. Quarterly cash dividends scheduled to be declared on July 15 and paid on August 6 to shareholders of record as of July 25.
  - C. Property taxes levied in the last calendar year scheduled to be paid quarterly in the coming year during the last month of each calendar quarter.
  - D. Recognition that 0.5% of the July sales on account will be uncollectible.
- Answer (A) is **correct**. Withholding amounts that must be forwarded to the federal government represent cash collections that must be disbursed. They would therefore be included in the cash budget for the month of disbursement.
  - Answer (B) is **incorrect**. The cash disbursement for the dividends will not be made until August.
  - Answer (C) is **incorrect**. The property tax remittances will not be made until September.
  - Answer (D) is **incorrect**. Uncollectible accounts do not involve a cash outlay.

**[29] Gleim #: 6.8.166 -- Source: CMA 0408 2-065**

Brown Company estimates that monthly sales will be as follows:

January	\$100,000
February	150,000
March	180,000

Historical trends indicate that 40% of sales are collected during the month of sale, 50% are collected in the month following the sale, and 10% are collected two months after the sale. Brown's accounts receivable balance as of December 31 totals \$80,000 (\$72,000 from December's sales and \$8,000 from November's sales). The amount of cash Brown can expect to collect during the month of January is

- A. \$76,800
- B. \$84,000
- C. \$108,000
- D. \$133,000

- Answer (A) is **incorrect**. The amount of \$76,800 results from treating the amounts given for previous months as total sales instead of remaining receivables.
- Answer (B) is **incorrect**. The amount of \$84,000 results from miscalculating the receivables from previous months.
- Answer (C) is **correct**. The amount collected in January on January sales will be \$40,000 ( $\$100,000 \times 40\%$ ). The \$72,000 balance in receivables from December sales represents 60% ( $50\% + 10\%$ ) of that month's total. Since the total December sales were \$120,000 ( $\$72,000 \div 60\%$ ), the amount expected to be collected in January is \$60,000 ( $\$120,000 \times 50\%$ ). The \$8,000 balance from November represents all the remaining expected collections from that month's sales. Thus, total January collections on receivables are expected to be \$108,000 ( $\$40,000 + \$60,000 + \$8,000$ ).
- Answer (D) is **incorrect**. The amount of \$133,000 results from using the complement of the collection percentages.

**[30] Gleim #: 6.8.167 -- Source: CMA 0408 2-067**

Bootstrap Corporation anticipates the following sales during the last 6 months of the year:

July	\$460,000
August	500,000
September	525,000
October	500,000
November	480,000
December	450,000

20% of Bootstrap's sales are for cash. The balance is subject to the collection pattern shown below.

Percentage of balance collected in the month of sale	40%
Percentage of balance collected in the month following sale	30%
Percentage of balance collected in the second month following sale	25%
Percentage of balance uncollectible	5%

What is the planned net accounts receivable balance as of December 31?

- A. \$279,300
- B. \$294,000
- C. \$360,000
- D. \$367,500

- Answer (A) is **incorrect**. The amount of \$279,300 results from subtracting the bad debts from the net receivables.

- Answer (B) is **correct**. December 31 receivables will consist of portions of credit sales from November ( $\$480,000 \times 80\% = \$384,000$ ) and December ( $\$450,000 \times 80\% = \$360,000$ ). The collections on these sales can be calculated as follows:

	Credit Sales	Collections			
		November	December	January	February
November	\$384,000	\$153,600	\$115,200	\$ 96,000	
December	360,000		144,000	108,000	\$90,000
				<u>\$204,000</u>	<u>\$90,000</u>

Bootstrap's December 31 balance in accounts receivable is therefore \$294,000 (\$204,000 + \$90,000).

- Answer (C) is **incorrect**. The amount of \$360,000 results from including an extra month in receivables that has already been collected.
- Answer (D) is **incorrect**. The amount of \$367,500 is based on total sales rather than credit sales.

**[31] Gleim #: 6.8.168 -- Source: CMA 0408 2-068**

Projected monthly sales of Wallstead Corporation for January, February, March, and April are as follows:

January	\$300,000
February	340,000
March	370,000
April	390,000

- The company bills each month's sales on the last day of the month.
- Receivables are booked gross and credit terms of sale are 2/10, n/30.
- 50% of the billings are collected within the discount period, 30% are collected by the end of the month, 15% are collected by the end of the second month, and 5% become uncollectible.

Budgeted cash collections for Wallstead Company during April would be

- A. \$343,300
- B. \$347,000
- C. \$349,300
- D. \$353,000

- Answer (A) is **correct**. April collections will consist of 15% of February's gross sales (\$51,000) and both components of March sales, those collected within the discount period ( $\$370,000 \times 98\% \times 50\% = \$181,300$ ), and those collected after it ( $\$370,000 \times 30\% = \$111,000$ ). Total April cash collections are therefore \$343,300 (\$51,000 + \$181,300 + \$111,000).
- Answer (B) is **incorrect**. The amount of \$347,000 results from failing to account for the 2% discount period on March sales.
- Answer (C) is **incorrect**. The amount of \$349,300 results from using April sales.
- Answer (D) is **incorrect**. The amount of \$353,000 uses April sales and overlooks the discount.

[32] Gleim #: 6.8.169 -- Source: CMA 0408 2-069

Tip-Top Cleaning Supply carries a large number of different items in its inventory, giving the firm a competitive advantage in its industry. Below is part of Tip-Top's budget for the first quarter of next year.

Sales	\$855,000
Cost of goods sold	425,000
Rent and salary expenses	375,000

Historically, all of the sales are on account and are made evenly over the quarter. 5% of all sales are determined to be uncollectible and written off. The balance of the receivables is collected in 50 days. This sales and collection experience is expected to continue in the first quarter. The projected balance sheet for the first day of the quarter includes the following account balances.

Cash	\$ 10,000
Accounts receivable (net)	450,000
Inventory	900,000
Accounts payable	800,000

How much cash can Tip-Top anticipate collecting in the first quarter (based on a 360-day year)?

- A. \$811,000
- B. \$830,000
- C. \$901,250
- D. \$902,500

- Answer (A) is **correct**. At the end of the quarter, sales will represent 50 days of sales, which is about 5/9 of the quarter. The other 4/9 of the quarter's sales will be collected during the quarter. Since bad debts will be 5% of sales, Tip-Top expects to collect \$812,250 ( $\$855,000 \times 95\%$ ). Multiply \$812,250 times 4/9 and the amount to be collected during the quarter is \$361,000. Add in the \$450,000 of beginning receivables to get total collections of \$811,000.
- Answer (B) is **incorrect**. The amount of \$830,000 results from failing to consider uncollectible accounts.
- Answer (C) is **incorrect**. The amount of \$901,250 results from using a 40-day collection period instead of a 50-day period.

- Answer (D) is **incorrect**. The amount of \$902,500 results from using a 40-day collection period and failing to deduct bad debts.

**[33] Gleim #: 6.8.170 -- Source: CMA 0408 2-072**

Prudent Corporation's budget for the upcoming accounting period reveals total sales of \$700,000 in April and \$750,000 in May. The sales cash collection pattern is

20% of each month's sales are cash sales.

5% of a month's credit sales are uncollectible.

70% of a month's credit sales are collected in the month of sale.

25% of a month's credit sales are collected in the month following the sale.

If Prudent anticipates the cash sale of a piece of old equipment in May for \$25,000, May's total budgeted cash receipts would be

- A. \$560,000
- B. \$702,500
- C. \$735,000
- D. \$737,500

- Answer (A) is **incorrect**. The amount of \$560,000 results from failing to include cash sales and the proceeds from the sale of the equipment.
- Answer (B) is **incorrect**. The amount of \$702,500 results from failing to consider uncollectible accounts and from deducting cash sales before calculating receivables.
- Answer (C) is **correct**. Prudent's cash collections can be calculated as follows:

	Total Sales	Credit Sales	Collections	
			April	May
April	\$700,000	\$560,000	\$392,000	\$140,000
May	750,000	600,000		420,000
Cash collections on credit sales			\$392,000	\$560,000
Cash sales			140,000	150,000
Proceeds from sale of equipment				25,000
Total cash received			<u>\$532,000</u>	<u>\$735,000</u>

- Answer (D) is **incorrect**. The amount of \$737,500 results from improperly including cash sales in the receivables payment pattern.

[34] Gleim #: 6.8.171 -- Source: CMA 0408 2-073

ANNCO sells products on account and experiences the following collection schedule:

In the month of sale	10%
In the month after sale	60%
In the second month after sale	30%

At December 31, ANNCO reports accounts receivable of \$211,500. Of that amount, \$162,000 is due from December sales and \$49,500 from November sales. ANNCO is budgeting \$170,000 of sales for January. If so, what amount of cash should be collected in January?

- A. \$129,050
- B. \$174,500
- C. \$211,500
- D. \$228,500

- Answer (A) is **incorrect**. All receivables from November would be collected in January, as would 2/3 of December's receivables.
- Answer (B) is **correct**. The \$49,500 of receivables from November sales that are still outstanding at December 31 are the last amounts that will be received from November. The \$162,000 in receivables from December sales that are still outstanding at December 31 contain the collections for the month and the second month after sale. Thus, this amount must constitute 90% of total sales for December (60% + 30%), meaning total December sales were \$180,000 ( $\$162,000 \div 90\%$ ). The portion of this that will be collected in January is \$108,000 ( $\$180,000 \times 60\%$ ). Of January's sales, 10% will be collected in January ( $\$170,000 \times 10\% = \$17,000$ ). Therefore, total cash collections for January will be \$174,500 ( $\$49,500 + \$108,000 + \$17,000$ ).
- Answer (C) is **incorrect**. The amount of \$211,500, the amount of receivables at December 31, is not the amount that will be collected in January.
- Answer (D) is **incorrect**. The amount of \$228,500 results from failing to divide the December portion in its month-after and second-month-after components.

[35] Gleim #: 6.8.172 -- Source: CMA 0408 2-075

Healthy Way, Inc., has decided to start a cash budgeting program to improve overall cash management. Information gathered from the past year reveals the following cash collection trends:

- 40% of sales are on credit
- 50% of credit sales are collected in month of sale
- 30% of credit sales are collected first month after sale
- 15% of credit sales are collected second month after sale
- 5% of credit sales result in bad debts

Gross sales for the last 5 months were as follows:

January	\$220,000
February	240,000
March	250,000
April	230,000
May	260,000

Sales for June are projected to be \$255,000. Based on this information, the expected cash receipts for March would be

- A. \$230,000
- B. \$237,400
- C. \$242,000
- D. \$243,200

- Answer (A) is **incorrect**. The amount of \$230,000 results from failing to account separately for cash sales.
- Answer (B) is **incorrect**. The amount of \$237,400 results from subtracting bad debts on April credit sales.

- Answer (C) is **correct**. Healthy Way's cash receipts can be calculated as follows:

	Total Sales	Credit Sales	Collections		
			January	February	March
January	\$220,000	\$88,000	\$ 44,000	\$ 26,400	\$ 13,200
February	240,000	96,000		48,000	28,800
March	250,000	100,000			50,000
Collections on credit sales			\$ 44,000	\$ 74,400	\$ 92,000
Collections on cash sales			132,000	144,000	150,000
Total cash collections			<u>\$176,000</u>	<u>\$218,400</u>	<u>\$242,000</u>

- Answer (D) is **incorrect**. The collections for March would be \$242,000.

[36] Gleim #: 6.8.173 -- Source: CMA 0408 2-077

Data regarding Johnsen, Inc.'s forecast dollar sales for the last 7 months of the year and Johnsen's projected collection patterns are as follows:

Forecasted sales	
June	\$700,000
July	600,000
August	650,000
September	800,000
October	850,000
November	900,000
December	840,000

Types of sales	
Cash sales	30%
Credit sales	70%

Collection pattern on credit sales (5% determined to be uncollectible)	
During the month of sale	20%
During the first month following the sale	50%
During the second month following the sale	25%

Johnsen's budgeted cash receipts from sales and collections on account for September are

- A. \$635,000
- B. \$684,500
- C. \$807,000
- D. \$827,000

- Answer (A) is **incorrect**. The amount of \$635,000 results from failing to account separately for cash sales.

- Answer (B) is **correct**. Johnsen's cash receipts can be calculated as follows:

	Total Sales	Credit Sales	Collections			
			June	July	August	September
June	\$700,000	\$490,000	\$ 98,000	\$245,000	\$122,500	
July	600,000	420,000		84,000	210,000	\$105,000
August	650,000	455,000			91,000	227,500
September	800,000	560,000				112,000
Collections on credit sales			\$ 98,000	\$329,000	\$423,500	\$444,500
Collections on cash sales			210,000	180,000	195,000	240,000
Total cash collections			<u>\$308,000</u>	<u>\$509,000</u>	<u>\$618,500</u>	<u>\$684,500</u>

- Answer (C) is **incorrect**. The amount of \$807,000 results from adding in the final month of collections from June sales, which would have ended in August.
- Answer (D) is **incorrect**. Total collections for September would be \$684,500.

**[Fact Pattern #7]**

Karmee Company has been accumulating operating data in order to prepare an annual profit plan. Details regarding Karmee's sales for the first 6 months of the coming year are as follows:

Estimated Monthly Sales	Type of Monthly Sale
January \$600,000	Cash sales 20%
February 650,000	Credit sales 80%
March 700,000	
April 625,000	
May 720,000	
June 800,000	

Collection Pattern for Credit Sales	
Month of sale	30%
One month following sale	40%
Second month following sale	25%

Karmee's cost of goods sold averages 40% of the sales value. Karmee's objective is to maintain a target inventory equal to 30% of the next month's sales in units. Purchases of merchandise for resale are paid for in the month following the sale.

The variable operating expenses (other than cost of goods sold) for Karmee are 10% of sales and are paid for in the month following the sale. The annual fixed operating expenses are presented below. All of these are incurred uniformly throughout the year and paid monthly except for insurance and property taxes. Insurance is paid quarterly in January, April, July, and October. Property taxes are paid twice a year in April and October.

Annual Fixed Operating Costs	
Advertising	\$ 720,000
Depreciation	420,000
Insurance	180,000
Property taxes	240,000
Salaries	1,080,000

**[37] Gleim #: 6.8.174 -- Source: CMA 1296 3-6**

(Refers to Fact Pattern #7)

The amount of cash collected in March for Karmee Company from the sales made during March will be

- A. \$140,000
- B. \$308,000
- C. \$350,000
- D. \$636,000

- Answer (A) is **incorrect**. The amount of \$140,000 excludes collections on March credit sales.
- Answer (B) is **correct**. Cash sales are 20% of monthly sales, credit sales are 80% of monthly sales, and collections on credit sales are 30% in the month of sale. Consequently, cash collected during a month equals 44% [ $20\% + (30\% \times 80\%)$ ] of sales for that month. Cash collections in March on March sales were therefore \$308,000 ( $\$700,000 \times 44\%$ ).
- Answer (C) is **incorrect**. The amount of \$350,000 assumes 20% of sales are for cash and that collections on credit sales equal 30% of total sales.
- Answer (D) is **incorrect**. Total cash collections during March on first quarter sales equals \$636,000.

**[38] Gleim #: 6.8.175 -- Source: CMA 1296 3-7**

(Refers to Fact Pattern #7)

Karmee Company's total cash receipts for the month of April will be

- A. \$504,000
- B. \$629,000
- C. \$653,000
- D. \$707,400

- Answer (A) is **incorrect**. The amount of \$504,000 ignores \$125,000 of April cash sales.
- Answer (B) is **correct**. Cash collected during a month on sales for that month equals 44% of total sales. Hence, cash receipts in April on April's sales are \$275,000 ( $\$625,000 \times 44\%$ ). April collections on March credit sales equal \$224,000 ( $\$700,000 \times 40\% \times 80\%$ ). April collections on February credit sales equal \$130,000 ( $\$650,000 \times 25\% \times 80\%$ ). Thus, total cash receipts for April were \$629,000 ( $\$275,000 + \$224,000 + \$130,000$ ).
- Answer (C) is **incorrect**. The amount of \$653,000 includes \$24,000 of bad debts from January sales.
- Answer (D) is **incorrect**. The amount of \$707,400 represents June collections.

[1] Gleim #: 6.9.176 -- Source: CMA 0205 2-11

Holland Company is in the process of projecting its cash position at the end of the second quarter. Shown below is pertinent information from Holland's records.

Cash balance at end of 1st quarter	\$ 36,000
Cash collections from customers for 2nd quarter	1,300,000
Accounts payable at end of 1st quarter	100,000
Accounts payable at end of 2nd quarter	75,000
All 2nd quarter costs and expenses (accrual basis)	1,200,000
Depreciation (accrued expense included above)	60,000
Purchases of equipment (for cash)	50,000
Gain on sale of asset (for cash)	5,000
Net book value of asset sold	35,000
Repayment of notes payable	66,000

From the data above, determine Holland's projected cash balance at the end of the second quarter.

- A. \$0
- B. \$25,000
- C. \$60,000
- D. \$95,000

- Answer (A) is **incorrect**. The cash balance did change in the second quarter.
- Answer (B) is **incorrect**. Improperly deducting rather than adding the book value of the sold asset results in \$25,000.
- Answer (C) is **incorrect**. Failing to take the book value of the sold asset into account results in \$60,000 (the book value plus the gain is the cash received).

- Answer (D) is **correct**. The change in Holland's cash balance can be calculated as follows:

Beginning cash balance	\$ 36,000
Add: cash collections	1,300,000
Less: net change in accounts payable	(25,000)
Less: accrual-basis costs and expenses	(1,200,000)
Add: depreciation expense (noncash)	60,000
Less: payment for equipment	(50,000)
Add: net cash received from asset sale	40,000
Less: retirement of notes payable	<u>(66,000)</u>
Ending cash balance	<u><u>\$ 95,000</u></u>

**[2] Gleim #: 6.9.177 -- Source: CMA 0205 2-10**

Steers Company has just completed its prospective financial statements for the coming year. Relevant information is summarized below:

Projected net income	\$100,000
Anticipated capital expenditures	50,000
Increase in working capital	25,000
Depreciation expense	15,000

From the information provided above, the increase in Steers' cash account for the coming year will be

- A. \$25,000
- B. \$40,000
- C. \$90,000
- D. \$160,000

- Answer (A) is **incorrect**. The increase in working capital is not the only line item that affects cash.
- Answer (B) is **correct**. The change in cash can be calculated as follows:

Accrual-basis net income	\$100,000
Less: capital outlays	(50,000)
Less: increase in working capital	(25,000)
Add: depreciation expense (noncash)	<u>15,000</u>
Increase in cash	<u><u>\$ 40,000</u></u>

- Answer (C) is **incorrect**. The amount of \$90,000 ignores the outlays for capital expenditures.
- Answer (D) is **incorrect**. Improperly adding the capital outlays and increase in working capital and subtracting the depreciation expense results in \$160,000.

**[Fact Pattern #1]**

The Raymar Company is preparing its cash budget for the months of April and May. The firm has established a \$200,000 line of credit with its bank at a 12% annual rate of interest on which borrowings for cash deficits must be made in \$10,000 increments. There is no outstanding balance on the line of credit loan on April 1. Principal repayments are to be made in any month in which there is a surplus of cash. Interest is to be paid monthly. If there are no outstanding balances on the loans, Raymar will invest any cash in excess of its desired end-of-month cash balance in U.S. Treasury bills. Raymar intends to maintain a minimum balance of \$100,000 at the end of each month by either borrowing for deficits below the minimum balance or investing any excess cash. Expected monthly collection and disbursement patterns are shown below.

- *Collections*: 50% of the current month's sales budget and 50% of the previous month's sales budget.
- *Accounts Payable Disbursements*: 75% of the current month's accounts payable budget and 25% of the previous month's accounts payable budget.
- All other disbursements occur in the month in which they are budgeted.

	<u>Budget Information</u>		
	<u>March</u>	<u>April</u>	<u>May</u>
Sales	\$40,000	\$50,000	\$100,000
Accounts payable	30,000	40,000	40,000
Payroll	60,000	70,000	50,000
Other disbursements	25,000	30,000	10,000

**[3] Gleim #: 6.9.178 -- Source: CMA 1293 3-19**

(Refers to Fact Pattern #1)

In April, Raymar's budget will result in

- A. \$45,000 in excess cash.
- B. A need to borrow \$50,000 on its line of credit for the cash deficit.
- C. A need to borrow \$100,000 on its line of credit for the cash deficit.
- D. A need to borrow \$90,000 on its line of credit for the cash deficit.

- Answer (A) is **incorrect**. Cash receipts equals \$45,000.
- Answer (B) is **incorrect**. The cash deficit will be \$92,500 without borrowing.
- Answer (C) is **correct**. Assuming Raymar maintained a \$100,000 cash balance at the end of March, the amount to be borrowed or invested in April is the difference between cash receipts and disbursements. April's cash collections are \$45,000  $[(\$50,000 \text{ April sales} \times 50\%) + (\$40,000 \text{ March sales} \times 50\%)]$ . Disbursements for accounts payable are \$37,500  $[(\$40,000 \text{ April payables} \times 75\%) + (\$30,000 \text{ March payables} \times 25\%)]$ . In addition to the accounts payable disbursements, payroll and other disbursements will require an additional \$100,000. Hence, total disbursements are estimated to be \$137,500. The net negative cash flow (amount to be borrowed to reach the required minimum cash balance of \$100,000) is \$92,500  $(\$137,500 - \$45,000)$ . Because the line of credit must be drawn upon in \$10,000 increments, the loan must be for \$100,000.
- Answer (D) is **incorrect**. A loan of only \$90,000 would still leave a negative cash balance of \$2,500.

**[4] Gleim #: 6.9.179 -- Source: CMA 1293 3-20**

(Refers to Fact Pattern #1)

In May, Raymar will be required to

- A. Repay \$20,000 principal and pay \$1,000 interest.
  - B. Repay \$90,000 principal and pay \$100 interest.
  - C. Pay \$900 interest.
  - D. Borrow an additional \$20,000 and pay \$1,000 interest.
- Answer (A) is **incorrect**. No funds are available to repay the loan. May receipts are less than May disbursements.
  - Answer (B) is **incorrect**. No funds are available to repay the loan. May receipts are less than May disbursements.
  - Answer (C) is **incorrect**. The 1% interest is calculated on a \$100,000 loan, not a \$90,000 loan.

- Answer (D) is **correct**. The company will have to borrow \$100,000 in April, which means that interest will have to be paid in May at the rate of 1% per month (12% annual rate). Consequently, interest expense is \$1,000 ( $\$100,000 \times 1\%$ ). May receipts are \$75,000 [ $(\$100,000 \text{ May sales} \times 50\%) + (\$50,000 \text{ April sales} \times 50\%)$ ]. Disbursements in May are \$40,000 [ $(\$40,000 \text{ May payables} \times 75\%) + (\$40,000 \text{ April payables} \times 25\%)$ ]. In addition to the May accounts payable disbursements, payroll and other disbursements are \$60,000, bringing total disbursements to \$101,000 ( $\$60,000 + \$40,000 + \$1,000$ ). Thus, disbursements exceed receipts by \$26,000 ( $\$101,000 - \$75,000$ ). However, cash has a beginning surplus balance of \$7,500 ( $\$100,000 \text{ April loan} - \$92,500 \text{ negative cash flow for April calculated using the collections and disbursements information given}$ ). As a result, the company needs to borrow an additional \$18,500 to eliminate its cash deficit. Given the requirement that loans be in \$10,000 increments, the May loan must be for \$20,000.

**[Fact Pattern #2]**

Karmee Company has been accumulating operating data in order to prepare an annual profit plan. Details regarding Karmee's sales for the first 6 months of the coming year are as follows:

Estimated Monthly Sales	Type of Monthly Sale
January \$600,000	Cash sales 20%
February 650,000	Credit sales 80%
March 700,000	
April 625,000	
May 720,000	
June 800,000	

Collection Pattern for Credit Sales	
Month of sale	30%
One month following sale	40%
Second month following sale	25%

Karmee's cost of goods sold averages 40% of the sales value. Karmee's objective is to maintain a target inventory equal to 30% of the next month's sales in units. Purchases of merchandise for resale are paid for in the month following the sale.

The variable operating expenses (other than cost of goods sold) for Karmee are 10% of sales and are paid for in the month following the sale. The annual fixed operating expenses are presented below. All of these are incurred uniformly throughout the year and paid monthly except for insurance and property taxes. Insurance is paid quarterly in January, April, July, and October. Property taxes are paid twice a year in April and October.

Annual Fixed Operating Costs	
Advertising	\$ 720,000
Depreciation	420,000
Insurance	180,000
Property taxes	240,000
Salaries	1,080,000

**[5] Gleim #: 6.9.180 -- Source: CMA 1296 3-8**

(Refers to Fact Pattern #2)

The purchase of merchandise that Karmee Company will need to make during February will be

- A. \$254,000
- B. \$260,000
- C. \$266,000
- D. \$338,000

- Answer (A) is **incorrect**. The amount of \$254,000 reverses the treatment of the change in inventory.
- Answer (B) is **incorrect**. February COGS is \$260,000.
- Answer (C) is **correct**. Purchases equal cost of goods sold, plus ending inventory, minus beginning inventory. Estimated cost of goods sold for February equals \$260,000 ( $\$650,000 \text{ sales} \times 40\%$ ). Ending inventory is given as 30% of sales in units. Stated at cost, this amount equals \$84,000 ( $\$700,000 \text{ March sales} \times 30\% \times 40\%$ ). Furthermore, beginning inventory is \$78,000 ( $\$260,000 \text{ COGS for February} \times 30\%$ ). Thus, purchases equal \$266,000 ( $\$260,000 + \$84,000 - \$78,000$ ).
- Answer (D) is **incorrect**. The sum of COGS and beginning inventory equals \$338,000.

**[6] Gleim #: 6.9.181 -- Source: CMA 1296 3-9**

(Refers to Fact Pattern #2)

The amount for cost of goods sold that will appear on Karmee Company's pro forma income statement for the month of February will be

- A. \$195,000
- B. \$254,000
- C. \$260,000
- D. \$272,000

- Answer (A) is **incorrect**. The amount of \$195,000 is based on 30% of sales.
- Answer (B) is **incorrect**. Cost of goods sold, minus ending inventory, plus beginning inventory equals \$254,000.
- Answer (C) is **correct**. Cost of goods sold is expected to be 40% of sales. Thus, cost of goods sold is \$260,000 ( $\$650,000 \text{ February sales} \times 40\%$ ).
- Answer (D) is **incorrect**. Purchases, plus ending inventory, minus beginning inventory equals \$272,000.

[7] Gleim #: 6.9.182 -- Source: CMA 1296 3-10

(Refers to Fact Pattern #2)

The total cash disbursements that Karmee Company will make for the operating expenses (expenses other than the cost of goods sold) during the month of April will be

- A. \$255,000
- B. \$290,000
- C. \$385,000
- D. \$420,000

- Answer (A) is **incorrect**. The amount of \$255,000 excludes variable selling expenses and advertising.
- Answer (B) is **incorrect**. The amount of \$290,000 includes depreciation but excludes variable selling expenses and advertising.
- Answer (C) is **correct**. Cash disbursements for variable operating expenses in April (excluding cost of goods sold) equal \$70,000 (\$700,000 March sales  $\times$  10%). Cash disbursements for fixed operating expenses (excluding depreciation, a noncash expense) include advertising ( $\$720,000 \div 12 = \$60,000$ ), salaries ( $\$1,080,000 \div 12 = \$90,000$ ), insurance ( $\$180,000 \div 4 = \$45,000$ ), and property taxes ( $\$240,000 \div 2 = \$120,000$ ). Hence, cash payments for April operating expenses are \$385,000 (\$70,000 + \$60,000 + \$90,000 + \$45,000 + \$120,000).
- Answer (D) is **incorrect**. The amount of \$420,000 includes depreciation.

**[Fact Pattern #3]**

Information pertaining to Noskey Corporation's sales revenue is presented in the following table:

	November Year 1 (Actual)	December Year 1 (Budget)	January Year 2 (Budget)
Cash sales	\$ 80,000	\$100,000	\$ 60,000
Credit sales	240,000	360,000	180,000
Total sales	<u>\$320,000</u>	<u>\$460,000</u>	<u>\$240,000</u>

Management estimates that 5% of credit sales are uncollectible. Of the credit sales that are collectible, 60% are collected in the month of sale and the remainder in the month following the sale. Purchases of inventory are equal to next month's sales, and gross profit margin is 30%. All purchases of inventory are on account; 25% are paid in the month of purchase, and the remainder are paid in the month following the purchase.

**[15] Gleim #: 6.9.190 -- Source: CMA 1291 3-25**

(Refers to Fact Pattern #3)

Noskey Corporation's budgeted total cash payments in December Year 1 for inventory purchases are

- A. \$405,000
- B. \$283,500
- C. \$220,500
- D. \$168,000

- Answer (A) is **incorrect**. The purchases valued at sales price, not cost, is \$405,000.
- Answer (B) is **correct**. The December inventory payments include 75% of November purchases plus 25% of December purchases. Given a gross margin of 30%, cost must be 70% of sales. November purchases are therefore \$322,000 (\$460,000 December sales  $\times$  70%), and the December outlay for November purchases is \$241,500 (\$322,000  $\times$  75%). Purchases during December are \$168,000 (\$240,000 January sales  $\times$  70%), and the December outlay for December purchases is \$42,000 (\$168,000  $\times$  25%), a total cash outlay of \$283,500.
- Answer (C) is **incorrect**. The amount of \$220,500 is calculated based on credit sales, not total sales.
- Answer (D) is **incorrect**. The cash payment for December purchases only is \$168,000.

---

**[Fact Pattern #4]**

Cooper Company's management team is preparing a cash budget for the coming quarter. The following budgeted information is under review:

	<u>January</u>	<u>February</u>	<u>March</u>
Revenue	\$700,000	\$800,000	\$500,000
Inventory purchases	350,000	425,000	225,000
Other expenses	150,000	175,000	175,000

The company expects to collect 40% of its monthly sales in the month of sale and 60% in the following month. 50% of inventory purchases are paid in the month of purchase and the other 50% in the following month. All payments for other expenses are made in the month incurred.

---

**[17] Gleim #: 6.9.192 -- Source: CMA 0408 2-066**

(Refers to Fact Pattern #4)

Cooper forecasts the following account balances at the beginning of the quarter.

Cash	\$100,000
Accounts receivable	300,000
Accounts payable (inventory)	500,000

Given the above information, the projected change in cash during the coming quarter will be

- A. \$412,500
- B. \$300,000
- C. \$112,500
- D. \$0

- Answer (A) is **incorrect**. The amount of \$412,500 results from including the beginning balance in cash and failing to include the beginning balances in accounts receivable and accounts payable.
- Answer (B) is **incorrect**. The amount of \$300,000 is merely the receivables from the previous quarter that will be collected in the current quarter.

- Answer (C) is **correct**. Cooper's collections for the quarter can be calculated as follows:

		Collections		
	Sales	January	February	March
January	\$700,000	\$280,000	\$420,000	
February	800,000		320,000	\$480,000
March	500,000			200,000
		<u>\$280,000</u>	<u>\$740,000</u>	<u>\$680,000</u>

Total collections are therefore \$1,700,000 (\$280,000 + \$740,000 + \$680,000). The disbursements for inventory can likewise be calculated as follows:

		Disbursements		
	Inventory Purchases	January	February	March
January	\$350,000	\$175,000	\$175,000	
February	425,000		212,500	\$212,500
March	225,000			112,500
		<u>\$175,000</u>	<u>\$387,500</u>	<u>\$325,000</u>

Total inventory disbursements are therefore \$887,500 (\$175,000 + \$387,500 + \$325,000). Disbursements for other expenses total \$500,000 (\$150,000 + \$175,000 + \$175,000). The net change in Cooper's balance of cash for the quarter can now be calculated:

Collections on sales	\$1,700,000
Disbursements for inventory	(887,500)
Disbursements for other expenses	(500,000)
Beginning accounts receivable	300,000
Beginning accounts payable	<u>(500,000)</u>
Change in cash	<u>\$ 112,500</u>

- Answer (D) is **incorrect**. Cash will increase during the quarter (receipts will exceed payments).

**[18] Gleim #: 6.9.193 -- Source: CMA 0408 2-070**

Monroe Products is preparing a cash forecast based on the following information:

- Monthly sales: December, \$200,000; January, \$200,000; February, \$350,000; March, \$400,000.
- All sales are on credit and collected the month following the sale.
- Purchases are 60% of next month's sales and are paid for in the month of purchase.
- Other monthly expenses are \$25,000, including \$5,000 of depreciation.

If the January beginning cash balance is \$30,000, and Monroe is required to maintain a minimum cash balance of \$10,000, how much short-term borrowing will be required at the end of February?

- A. \$60,000
- B. \$70,000
- C. \$75,000
- D. \$80,000

- Answer (A) is **incorrect**. The amount of \$60,000 results from failing to include the minimum balance requirement.
- Answer (B) is **correct**. Monroe's short-term cash requirements at the end of February can be calculated as follows:

Beginning cash balance	\$ 30,000
Collections on December sales (in January)	200,000
Collections on January sales (in February)	200,000
Disbursements for inventory (in January)	(210,000)
Disbursements for inventory (in February)	(240,000)
Disbursements for other expenses (in January)	(20,000)
Disbursements for other expenses (in February)	(20,000)
Minimum balance requirement	<u>(10,000)</u>
Shortfall	<u><u>\$ (70,000)</u></u>

- Answer (C) is **incorrect**. The amount of \$75,000 results from treating that one month of depreciation as a cash expense, which it is not.
- Answer (D) is **incorrect**. The amount of \$80,000 results from treating depreciation as a cash expense.

**[19] Gleim #: 6.9.194 -- Source: CMA 0408 2-078**

The Mountain Mule Glove Company is in its first year of business. Mountain Mule had a beginning cash balance of \$85,000 for the quarter. The company has a \$50,000 short-term line of credit. The budgeted information for the first quarter is shown below.

	<u>January</u>	<u>February</u>	<u>March</u>
Sales	\$60,000	\$40,000	\$50,000
Purchases	35,000	40,000	75,000
Operating costs	25,000	25,000	25,000

All sales are made on credit and are collected in the second month following the sale. Purchases are paid in the month following the purchase, while operating costs are paid in the month that they are incurred. How much will Mountain Mule need to borrow at the end of the quarter if the company needs to maintain a minimum cash balance of \$5,000, as required by a loan covenant agreement?

- A. \$0
- B. \$5,000
- C. \$10,000
- D. \$45,000

- Answer (A) is **incorrect**. Expenses will exceed income for the quarter.
- Answer (B) is **incorrect**. The amount of \$5,000 is only the minimum required balance.
- Answer (C) is **correct**. Mountain Mule's short-term borrowing needs can be calculated as follows:

Beginning cash balance	\$ 85,000
Collections on January sales (in March)	60,000
Disbursements for January inventory (in February)	(35,000)
Disbursements for February inventory (in March)	(40,000)
Disbursements for other expenses (\$25,000 × 3)	(75,000)
Minimum balance requirement	<u>(5,000)</u>
Shortfall	<u><u>\$ (10,000)</u></u>

- Answer (D) is **incorrect**. The amount of \$45,000 results from simply drawing the entire line of credit over the minimum balance.

**[8] Gleim #: 6.10.202 -- Source: CMA 0408 2-036**

Netco's sales budget for the coming year is as follows.

<u>Item</u>	<u>Volume in Units</u>	<u>Sales Price</u>	<u>Sales Revenue</u>
1	200,000	\$50	\$10,000,000
2	150,000	10	1,500,000
3	300,000	30	<u>9,000,000</u>
Total sales revenue			<u><u>\$20,500,000</u></u>

Items 1 and 3 are different models of the same product. Item 2 is a complement to Item 1. Past experience indicates that the sales volume of Item 2 relative to the sales volume of Item 1 is fairly constant. Netco is considering a 10% price increase for the coming year for Item 1, which will cause sales of Item 1 to decline by 20%, while simultaneously causing sales of Item 3 to increase by 5%. If Netco institutes the price increase for Item 1, total sales revenue will decrease by

- A. \$1,050,000
- B. \$850,000
- C. \$750,000
- D. \$550,000

- Answer (A) is **correct**. First, the changes in sales volume can be calculated:

<u>Item</u>	<u>Unit Volume Before Price Change</u>		<u>Unit Change Factor</u>		<u>Unit Volume After Price Change</u>
1	200,000	×	0.80	=	160,000
2	150,000	×	0.80	=	120,000
3	300,000	×	1.05	=	315,000

Next, the changes in unit price:

<u>Item</u>	<u>Price Before Price Change</u>		<u>Price Change Factor</u>		<u>Price After Price Change</u>
1	\$50	×	1.10	=	\$55
2	10	×	1.00	=	10
3	30	×	1.00	=	30

Third, the total sales revenue resulting from the changes in volume and price:

<u>Item</u>	<u>Unit Volume After Price Change</u>		<u>Price After Price Change</u>		<u>Sales Revenue After Price Change</u>
1	160,000	×	\$55	=	\$8,800,000
2	120,000	×	10	=	1,200,000
3	315,000	×	30	=	9,450,000
					<u>\$19,450,000</u>

The decrease in Netco's total revenue after the price change will therefore be \$1,050,000 (\$20,500,000 – \$19,450,000).

- Answer (B) is **incorrect**. The amount of \$850,000 results from increasing the price of Item 3 rather than the volume.
- Answer (C) is **incorrect**. The amount of \$750,000 results from failing to reduce the unit volume of Item 2 in tandem with the reduction in Item 1.
- Answer (D) is **incorrect**. Total sales revenue will decrease by \$1,050,000.

---

**[Fact Pattern #1]**

Super Drive, a computer disk storage and back-up company, uses accrual accounting. The company's Statement of Financial Position for the year ended November 30 is as follows:

Super Drive  
Statement of Financial Position  
as of November 30

Assets		Liabilities and Stockholders' Equity	
Cash	\$ 52,000	Accounts payable	\$ 175,000
Accounts receivable, net	150,000	Common stock	900,000
Inventory	315,000	Retained earnings	<u>442,000</u>
Property, plant, and equipment	<u>1,000,000</u>	Total liabilities and	
Total assets	<u>\$1,517,000</u>	stockholders' equity	<u>\$1,517,000</u>

Additional information regarding Super Drive's operations include the following:

- Sales are budgeted at \$520,000 for December and \$500,000 for January of the next year.
- Collections are expected to be 60% in the month of sale and 40% in the month following the sale.
- Eighty percent of the disk drive components are purchased in the month prior to the month of sale, and 20% are purchased in the month of sale. Purchased components are 40% of the cost of goods sold.
- Payment for the components is made in the month following the purchase.
- Cost of goods sold is 80% of sales.

---

**[9] Gleim #: 6.10.203 -- Source: CMA 1294 3-8**

(Refers to Fact Pattern #1)

Super Drive's projected balance in accounts payable on December 31 is

- A. \$161,280
- B. \$326,400
- C. \$166,400
- D. \$416,000

- Answer (A) is **correct**. Payments are made in the month following purchase. The balance in accounts payable on November 30 is \$175,000; this amount will be paid in December. The account is credited for purchases of a portion of components to be used for sales in December (20% of December components) and for sales in January (80% of January components). Cost of goods sold is 80% of sales, and components are 40% of cost of goods sold. Thus, December component needs are \$166,400 ( $\$520,000 \text{ sales} \times 80\% \times 40\%$ ), and January component needs are \$160,000 ( $\$500,000 \text{ sales} \times 80\% \times 40\%$ ). The December purchases of December component needs equal \$33,280 ( $\$166,400 \times 20\%$ ). December purchases of January component needs are \$128,000 ( $\$160,000 \times 80\%$ ). Hence, the total of December purchases (ending balance in accounts payable) equals \$161,280 ( $\$33,280 + \$128,000$ ).
- Answer (B) is **incorrect**. The sum of the component needs for December and January equals \$326,400.
- Answer (C) is **incorrect**. December component needs equals \$166,400.
- Answer (D) is **incorrect**. Cost of sales for December equals \$416,000.

[10] Gleim #: 6.10.204 -- Source: CMA 1294 3-9

(Refers to Fact Pattern #1)

Super Drive's projected gross profit for the month ending December 31 is

- A. \$416,000
- B. \$104,000
- C. \$134,000
- D. \$536,000

- Answer (A) is **incorrect**. Cost of goods sold is \$416,000 (80% of sales).
- Answer (B) is **correct**. Given that cost of goods sold is 80% of sales, gross profit is 20% of sales. Consequently, pro forma gross profit is \$104,000 ( $\$520,000 \times 20\%$ ).
- Answer (C) is **incorrect**. The amount of \$134,000 equals 20% of the sum of November receivables and December sales.
- Answer (D) is **incorrect**. Gross profit cannot be greater than sales.

---

**[Fact Pattern #2]**

Kelly Company is a retail sporting goods store that uses accrual accounting for its records. Facts regarding Kelly's operations are as follows:

- Sales are budgeted at \$220,000 for December Year 1 and \$200,000 for January Year 2.
- Collections are expected to be 60% in the month of sale and 38% in the month following the sale.
- Gross margin is 25% of sales.
- A total of 80% of the merchandise held for resale is purchased in the month prior to the month of sale and 20% is purchased in the month of sale. Payment for merchandise is made in the month following the purchase.
- Other expected monthly expenses to be paid in cash are \$22,600.
- Annual depreciation is \$216,000.

Below is Kelly Company's statement of financial position at November 30, Year 1.

Assets

Cash	\$ 22,000
Accounts receivable (net of \$4,000 allowance for uncollectible accounts)	76,000
Inventory	132,000
Property, plant, and equipment (net of \$680,000 accumulated depreciation)	870,000
Total assets	<u><u>\$1,100,000</u></u>

Liabilities and Stockholders' Equity

Accounts payable	\$ 162,000
Common stock	800,000
Retained earnings	138,000
Total liabilities and stockholders' equity	<u><u>\$1,100,000</u></u>

---

**[11] Gleim #: 6.10.205 -- Source: CMA 1283 4-23**

(Refers to Fact Pattern #2)

Kelly's pro forma income (loss) before income taxes for December Year 1 is

- A. \$32,400
- B. \$28,000
- C. \$10,000
- D. Some amount other than those given.

- Answer (A) is **incorrect**. The amount of \$32,400 does not reflect depreciation or bad debt expense.
- Answer (B) is **incorrect**. The amount of \$28,000 does not consider depreciation.
- Answer (C) is **correct**. Sales are budgeted at \$220,000. Given that cost of goods sold is 75% of sales, or \$165,000, gross profit is \$55,000. Deduct cash expenses of \$22,600, depreciation of \$18,000 ( $\$216,000 \div 12$ ), and bad debt expense of \$4,400 ( $\$220,000 \times .02$ ). This leaves an income of \$10,000.
- Answer (D) is **incorrect**. The correct amount is given in one of the other answer choices.

**[12] Gleim #: 6.10.206 -- Source: CMA 1283 4-24**

(Refers to Fact Pattern #2)

Kelly's projected balance in accounts payable on December 31, Year 1, is

- A. \$162,000
- B. \$204,000
- C. \$153,000
- D. Some amount other than those given.

- Answer (A) is **incorrect**. The accounts payable balance on November 30 is \$162,000.
- Answer (B) is **incorrect**. Estimated purchases in December at the company's selling prices equals \$204,000.
- Answer (C) is **correct**. The balance is equal to the purchases made during December since all purchases are paid for in the month following purchase. Purchases for December is given as 20% of December's sales and 80% of January's sales. Thus, of the \$220,000 of merchandise sold during December, 20%, or \$44,000, would have been purchased during the month. January's sales are expected to be \$200,000, so 80% of that amount, or \$160,000, would have been purchased during December. December purchases are thus estimated as \$204,000 at the company's selling prices. The merchandise costs only 75% of the marked selling prices, however. Therefore, the balance in the purchases account at month-end is projected to be \$153,000 ( $\$204,000 \times 75\%$ ).
- Answer (D) is **incorrect**. The correct amount is given in one of the other answer choices.

[13] Gleim #: 6.10.207 -- Source: CMA 1283 4-25

(Refers to Fact Pattern #2)

Kelly's projected balance in inventory on December 31, Year 1, is

- A. \$160,000
- B. \$120,000
- C. \$153,000
- D. \$150,000

- Answer (A) is **incorrect**. Ending inventory at the company's selling prices equals \$160,000.
- Answer (B) is **correct**. The inventory is expected to be 80% of January's needs. Projected January sales of  $\$200,000 \times 80\% = \$160,000$ . Thus, the ending inventory would be goods that the company could sell for \$160,000. Given a gross margin of 25%, cost would only be 75% of sales, and ending inventory would be \$120,000 ( $\$160,000 \times 75\%$ ).
- Answer (C) is **incorrect**. The projected balance in accounts payable is \$153,000.
- Answer (D) is **incorrect**. The ending inventory would be \$150,000 if 100% of January's needs are purchased in December.

# PART 1

# Financial Planning, Performance and Control

## C. Cost Management (25% - Levels A, B, and C) U.4,5,6 & 7

This section represents 25% of the Part 1 Exam. This section focuses on the process of determining and also ways of controlling how much it costs to produce a product. This includes several types of cost accumulation and cost allocation systems as well as sources of operational efficiency and business process performance for a firm. An important concept in the business process performance portion is the concept of competitive advantage and how a firm can attain it.

STUDY UNIT Four

## COST MANAGEMENT TERMINOLOGY AND CONCEPTS

### MANAGEMENT ACCOUNTING, FINANCIAL ACCOUNTING, AND COST ACCOUNTING (different goals)

#### Management accounting (internal reporting)

- Measures and reports financial and nonfinancial information that helps managers make decisions to fulfill the goals of an organization.

#### Financial accounting (external reporting based on generally accepted accounting principles (GAAP)).

#### Cost accounting

- provides information for management accounting and financial accounting.

#### Cost Management

- describe the approaches and activities of managers in short-run and long-run planning and control decisions that increase value for customers and lower costs of products and services.

#### Three features of cost accounting and cost management across a wide range of applications are:

- Calculating the cost of products, services, and other cost objects (CMA Part 1).
- Obtaining information for planning and control and performance evaluation (CMA Part 1).
- Analyzing the relevant information for making decisions (CMA Part 2).

### Cost, Cost objects and Cost pools

#### Cost

**Cost** a resource sacrificed or forgone to achieve a specific objective. An actual cost is the cost incurred (a historical cost), as distinguished from a budgeted (or forecasted) cost.

#### Cost Pool

Often costs are collected into meaningful groups called **cost pools**.

#### Cost object (anything for which a measurement of costs is desired)

Examples: A cost object is any

- product,
- service,
- customer,
- activity, or
- organizational unit

to which costs are assigned for some management purpose.

#### Cost accumulation and Cost assignment

A costing system typically accounts for costs in two basic stages: accumulation followed by assignment.

**Cost accumulation** is the collection of cost data in some organized way by means of an accounting system.

Beyond accumulating costs, managers **assign** costs to designated cost objects

**Cost assignment** is a general term that encompasses both:

- tracing** accumulated costs that have a *direct* relationship to a cost object and
- allocating** accumulated costs that have an *indirect* relationship to a cost object.

## Direct cost and Indirect cost (TRACING COSTS TO COST OBJECTS)

### Direct costs of a cost object (EASILY TRACED)

A direct cost can be easily (i.e., conveniently and economically without excessive cost and without significant effort) traced to a cost pool or object, as the cost directly relates to that item.

Common direct costs include:

1. Direct Raw Materials:
2. Direct Labor

### Indirect costs of a cost object (not easily traceable to a cost pool or cost object)

Indirect costs are related to the particular cost object but cannot be traced to a cost object in an economically feasible (cost-effective) way. Indirect costs are typically incurred to benefit two or more cost pools or objects.

Examples of indirect costs include:

1. Indirect Materials
2. Indirect Labor
3. Other Indirect Costs (Common cost)

### "OVERHEAD" ALLOCATION USING ALLOCATION BASES (COST DRIVERS)

**Cost allocation** is made by using **cost drivers** (also called **allocation bases**), management accountants use cost allocation techniques in cases which direct tracing is not possible, and so cost drivers are used instead.

**Cost drivers** are: Activities that cause costs to increase as the activity increases

For example, if the cost driver for materials handling cost is the number of parts, the total cost of materials handling can be assigned to each product on the basis of its total number of parts relative to the total number of parts in all other products.

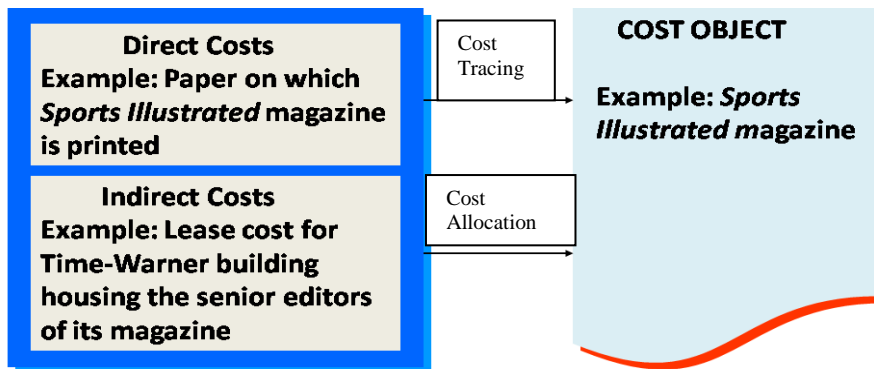

**Cost allocation is necessary for, among other things,**

- product costing (P1 CMA),
- pricing(P2 CMA),,
- investment and disinvestment decisions(P2 CMA),,
- managerial performance measurement(P1 CMA),,
- make-or-buy decisions(P2 CMA),
- determination of profitability(P2 CMA), and
- measuring income and assets for external reporting(P1 CMA).

Cost allocation is less meaningful for internal purposes because responsibility accounting systems emphasize controllability, a process often ignored in cost allocation.

## Example: Cost Assignment

### Reasons for indirect cost allocation to cost objects

- measure income and assets for external reporting purposes.
- justify costs for reimbursement purposes.
- provide information for economic decision making
- To motivate managers and employees

## Manufacturing and Nonmanufacturing costs

### Manufacturing Costs (Treated as Product Costs)

Most manufacturing companies separate manufacturing costs into three broad categories:

1. **Direct Materials** costs are the acquisition costs of all materials that eventually become part of the cost object (work in process and then finished goods) and that can be traced to the cost object in an economically feasible way.

Examples of direct material costs are the aluminum used to make Pepsi cans and the paper used to print Sports Illustrated.

2. **Direct manufacturing labor costs** include the compensation of all manufacturing labor that can be traced to the cost object (work in process and then finished goods) in an economically feasible way.

Examples include wages and fringe benefits paid to machine operators and assembly-line workers who convert direct materials purchased to finished goods.

3. **Indirect manufacturing costs** are all manufacturing costs that are related to the cost object (work in process and then finished goods) but that cannot be traced to that cost object in an economically feasible way.

Indirect manufacturing costs "Manufacturing overhead" includes items such as

- I. indirect materials;
- II. indirect labor and
- III. other MOH costs.

### Common practice (single cost pool)

Usually all indirect costs-for indirect materials, indirect labor, and other indirect items-are commonly combined into a single cost pool called overhead.

The previous costs can be combined as follows

1. **Prime costs** which include (DM & DL) and
2. **Conversion cost** which include (DL & MOH).

### Nonmanufacturing costs (selling, general, and administrative (SG&A) costs) (Treated as Period Costs)

Nonmanufacturing costs are often divided into two categories:

- (1) Selling costs and
- (2) General & administrative costs.

Nonmanufacturing costs can be viewed by the value chain costs other than manufacturing:

- Research and development costs
- Design costs
- Marketing costs
- Distribution costs
- Customer service costs
- Administrative costs

## Product costs and period costs

### Product (inventoriable) costs

For financial accounting purposes, product costs include all costs involved in acquiring or making a product (only the costs necessary to complete the product), product costs are capitalized as part of finished goods inventory, then become a component of cost of goods sold.

Product costs for a manufacturing firm include,

1. **Direct materials.** The materials used to manufacture the product, which become a physical part of it.
2. **Direct labor.** The labor used to manufacture the product.
3. **Factory overhead.** The indirect costs for materials, labor, and facilities used to support the manufacturing process.

### Period (expired) costs

Period costs are all the costs that are not product costs. Thus it includes all nonmanufacturing costs in the income statement such as general, selling, and administrative and any abnormal spoilage costs that are necessary for the management of the company but are not involved directly or indirectly in the manufacturing process (or in the purchase of the products for resale). For financial accounting purposes, period costs include all the value-chain costs except the production costs.

## Types of inventory in manufacturing firms

Manufacturing firms have three types of inventory:

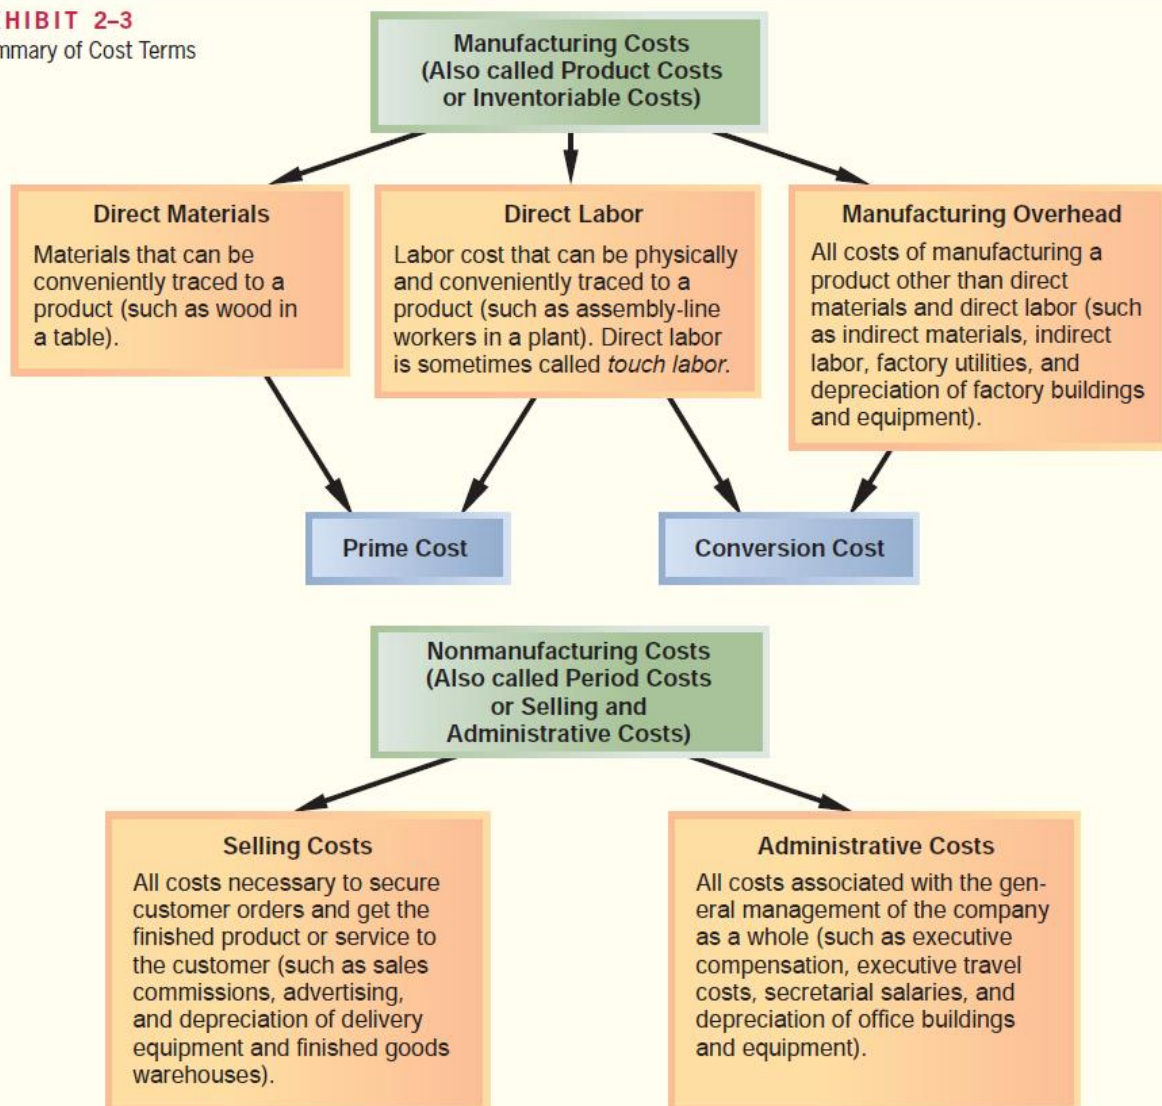

1. **Direct materials inventory.** Direct materials in stock and awaiting use in the manufacturing process (for example, the computer chips and components needed to manufacture cellular phones).
2. **Work-in-process (also called work in progress) inventory.** Goods partially worked on but not yet fully completed (for example, cellular phones at various stages of completion in the manufacturing process).
3. **Finished-goods inventory.** Goods (for example, cellular phones) fully completed but not yet sold.

Exhibit 5-3 contains a summary of the cost terms that we have introduced so far.

**EXHIBIT 2-3**

Summary of Cost Terms

**PASS KEY**

Cost accounting systems are designed to meet the goal of measuring cost objects or objectives. The most frequent objectives include:

- Product Costing (inventory and cost of goods manufactured and sold)
- Efficiency Measurements (comparisons to standards)
- Income Determination (profitability)

## Cost behavior Patterns: Variable costs and fixed costs

### A. VARIABLE COST

#### 1. Behavior

A variable cost changes proportionally with the cost driver (e.g., typical cost drivers include sales volume and production volume).

#### 2. Amount (Constant Per Unit, Total Varies)

##### Variable cost & activity

A variable cost is a cost that varies, in total, in direct proportion to changes in the level of activity or volume (the cost driver). The activity can be expressed in many ways, such as units produced, units sold, miles driven, beds occupied, lines of print, hours worked, and so forth.

**Example:** A good example of a variable cost is direct materials. The cost of direct materials used during a period will vary, in total, in direct proportion to the number of units that are produced, another examples direct labor and part of manufacturing overhead.

Variable cost per unit remains constant in the short run regardless of the level of production. Straight line, parallel to the horizontal axis.

Variable costs in total, on the other hand, vary directly and proportionally with changes in volume. Straight line, sloping upward to the right.

### B. FIXED COST

#### 1. Behavior

In the short-term and within a relevant range, a fixed cost does not change when the cost driver changes.

A fixed cost is a cost that remains constant, in total, for a given time period despite, regardless of changes in the level of activity.

#### 2. Amount (Varies per Unit, Total Remains Constant)

##### **PASS KEY**

The distinction between variable costs and fixed costs allows managers to determine the effect of a given percentage change in production output on costs. Be careful! The examiners often attempt to trick candidates by providing a fixed cost per unit for a given volume of production. As fixed costs are "fixed," the candidate must convert this format to a dollar amount that will not change as production volume changes within a relevant range.

### 3. Long-Run Characteristics

Given enough time (and a long enough relevant range), any cost can be considered variable.

Total Fixed cost, Straight line, parallel to the horizontal axis.

Fixed cost per unit, on the other hand, varies indirectly with the activity level, the unit cost decreases as volume increases.

#### Relevant range (cost relationships hold constant)

The relevant range is the range for which the assumptions of the cost driver (i.e., **linear relationship** with the costs incurred) are valid. Total costs are assumed to be linear when plotted on a graph.

A summary of both variable and fixed cost behavior .

Cost	Behavior of the Cost (within the relevant range)	
	In Total	Per Unit
Variable cost	Total variable cost increases and decreases in proportion to changes in the activity level.	Variable cost per unit remains constant.
Fixed cost	Total fixed cost is not affected by changes in the activity level within the relevant range.	Fixed cost per unit decreases as the activity level rises and increases as the activity level falls.

### C. SEMI-VARIABLE COSTS (MIXED COSTS)

Costs frequently contain both fixed and variable components. A cost that includes components which remain constant over the relevant range and includes components that fluctuate in direct relation to production are termed semi variable.

**Mixed (semivariable) costs** combine fixed and variable elements, e.g., rental expense on a car that carries a flat fee per month plus an additional fee for each mile driven.

**Step Costs** a cost is said to be a step cost when it varies with the cost driver but does so in discrete steps (Exhibit 3-15). step costs is another type of nonlinear-cost function, one that is constant over small ranges of output but increases by steps (discrete amounts) as levels of activity increase.

**EXHIBIT 3.9** A Step Cost

## Methods of estimating mixed costs

Sometimes the fixed and variable portions of a mixed cost are not set by contract as in the above example and thus must be estimated. **Two methods of estimating mixed costs are in general use:**

- The high-low method
- The regression (scattergraph) method

### The high-low method

The high-low method is the less accurate but the quicker of the two methods. The difference in cost between the highest and lowest levels of activity is divided by the difference in the activity level to arrive at the variable portion of the cost.

EXAMPLE: A company has the following cost data:

Month	Machine Hours	Maintenance Costs
April	1,000	\$2,275
May	1,600	\$3,400
June	1,200	\$2,650
July	800	\$1,900
August	1,200	\$2,650
September	1,000	\$2,275

The slope coefficient,  $b$ , is calculated as follows:

$$\text{Slope coefficient} = \frac{\text{Difference between costs associated with highest and lowest observations of the cost driver}}{\text{Difference between highest and lowest observations of the cost driver}}$$

*The numerator* can be derived by subtracting the cost at the lowest level (July) from the cost at the highest level (May) [\$3,400 – \$1,900 = \$1,500].

*The denominator* can be derived by subtracting the lowest level of activity (July) from the highest level (May) [1,600 – 800 = 800].

The *variable portion* of the cost is therefore \$1.875 per machine hour ( $\$1,500 \div 800$ ).

The *fixed portion* can be calculated by inserting the appropriate values for either the high or low month in the range:

$$\begin{aligned}\text{Fixed portion} &= \text{Total cost} - \text{Variable portion} \\ &= \$1,900 - (\$1.875 \times 800 \text{ hours}) \\ &= \$1,900 - \$1,500 \\ &= \$400\end{aligned}$$

### The regression (scattergraph) method

The regression (scattergraph) method is considerably more complex and determines the average rate of variability of a mixed cost rather than the variability between the high and low points in the range.

### Total costs and unit costs

In general, focus on total costs, not unit costs. When making total cost estimates think of variable costs as an amount per unit and fixed costs as a total amount. The unit cost of a cost object should be interpreted cautiously when it includes a fixed cost component.

## Relationships of types of costs

We have introduced two major classifications of costs: direct/indirect and variable/fixed costs may simultaneously be

- Direct and variable
- Direct and fixed
- Indirect and variable
- Indirect and fixed

Exhibit 3-9 shows examples of costs in each of these four cost classifications for the Ford Windstar.

		Assignment of Costs to Cost Object	
		Direct Costs	Indirect Costs
Cost-Behavior Pattern	Variable Costs	<ul style="list-style-type: none"> <li>• Cost object: BMW X5s produced</li> <li>Example: Tires used in assembly of automobile</li> </ul>	<ul style="list-style-type: none"> <li>• Cost object: BMW X5s produced</li> <li>Example: Power costs at Spartanburg plant. Power usage is metered only to the plant, where multiple products are assembled.</li> </ul>
	Fixed Costs	<ul style="list-style-type: none"> <li>• Cost object: BMW X5s produced</li> <li>Example: Salary of supervisor on BMW X5 assembly line</li> </ul>	<ul style="list-style-type: none"> <li>• Cost object: BMW X5s produced</li> <li>Example: Annual lease costs at Spartanburg plant. Lease is for whole plant, where multiple products are produced.</li> </ul>

#### Exhibit 2-5

Examples of Costs in Combinations of the Direct/Indirect and Variable/Fixed Cost Classifications for a Car Manufacturer

## Cost of goods sold in merchandising and manufacturing firms

### 1. Cost of goods sold in merchandising firms.

Cost of goods sold is a straightforward computation for a retailer because merchandising-sector companies purchase and then sell tangible products without changing their basic form, it have only a single class of inventory.

Beginning inventory	\$XX,XXX
Add: purchases	X,XXX
Less: ending inventory	(X,XXX)
<b>Cost of goods sold</b>	<b><u>XX,XXX</u></b>

### 2. Cost of goods sold in manufacturing firms.

The calculation is more complex for a manufacturer, because manufacturing-sector companies purchase materials and components and convert them into finished goods, manufacturers have three distinct classes of inventory.

**Cost of goods sold** contains an additional component called **cost of goods manufactured**, analogous to the retailer's purchases account.

Beginning work-in-process inventory	\$XX,XXX
Add: total manufacturing costs	X,XXX
Less: ending work-in-process inventory	(X,XXX)
<b>Cost of goods manufactured</b>	<b><u>XX,XXX</u></b>

A comparison of these computations in full is as follows:

Cost of goods sold for a retailer:			Cost of goods sold for a manufacturer:		
Beginning inventory		\$ XXX,XXX	Beginning raw materials inventory		\$ XXX,XXX
Add: Purchases	\$X,XXX,XXX		Add: Purchases	\$X,XXX,XXX	
Less: Returns and discounts	(XX,XXX)		Less: Returns and discounts	(XX,XXX)	
<b>Net purchases</b>	<b>X,XXX,XXX</b>		<b>Net purchases</b>	<b>X,XXX,XXX</b>	
Add: Freight-in	XX,XXX		Add: Freight-in	XX,XXX	
<b>Goods available for sale</b>	<b>X,XXX,XXX</b>		<b>Raw materials available for use</b>	<b>X,XXX,XXX</b>	
Less: Ending inventory	(XXX,XXX)		Less: Ending raw materials inventory	(XXX,XXX)	
<b>Costs of goods sold</b>	<b><u>XX,XXX,XXX</u></b>		<b>Direct materials used in production</b>		<b>\$X,XXX,XXX</b>
			Direct labor costs		X,XXX,XXX
			Manufacturing overhead costs		XXX,XXX
			<b>Total manufacturing costs for the period</b>		<b>X,XXX,XXX</b>
			Add: Beginning work-in-process inventory		XXX,XXX
			Less: Ending work-in-process inventory		(XXX,XXX)
			<b>Costs of goods manufactured</b>		<b>X,XXX,XXX</b>
			Add: Beginning finished goods inventory		XXX,XXX
			<b>Goods available for sale</b>		<b>X,XXX,XXX</b>
			Less: Ending finished goods inventory		(XXX,XXX)
			<b>Costs of goods sold</b>		<b><u>\$X,XXX,XXX</u></b>

## Cost Classification for decision making

To facilitate management decision making and planning, the management accountant provides relevant, timely, and accurate information at a reasonable cost. Relevance is the most critical of the decision-making concepts; timeliness, accuracy, and cost are unimportant if the information is irrelevant.

### Relevant Cost

The concept of relevant cost arises when the decision maker must choose between two or more options. To determine which option is best, the decision maker must determine which option offers the highest benefit, usually in dollars. Thus, the decision maker needs information on relevant costs.

A **relevant cost** has two properties: (1) it *differs for each decision option* and (2) it will be *incurred in the future*. If a cost is the same for each option, including it in the decision only wastes time and increases the possibility for simple errors. Costs that have already been incurred or committed are irrelevant because there is no longer any discretion about them.

### Differential Cost & Incremental cost

A **differential cost** is a cost that differs for each decision option and is therefore relevant for the decision maker's choice. In practice, another term is often used interchangeably with differential cost called Incremental cost and it is the additional cost inherent in a given decision.

EXAMPLE: A company must choose between introducing two new product lines. The incremental choice of the first option is the initial investment of \$1.5 million; the incremental choice of the second option is the initial investment of \$1.8 million. The differential cost of the two choices is \$300,000.

### Opportunity Cost (Implicit cost)

**Opportunity cost** is the benefit lost when choosing one option precludes receiving the benefits from an alternative option.

For example, if a sales manager chooses to forgo an order from a new customer to ensure that a current customer's order is filled on time, the potential profit from the lost order is the manager's *opportunity cost* for this decision.

The opposite of the opportunity cost is the outlay costs (explicit, accounting, or out-of-pocket costs) that require actual cash disbursements.

### Sunk Cost

**Sunk costs** are costs that have been incurred or committed in the past and are therefore irrelevant because the decision maker no longer has discretion over them.

For example, if a company purchased a new machine without warranty that failed the next day, the purchase price is *irrelevant* for the present decision to replace or to repair the machine.

**Avoidable vs. Committed** (establish the current level of operating capacity/ typically fixed costs)

**Avoidable costs** are those that may be eliminated by not engaging in an activity or by performing it more efficiently. An example is direct materials cost, which can be saved by ceasing production.

**Committed costs**

- Committed costs are Costs which are **governed mainly by past decisions** that established the present levels of operating and organizational capacity and which only change slowly in response to small changes in capacity.
- Committed costs are those which are required as a result of past decisions and cannot be altered in the short run.
- Committed costs arise from holding property, plant, and equipment.

Examples are insurance, real estate taxes, Long-term lease payments, and depreciation. They are by nature long-term and cannot be reduced by lowering the short-term level of production.

**Engineered vs. Discretionary**

**Engineered costs** are those having a direct, observable, quantifiable cause-and effect relationship between the level of output and the quantity of resources consumed.

Examples are direct materials and direct labor.

**Discretionary costs**

- are those characterized by an uncertainty in the degree of causation between the level of output and the quantity of resources consumed.
- They tend to be the subject of a periodic (e.g., annual) outlay decision.
- “Discretionary costs” are costs which: Management decides to incur in the current period to enable the company to achieve objectives other than the filling of orders placed by customers.
- Costs that arise from periodic budgeting decisions that have no strong input-output relationship are commonly called Discretionary costs.

Examples are advertising and R&D costs

## Other COST CLASSIFICATION

**Joint vs. Separable**

- Often a manufacturing process involves processing a single input up to the point at which multiple end products become separately identifiable, called the split-off point.
- **Joint costs** are those costs incurred before the split-off point, i.e., since they are not traceable to the end products, they must be allocated.
- **Separable costs** are those incurred beyond the split-off point, i.e., once separate products become identifiable.
- **By-products** are products of relatively small total value that are produced simultaneously from a common manufacturing process with products of greater value and quantity (joint products).
- An example is petroleum refining. Costs incurred in bringing crude oil to the fractionating process are joint costs.

## Normal vs. Abnormal Spoilage

- **Normal spoilage** is the spoilage that occurs under normal operating conditions. It is essentially uncontrollable in the short run, since normal spoilage is expected under efficient operations, it is treated as a product cost, that is, it is absorbed into the cost of the good output.
- **Abnormal spoilage** is spoilage that is not expected to occur under normal, efficient operating conditions. The cost of abnormal spoilage should be separately identified and reported to management,
- When compared with normal spoilage, abnormal spoilage: Is generally thought to be **more controllable** by production management than normal spoilage.

Abnormal spoilage is typically treated as a period cost (**a loss account**) because of its unusual nature. Abnormal spoilage should be charged to in the period that detection of the spoilage occurs

## Rework, Scrap, and Waste

- **Rework** consists of end products that do not meet standards of salability but can be brought to salable condition with additional effort, the decision to rework or discard is based on whether the marginal revenue to be gained from selling the reworked units exceeds the marginal cost of performing the rework.
- **Scrap** consists of raw material left over from the production cycle but still usable for purposes other than those for which it was originally intended, Scrap may be used for a different production process or may be sold to outside customers, usually for a nominal amount.
- **Waste** consists of raw material left over from the production cycle for which there is no further use, Waste is not salable at any price and must be discarded.

## Other Costs

- **Carrying costs** are the costs of storing or holding inventory. Examples include the cost of capital, insurance, warehousing, breakage, and obsolescence.
- **Transferred-in costs** are those incurred in a preceding department and received in a subsequent department in a multi-departmental production setting.
- **Value-adding costs** are the costs of activities that cannot be eliminated without reducing the quality, responsiveness, or quantity of the output required by a customer or the organization.

## Capacity levels Denominator-level capacity choices

Capacity levels can be measured in terms of

- what a plant can supply-theoretical capacity or practical capacity.
- demand for the output of a plant-normal capacity utilization or master-budget capacity utilization.

## What a plant can supply

**Theoretical capacity** (ideal goal of capacity usage)

- based on producing at full efficiency all the time.
- does not allow for any plant maintenance, interruptions because of bottle breakage on the filling lines, or any other factor.
- is unattainable in the real world as it assume continuous operations with no holidays, downtime, etc.

### Practical capacity

- is the level of capacity that reduces theoretical capacity by unavoidable operating interruptions, such as scheduled maintenance time, shutdowns for holidays, so it allows for unavoidable delays in production for maintenance, holidays, etc.
- is the maximum level at which output is produced efficiently.
- Is the upper limit of a company's productive output capacity given its existing resources.
- Use of practical capacity as a denominator value usually results in underapplied overhead because it always exceeds the actual level of use (U.7)

### Capacity levels in terms of demand

In contrast, normal capacity utilization and master budget capacity utilization measure capacity levels in terms of demand for the output of the plant - the amount of the available capacity that the plant **expects to use** based on the demand for its products. In many cases, budgeted demand is well below the production capacity available.

#### Normal capacity utilization

- is the long-term average level of capacity utilization that satisfies average customer demand over a period (say, 2 to 3 years) that includes seasonal, cyclical, and trend factors. Deviations in a given year will be offset in subsequent years.

#### Master-budget capacity utilization

- is expected level of capacity utilization for the current budget period, typically one year.

These two capacity utilization levels can differ-for example, when an industry has cyclical periods of high and low demand or when management believes that the budgeted production for the coming period is not representative of long-run demand.

## Costing Techniques

The rest of the current chapter provides you with a brief explanation with the various topics that will be studied in more details in the rest of the current part, the major topics are:

1. Inventory Costing: absorption costing (AC) Vs. variable costing (VC), (Ch.5)
2. Cost Accumulation, Cost Measurement and Overhead Assignment in traditional costing system and in ABC. (Ch.4& 5)
3. Cost Allocation (Ch .5)
  - a. Allocating joint costs
  - b. Allocating service department costs
4. Standard Costing, Flexible Budgeting, and Variance Analysis (Ch.7)
5. Target costing :market price of the product is taken as a given.(P2 CMA)

## C. Cost Management (25% - Levels A, B, and C)

Job costing (Cost accumulation method) with Actual costing (Cost measurement method)

Job costing (Cost accumulation method) with Normal Costing (Cost measurement method) & End-of-Accounting- Year Adjustments

ACTUAL/NORMAL/STANDARD COSTS

TRADITIONAL COSTING SYSTEMS (single & departmental) Vs. ABC

## STUDY UNIT FIVE COST ACCUMULATION SYSTEMS

### INTRODUCTION

**Product costing** is the process of accumulating, classifying, and assigning direct materials, direct labor, and factory overhead costs to products or services.

Product costing provides useful cost information for both manufacturing and nonmanufacturing firms for

- (1) product and service cost determination and inventory measurement,
- (2) management planning, cost control, and performance evaluation, and
- (3) strategic and operational decision making.

**Several different types of product costing systems are available;** these include :

- (1) **Cost accumulation method**-job or process costing systems,
- (2) **Cost measurement method**-actual, normal, or standard costing systems, and
- (3) **Overhead assignment method**-traditional or activity-based costing systems.

**The choice of a particular system depends on**

- (1) the nature of the industry and the product or service,
- (2) the firm's strategy and management information needs, and
- (3) the costs and benefits of acquiring, designing, modifying, and operating a particular system.

Cost accumulation systems represent the manner in which the accounting system develops costs. The system is modified by the cost object involved. Most commonly tested cost accumulation systems are job order costing and process costing,

- if the cost object is a custom order, **job costing** may be used, and
- if the cost object is a mass produced homogeneous product (e. g., steel), **process costing** using average costs would be used.
- Further, there are many variations of cost accumulation systems-those that use components of both job order costing and process costing (e. g., **operations costing**), and
- those that account for certain costs at the end of the process (e. g., **back flush costing**) because there is little need for in- process inventory valuation.
- Other systems (e. g., **life cycle costing**) seek to monitor costs throughout the product's life cycle and expand on the traditional costing systems that focus only on the manufacturing phase of a product's life.
- Finally, the assignment of costs to cost objects may occur using a variety of cost drivers (or allocation bases). **Activity- based costing** is an approach that assists in the assignment of costs, regardless of the cost accumulation system used.

# **JOB ORDER COSTING (COST ACCUMULATION SYSTEM)**

### III. JOB ORDER COSTING (COST ACCUMULATION SYSTEM)

Job-order costing is the method of product costing that identifies the job (or individual units or batches) as the cost objective and is used when there are relatively few units produced and when each unit is unique or easily identifiable.

#### Cost Accumulation: Job or Process Costing?

Exhibit 12-1 Differences between Job and Process Costing	
Job Costing	Process Costing
Costs accumulated by job	Costs accumulated by process or department
Production of wide variety of heterogeneous products or services	Mass production of homogeneous products or services
Unit cost computed by dividing total job costs by number of units produced or served at the end of the job	Unit cost computed by dividing the total process costs of the period by number of units produced or served at end of the period

#### Cost Measurement: Actual, Normal, or Standard Costing?

Costing System	Types of Cost Used For		
	Direct Materials	Direct Labor	Factory Overhead
Actual costing	Actual cost	Actual cost	Actual cost
Normal costing	Actual cost	Actual cost	Estimated overhead cost (using predetermined rate(s))
Standard costing	Standard cost	Standard cost	Standard cost

#### A. COST OBJECTIVE IS THE JOB (OR UNIT)

Under job order costing, cost is allocated to a specific job as it moves through the manufacturing process.

Record keeping for job-costing emphasizes the job as the cost objective.

Job-cost systems are best suited for customized production environments such as construction, aircraft assembly, printing, etc. A new job-cost record would be started every time a new job (building project, airplane or print job) is started.

#### B. JOB COST RECORDS

Job-cost records are maintained for each product, service, or batch of products, and they serve as the primary records used to accumulate all costs for the job. Job-cost records are also referred to as job-cost sheets or job orders. Job-cost records accumulate data from the following internal documents:

##### 1. Materials Requisitions

Materials requisitions are documents that show the materials requested for use on the job.

##### 2. Labor Time Tickets (Time Cards)

Labor time tickets (time cards) are documents that show the labor hours and labor rate associated with the time applied to the job.

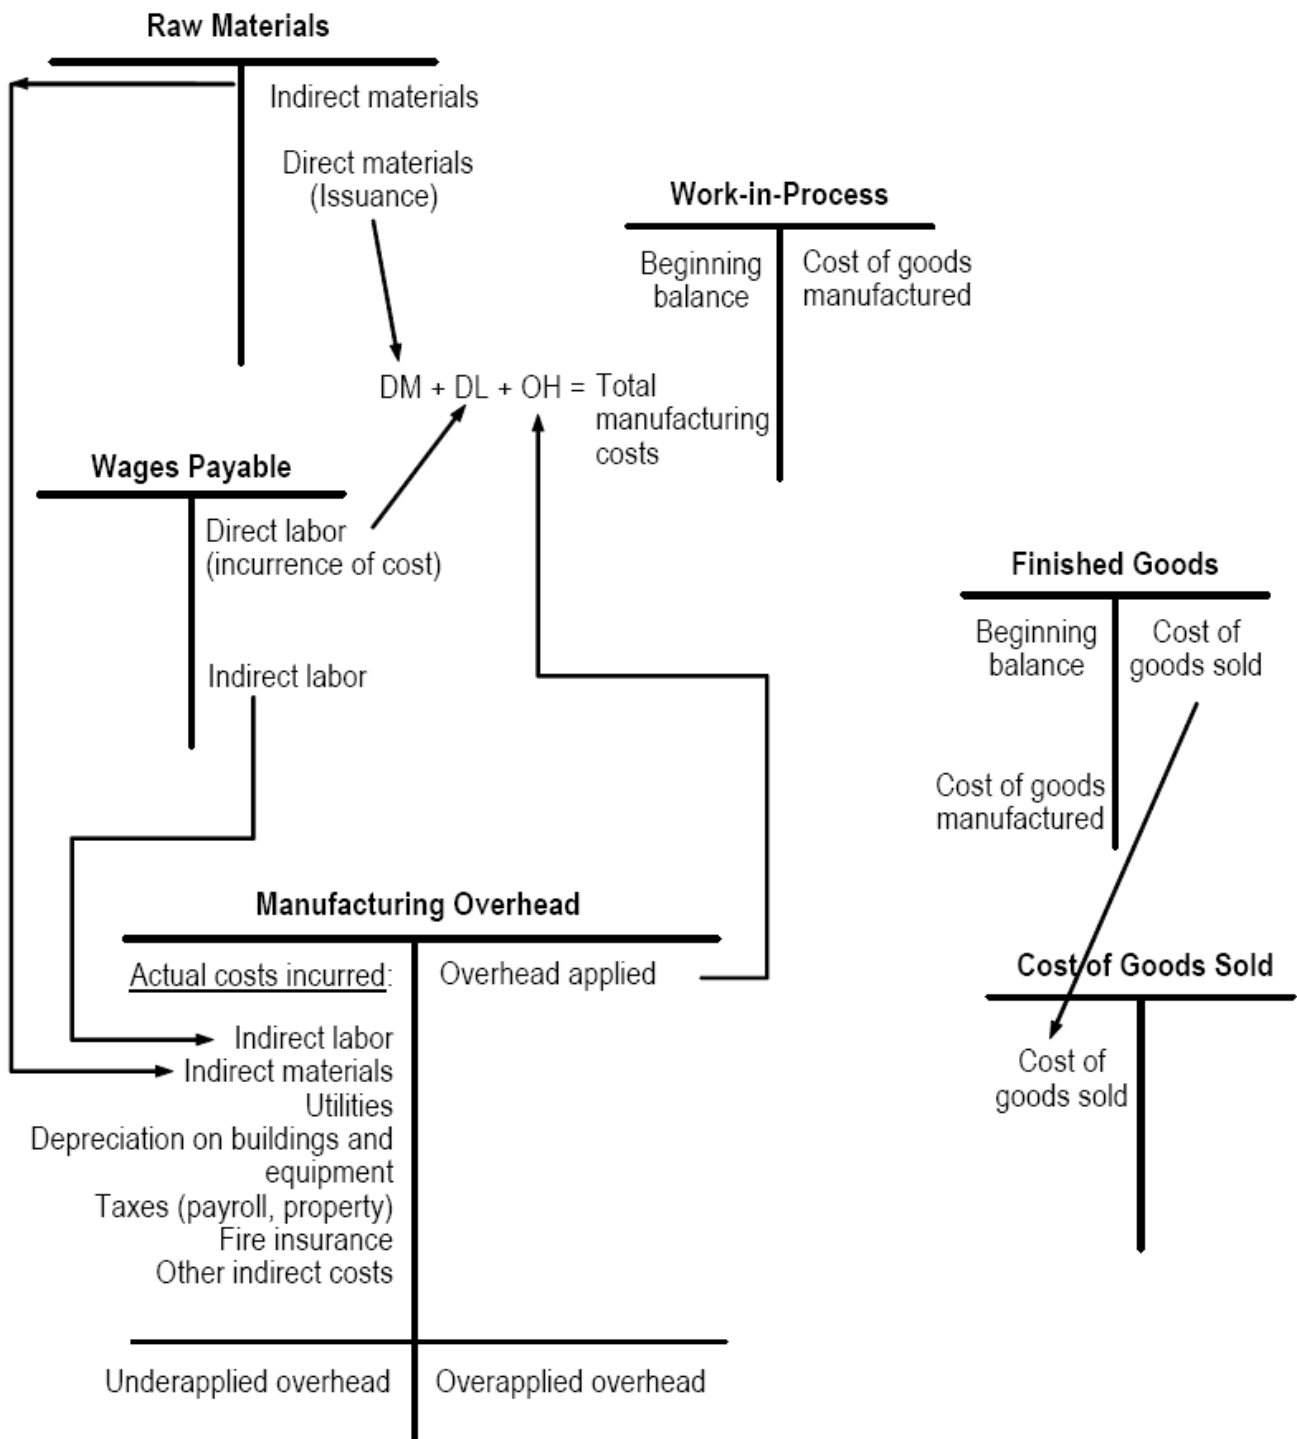

##### 3. Overview of Job Order Costing

Job-costing systems require a limited number of work-in-process accounts.

Pictorial Overview

Job Order Costing

**PASS KEY**

Application of overhead is accomplished in two steps:

Step #1: Calculate Overhead Rate = Budgeted Overhead Costs ÷ Estimated Cost Driver

Step #2: Apply Overhead = Actual Cost Driver x Overhead Rate (from Step #1)

# Supplementary REQUIRED HOMEWORK READING: JOB COSTING BASED ON ICMA SUGGESTED READING LIST

### Comprehensive example (Robinson Company):

Robinson Company: manufacture and install specialized machinery for the paper-making industry.

The specific job we will focus on is the manufacture and installation of a small pulp machine, which converts wood to pulp, for Western Pulp and Paper Company in 2003.

Based on a cost estimate, Robinson prices the job at \$15,000.

### Job costing (Cost accumulation method) with actual costing (Cost measurement method)

Consider Robinson's *actual costing* system, a job-costing system that uses *actual costs* to determine the cost of individual jobs.

Actual costing is a costing method that:

- traces direct costs to a cost object by using the actual direct-cost rates times the actual quantity of the direct-cost inputs.
- It allocates indirect costs based on the actual indirect-cost rates times the actual quantity of the cost-allocation bases.

### General Approach to Job Costing

**Step 1:** Identify the Job That Is the Chosen Cost Object.: Job WPP 298, manufacturing a pulp machine for the Western Pulp and Paper Company in 2006.

**Step 2:** Identify the Direct Costs of the Job.

- **Direct materials:** :The total actual direct material cost is \$4,606,
- **Direct manufacturing labor T:** The total direct manufacturing labor costs of \$1,579 for the pulp machine.

**Step 3:** Select the Cost-Allocation Bases to Use for Allocating Indirect Costs to the Job: **Robinson, however, chooses direct manufacturing labor-hours as the sole allocation base for linking all indirect manufacturing costs to jobs.**

### Cause-and-effect relationship

There is a strong cause-and-effect relationship between the direct manufacturing labor-hours required by an individual job-that's the cause-and the indirect manufacturing resources demanded by that job that's the effect. In 2006, Robinson records 27,000 actual direct manufacturing labor-hours.

**Step 4:** Identify the Indirect Costs Associated with Each Cost-Allocation Base. Robinson believes that a single cost-allocation base-direct manufacturing labor-hours-can be used to allocate indirect manufacturing costs to jobs. Robinson creates a **single cost pool** called manufacturing overhead costs. In 2006, actual manufacturing overhead costs total \$1,215,000.

**Step 5:** Compute the Rate per Unit of Each Cost-Allocation Base Used to Allocate Indirect Costs to the Job.

For each cost pool, the actual indirect-cost rate is calculated by dividing total indirect costs in the pool (determined in step 4) by the total quantity of the cost-allocation base (determined in step 3). Robinson calculates the allocation rate for its single manufacturing overhead cost pool as follows

$$\text{Actual manufacturing overhead rate} = \frac{\text{Actual manufacturing overhead costs}}{\text{Actual total quantity of cost-allocation base}}$$

$$\$1,215,000 \div 27,000 \text{ direct manufacturing labor-hours} = \$45 \text{ per direct manufacturing labor-hour}$$

**Step 6: Compute the Indirect Costs Allocated to the Job.** The indirect costs of a job are computed by multiplying the actual quantity of each different allocation base (one allocation base for each cost pool) associated with the job by the indirect-cost rate of each allocation base (computed in step 5).

To make the pulp machine, Robinson uses 88 direct manufacturing labor-hours, the cost-allocation base for its only manufacturing overhead cost pool (out of the 27,000 total direct manufacturing labor-hours for 2006).

Manufacturing overhead costs allocated to the pulp machine job equal \$3,960

$$(\$45 \text{ per direct manufacturing labor-hour} \times 88 \text{ hours}) = \$3,960$$

**Step 7: Compute the Total Cost of the Job by Adding All Direct and Indirect Costs Assigned to the Job** the total manufacturing costs of the Western Pulp job are \$10,145

**Direct manufacturing costs**

Direct materials	\$4,606	
Direct manufacturing labor	\$1,579	\$6,185

**Manufacturing overhead costs**

(\$45 per direct manuf. labor –hour x 88hours) 3,960

**Total manufacturing costs of job** **\$10,145**

Recall, Robinson was paid \$15,000 for the job. With that revenue, the actual-costing system shows a gross margin of \$4,855 (\$15,000 - \$10,145) and a gross-margin percentage of 32.4% (\$4,855 ÷ \$15,000 = 0.324).

**Job costing (Cost accumulation method) with Normal Costing (Cost measurement method)**

The difficulty of calculating actual indirect-cost rates on a weekly or monthly basis means managers **cannot** calculate the actual costs of jobs as they are completed. However, managers want a close approximation of the manufacturing costs of various jobs regularly during the year, not just at the end of the fiscal year. Managers want manufacturing costs (and other costs, such as marketing costs) for ongoing uses, including pricing jobs, monitoring **and managing costs, and preparing interim financial statements. Because of the benefits of immediate access to job costs, few companies wait until the actual manufacturing overhead** is finally known (at year-end) before allocating overhead costs to compute job costs.

Instead, a *predetermined* or *budgeted* indirect-cost rate is calculated for each cost pool at the beginning of a fiscal year, and overhead costs are allocated to jobs as work progresses. For the numerator and denominator reasons already described, for each cost pool, the **budgeted indirect-cost rate is computed as follows:**

$$\text{Budgeted Indirect-Cost Rate} = \frac{\text{Budgeted annual indirect costs}}{\text{Budgeted annual quantity of the cost-allocation base}}$$

Using budgeted indirect-cost rates gives rise to normal costing.

Normal costing is a costing system that:

- **traces** direct costs to a cost object by using the actual direct-cost rates times the actual quantities of the direct-cost inputs and that
- **allocates** indirect costs based on the budgeted indirect-cost rates times the actual quantities of the cost-allocation bases.

Both actual costing and normal costing trace direct costs to jobs in the same way.

The actual quantities and actual rates of direct materials and direct manufacturing labor used on a job are known from the source documents as the work is done. The only difference between actual costing and normal costing is that actual costing uses *actual* indirect-cost rates, whereas normal costing uses *budgeted* indirect-cost rates to cost jobs.

#### Actual costing vs. Normal costing.

	<u>Actual Costing</u>	<u>Normal Costing</u>
Direct Costs	<i>Actual direct-cost rates x</i> actual quantities of direct-cost inputs	<i>Actual direct-cost rates x</i> actual quantities of direct-cost inputs
Indirect Costs	<i>Actual indirect-cost rates x</i> actual quantities of cost-allocation bases	<i>Budgeted indirect-cost rates x</i> actual quantities of cost-allocation bases

We illustrate normal costing for the Robinson Company example using the seven-step procedure. The following budgeted data for 2006 are for its manufacturing operations

	<u>Budget</u>
Total manufacturing overhead costs	\$1,120,000
Total direct manufacturing labor-hours	28,000

Steps 1 and 2 are exactly as before: Step 1 identifies WPP 298 as the cost object; Step 2 calculates actual direct material costs of \$4,606, and actual direct manufacturing labor costs of \$1,579. Recall from Step 3 that Robinson uses a single cost-allocation base, direct manufacturing labor-hours, to allocate all manufacturing overhead costs to jobs. The budgeted quantity of direct manufacturing labor-hours for 2006 is 28,000 hours. In Step 4, **Robinson groups all the indirect manufacturing costs into a single** manufacturing overhead cost pool. In Step 5, the budgeted manufacturing overhead rate for 2006 is calculated as

Budgeted manufacturing overhead rate = Budgeted manufacturing overhead costs ÷ Budgeted total quantity of cost-allocation base

= \$ 1,120,000 ÷ 28,000 direct manufacturing labor-hours DMLH

= **\$40** per direct manufacturing labor-hour.

In Step 6, under a normal-costing system,

Manufacturing overhead costs= Budgeted manufacturing X *Actual quantity* of direct  
allocated to WPP 298 overhead rate manufacturing labor-hours

= \$40 per direct manufacturing labor-hour X 88 direct manufacturing labor-hours

In Step 7, the cost of the job under normal costing is \$9,705, calculated as

Direct manufacturing costs

Direct materials	\$4,606	
Direct manufacturing labor	1,579	\$6,185

Manufacturing overhead costs

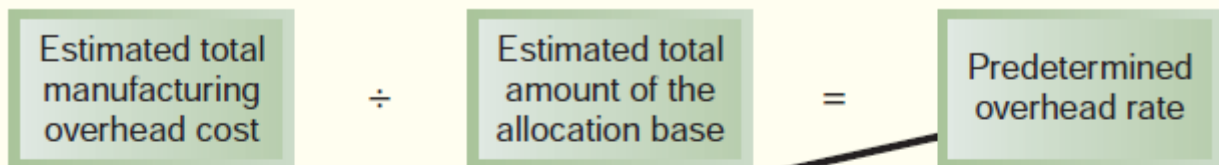

(\$40 x 88 actual direct manufacturing labor-hours)	3,520
---	-------

<b>Total manufacturing costs of job</b>	<b><u>\$9,705</u></b>
---	-----------------------

The manufacturing cost of the WPP 298 job is lower by \$440 under normal costing (\$9,705) than it is under actual costing (\$10,145) because the budgeted indirect-cost rate is \$40 per hour, whereas the actual indirect-cost rate is \$45 per hour. That is, (\$45 - \$40) x 88 actual direct manufacturing labor-hours = \$440.

As we discussed previously, manufacturing costs of a job are available much **earlier** under a normal-costing system. Consequently, Robinson's manufacturing and sales managers can evaluate the profitability of different jobs, the efficiency with which the jobs are done, and the pricing of different jobs as soon as the jobs are completed, while the experience is still fresh in everyone's mind. Another advantage of normal costing is that corrective actions can be implemented much sooner.

At the beginning of the period:

During the period:

At the end of the period:

### Budgeted Indirect Costs and End-of-Accounting- Year Adjustments

Using budgeted indirect-cost rates and normal costing instead of actual costing has the advantage that indirect costs can be assigned to individual jobs on an ongoing and timely basis, rather than only at the end of the fiscal year when actual costs are known.

However, budgeted rates are unlikely to equal actual rates because they are based on estimates made **up to 12 months before actual costs are incurred**. We now consider adjustments that need to be made when, at the end of the fiscal year, indirect costs allocated differ from actual **indirect costs incurred**. Recall that for the **numerator and denominator reasons discussed** earlier, we do *not* expect actual overhead costs incurred each month to equal overhead costs allocated each month.

- ✚ **Underallocated** indirect costs (a debit balance in overhead applied) occur when the allocated amount of indirect costs in an accounting period is less than the actual (incurred) amount, because (a) Activity level was lower than expected, or (b) Actual overhead costs were higher than expected.
- ✚ **Overallocated** indirect costs (a credit balance in overhead applied) occur when the allocated amount of indirect costs in an accounting period is greater than the actual (incurred) amount because (a) activity level was higher than expected, or (b) Actual overhead costs were lower than expected.

- ✓ Underallocated (overallocated) indirect costs are also called underapplied (overapplied) indirect costs and underabsorbed (overabsorbed) indirect costs.
- **Underallocated (overallocated) indirect costs = Indirect costs incurred - Indirect costs allocated.**

Consider the manufacturing overhead indirect-cost pool at Robinson Company. There are two indirect-cost accounts in the general ledger that have to do with manufacturing overhead:

1. **Manufacturing Overhead Control**, the record of the actual costs in all the individual overhead categories (such as indirect materials, indirect manufacturing labor, supervision, engineering, power, and plant depreciation)
2. **Manufacturing Overhead Allocated**, the record of the manufacturing overhead allocated to individual jobs on the basis of the budgeted rate multiplied by actual direct manufacturing labor-hours

Assume the following annual data for the Robinson Company:

Dr	Manufacturing Overhead Control		Manufacturing Overhead Allocated	Cr
	Bal. Dec. 31, 2006 <b>1,215,000</b>			Bal Dec. 31, 2006 <b>1,080,000</b>

The \$1,080,000 credit balance in Manufacturing Overhead Allocated results from multiplying the 27,000 actual direct manufacturing labor-hours worked on all jobs in 2006 by the budgeted rate of \$40 per direct manufacturing labor-hour.

The \$135,000 difference (a net debit) is an underallocated amount because actual manufacturing overhead costs are **greater than the allocated amount**. This difference arises from two reasons related to the computation of the \$40 budgeted hourly rate:

1. Numerator reason (indirect-cost pool). Actual manufacturing-overhead costs of \$1,215,000 are greater than the budgeted amount of \$1,120,000.

2. Denominator reason (quantity of allocation base). Actual direct manufacturing labor-hours of 27,000 are fewer than the budgeted 28,000 hours.

There are three main approaches to accounting for the \$135,000 underallocated manufacturing overhead caused by Robinson underestimating manufacturing overhead costs and overestimating the quantity of the cost-allocation base:

- (1) adjusted allocation rate approach,
- (2) proration approach, and
- (3) write-off to cost of goods sold approach.

### (1) Adjusted Allocation-Rate Approach

The adjusted allocation-rate approach restates all overhead entries in the general ledger and subsidiary ledgers using actual cost rates rather than budgeted cost rates.

- First, the actual manufacturing overhead rate is computed at the end of the fiscal year.
- Then, the manufacturing overhead costs allocated to every job during the year are recomputed using the actual manufacturing overhead rate (rather than the budgeted manufacturing overhead rate).
- Finally, end-of-year closing entries are made.

The result is that at year-end, every job-cost record and finished goods record-as well as the ending Work-in-Process Control, Finished Goods Control, and Cost of Goods Sold accounts-accurately represent actual manufacturing overhead costs incurred.

#### Consider the Robinson example.

The actual manufacturing overhead (\$1,215,000) exceeds the manufacturing overhead allocated (\$1,080,000) by 12.5% [ $(\$1,215,000 - \$1,080,000) \div \$1,080,000$ ].

The actual 2006 manufacturing overhead rate is \$45 per direct manufacturing labor-hour ( $\$1,215,000 \div 27,000$  hours) rather than the budgeted \$40 per direct manufacturing labor-hour. At year-end, Robinson could increase the manufacturing overhead allocated to each job in 2006 by 12.5% using a single software command. The command would adjust both the subsidiary ledgers and the general ledger. Consider the Western Pulp machine job, WPP 298. Under normal costing, the manufacturing overhead allocated to the job is \$3,520 (the budgeted rate of \$40 per direct manufacturing labor-hour x 88 hours). Increasing the manufacturing overhead allocated by 12.5%, or \$440 ( $\$3,520 \times 0.125$ ), means the adjusted amount of manufacturing overhead allocated to Job WPP 298 equals \$3,960 ( $\$3,520 + \$440$ ).

Note under actual costing, manufacturing overhead allocated to this job is also \$3,960 (the actual rate of \$45 per direct manufacturing labor-hour x 88 hours). Making this adjustment under normal costing for each job in the subsidiary ledgers ensures that all \$1,215,000 of manufacturing overhead is allocated to jobs.

The adjusted allocation-rate approach yields the benefits of both the *timeliness and convenience of normal costing during the year and the accuracy of actual costing at year-end*. Each individual job-cost record and the end-of-year account balances for inventories and cost of goods sold are adjusted to actual costs.

### (2) Proration Approach

Proration spreads underallocated overhead or overallocated overhead among:

- ending work in process,
- finished goods, and
- cost of goods sold.

Materials inventory is not  
included in this proration

In our Robinson example, end-of-period proration is made to the ending balances in Work-in-Process Control, Finished Goods Control, and Cost of Goods Sold. Assume the following actual results for Robinson Company in 2006:

Account	Account Bal. (Before proration)	Allocated MOH Included in each Account Bal. (Before proration)
WIP Control	\$50,000	\$16,200
FG Control	\$75,000	\$31,320
COGS Control	<u>\$2,375,000</u>	<u>\$1,032,480</u>
	<u><b>\$2,500,000</b></u>	<u><b>\$1,080,000</b></u>

### How should Robinson prorate the underallocated \$135,000 of manufacturing overhead at the end of 2006?

Robinson should prorate underallocated or overallocated amounts on the basis of the total amount of manufacturing overhead allocated (before proration) in the ending balances of Work-in-Process Control, Finished Goods Control, and Cost of Goods Sold. The \$135,000 underallocated overhead is prorated over the three affected accounts in proportion to their total amount of manufacturing overhead allocated (before proration) in column 2 of the following table, resulting in the ending balances (after proration) in column 5 at actual costs.

	A	B	C	D	E	F	G
		Account Balance (Before Proration)	Allocated Manufacturing Overhead Included in Each Account Balance (Before Proration)	Allocated Manufacturing Overhead Included in Each Account Balance as a Percent of Total	Proration of \$135,000 of Underallocated Manufacturing Overhead		Account Balance (After Proration)
10							
11	Account	(1)	(2)	(3) = (2) / \$1,080,000	(4) = (3) x \$135,000		(5) = (1) + (4)
12	Work-in-process control	\$ 50,000	\$ 16,200	1.5%	0.015 x \$135,000 =	\$ 2,025	\$ 52,025
13	Finished goods control	75,000	31,320	2.9%	0.029 x 135,000 =	3,915	78,915
14	Cost of goods sold	<u>2,375,000</u>	<u>1,032,480</u>	<u>95.6%</u>	0.956 x 135,000 =	<u>129,060</u>	<u>2,504,060</u>
15	Total	<u><b>\$2,500,000</b></u>	<u><b>\$1,080,000</b></u>	<u><b>100.0%</b></u>		<u><b>\$135,000</b></u>	<u><b>\$2,635,000</b></u>

MOH Allocated is \$135,000 less than MOH Control. That is, MOH Allocated is *under allocated*. Its balance is smaller than the balance of MOH Control.

This understated MOH Allocated flowed into Work-in-Process Control, which in turn flowed into Finished Goods Control and Cost of Goods Sold. Because all three of these accounts are understated, they would be increased under the proration approach.

Recall that the actual manufacturing overhead (\$1,215,000) exceeds the manufacturing overhead allocated (\$1,080,000) by 12.5%. The proration amounts in column 3 can also be derived by multiplying the balances in column 2 by 0.125. For example, the \$3,915 proration to Finished Goods is  $0.125 \times \$31,320$ . The journal entry to record this proration is

Work-in-Process Control	2,025	
Finished Goods Control	3,915	
Cost of Goods Sold	129,060	
Manufacturing Overhead Allocated	1,080,000	
Manufacturing Overhead Control		1,215,000

If manufacturing overhead had been overallocated, the work-in-Process, Finished Goods, and Cost of Goods Sold accounts would be decreased (credited) instead of increased (debited).

This journal entry restates the 2006 ending balance for work-in-process Control, Finished Goods Control, and cost of Goods Sold to what they would have been if actual manufacturing overhead rates had been used rather than budgeted manufacturing overhead rates. this method reports the same 2006 ending balances in the general ledger as the adjusted allocation-rate approach.

Some companies use the proration base but base it on the column 1 amounts of the preceding table-that is, the ending balance of work-in-process Control, Finished Goods Control, and cost of Goods Sold before proration. It gives the same result as the previous proration only if the proportions of manufacturing overhead costs to total costs, and therefore direct costs, are the same in the Work-in-Process Control, Finished Goods Control, and Cost of Goods Sold accounts. In general, the proportion of direct costs to manufacturing overhead costs in the various accounts are not the same. That's because manufacturing overhead is usually allocated using a cost-allocation base such as direct manufacturing labor-hours rather than direct costs.

The following table shows that prorations based on ending account balances will not be the same as the more-accurate prorations calculated earlier based on the amount of manufacturing overhead allocated to the accounts.

	A	B	C	D	E	F
		Account Balance (Before Proration)	Account Balance as a Percent of Total	Proration of \$135,000 of Underallocated Manufacturing Overhead		Account Balance (After Proration)
1						
2	Account	(1)	(2) = (1) / \$2,500,000	(3) = (2) x \$135,000		(4) = (1) + (3)
3	Work-in-process control	\$ 50,000	2.0%	0.02 x \$135,000 =	\$ 2,700	\$ 52,700
4	Finished goods control	75,000	3.0%	0.03 x 135,000 =	4,050	79,050
5	Cost of goods sold	2,375,000	95.0%	0.95 x 135,000 =	128,250	2,503,250
6	Total	<u>\$2,500,000</u>	<u>100.0%</u>		<u>\$135,000</u>	<u>\$2,635,000</u>

However, proration based on ending balances is frequently justified as being an expedient way of approximating the more accurate results from using indirect costs allocated.

### (3) Write-Off to Cost of Goods Sold Approach

Under this approach, the total under- or overallocated manufacturing overhead is included in this year's Cost of Goods Sold. For Robinson, the journal entry would be:

Cost of Goods Sold	135,000
Manufacturing Overhead Allocated	1,080,000
Manufacturing Overhead Control	1,215,000

Robinson's two Manufacturing Overhead accounts are closed with the difference between them included in cost of goods sold. The Cost of Goods Sold account after the write-off equals \$2,510,000, the balance before the write-off of \$2,375,000 plus the underallocated manufacturing overhead amount of \$135,000.

If Factory Overhead is . . .	<u>Alternative 1</u> Allocation	<u>Alternative 2</u> Close to Cost of Goods Sold
<b>UNDERAPPLIED</b> (Applied OH is less than actual OH)	<b>INCREASE</b> Work in Process Finished Goods Cost of Goods Sold	<b>INCREASE</b> Cost of Goods Sold
<b>OVERAPPLIED</b> (Applied OH is greater than actual OH)	<b>DECREASE</b> Work in Process Finished Goods Cost of Goods Sold	<b>DECREASE</b> Cost of Goods Sold

- ✚ Proration should be based on the manufacturing overhead allocated component in the ending balances of Work-in-Process Control, finished Goods Control and Cost of Goods Sold. This proration method results in the most accurate inventory and Cost of Goods Sold numbers being reported in the financial statements.
- ✚ Prorating to each individual job (as in the adjusted allocation-rate approach) is useful if the goal is to develop the most accurate record of individual job costs for profitability analysis purposes.
- ✚ The write-off to Cost of Goods Sold is the simplest approach for dealing with under or overallocated overhead. If the amount of under- or overallocated overhead is small-in comparison with total operating income or some other measure of materiality-the write off to Cost of Goods Sold approach yields a good approximation to more-accurate, but more-complex, approaches.

# **TRADITIONAL COSTING SYSTEMS**

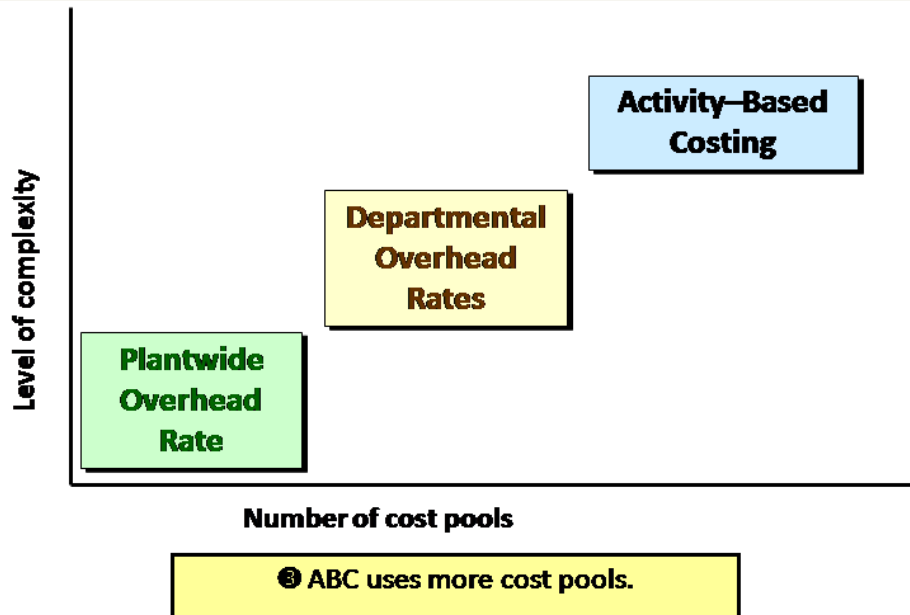

## **(single & departmental) Vs. ABC**

### **(COST ALLOCATION SYSTEMS)**

## TRADITIONAL COSTING SYSTEMS (single & departmental) Vs. ABC

"Best practice" ABC differs from traditional costing in five ways.

### LIMITATIONS OF TRADITIONAL COSTING SYSTEMS

For example, Dole Company has two factories Alpha and Beta. Alpha is a highly automated factory; Beta is a labor-intensive factory. The company has budgeted the following information for the year:

## Single Plant-wide Overhead Rate

Dole Company has two factories Alpha and Beta. Alpha is a highly automated factory while Beta is a labor-intensive factory. The company uses a single plant-wide overhead rate based upon labor hours.

Annual Budget Data	Alpha Division	Beta Division	Total
Budgeted overhead	\$ 400,000	\$ 200,000	\$ 600,000
Budgeted labor hours	10,000	50,000	60,000
Budgeted machine hours	20,000	40,000	24,000

$$\text{Single Plant-wide Overhead Rate} = \frac{\$600,000}{60,000} = \$10 \text{ per labor hour}$$

During the first month of operations the company has the following information for its two products Widget and Gidget

	Alpha Division	Beta Division
<b>Widget:</b>		
Labor hours	500	4,000
Machine hours	800	200
<b>Gidget:</b>		
Labor hours	500	1,000
Machine hours	1,200	400

Using the plant-wide rate, factory overhead is applied to the two products as shown below.

	Widget	Gidget
<b>Alpha:</b>		
\$10 x 500	\$ 5,000	
\$10 x 500		\$ 5,000
<b>Beta:</b>		
\$10 x 4,000	40,000	
\$10 x 1,000		10,000
Overhead applied	<u>\$ 45,000</u>	<u>\$ 15,000</u>

To obtain more accurate product-costing information, assume that Dole Company decides to use two cost drivers, i.e., two separate departmental overhead rates for overhead costs, with a machine-hour-based rate for Alpha and a labor-hour-based rate for Beta. The departmental predetermined overhead cost driver rates are calculated as follows:

## Departmental Overhead Rates

To obtain more accurate product costing the company decided to use departmental overhead rates. The overhead in Alpha is to be based on machine hours, and Beta will use labor hours.

$$\text{Alpha's Departmental Overhead Rate} = \frac{\$400,000}{20,000} = \$20 \text{ per machine hour}$$

$$\text{Beta's Departmental Overhead Rate} = \frac{\$200,000}{50,000} = \$4 \text{ per labor hour}$$

Using departmental overhead rates, the factory overhead cost assigned to the two products follows:

	Widget	Gidget
Alpha: (cost driver: machine-hours)		
\$20 × 800	\$16,000	
\$20 × 1,200		\$24,000
Beta: (cost driver: labor-hours)		
\$4 × 4,000	16,000	
\$4 × 1,000		4,000
Total overhead applied	<u>\$32,000</u>	<u>\$28,000</u>

The preceding calculations show that the applied overhead costs with the single plantwide overhead cost driver rate are \$13,000 (\$45,000 - \$32,000) higher for Widget and \$13,000 (\$15,000 - \$28,000) lower for Gidget than had the firm used the two departmental overhead rates. Gidget requires considerably more machine-hours than Widget, but the overhead cost allocation to products with the single plantwide overhead cost driver rate does not consider these differences. Use of departmental rates causes product cost to more accurately reflect the different amount of labor and the different types of machinery and labor involved in producing the two products.

Departmental rates, however, do not consider the varying overhead costs of different processes or activities; within a department because some factory overhead costs are not volume based. For example, machine setup cost, product design cost, purchase ordering cost, and materials handling cost are not directly related to either direct labor-hours or machine-hours. The traditional volume-based plantwide and departmental cost driver rate overhead allocation methods can lead to inaccurate product costing.

# ACTIVITY-BASED COSTING

## (Transaction-based costing)

## ACTIVITY-BASED COSTING (transaction-based costing)

### Definition

- Activity-based costing (ABC) is defined as a cost accounting system that is based on activity level as the fundamental cost object. Activity-based costing is also referred to as transaction-based costing. The cost driver is typically the number of transactions involved in a particular activity.

### Characteristics of ABC

- ABC applies a more focused and detailed approach than using a department or plant as the level for gathering costs.
- ABC can be part of a job order system or a process cost system.
- ABC can be used for manufacturing or service businesses.
- ABC takes a long-term viewpoint and treats production costs as variable.
- The cost driver is often a non-financial variable.
- ABC may be used for internal and external purposes (as can job order costing and process costing).
- ABC is a **refinement of an existing costing system** (job-order or process)
  - Under a traditional (volume-based) costing system, overhead is simply dumped into a single cost pool and spread evenly across all end products.
  - Under ABC, indirect costs are attached to activities that are then rationally allocated to end products.
- ABC may be used by manufacturing, service, or retailing entities.
- ABC focuses management on the **cost/benefit of activities**. Value-added activities increase the product value or service.

#### a. Value Chain (Value-added Activities)

A value chain is a series of activities in which customer usefulness is added to the product. Support activities directly support value-added activities.

#### b. Non-value Added Activities

Non-value added activities do not increase product value or service and are targeted for elimination. These types of activities (e. g. warehousing) should be eliminated.

### ABC Vs. Peanut-butter costing.

- The inaccurate averaging or spreading of indirect costs over products or service units that use different amounts of resources is called **peanut-butter costing**.
  - Peanut-butter costing results in **product-cost cross-subsidization**, the condition in which the miscosting of one product causes the miscosting of other products.
  - The peanut-butter effect of using a **traditional (i.e., volume-based) costing system** can be summarized as follows:
    - ✓ Direct labor and direct materials are traced to products or service units.
    - ✓ A single pool of indirect costs (overhead) is accumulated for a given organizational unit.
    - ✓ Indirect costs from the pool are assigned using an allocative (rather than a tracing) procedure, such as using a single overhead rate for an entire department, e.g., \$3 of overhead for every direct labor hour.
      - The effect is an *averaging of costs* that may result in significant inaccuracy when products or service units do not use similar amounts of resources.
      -

A traditional cost system assigns overhead with a single plant-wide overhead application rate or rates for operating departments. These rates are volume-based using an application basis such as direct labor hours or machine hours. **All overhead costs, however, do not fluctuate with volume.** Assigning these costs with a volume basis will distort the amount of costs assigned to various product lines. Activity-based costing attempts to correct this by emphasizing long-term product analysis.

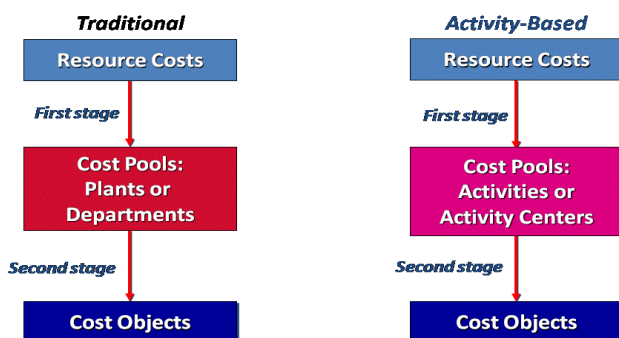

✚ **Volume-based systems**, as illustrated above, involve:

- Accumulating costs in **general ledger accounts** (utilities, taxes, etc.).
- Using a **single cost pool** to combine the costs in all the related accounts.
- Selecting a **single driver** to use for the entire indirect cost pool.
- Allocating the indirect cost pool to **final cost objects**.

✚ **Activity-based systems**, by contrast, involve(4 main steps):

- Identifying organization **activities** that constitute overhead.
  - In this step ABC team will define activities , activity cost pools and activity measures (resource cost drivers)
  - Activity cost pools will group activities according to five categories of activities (unit-level activity, batch-level activity, product-sustaining activity, facility-sustaining activity, customer-level activity)
- Assigning the costs of **resources** consumed by the activities to activity cost pools using resource cost drivers, In this step first-stage allocation will be applied ,
  - Stage one: resource cost assignment of overhead costs to activity cost pools or groups of activities called *activity centers* using appropriate resource cost drivers (here functionally organized overhead costs derived from a company's general ledger will be assigned to the activity cost pools.)
- Calculate activity rates (by dividing total cost for each activity by its *total*/activity (activity cost driver) (ex: the cost of product design cost pool will be divided by no. of designs (activity cost driver).
- Assign overhead costs to cost objects , in this step second-stage allocation will be applied,
  - Stage two: activity cost assignment of activity costs to cost objects (Product or service) using appropriate activity cost drivers.

### Two-Stage Allocation Procedures

## ABC TERMS

### Activity

An **activity** is work performed within an organization. It is also an aggregation of actions performed within an organization useful for purposes of activity-based costing.

Activities are composed of actions, movements, or work sequences.

For example, moving inventory is a warehousing activity

### Resource

A **resource** is an economic element applied or used to perform activities.

Salaries and materials, for example, are resources used in performing activities.

### Two types of cost drivers

As defined in Chapter 3, a cost driver is any factor that causes a change in the cost of an activity. It is also a measurable factor used to assign costs to activities and from activities to other activities, products, or services.

**Note; In respect to ABC, two more terms with which you need to be familiar are resource drivers and activity drivers. These are details in the allocation process and you are not expected to know this for a numerical question, but perhaps for a CMA word question.**

The two types of cost drivers are

- resource cost drivers and
- activity cost drivers.

A **resource cost driver** is a measure of the amount of resources consumed by an activity. It is the cost driver used to assign a resource cost consumed by an activity to a particular cost pool.

An example of a resource cost driver is the percentage of total square feet required to perform an activity.

An **activity cost driver** measures how much of an activity a cost object uses. It is used to assign cost pool costs to cost objects.

An example is machine hours required for the activity of running machines to produce product X.

**Activity-based costing (ABC) is a costing approach that assigns costs to products, services, or customers based on the consumption of resources caused by activities. Resources are assigned to activities, and activities are assigned to cost objects based on the activities' use.**

*ABC recognizes the causal relationships of cost drivers to activities*

### Categories of Activities

There are five categories of activities, based upon where the activity occurs in relation to the final product and the facility as a whole. These four categories are;

1. A **unit-level activity** : These activities are performed for each unit that is produced.

Examples of unit-level (volume-based or unit-based) activities include using direct materials, using direct labor-hours, inserting a component, inspecting every item, and running machines.

2. A **batch-level activity**: These activities occur each time a batch is produced rather than for each unit of production.

Examples of batch-level activities are setting up machines, placing purchase orders, scheduling production, inspecting every batch, and handling materials.

3. A **product-sustaining activity** is performed to support the production of a specific product.

Examples of product-sustaining activities include designing products, administering parts, issuing engineering change orders, and expediting.

4. A **facility-sustaining activity** is performed to support the production of products in general. Examples of facility-sustaining activities include providing security, safety, maintenance, and plant management, calculating plant depreciation, and paying property taxes.

5. A **customer-level activity** includes activities that are performed to support customer needs such as customer service, phone banks, or custom orders.

Note; Fortunately, on the CMA Exam you will generally not need to identify the cost drivers or cost pools in a large question because they will be provided for you. You will simply need to use the provided information to determine the amount of overhead that will need to be allocated to any product. In a smaller question it is possible that you will need to determine the appropriate driver, but these are usually fairly direct, and if you simply think about what would cause costs to be incurred, you will see the correct answer.

## **Benefits and Limitations of an Activity Based Costing System**

### **Benefits**

Activity-based costing helps reduce distortions caused by traditional cost allocations.

It provides a clear view of how the mix of a firm's diverse products, services, and activities contributes to the bottom line in the long run.

### **Major benefits of the activity-based costing are the following:**

1. ABC provides more accurate and informative product costs, which lead to more accurate product profitability measurements and to better-informed strategic decisions about pricing, product line, customer market, and capital expenditure.
2. ABC provides more accurate measurements of activity-driving costs, which helps managers improve product and process value by making better product design decisions, controlling costs better, and fostering various value-enhancement projects.
3. ABC provides managers easier access to relevant costs for making business decisions, enabling them to take a more competitive position

### Limitations

Although activity-based costing provides better tracing of costs to individual products than traditional systems, managers should be aware of its limitations before using it to calculate product costs:

1. Allocations. Even if activity data are available, some costs probably require allocations to departments and products based on arbitrary volume measures because finding a specific activity that causes the incurrence of the costs might not be practical. Examples are some of the facility-sustaining costs, such as cleaning the factory and managing the production process
2. ABC reports do not conform to GAAP, so restating financial data adds an expense and causes confusion (unsure whether to rely on the ABC or external data).
3. Expense and time. An ABC system is very expensive to develop and is very time consuming. Like most innovative management or accounting systems,
4. ABC usually requires more than a year for successful development and implementation.
5. ABC generates vast amounts of information. Too much information can mislead managers into concentrating on the wrong data.

### Comprehensive Example to compute product costs under a traditional costing system and an activity based costing system.

The following example contrasts steps 2 and 3 of the traditional costing system, using direct labor-hours as the cost driver, with the activity-based costing system, using both volume-based and non-volume-based cost drivers.

## Comparison of Traditional and Activity-Based Systems

### Northern High-Tech, Inc.

Northern High-Tech, Inc., successfully produces and sells two types of quality printers, the deluxe and the regular. Assume that the company has the following financial and cost data for the two products:

Northern High-Tech provides the following information about the two products it sells.

	Deluxe	Regular
Production volume	5,000	15,000
Selling price	\$400	\$200
Unit direct material and labor costs	\$200	\$80
Direct labor-hours	25,000	75,000

25,000 + 75,000 = 100,000

**Overhead Rate**

$$\frac{\$2,000,000}{100,000} = \$20 \text{ DLH}$$

	Budgeted Cost Pool	Activity Driver
Engineering	\$ 125,000	Engineering hours
Setups	300,000	Number of setups
Machine running	1,500,000	Machine-hours
Packing	75,000	Number of packing orders
	<u>\$2,000,000</u>	

The company's management accountant has identified the following activities, budgeted cost pools, and activity drivers:

Activity	Budgeted Cost Pool	Activity Cost Driver
Engineering	\$ 125,000	Engineering hours
Setups	300,000	Number of setups
Machine running	1,500,000	Machine-hours
Packing	75,000	Number of packing orders
Total	<u>\$2,000,000</u>	

These are the actual activity units or transactions for each product:

Here are the actual activity units or transactions for both products:

Activity Consumption			
Activity Driver	Deluxe	Regular	Total
Engineering hours	5,000	7,500	12,500
Number of setups	200	100	300
Machine-hours	50,000	100,000	150,000
Number of packing orders	5,000	10,000	15,000

**Traditional Costing Analysis** In the traditional costing approach, the factory overhead (OH) is allocated on the basis of direct labor-hours (DLH) as the cost driver:

**Traditional Costing Analysis** In the traditional costing approach, the factory overhead (OH) is allocated on the basis of direct labor-hours (DLH) as the cost driver:

Total DLH:  $25,000 + 75,000 = 100,000$

Overhead rate per DLH:  $\$2,000,000 / 100,000 = \$20$

OH assigned to deluxe:  $\$20 \times 25,000 = \$500,000$

Deluxe OH cost per unit:  $\$500,000 / 5,000 = \$100$

OH assigned to regular:  $\$20 \times 75,000 = \$1,500,000$

Regular OH cost per unit:  $\$1,500,000 / 15,000 = \$100$

Exhibit 4-5 presents a product profitability analysis under the traditional costing system.

**Activity-Based Costing Analysis** In the activity-based costing approach, the cost driver rate for each activity cost driver—that is, the activity rate—is calculated as follows:

**Calculate the activity rate for each activity cost driver.**

Activity-Based Costing Analysis			
Activity Driver	Cost	Activity Consumption	Activity Rate
Engineering hours	\$ 125,000	12,500	\$ 10
Number of setups	300,000	300	1,000
Machine-hours	1,500,000	150,000	10
Number of packing orders	75,000	15,000	5

$$\$125,000 \div 12,500 = \$10 \text{ per engineering hour}$$

Factory overhead costs are assigned to both products, as shown by these calculations

Deluxe Model				
Activity Driver	Activity Rate	Number of Activities	Total OH	Unit OH
Engineering hours	\$ 10	5,000	\$ 50,000	\$ 10
Number of setups	1,000	200	200,000	40
Machine-hours	10	50,000	500,000	100
Number of packing orders	5	5,000	25,000	5
Production volume = 5,000 units			<u>\$ 775,000</u>	<u>\$ 155</u>

$$\$50,000 \div 5,000 = \$10 \text{ per unit}$$

### Regular Model

Activity Driver	Activity Rate	Number of Activities	Total OH	Unit OH
Engineering hours	\$ 10	7,500	\$ 75,000	\$ 5.00
Number of setups	1,000	100	100,000	6.67
Machine-hours	10	100,000	1,000,000	66.67
Number of packing orders	5	10,000	50,000	3.33
Production volume = 15,000 units			<u>\$1,225,000</u>	<u>\$ 81.67</u>

$$\$75,000 \div 15,000 = \$5.00 \text{ per unit}$$

### EFFECTS OF ABC

An ABC system will apply high amounts of overhead to a product that places high demands on expensive resources. If a product places few demands on expensive resources, the system will assign little of that cost to the product. This will remove much of the cost distortion caused by traditional, volume- based overhead systems.

Exhibit 4-6 presents a product profitability analysis under the activity-based costing system and Exhibit 4-7 compares product costs and profit margins under the two costing systems.

#### Exhibit 4-5 Product Profitability Analysis under the Traditional Costing System

	Deluxe	Regular
Unit selling price	<u>\$400</u>	<u>\$200</u>
Unit product cost		
Direct material and labor	\$200	\$ 80
Factory overhead	<u>100</u>	<u>100</u>
Cost per unit	<u>\$300</u>	<u>\$180</u>
Product margin	<u>\$100</u>	<u>\$ 20</u>

#### Exhibit 4-6 Product Profitability Analysis under the ABC Costing System

	Deluxe		Regular	
Unit selling price		\$400		\$200.00
Unit product cost				
Direct material and labor		\$200		\$80.00
Factory overhead				
Engineering	\$ 10		\$ 5.00	
Setups	40		6.67	
Machine running	100		66.67	
Packing	<u>5</u>	<u>155</u>	<u>3.33</u>	<u>81.67</u>
Cost per unit		<u>355</u>		<u>161.67</u>
Product margin		<u>\$ 45</u>		<u>\$ 38.33</u>

**Exhibit 4-7 Comparison of Alternative Costing Approaches**

	<i>Allocation Method</i>		
	(1) Traditional	(2) ABC	(1) – (2) Difference
<b>Deluxe</b>			
Total overhead	\$ 500,000	\$ 775,000	\$(275,000)
Unit OH cost	100	155	(55)
Unit margin	100	45	55
<b>Regular</b>			
Total overhead	\$1,500,000	\$1,225,000	\$ 275,000
Unit OH cost	100	81.67	18.33
Unit margin	20	38.33	(18.33)

Remember that one major limitation of the traditional costing system is that it generally undercosts complex low-volume products and overcasts high-volume products.

The activity-based costing system presents a more accurate measurement pattern of overhead consumption. The preceding comparison shows that the traditional product costing system can significantly undercost the deluxe printer (a low-volume product) and overcast the regular printer (a high-volume product) compared with the actual overhead consumption. Consequently, traditional product costing can cause distorted inventory measurement, incorrect product-line decisions, unrealistic pricing, ineffective resource allocations, misplaced strategic focus, misidentified critical success factors, and lost competitive advantage.

# LIFE-CYCLE COSTING

### **LIFE-CYCLE COSTING (basis for cost planning and product pricing NOT GAAP)**

A life-cycle approach to budgeting estimates a product's revenues and expenses over its entire sales life cycle beginning with research and development, proceeding through the introduction and growth stages into the maturity stage, and finally into the harvest or decline stage.

Accordingly, life-cycle costing takes a long-term view of the entire cost life cycle, also known as the value chain.

#### Value Chain for a Manufacturer

Upstream costs

Downstream costs

The total costs for a product's life cycle have three phases, thus Costs are determined for all value-chain categories:

1. Upstream (R&D, design),
  - a. Upstream costs: costs that are prior to the manufacturing of the product or sale of the service, such as R&D or design (prototypes, tests, and engineering)
2. Manufacturing,
  - a. Manufacturing costs: costs involved in producing a product or service, such as purchasing and direct and indirect manufacturing costs and
3. Downstream (marketing, distribution, and customer service).
  - a. Downstream costs: costs subsequent to (or coincident with) manufacturing costs, such as marketing, distribution (packaging, shipping and handling, promotions, and advertising), service costs, and warranty costs (defect recalls, returns, and liability).

### **LIFE CYCLE COSTING VS. TRADITIONAL COSTING**

In contrast, traditional approaches focus on cost control (as opposed to cost reduction) during production and treat pre- and postproduction (upstream and downstream) costs as period costs that are largely ignored in determining the profitability of specific products.

- a. Other costs that traditional methods ignore are the after-purchase costs (operating, .support, repair; and disposal) incurred by customers.

### **CMA Sample Q (Whole-life cost equals the Life-cycle cost plus after-purchase costs.)**

Claremont Company has been asked to evaluate the profitability of a product that it manufactured and sold from Year 7 through Year 10. The product had a one-year warranty from date of sale. The following information appears in the financial records.

Research, development, and design cost	Manufacturing and distribution costs	Warranty costs	Warranty cost
Yr 5 & Yr 6	Yr 7 - Yr 10	Yr 7 - Yr 10	Yr 11
\$5,000,000	\$7,000,000	\$200,000	\$100,000

The life-cycle cost for this product is.....

Life-cycle costing takes into account costs incurred at all stages of the value-chain, not just manufacturing. The life-cycle cost for this product is thus \$12,300,000 (\$5,000,000 + \$7,000,000 + \$200,000 + \$100,000).

#### Life-cycle and whole-life cost concepts are associated with target costing and target pricing

A firm may determine that market conditions require that a product sell at a given target price. Hence, a target cost can be determined by subtracting the desired unit profit margin from the target price. The cost reduction objectives of life-cycle and whole-life cost management can therefore be determined using target costing.

#### LIFE-CYCLE COSTING (NOT GAAP)

For financial statement purposes, costs during the upstream phase must be expensed in the period incurred. For management accounting purposes, the costs (such as R&D) that result in marketable products represent a life-cycle investment and must therefore be capitalized.

#### Backflush costing in just-in-time production systems

A just-in-time (JIT) system produces materials just as they are needed for the next step in production. The trigger for manufacturing at a particular work area is the demand from the next station down the line, thus JIT production systems are a "demand-pull" manufacturing system. Customer demand triggers initial production need, working backward all the way to raw material purchases at the beginning of the cycle. JIT also reduces manufacturing lead time by organizing manufacturing into cells that are closely coordinated. HT ensures timely material deliveries and meets customer demands while simultaneously ensuring high-quality products at the lowest possible cost. Therefore, organizations using HT production have very little inventory, making the choice of inventory valuation methods (e.g., FIFO, weighted-average) and inventory costing methods (e.g., absorption costing, variable costing) irrelevant because the costs flow directly to cost of goods sold during an accounting period.

#### Backflush costing Vs. Traditional costing systems (sequential tracking)

Backflush costing. Costing system that omits recording some or all of the journal entries relating to the cycle from purchase of direct material to the sale of finished goods.

Traditional costing systems use sequential tracking, which is any process that records purchases and movements of costs between inventories and accounts in the order in which they occur.

# Process Cost Accounting

## (COST ACCUMULATION SYSTEM)

## Process cost accounting

Process cost accounting is used to assign costs to inventoriable goods or services. It is applicable to **relatively homogeneous products** that are mass produced on a continuous basis (e.g., petroleum products, thread, computer monitors, Oil refining, Textiles, Paints, Flour, Canneries, Rubber, Steel, Food processing).

### Characteristics of Process Costing

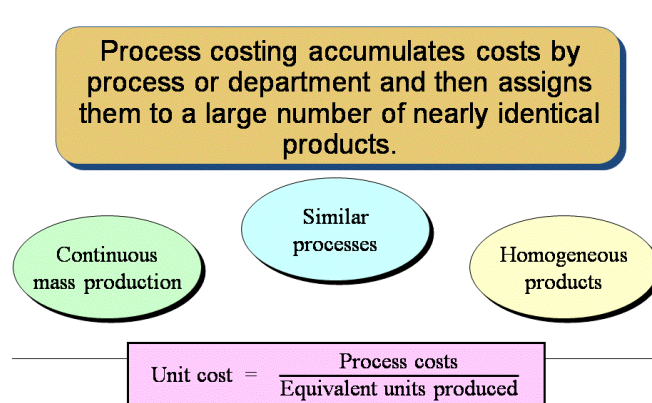

Due to mass production direct labor costs are usually small in comparison to other costing system , thus DL cost combined with Manufacturing overhead to constitutes conversion costs.

### Comparing Job-Order and Process Costing

Where job-order costing uses subsidiary ledgers to keep track of specific jobs, process costing typically has a **work-in-process account for each department** through which the production of output passes.

Process costing is an averaging process that calculates the average cost of all units:

- 1) Costs are accumulated for a cost object that consists of a large number of similar units of goods or services;
- 2) Work-in-process is stated in terms of equivalent units;
- 3) Unit costs are established.

The accumulation of costs under a process costing system is **by department rather than by project**. This reflects the continuous, homogeneous nature of the manufacturing process.

Because manufacturing overhead is assigned to work-in-process as part of conversion costs, there is **rarely an overhead control or overhead applied account** under process costing, and the issue of over- or underapplied overhead does not arise. The exception is when a standard costing system is used. Under standard costing, a predetermined overhead rate (as in job-order costing) is used to assign overhead costs. (See **flow of cost accumulation** in a process costing system in your book).

#### Steps in process costing

1. Account for all units (physical flow of quantities).
2. Compute the equivalent units of production (EUP).
3. Compute unit cost per EUP.

**Step 1: Account for All Units :** step 1 important to determine any missing information in questions (normally spoilage), same in both FIFO and Weighted average methods, ignores the % percentage of completion for beginning and ending WIP).

Beginning WIP	XX
Started Units this period	XX
	<hr/>
Total Units to Account for	xxxxxx

### Step 2: compute Equivalent Units of Production

Equivalent units are the product of the number of partially completed units and the percentage completion of those units.

We need to calculate equivalent units because a department usually has some partially completed units in its beginning and ending inventory.

- One equivalent unit is the amount of direct materials or conversion costs (direct labor and manufacturing overhead) required to produce one unit of finished goods.
- The objective is to allocate direct materials and conversion costs incurred during the period to finished goods, ending work-in-process (EWIP) and spoilage.
- EUP is separately computed for direct materials and conversion (DL & MOH) costs.

## Equivalent Units – The Basic Idea

Two half completed products are *equivalent to* one completed product.

So, 10,000 units 70% complete are *equivalent to* 7,000 complete units.

Example: For the current period, Jones started 15,000 units and completed 10,000 units, leaving 5,000 units in process 30 percent complete. How many equivalent units of production did Jones have for the period?

- a. 10,000
- b. 11,500
- c. 13,500
- d. 15,000

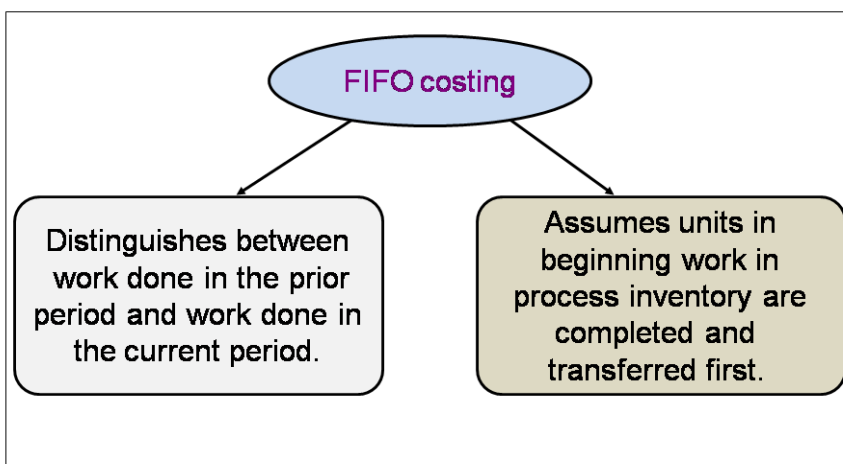

Answer:  $10,000 \text{ units} + (5,000 \text{ units} \times 0.30)$   
 $= 11,500 \text{ equivalent units}$

Two cost-flow assumptions in Process costing: First In First Out (FIFO).Vs. Weighted Average.

### First In First Out (FIFO)

#### Assumptions:

Only costs incurred this period are allocated between finished goods and EWIP. Manufacturing costs in beginning work in process (BWIP) are excluded from the current –period unit cost calculations.

The beginning work in process (BWIP) inventory is to be completed and transferred first.

The ending work-in-process (EWIP) inventory results from goods processed this period.

EUP is separately computed for direct materials and conversion (DL & MOH) costs.

EUP Computation under FIFO (If materials are added as work in process continually):

	<u>Material</u>	<u>Conversion</u>
Total units Completed	XX	XX
- Beginning WIP (regardless of % of completion)	(XX)	(XX)
<hr/>		
Units Started and Completed this Period	XX	XX
+ Amount needed to complete Beginning WIP	XX	XX
+ Amount Completed on Ending WIP	XX	XX
<hr/>		
EUP under FIFO	XX	XX
<hr/>		

If materials are added at the beginning of a process :

Total Units Completed	XX
+ Amount of materials Needed to Complete BWIP	zero
+ Amount of materials Added to Date on EWIP	100%
<hr/>	
EUP for Materials	XXX
<hr/>	

If materials are added at the end of a process

Total Units Completed	XX
+ Amount of materials Needed to Complete BWIP	100%
+ Amount of materials Added to Date on EWIP	zero
<hr/>	
EUP for Materials	XXX
<hr/>	

## EUP : Weighted Average

### ➤ Assumptions

- No differentiation is made between goods started in the preceding and the current periods.
- The beginning WIP inventory costs are merged with the costs of the units started during the period and new average cost is obtained.
- EUP under weighted average differs from EUP under FIFO by the amount of EUP in beginning WIP.
- Total EUP completed from beginning WIP is not deducted in determining current EUP.

EUP under weighted average costing may be computed as follows:

Total Units Completed this period	XX
+ Work to date on Ending WIP	XX
	<hr/>
EUP under weighted average	<u>XXXX</u>

### Comparing Weighted Average to FIFO

- ✓ The difference between weighted average and FIFO is the handling of beginning WIP.
- ✓ If there is no beginning WIP inventory, both assumptions will have the same EUP.

## EUP :Example 1

➤ The following data relate to the activities of department A during the month of January :

assume that all materials are added at the beginning of the process .

	Units
Beginning WIP (66.67% Completed as to Conversion)	1,500
Units started this period	5,000
Units Completed and Transferred to the following process	5,500
EWIP (60% Completed as to conversion)	1,000

### Required

Compute EUP using FIFO and Weighted Average.

## EUP :Example 1 Solution

➤ Accounting for all units (Physical Quantities)

	<u>Units</u>
BWIP	1500
Units Started this period	<u>5000</u>
<b>Total Units to Account for</b>	<b><u>6500</u></b>
Units completed and transferred	5500
EWIP	<u>1000</u>
<b>Total Units to Accounted for</b>	<b><u>6500</u></b>

**EUP : Examples 1 solution (EUP-FIFO)**

	<u>Materials</u>	<u>Conversion</u>

### Step 3 : Compute Unit Cost

#### ➤ Unit Cost Under FIFO

<u>Current Manufacturing Cost</u>					
EUP (FIFO)					
Manufacturing Cost	Current MC	÷	EUP (FIFO)	=	Unit Cost
DM	\$xx	÷	xx	=	\$xx
Conversion (DL&MOH)	\$xx	÷	xx	=	xx
Total Unit Cost –FIFO					\$XXX

#### ➤ Unit cost under Weighted Average (WA)

<u>Cost of BWIP + Current manufacturing Cost</u>					
EUP (WA)					
Manufacturing Cost	BWIP Cost + Current MC	÷	EUP (WA)	=	Unit Cost
DM	\$xx + \$xx	÷	xx	=	\$xx
Conversion (DL&MOH)	\$xx + \$xx	÷	xx	=	xx
Total Unit Cost –Weighted Average					\$XXX

### Accounting for spoilage

Southwood Industries uses a process costing system and inspects its goods at the end of manufacturing. The inspection as of June 30 revealed the following information for the month of June.

Good units completed	16,000
Normal spoilage (units)	300
Abnormal spoilage (units)	100

Unit costs were: materials, \$3.50; and conversion costs, \$6.00.

What is the number of units that Southwood would transfer to its finished goods inventory and the related cost of these units are?

Step 1: calculating the total cost of the completed units = 16,000 X (\$3.5+\$6) = **\$ 152,000**

Step 2: adding only the cost of normal spoilage as it represents the additional product cost for the completed units totaled 16,000 {Cost of Normal spoilage = 300 X (\$3.5+\$6) = **\$2,850**}

Thus, for sure the number of units that Southwood would transfer to its finished goods inventory should be based on the 16,000 “Good units completed” but with total cost = **\$ 152,000 + \$2,850= \$154,850**

## Operation costing

Many companies have costing systems that are neither pure job costing nor pure process costing but have elements of both. so it use a hybrid system called Operation costing, in a hybrid system direct materials costs are charged to specific products (as in job-order systems) but conversion costs are accumulated and a unit conversion cost for each operation is derived (as in process costing).

Example : Fashion Inc. manufactures women's dresses using cotton and polyester. Since the same style dresses are made out of both fabrics, Fashions uses operation costing.

During June, 1,000 cotton dresses were completely produced.

Also during June, 1,500 polyester dresses were started by adding all materials at the beginning of the process. Of these 1,500 dresses, 700 were completely finished and the remainder were 25 percent complete by the end of the month. There was no work-in-process inventory at the beginning of June.

Costs incurred during June were as follows.

Cotton	\$10,000
Polyester	22,500
Conversion costs	13,300

The cost per unit to manufacture one polyester dress during June was

	<b>M</b>	<b>C</b>	
	\$22,500	\$13,300.0	
<b>units</b>	1500	1900	
<b>per unit</b>	<b>\$15</b>	<b>\$7</b>	<b>\$22</b>

## STUDY UNIT SIX COST ALLOCATION TECHNIQUES

### Introduction

Cost allocation, which is a problem in nearly every organization and nearly every facet of accounting, provides information needed for both strategic and operating decisions.

There is rarely one "best" way to allocate costs. Cost allocation requires judgment, and reasonable people may differ in their judgments. Job costing and ABC in units 4 examined topics related largely to the allocation of indirect costs to individual products. As we saw then, finding answers to cost-allocation questions is often difficult. The answers are seldom clearly right or wrong.

### Cost allocation issues

- Macro issues: allocating costs to divisions, plants, and customers.
- Micro issues: allocating support costs to operating departments and allocating common costs to various cost objects.

The question now why do managers allocate indirect costs to these cost objects? Now we will illustrate four purposes of cost allocation then introducing four criteria used to guide cost allocation decisions.

### Four purposes of cost allocation

1. To provide information for **economic decisions**
2. To **motivate** managers and employees
3. To **justify** costs or compute reimbursement
4. To measure income and assets for reporting to **external parties**

### Different costs are appropriate for different purposes

(allocate or not according to management decision purpose)

Consider costs of a product in terms of the business functions in the value chain (research and development, marketing, distribution, and customer service costs).

For some decision related to the **economic-decision purpose**

- (for example, long-run product pricing), the costs in all six functions should be included.

For the **motivation purpose**, costs from more than one business function are often included to emphasize to managers how costs in different functions are related to each other.

- For example, product designers in some Japanese companies incorporate costs of other functions in the value chain - such as production, distribution, and customer service into their product-cost estimates. The aim is to focus attention on how different product design options affect total costs.

For the **cost-reimbursement purpose**, the particular contract will often stipulate whether all six of the business functions or only a subset of them are to be reimbursed.

- For instance, cost-reimbursement rules for U.S. government contracts explicitly exclude marketing costs.

For the **purpose of income and asset measurement** for reporting to external parties, inventoriable costs under GAAP include only manufacturing costs (and product design costs in some cases). In the United States, R&D costs in most industries are a period cost when they are incurred, as are marketing, distribution, and customer-service costs

**Cost allocations can be used to motivate managers to consume less or more of the company's resources**

- To *discourage* use, the cost of a department's services could be allocated according to the amount of services used.
- To *encourage* use of a department's services (for example, internal audit). Top management might
  - not allocate any of the cost of that department's services or
  - allocate a fixed amount of the cost of that department to other departments regardless of how much of those services are used by those other departments (the other departments may feel obligated to use the services to get their "money's worth")

## CRITERIA TO GUIDE COST-ALLOCATION DECISIONS

These decisions affect both the number of indirect-cost pools and the cost-allocation base for each indirect-cost pool. Managers must first identify the purpose for a particular cost allocation and then select the criteria, to allocate costs.

**1. Cause and Effect** (most preferred). It identifies variables that cause cost objects to incur costs.

Using this criterion, managers identify the variables that **cause** resources to be consumed. For example, managers may use hours of testing as the variable when allocating the costs of a quality-testing area to products. Cost allocations based on the cause-and-effect criterion are likely to be the most credible to operating personnel.

The cause-and-effect criterion is the primary one used in activity-based costing (ABC) applications. ABC systems use the concept of a cost hierarchy to identify the cost drivers that best demonstrate the cause-and-effect relationship between each activity and the costs in the related cost pool. The cost drivers are then chosen as cost allocation bases.

**2. Benefits Received.** (most frequently used alternative when a cause-and-effect relationship cannot be determined.)

Using this criterion, managers identify the beneficiaries of the outputs of the cost object. The costs of the cost object are allocated among the beneficiaries in proportion to the benefits each receives. Consider a corporate wide advertising program that promotes the general image of the corporation rather than any individual product. The costs of this program may be allocated on the basis of division revenues; the higher the revenues, the higher the division's allocated cost of the advertising program. The rationale behind this allocation is that divisions with higher revenues apparently benefited from the advertising more than divisions with lower revenues and, therefore, ought to be allocated more of the advertising costs.

We emphasize the superiority of the cause and-effect and the benefits-received criteria, especially when the purpose of cost allocation is economic decisions or motivation.

**3. Fairness or Equity.** (Least preferred) This criterion is often cited in government contracts when cost allocations are the basis for establishing a price satisfactory to the government and its suppliers. Cost allocation here is viewed as a "reasonable" or "fair" means of establishing a selling price in the minds of the contracting

parties. For most allocation decisions, fairness is a difficult-to-achieve objective rather than an operational criterion.

**4. Ability to Bear.** (least preferred) ) This criterion advocates allocating costs in proportion to the cost object's ability to bear costs allocated to it. An example is the allocation of corporate executive salaries on the basis of division operating income. The presumption is that the more-profitable divisions have a greater ability to absorb corporate headquarters' costs.

the more profitable divisions have a greater ability to bear costs. It subsidizes poor performers at the expense of the best performers. It is usually unacceptable because of its negative effect on managerial motivation

Fairness and ability to bear are less frequently used criteria than cause and effect or benefits received. Fairness is a difficult criterion on which to obtain agreement. What one party views as fair, another party may view as unfair.

The following sequential outline gives the "big picture" of cost allocation:

1. Determine the purpose of the allocation, because the purpose defines *what costs* will be allocated.
2. Decide *how* to allocate the costs from step 1. To do so,
  - a. Decide *how many indirect- cost pools* to form, and then
  - b. Identify an *allocation base* (preferably a cost driver) *for each cost pool*

# Inventory-costing choices: Absorption (Full) vs. Variable\* (Direct\*\*)

\* *variable costing* is a less than perfect term to describe this inventory-costing method because not all variable costs are inventoriable costs. Only variable manufacturing costs are inventoriable.

\*\* direct costing is not an accurate description for two reasons: (1) Variable costing does not include all direct costs as inventoriable costs. Only direct variable manufacturing costs are included. Any direct fixed manufacturing costs and any direct nonmanufacturing costs are excluded from inventoriable costs.

(2) Variable costing includes as inventoriable costs not only direct manufacturing costs but also some indirect costs (indirect variable manufacturing costs).

## Inventory-costing choices: Absorption (Full) vs. Variable (Direct)

After the cost accumulation method and the cost measurement method have been chosen, the firm must decide how it is going to account for allocating overhead (fixed and variable) to the products. There are two different approaches that can be used to determine which manufacturing costs are to be included in the cost of the product:

- I. Absorption (or full) costing and
- II. Variable (direct) costing.

### A. ABSORPTION (GAAP COSTING)

Absorption costing capitalizes fixed factory overhead expenses as part of the cost of inventory (goods manufactured and not yet sold) in accordance with generally accepted accounting principles (GAAP). Therefore, absorption costing includes direct material, direct labor, and all overhead (variable and fixed) as inventoriable costs. Absorption costing is also referred to as "conventional," "absorption," "full" or "full absorption" costing.

#### 1. Benefits of Absorption Costing

- a. Absorption costing is GAAP.
  - b. The Internal Revenue Service requires the use of the absorption method for financial reporting.
- Accountants who support absorption costing maintain that inventories should carry a fixed manufacturing cost component. Why? Because both variable manufacturing costs and fixed manufacturing costs are necessary to produce goods. Therefore, both types of costs should be inventoriable, regardless of their different behavior patterns.

#### 2. Limitations of Absorption Costing

- a. The level of inventory affects net income because fixed costs are a component of product cost.
- b. The net income reported under the absorption method is less reliable (especially for use in performance evaluations) than under the variable method because the cost of the product includes fixed costs and, therefore, the level of inventory affects net income.

Note that; under the absorption method, management was able to show higher income by overproducing. If the manager was being given a bonus for a higher level of income, (s)he could obtain the bonus by producing more units than could be sold. As a result, some fixed costs would be added to the balance sheet as inventories. Thus, the income statement and balance sheet both look good, despite the fact that the production manager has done a bad thing: (S)he has produced excessive inventories, which require the company to incur storage and financing costs. Spoilage may also be a result.

### B. VARIABLE (Direct) COSTING

Under **variable costing**, only those manufacturing costs that vary with output (Variable manufacturing costs) are treated as product costs (inventory cost). This includes direct materials, variable overhead and ordinarily direct labor. Fixed manufacturing overhead is treated as a period cost and it is expensed on the income statement as incurred.

#### 1. Management Tool

Variable costing is used as a management tool to identify contribution margin, calculate breakeven and expedite profit planning (cost volume profit analysis CVP analysis).

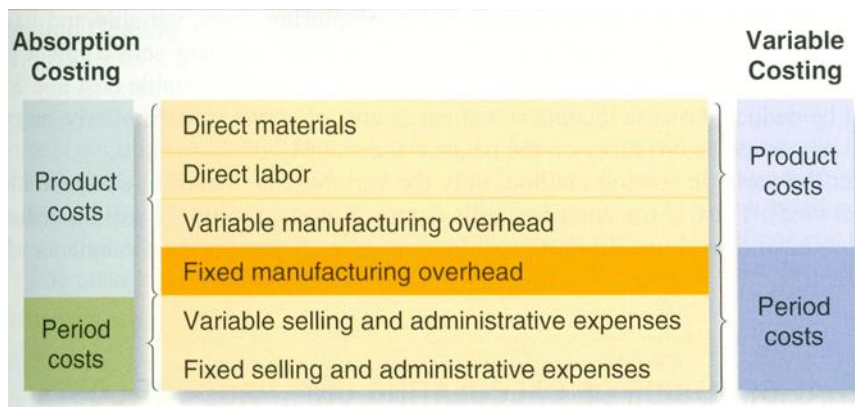

## 2. Benefits of Variable Costing

- Variable costing attains the objectives of management control systems as the costs are listed separately so that they may be easily traced to and controlled by management.
- The net income reported under the contribution income statement is more reliable (especially for use in performance evaluations) than under the absorption method because the cost of the product does not include fixed costs and therefore the level of inventory does not affect net income. Under the variable costing method, a production manager cannot manipulate income levels by overproducing. Given the same cost structure every year, the income levels will be based on sales, not the level of production.
- Variable costing isolates the contribution margins in financial statements to aid in decision-making (the contribution margin is defined as sales price less all variable costs including variable sales and administrative costs and breakeven analysis is often based on contribution margins).

Accountants who favor variable costing for external reporting maintain that the fixed portion of manufacturing costs is more closely related to the capacity to produce than to the actual production of specific units. Hence, fixed costs should be expensed, not inventoried.

## 4. Limitations of Variable Costing

- Variable costing is not GAAP.
- The Internal Revenue Service does not allow the use of the variable cost method for financial reporting. If a company uses VC, it must be in addition to AC.

**Absorption costing (or full costing) is an inventory costing system that includes both variable and fixed manufacturing costs. Inventory absorbs all costs of manufacturing.**

**Variable costing (or direct costing) is an inventory costing method that includes all variable manufacturing costs as inventoriable costs but excludes fixed manufacturing costs. Variable costing expenses fixed manufacturing costs in the period in which the costs are incurred.**

**Each method expenses all nonmanufacturing costs (both fixed and variable) in the period in which they occur. Therefore, these two methods differ only in how they account for fixed manufacturing costs.**

Relation between Production and Sales for the Period	Effect on Inventories 	Relation between Absorption and Variable Costing Net Operating Incomes
Units produced = Units sold	No change in inventories 	Absorption costing net operating income = Variable costing net operating income
Units produced > Units sold	Inventories increase 	Absorption costing net operating income > Variable costing net operating income*
Units produced < Units sold	Inventories decrease 	Absorption costing net operating income < Variable costing net operating income <sup>†</sup>
<p>*Net operating income is higher under absorption costing because fixed manufacturing overhead cost is <i>deferred</i> in inventory under absorption costing as inventories increase.</p> <p><sup>†</sup>Net operating income is lower under absorption costing because fixed manufacturing overhead cost is <i>released</i> from inventory under absorption costing as inventories decrease.</p>		

Under variable costing, operating profit is a function of sales. Under absorption costing, it is a function of sales and production.

#### D. GROSS MARGIN (ABSORPTION COSTING: external reporting) VS. CONTRIBUTION MARGIN (VARIABLE COSTING: internal reporting) INCOME STATEMENTS

The VC income statement uses the contribution-margin format that distinguishes variable costs from fixed costs (based on cost behavior). This format highlights the lump-sum fixed manufacturing overhead (FMOH) costs that are expensed in the period incurred. The AC income statement uses the gross-margin format that distinguishes manufacturing costs from nonmanufacturing costs (functionally based income statement).

Two items distinguish gross margin (GM) from contribution (CM): (1) FMOH costs and (2) variable nonmanufacturing (VNM) costs. AC expenses FMOH costs related to units sold (as part of cost of goods sold) in calculating GM. In contrast, VC expenses total FMOH costs after calculating CM. Also, in AC all nonmanufacturing costs are subtracted from GM; but in VC, VNM costs are subtracted in calculating CM.

### ABSORPTION COSTING

Sales Revenues	\$XX
Less: Cost of goods sold	(x)
*Gross margin	XX
Less: Variable selling and administrative expenses	(x)
Fixed selling and administrative expenses	(x)
Operating income	<u>\$XX</u>

\*Gross profit margin may also be stated as a percentage, which is calculated as gross margin (or profit) divided by sales

### VARIABLE COSTING

Sales Revenues	\$XX
Less: Variable cost of goods sold (excludes fixed overhead)	(x)
Contribution margin from manufacturing	<u>\$XX</u>
Less: variable selling and administrative expenses	(x)
Contribution margin	\$XX
Less: Fixed expenses:	
Fixed manufacturing overhead	\$xx
Fixed selling and administrative expenses	x
Total fixed expenses	(XX)
Operating income	<u>\$XX</u>

Example:

Units made:	700
Units sold:	500
Variable manufacturing costs per unit:	\$30
Variable selling (marketing) costs per unit:	\$20
Fixed manufacturing costs per unit:	\$25
Fixed selling (marketing) costs:	\$14,000

Figure 2-28: Variable Costing vs. Absorption Costing

Variable Costing		Absorption Costing	
Revenues: $200 \times 500$ units	\$100,000	Revenues: $200 \times 500$ units	\$100,000
Variable costs		Costs of goods sold	
Beginning inventory	\$0	Beginning inventory	\$0
+ Variable manufacturing costs: $\$30 \times 700$	+21,000	+ Variable manufacturing costs: $\$30 \times 700$	+21,000
= Cost of goods available for sale	21,000	+ Fixed manufacturing costs: $\$25 \times 700$	+17,500
- Ending inventory: $\$30 \times 200$	-6,000	= Cost of goods available for sale	38,500
= Variable cost of goods sold	15,000	- Ending inventory: $(\$30 \text{ variable} + \$25 \text{ fixed}) \times 200$	-11,000
+ Variable marketing costs: $\$20 \times 500$	+10,000		-27,500
= Total variable costs	-25,000	= Cost of goods sold	
= Contribution margin	75,000	= Gross margin	72,500
Fixed costs		Operating costs	
Fixed manufacturing costs: $\$25 \times 700$	17,500	Variable marketing costs: $\$20 \times 500$	10,000
+ Fixed marketing costs	+14,000	+ Fixed marketing costs	+14,000
+/- Adjustment for fixed cost variances	0	+/- Adjustment for operating cost variances	0
= Total fixed costs	-31,500	= Total operating costs	-24,000
= Operating income	<u>\$43,500</u>	= Operating income	<u>\$48,500</u>

In summary, when inventory increases, net income under absorption costing will be greater than under variable costing by the amount of the fixed cost of the change in inventory (200 units x \$25 = \$5,000 in Figure 2-28). When inventory decreases, net income under absorption costing will be less than under variable costing by the amount of the change in inventory fixed cost.

The difference in reported operating income can be calculated :

$$\begin{array}{ccccccc} \text{Absorption-costing} & & \text{Variable-costing} & & \text{Fixed manufacturing} & & \text{Fixed manufacturing} \\ \text{operating} & \bigcirc & \text{operating} & \bigcirc & \text{cost in ending inventory} & \bigcirc & \text{cost in beginning inventory} \\ \text{income} & - & \text{income} & = & \text{under Absorption-costing} & - & \text{under Absorption-costing} \end{array}$$

The difference between VC and AC operating incomes is *a matter of timing*. Under VC, FMOH costs are expensed in the period incurred. Under AC, FMOH costs are allocated to output produced and are not expensed until those units are sold. In fact, if a company has zero inventory at the beginning and end of each accounting period, there is no difference between these two methods of costing.

However as methods such as just-in-time production and other inventory reduction methods increase in importance, the differences between variable and absorption costing will grow less material.

### ABSORPTION (GAAP COSTING) with standard costing (MEASUREMENT SYSTEM) CMA EXAMPLE (TO BE STUDIED AFTER U.7)

Dremmon Corporation uses a standard cost accounting system. Data for the last fiscal year are as follows.

	Units	
Beginning inventory of finished goods	100	
Production during the year	700	
Sales	750	
Ending inventory of finished goods	50	
<u>Per Unit</u>		
Product selling price	\$200	
Standard variable manufacturing cost	90	
Standard fixed manufacturing cost	20*	
Budgeted selling and administrative costs (all fixed)		\$45,000

**\*Denominator level of activity is 750 units for the year.**

There were no price, efficiency, or spending variances for the year, and actual selling and administrative expenses equaled the budget amount. Any volume variance is written off to cost of goods sold in the year incurred. There are no work-in-process inventories. Assuming that Dremmon used absorption costing, the amount of operating income earned in the last fiscal year was

THE AMERICAN UNIVERSITY IN CAIRO  
School of Continuing Education

sales rev	150,000
Cost of Goods Sold	
Beginning inventory	11,000
Variable manufacturing costs	63,000
Fixed manufacturing costs	14,000
<b>Cost for goods available for sale</b>	<b>88,000</b>
deduct ending inventory	5,500
Total COGS(at standard costs)	82,500
<u>Adjustment for manufacturing variances</u>	<u>1,000</u>
<b>Total COGS</b>	<b>83,500</b>
Gross Margin	66,500
Operating cost	45,000
Operating income	21,500

Dremmon has a production-volume variance because production (700 units) differs from the budgeted level of production of 750 units per year used to calculate the budgeted fixed manufacturing cost per unit.

The \$20 fixed manufacturing cost rate is based on a budgeted denominator level of 750 units produced per year ( $\$15,000 \div 750 \text{ units} = \$20 \text{ per unit}$ ). Whenever production - that's the quantity produced not the quantity sold - deviates from the denominator level, there will be a production-volume variance. The amount of the variance here is \$20 per unit multiplied by the difference between the actual level of production and the denominator level.

Production was 700 units, 50 lower than the denominator level of 750 units. The result is an unfavorable production-volume variance of \$1,000 ( $\$20 \text{ per unit} \times 50 \text{ units}$ ).

Recall how standard costing works. Each time a unit is manufactured, \$20 of fixed manufacturing costs is included in the cost of goods manufactured and available for sale.

When 700 units are manufactured, \$14,000 ( $\$20 \text{ per unit} \times 700 \text{ units}$ ) of fixed costs are included in the cost of goods available for sale. Total fixed manufacturing costs for are \$15,000. The production-volume variance of \$1,000 U equals the difference between \$15,000 and \$14,000. Note how, the fixed manufacturing costs included in the cost of goods available for sale plus the production-volume variance always equals \$15,000. The production-volume variance, which relates to fixed manufacturing overhead, exists under absorption costing but not under variable costing. Why? Because under variable costing, fixed manufacturing costs of \$15,000 are always treated as an expense of the period, regardless of the level of production (and sales).

The PVV is the difference between the lump-sum budgeted FMOH and FMOH allocated to output produced. Because FMOH costs aren't allocated to output produced under VC (FMOH costs are expensed as incurred), there is no PVV under VC.

# Allocating Joint Costs

## Allocating Joint Costs

### Identify the methods used for allocating Joint Costs

In a joint-production process, the juncture where one or more products become separately identifiable is called the splitoff point. Separable costs are all of the costs incurred beyond the splitoff point that are assignable to one or more individual products. For example, the joint-production process of milling timber (logs) yields various grades of lumber as well as sawdust and wood chips. The splitoff point is where individual boards are cut from the timber. The costs of planing these boards into finished lumber are separable costs of the finished lumber. This topic examines methods for allocating costs to joint products. We also examine how cost numbers appropriate for one purpose, such as external reporting, may not be appropriate for other purposes, such as decisions about the further processing of joint products.

## Joint Products and Byproducts

Main Products  
Joint Products

Byproducts

High

Low

Sales Value

## Definitions

**Joint products** are two or more separate products produced by a common manufacturing process from a common input.

**Joint product costs** are incurred in the production of two or more products simultaneously from processing the same raw material by a single process. They are incurred prior to the split-off point and are not separately identifiable. They may be allocated to the joint products based upon their sales value, net realizable value, or physical measure at the point they become separate.

**Split-off point** represents the stage of production at which joint products become identifiable as separate products. These products can be further processed or sold at the split-off point.

**Separable costs** are additional costs incurred for a specific product after the split-off point.

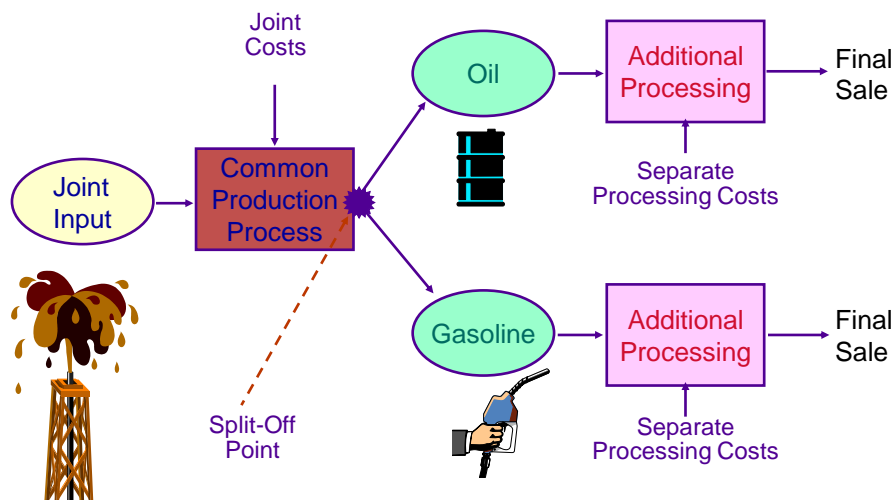

**Net Realizable Value (NRV)** equals sales value less estimated cost to complete and sell.

## Allocation of Joint Costs

- a. Allocation of joint costs IS essential for valuing inventory and determining cost of goods sold.
- b. Joint product cost allocation should not be used in deciding whether to further process or sell the products at the split-off point, i.e., joint costs are irrelevant for that decision.

A joint-production process can yield joint products (or a main product) and byproducts. A joint product has relatively high sales value (revenue) compared to the other products yielded by the joint-production process. If a joint-production process yields only one product with a relatively high sales value, that product is called a main product. A byproduct has a relatively low sales value compared with the sales value of a joint or main product. A joint product can become a byproduct (or vice versa) if its market price moves sizably in one direction.

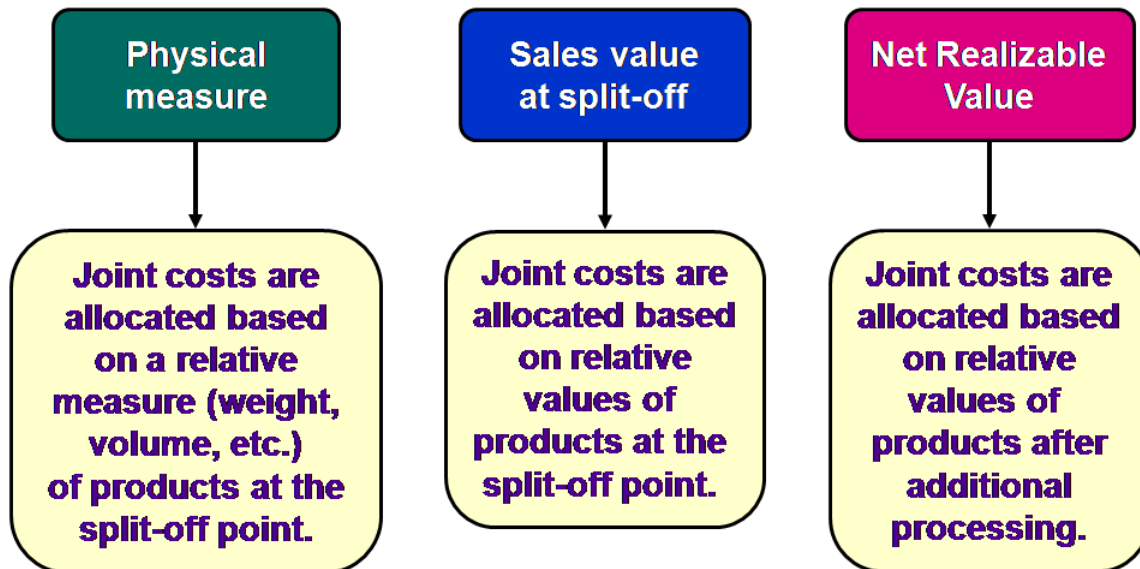

## Joint Product Costing

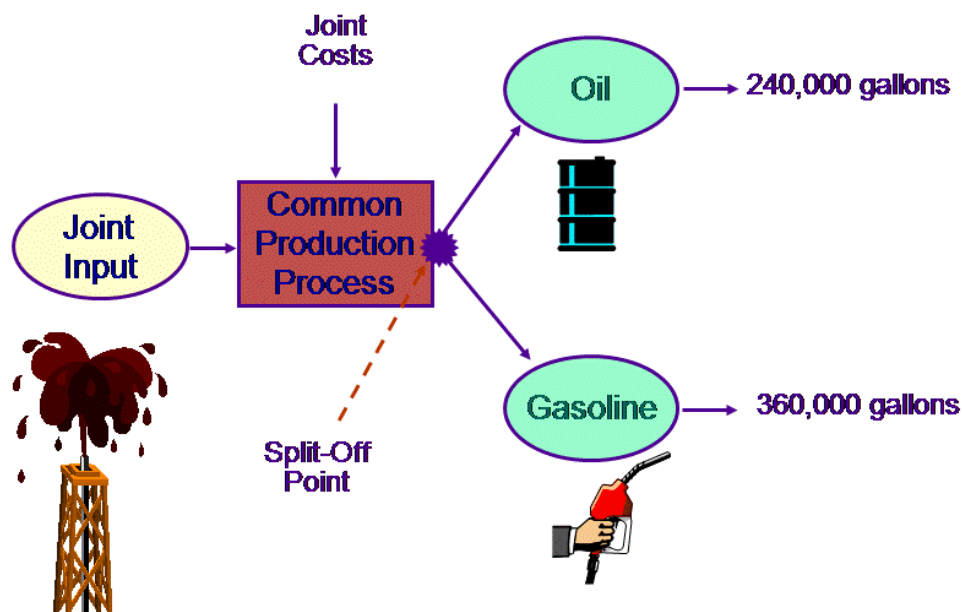

## Methods of allocating joint costs

### Joint Cost Allocation Methods

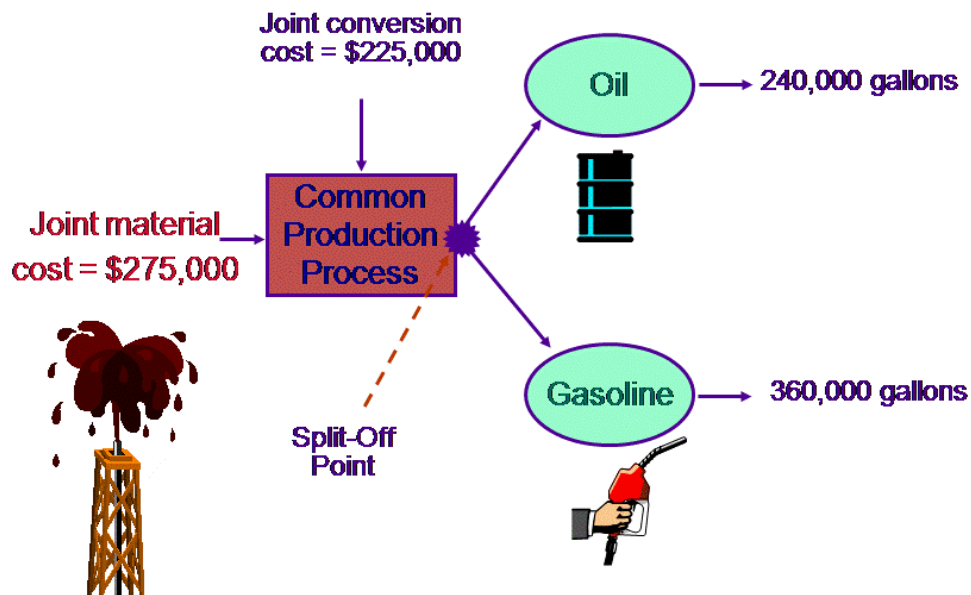

### Physical Measure Method

## Physical Measure Method

## Physical Measure Method

	Product		Total

	Oil	Gasoline	
<b>Sales value at split-off point</b>	\$ 200,000	\$ 600,000	\$ 800,000
<b>Proportionate share:</b> \$200,000 ÷ \$800,000 \$600,000 ÷ \$800,000	25%	75%	
<b>Allocated joint costs:</b> \$500,000 × 25% \$500,000 × 75%	\$ 125,000	\$ 375,000	

\$275,000 joint conversion cost plus  
\$225,000 joint material cost

## Sales Values at Split-off Point Method: Summary

Advantages	Disadvantages
❶ Easy to calculate	❶ Market prices for some industries change constantly
❷ Costs are allocated according to the individual product's revenue	❷ Sales price at split-off might not be available because additional processing is necessary for sale

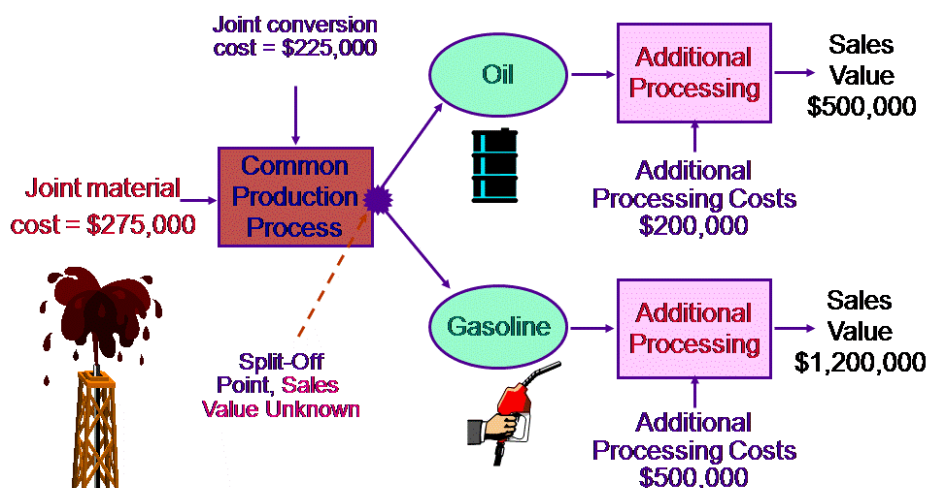

## Net Realizable Value Method

If products require further processing beyond the split-off point before they are marketable, it may be necessary to **estimate** the net realizable value at the split-off point.

$$\text{Estimated NRV} = \text{Final Sales Value} - \text{Added Processing Costs}$$

## Net Realizable Value Method

	Product		Total
	Oil	Gasoline	
Sales value	\$ 500,000	\$ 1,200,000	\$ 1,700,000
Less additional processing costs	?	?	?
Estimated NRV at split-off point	?	?	?
Proportionate share:	?	?	
Allocated joint costs:	?	?	

	Product		Total
	Oil	Gasoline	
Sales value	\$ 500,000	\$ 1,200,000	\$ 1,700,000
Less additional processing costs	200,000	500,000	700,000
Estimated NRV at split-off point	\$ 300,000	\$ 700,000	\$ 1,000,000
Proportionate share:	?	?	
Allocated joint costs:	?	?	

	Product		Total
	Oil	Gasoline	
Sales value	\$ 500,000	\$ 1,200,000	\$ 1,700,000
Less additional processing costs	200,000	500,000	700,000
Estimated NRV at split-off point	\$ 300,000	\$ 700,000	\$ 1,000,000
Proportionate share:			
$\$300,000 \div \$1,000,000$	30%		
$\$700,000 \div \$1,000,000$		70%	
Allocated joint costs:			
$\$500,000 \times 30\%$	\$ 150,000		
$\$500,000 \times 70\%$		\$ 350,000	

### The NRV Method: Summary

Advantages	Disadvantages
① It produces an allocation that yields a predictable, comparable level of profitability among products	① More difficult to calculate than the other two methods
② Selling price at split-off does not have to be available	② Based on an estimated value

# Service Cost Allocation

## Service Cost Allocation

### *Operating departments vs. service departments*

#### **Operating departments**

The central purposes of the organization are carried out in the operating departments (ex.: machining and assembly departments.)

#### **Service departments**

Do not directly engage in operating activities. Instead, they provide services or assistance to the operating departments. (ex.: Cafeteria, Internal Auditing, Human Resources, Cost Accounting, and Purchasing.)

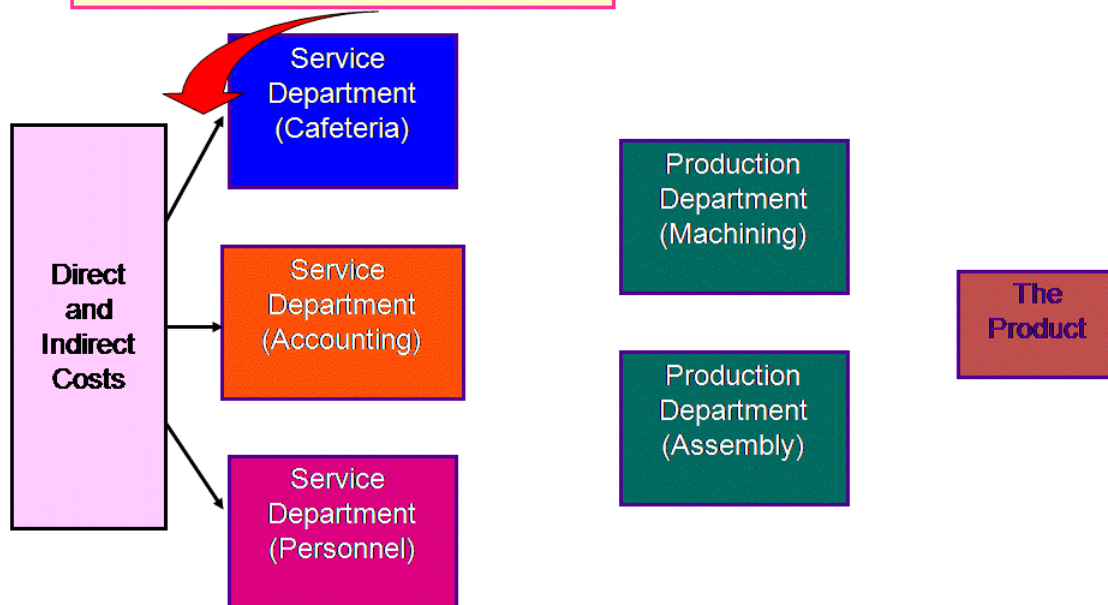

#### **Service Department Costs**

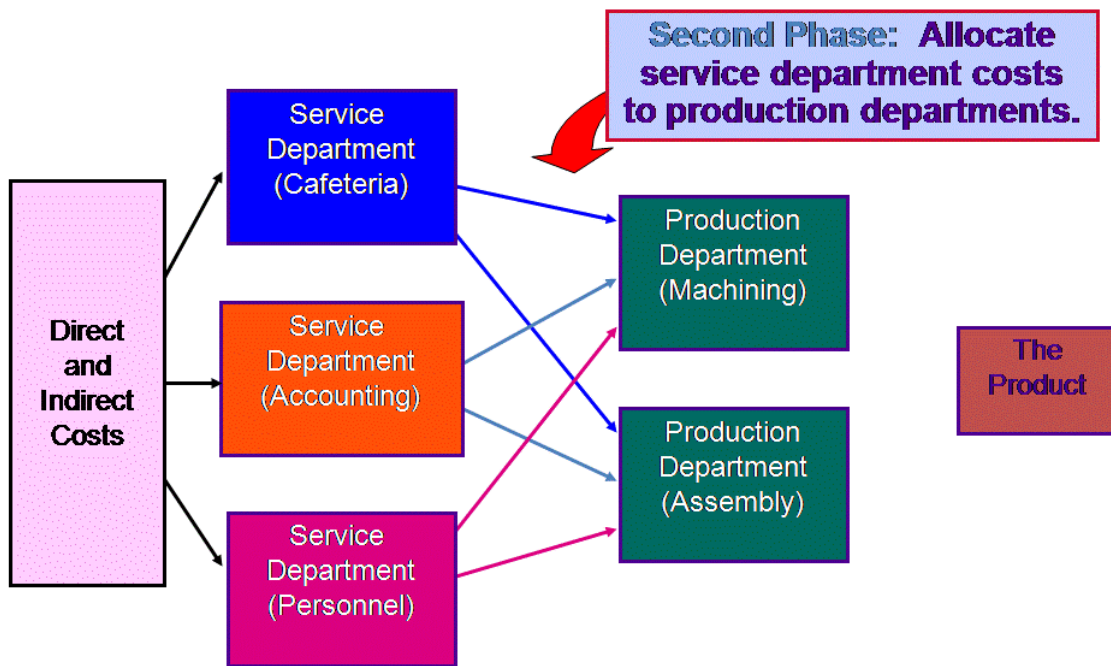

The overhead costs of operating departments commonly include allocations of costs from the service departments. For GAAP purposes to the extent that service department costs are classified as production costs, they should be included in unit product costs and thus must be allocated to operating departments in a process costing system.

This is necessary for product costing and financial reporting: all manufacturing costs, whether originating in production departments or in service departments, must be assigned to the goods produced for proper inventory valuation and cost of goods sold determination. When service departments also render services to each other, their costs may be allocated to each other before allocation to operating departments.

### **Service and Production Department Cost Allocation**

#### **First Phase: Trace direct costs and allocate indirect costs**

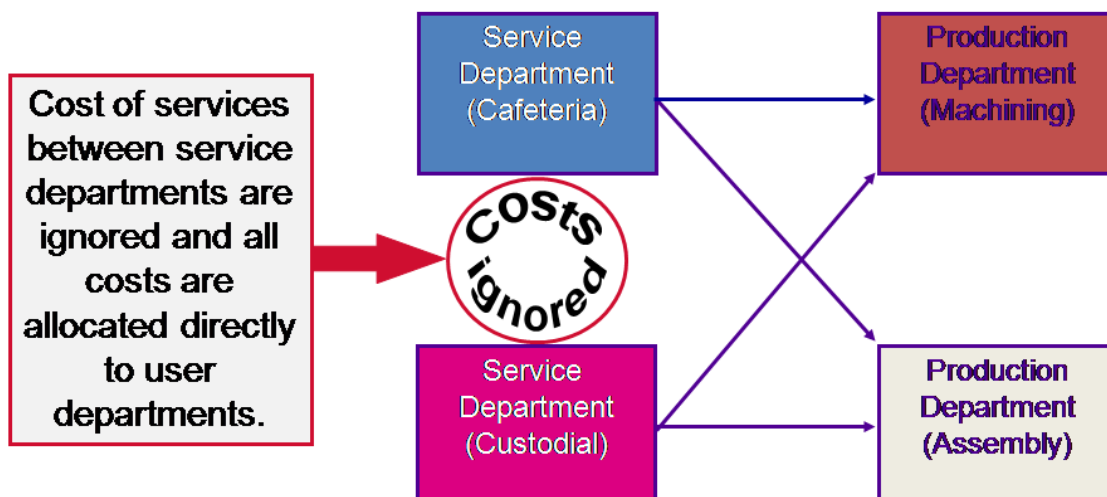

Three approaches are used to allocate the costs of service departments to other departments:

- The direct method,
- The step-down method, and
- The reciprocal method.

#### The direct method

The direct method is the simplest and most common but least accurate of the methods. All service department costs are allocated directly to production departments. It ignores any service rendered by one service department to another, i.e., no attempt is made to allocate the costs of service departments to other service departments. Thus, no allocation is made of the cost of services rendered to other service departments.

## Direct Method

### The step-down method

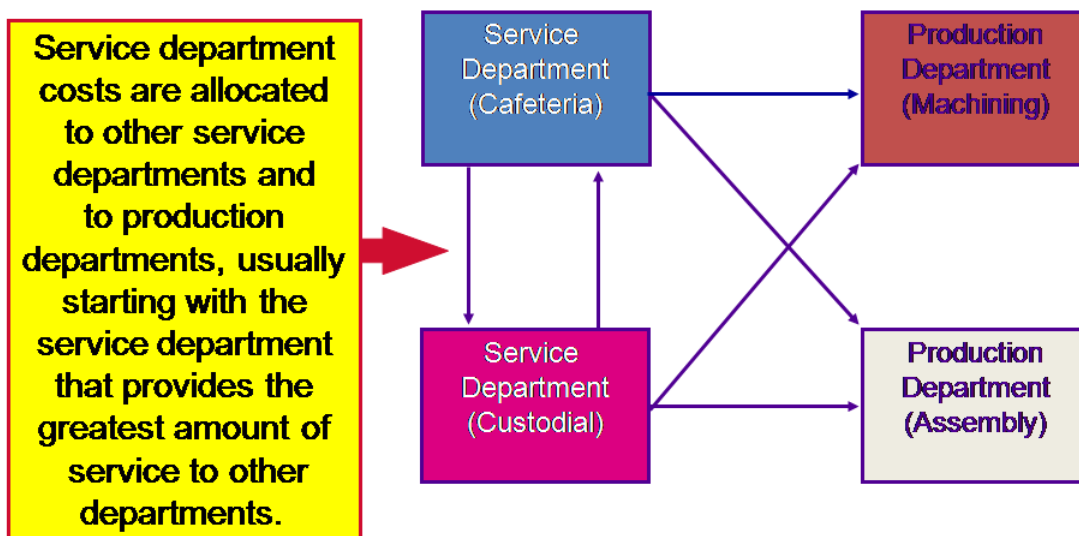

The step-down method is a sequential process. It is slightly more involved than the direct method but is more accurate. The service departments are allocated in order, from the one that provides the most service to other service departments down to the one that provides the least. As each allocation is performed, the costs of the services departments are allocated to both the remaining service departments and the production departments. This method allocates service department costs to other service departments in addition to the producing departments, i.e. it allows for partial recognition of services rendered by a service departments to another.

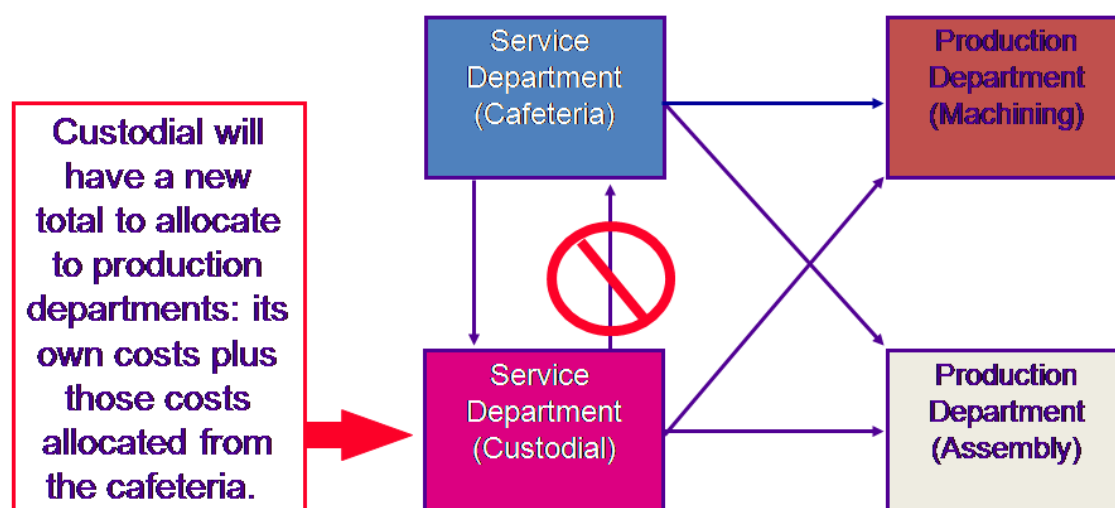

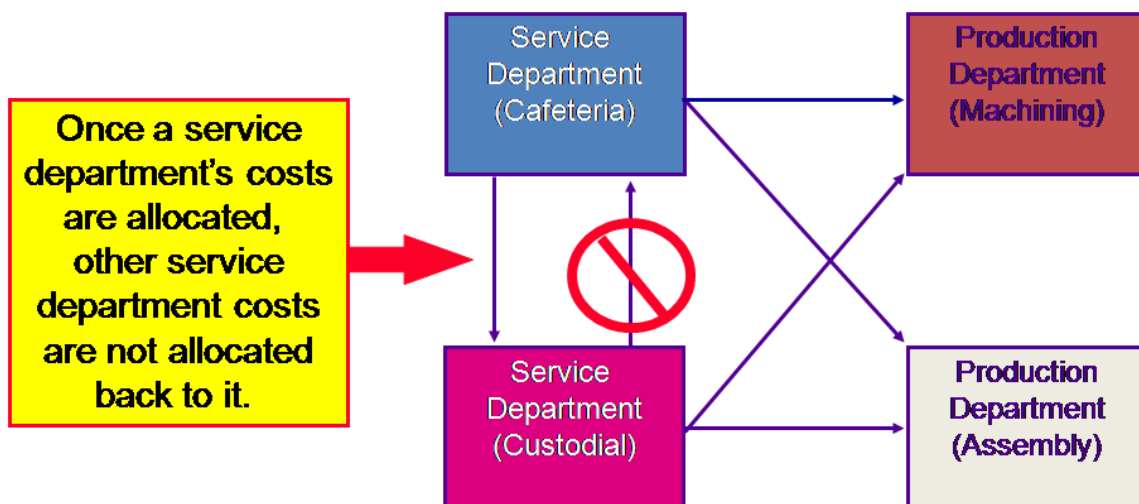

#### Step-down method steps:

##### Begin Allocation:

- With the service department that provides the highest percentage of its total services to other service departments, or
  - With the service department providing services to the greatest number of other service departments, or
  - With the service department having the greatest dollar cost of services provided to other service departments.
- 2) The costs of the remaining service departments are then allocated in the same manner.
  - 3) No cost is assigned back to service departments whose costs have already been allocated.
  - 4) The process continues until all service department costs are allocated.

## Step Method

### The reciprocal method

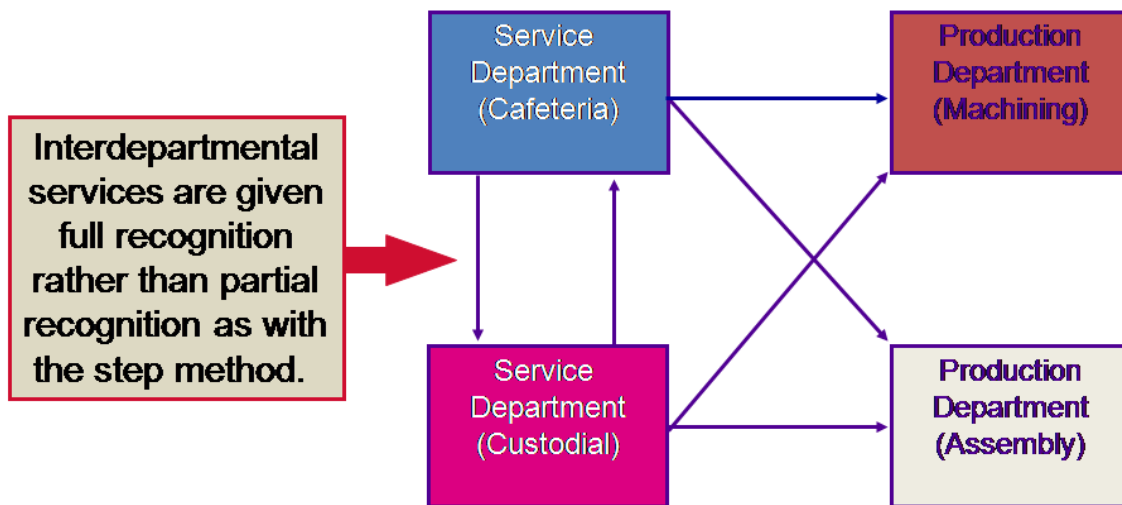

- Theoretically, this method is the most appropriate for allocating service department costs.
- It allows reflection of all reciprocal services among service departments.
- Simultaneous equations are used to compute the completed reciprocated cost.

The reciprocal method is by far the most complex and most accurate of the three methods.

, Simultaneous equations are used to allocate each service department's costs among all other service departments and production departments.

# Reciprocal Method

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Number of employees	15	10	20	30
Square feet occupied	5,000	2,000	25,000	50,000

Service Department	Allocation Base
Cafeteria	Number of employees
Custodial	Square feet occupied

## The direct method

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	?	?	?	?
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	0	144,000	?
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

$$\$360,000 \times \frac{20}{20 + 30} = \$144,000$$

Allocation base: Number of employees

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	0	144,000	216,000
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

$$\$360,000 \times \frac{30}{20 + 30} = \$216,000$$

Allocation base: Number of employees

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	0	144,000	216,000
Custodial allocation	0	(90,000)	30,000	?
Total after allocation	\$ 0	\$ 0	\$ 574,000	?

$$\$90,000 \times \frac{25,000}{25,000 + 50,000} = \$30,000$$

Allocation base: Square feet occupied

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	0	144,000	216,000
Custodial allocation	0	(90,000)	30,000	60,000
Total after allocation	\$ 0	\$ 0	\$ 574,000	\$ 976,000

$$\$90,000 \times \frac{50,000}{25,000 + 50,000} = \$60,000$$

Allocation base: Square feet occupied

## Step Method

We will use the same data used in the direct method example.

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	?	?	?	?
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	60,000	?	?
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

$$\$360,000 \times \frac{10}{10 + 20 + 30} = \$60,000$$

Allocation base: Number of employees

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	60,000	120,000	?
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

$$\$360,000 \times \frac{20}{10 + 20 + 30} = \$120,000$$

Allocation base: Number of employees

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	60,000	120,000	180,000
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

$$\$360,000 \times \frac{30}{10 + 20 + 30} = \$180,000$$

Allocation base: Number of employees

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	60,000	120,000	180,000
Custodial allocation	?	(150,000)	?	?
Total after allocation	?	\$ 0	?	?

New total = \$90,000 original custodial cost plus \$60,000 allocated from the cafeteria.

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	60,000	120,000	180,000
Custodial allocation	0	(150,000)	50,000	?
Total after allocation	\$ 0	\$ 0	\$ 570,000	?

$$\$150,000 \times \frac{25,000}{25,000 + 50,000} = \$50,000$$

Allocation base: Square feet occupied

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(360,000)	60,000	120,000	180,000
Custodial allocation	0	(150,000)	50,000	100,000
Total after allocation	\$ 0	\$ 0	\$ 570,000	\$ 980,000

$$\$150,000 \times \frac{50,000}{25,000 + 50,000} = \$100,000$$

Allocation base: Square feet occupied

## Reciprocal Method

The Custodial Department receives:

$$\frac{10}{10 + 20 + 30} = \frac{1}{6} \text{ of Cafeteria costs.}$$

The Cafeteria Department receives:

$$\frac{5,000}{5,000 + 25,000 + 50,000} = \frac{1}{16} \text{ of Custodial costs.}$$

The total cost of each service department is equal to:

Direct costs of that department  
+ Costs allocated to that department

In equation form:

$$\begin{aligned} \text{Cu} &= \$90,000 + \text{Ca} \frac{1}{6} \\ \text{and} \\ \text{Ca} &= \$360,000 + \text{Cu} \frac{1}{16} \end{aligned}$$

Cu = Total costs of Custodial Department  
Ca = Total costs of Cafeteria Department

In equation form:

$$\begin{aligned} \text{Cu} &= \$90,000 + \text{Ca} \frac{1}{6} \\ \text{and} \\ \text{Ca} &= \$360,000 + \text{Cu} \frac{1}{16} \end{aligned}$$

Two equations and two unknowns are solved by substitution:

$$\text{Ca} = \$360,000 + \frac{1}{16} (\$90,000 + \frac{1}{6} \text{Ca})$$

$$\text{Ca} = \$369,474 \text{ (rounded)}$$

and

$$\text{Cu} = \$90,000 + \frac{1}{6} (\$369,474) = \$151,579$$

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	?	?	?	?
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(369,474)	61,579	?	?
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

$$\$369,474 \times \frac{10}{10 + 20 + 30} = \$61,579$$

Allocation base: Number of employees

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(369,474)	61,579	123,158	?
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

$$\$369,474 \times \frac{20}{10 + 20 + 30} = \$123,158$$

Allocation base: Number of employees

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(369,474)	61,579	123,158	184,737
Custodial allocation	?	?	?	?
Total after allocation	?	?	?	?

$$\$369,474 \times \frac{30}{10 + 20 + 30} = \$184,737$$

Allocation base: Number of employees

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(369,474)	61,579	123,158	184,737
Custodial allocation	9,474	(151,579)	?	?
Total after allocation	\$ 0	\$ 0	?	?

$$\$151,579 \times \frac{5,000}{5,000 + 25,000 + 50,000} = \$9,474 \text{ (rounded)}$$

Allocation base: Square feet occupied

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(369,474)	61,579	123,158	184,737
Custodial allocation	9,474	(151,579)	47,368	?
Total after allocation	\$ 0	\$ 0	\$ 570,526	?

$$\$151,579 \times \frac{25,000}{5,000 + 25,000 + 50,000} = \$47,368 \text{ (rounded)}$$

Allocation base: Square feet occupied

	Service Departments		Production Departments	
	Cafeteria	Custodial	Machining	Assembly
Departmental costs before allocation	\$ 360,000	\$ 90,000	\$ 400,000	\$ 700,000
Cafeteria allocation	(369,474)	61,579	123,158	184,737
Custodial allocation	9,474	(151,579)	47,368	94,737
Total after allocation	\$ 0	\$ 0	\$ 570,526	\$ 979,474

$$\$151,579 \times \frac{50,000}{5,000 + 25,000 + 50,000} = \$94,737 \text{ (rounded)}$$

Allocation base: Square feet occupied

## Comparison of Methods

Method	Totals after allocation	
	Machining Department	Assembly Department
Direct	\$ 574,000	\$ 976,000
Step	570,000	980,000
Reciprocal	570,526	979,474

- The reciprocal method is superior because:
  - It considers all services provided to other service departments.
  - The total cost of operating a service department is computed.
- The reciprocal method requires the use of matrix algebra with three or more service departments.

## Cost Allocation and SBU evaluation

A pervasive issue when using cost SBUs is how to allocate the jointly incurred costs of service departments, such as IT, engineering, human resources, or maintenance, to the departments using the service.

The choice of method affects the amount of cost allocated to each cost SBU and therefore is critical in effective cost SBU evaluation.

For example, if the cost of maintenance is allocated based on the square feet of space in each production department, the departments with more space have higher costs. The incentives of such an allocation method are not clear because the production departments likely cannot control the amount of space they occupy. Alternatively, if maintenance costs are allocated on the basis of the number of maintenance jobs requested, the production departments can control their allocated maintenance costs by controlling usage.

**The criteria for choosing the cost allocation method, are the same as the objectives for management control: to**

- (1) motivate managers to exert a high level of effort,
- (2) provide an incentive for managers to make decisions consistent with top management's goals, and
- (3) provide a basis for a fair evaluation of managers' performance.

For example, when management wants to encourage production departments to *reduce* the amount of maintenance, allocation based on usage provides the desired incentive. In contrast, if management wants the departments to increase the use of maintenance to improve the serviceability of the equipment, the most effective incentive might be not to allocate the maintenance cost or perhaps to subsidize it in some way.

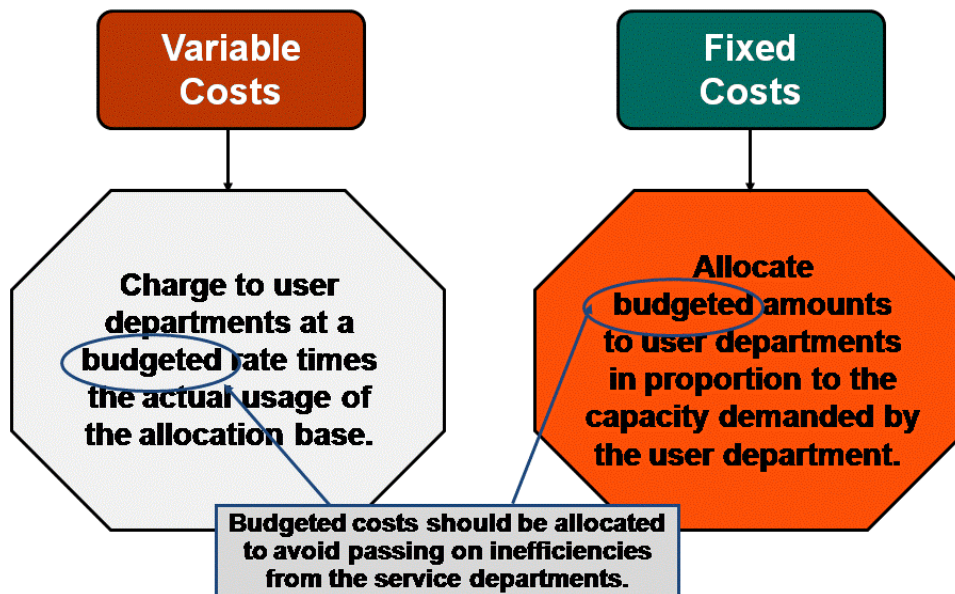

A useful guide in choosing the cost allocation method, in addition to the three criteria just explained, is to use dual allocation. **Dual allocation** is a cost allocation method that separates fixed and variable costs. Variable costs are directly traced to user departments, and fixed costs are allocated on some logical basis.

For example, the variable costs of maintenance, such as supplies, labor, and parts, can be traced to each maintenance job and charged directly to the user department. This approach is both fair and positively motivating. In contrast, the fixed costs of the maintenance department (training, manuals, equipment, etc.) that cannot be traced to each maintenance job should be allocated to the user departments using a basis that fairly reflects each department's use of the service. For example, those departments whose maintenance jobs require more expensive equipment might be allocated a higher proportion of the maintenance department's fixed costs. To improve on dual allocation, indirect costs could be traced to cost SBUs using activity-based costing.

This approach tends to produce the most accurate cost assignment and therefore would be the most motivating and fairest to the SBU managers.

## Separate Fixed and Variable Costs: Dual Allocation

## Separate Fixed and Variable Costs: Dual Allocation

**Ace Co. has a maintenance department and two operating departments: cutting and assembly. Variable maintenance costs are budgeted at \$0.60 per machine hour. Fixed maintenance costs are budgeted at \$200,000 per year. Data relating to the current year are:**

User Departments	Percent of Capacity Demanded	Actual Hours Used
Cutting	60%	80,000
Assembly	40%	40,000
Total hours	100%	120,000

**Allocate maintenance costs to the two operating departments.**

	Cutting Department	Assembly Department
Variable cost allocation:		
$\$0.60 \times 80,000$ hours used	\$ 48,000	
$\$0.60 \times 40,000$ hours used		\$ 24,000
Fixed cost allocation		
Total allocated cost		

**Variable costs are allocated based on hours used.**

	Cutting Department	Assembly Department
Variable cost allocation:		
$\$0.60 \times 80,000$ hours used	\$ 48,000	
$\$0.60 \times 40,000$ hours used		\$ 24,000
Fixed cost allocation		
60% of \$200,000	120,000	
Total allocated cost	\$ 168,000	

**Variable costs are allocated based on hours used.  
Fixed costs are allocated based on  
capacity demanded..**

	Cutting Department	Assembly Department
Variable cost allocation:		
$\$0.60 \times 80,000$ hours used	\$ 48,000	
$\$0.60 \times 40,000$ hours used		\$ 24,000
Fixed cost allocation		
60% of \$200,000	120,000	
40% of \$200,000		80,000
Total allocated cost	\$ 168,000	\$ 104,000

**Variable costs are allocated based on hours used.  
Fixed costs are allocated based on  
capacity demanded..**

## STUDY UNIT SEVEN OPERATIONAL EFFICIENCY AND BUSINESS PROCESS PERFORMANCE

### Just-in-time

#### Definitions:

**Just-in-time system** :A comprehensive production and inventory system that purchases or produces materials and parts only as needed and just in time to be used at each stage of the production process.

**Just-in-time (JIT) production (Also called *lean production*)**: Demand-pull manufacturing system in which each component in a production line is produced as soon as and only when needed by the next step in the production line..

**Just-in-time (JIT) purchasing**: The purchase of goods or materials so that they are delivered just as needed for production.

**Just-In-Time Inventory management systems** are based on a manufacturing philosophy that combines purchasing, production and Inventory control into one function.

#### Purpose

- minimize the level of inventories because many-inventory-related activities are viewed as nonvalue-added.
- meet customer demand in a timely manner, with high-quality products, and at the lowest possible cost, Higher productivity, reduced order costs as well as carrying costs, faster and cheaper setups, shorter manufacturing cycle times, better due date performance, improved quality, and more flexible processes are objectives of JIT methods.
- The ultimate objectives are increased competitiveness and higher profits.

#### JIT (Demand Pull ) System vs. Traditional (push) systems

In a push system, a department produces and sends all that it can to the next step for further processing, which means that the manufacturer is producing something without understanding consumer demand. This can result in large, useless stocks of inventory. The main Idea of JIT is that nothing is produced until the next process in the assembly line needs it. This demand-pull feature requires close coordination between workstations.

#### Benefits

- **Reduction in the cost of carrying the inventory** and reduces nonvalue adding activities.
- Greater emphasis on **improving quality** by eliminating the causes of rework, scrap and waste.
- **Setup times are decreased.**
- **Lower investments in space**
- Higher quality and lower inventory go together.
- JIT increases inventory turnover ( $\text{cost of sales} \div \text{average inventory}$ ) and decreases inventory as a percentage of total assets.
- Backflush costing is utilized with just-in-time production as a planning and control system. Backflush costing is less costly to operate than most traditional costing systems.

**The minimization of inventory reduces the number of suppliers, storage costs, transaction costs, etc**

### Limitations

- an increased **risk of stockout costs**
- JIT implementation is not appropriate for high-mix manufacturing environments, which often have thousands of products and dozens of work centers.

### Carrying costs vs. Stockout costs

The objective of a JIT system is to reduce carrying costs by eliminating inventories and increasing the deliveries made by suppliers. Ideally, shipments are received just in time to be incorporated into the manufacturing process. This system increases the risk of stockout costs because the inventory buffer is reduced or eliminated.

### Characteristics of JIT Systems

The major characteristics of a JIT environment are:

- **Production organized into manufacturing work cells**
- **Multiskilled workers**
- **Reduced setup times**
- **Reduced manufacturing lead times**
- **Reliable suppliers**
  - Buyer-supplier relationships are further facilitated by electronic data interchange (EDI), a technology that allows the supplier access to the buyer's online inventory management system. Thus, electronic messages replace paper documents (purchase orders and sales invoices), and the production schedules and deliveries of the parties can be more readily coordinated.
  - The use of just-in-time production generally involves developing relationships with a minimum number of suppliers that reliably deliver high quality products.

### kanban

A set of control cards used by workers to signal the need for materials and products to move from one operation to the next in an assembly line

Kanban is one of the many elements in the JIT system. It means "ticket," "card," or "sign" or "visual record" or "markers" in Japanese. Workers respond only after receiving a kanban. When production is complete, the kanban is attached to the finished order and sent downstream to the next work cell.

## Material requirements or Material Resource planning (MRP)

### Definition

It is an approach that uses computer software to help manage a manufacturing process. MRP is a "Push-through" system that manufactures finished goods for inventory on the basis of demand forecasts.

- In MRP systems, a master production schedule indicates the quantities and timing of each part to be produced. Once the scheduled production run begins, departments push output through a system, regardless of whether that output is needed.

### Benefits of MRP Systems

The benefits of MRP systems include:

- Less coordination required between functional areas; everyone follows the bill of materials.
- Scheduling improvements; levels load when demand is variable or relatively unpredictable.
- Predictable raw material needs; can take advantage of bulk purchasing and other price breaks.
- More efficient inventory control; schedules to use up raw materials or build finished goods.
- Additional inventory on hand to cover orders should product be damaged or lost in transit to a customer.
- Quick response to new customer demand; can supply new customers from existing inventory rather than building product after the order is received.

- Better manufacturing process control; minimizes retooling and machine setup time.
- Reduced idle time.
- Lower setup costs.
- Lower inventory carrying costs.
- Increased flexibility in responding to market change

### **Limitations**

The primary disadvantage of an MRP environment is potential inventory accumulation. Workstations may receive parts that they are not ready to process.

**Manufacturing resource planning (MRP II)** is a closed-loop manufacturing system that integrates all facets of a manufacturing business, including production, sales, inventories, . schedules, and cash flows.. The same system is used for both the financial reporting and managing operations (both use the same transactions and numbers). Because manufacturing resource planning encompasses materials requirements planning, MRP is a component of an MRP system.

## **Outsourcing**

### **Definition**

Process of purchasing goods and services from outside vendors rather than producing the same goods or providing the same services within the organization. For smaller business, outsourcing may provide access to resources and expertise for capabilities they may not have internally. For larger businesses, outsourcing can improve specific functions.

### **Benefits**

- By Outsourcing certain functions to a specialist, management can free up resources within the company in order to focus on the primary operations of the company and strategic revenue-generating activities.
- It may also be cheaper to outsource a function to a company that specializes in an area than It Is to run and support that function internally.
- Benefits of outsourcing include reliable service, reduced costs, avoidance of the risk of obsolescence, and access to technology.
- Can improve efficiency and effectiveness by gaining outside expertise or scale
- Can provide access to current technologies at reasonable cost without the risk of obsolescence
- Can reduce expenses by gaining capabilities without incurring overhead costs (for example, staffing, benefits, space)
- May improve the quality and/or timeliness of products or services

### **Limitations**

Despite many attractive advantages, outsourcing is not the answer for all activities or functions and should consider the following key cautions: May cost more to go outside for specific expertise

- Can result in a loss of in-house expertise and capabilities
- Can reduce process control
- May reduce control over quality
- May lead to less flexibility (depending on the external supplier)
- May result in less-personalized service
- Creates privacy and confidentiality issues
- Can result in “giving knowledge away” and lead to competitors obtaining expertise, scale, customers, etc.
- Potential for employee morale and loyalty issues

## Theory of constraints (TOC) and throughput costing

### Definition

An analysis of operations that improves profitability and cycle time by identifying the bottleneck in the operation and determining the most profitable product mix given the bottleneck

According to the theory of constraints, increasing the efficiency of operations at non-bottleneck machines will make the slowdowns at bottlenecks worse as it will increase the traffic at bottlenecks.

Theory of Constraints is an important way for a company to speed up its manufacturing time so it can improve its customer response time and its profitability

Manufacturing cycle time, also called manufacturing lead time or throughput time, is defined as

- the amount of time between the receipt of a customer order the shipment of the order.
- Duration between the time an order is received by manufacturing to the time it becomes a finished good.

### Drum-Buffer-Rope System

The drum-buffer-rope (PBR) system is a TOC method for balancing the flow of production through the constraint thereby reducing the amount of inventory at the constraint and improving overall productivity .

**The drum** connotes the constraint, the rope is the sequence of processes prior to and including the constraint, and the buffer is the minimum amount of work-in-process input needed to keep the drum busy.

The objective of the drum-buffer-rope system is to keep the process flow running smoothly through the constraint by careful timing and scheduling of the processes in the rope leading up to the constraint.

### The steps in a TOC analysis are as follows:

1. Identify the constraint.
2. Determine the most profitable product mix given the constraint.
3. Maximize the flow through the constraint.
4. Increase capacity at the constraint. .
5. Redesign the manufacturing process for greater flexibility and speed.

### Basic Principles in the Theory of Constraints

- **Throughput** is product produced and shipped.
- **Throughput time** or **manufacturing cycle time** is the time that elapses between the receipt of a customer's order and the shipment of the order.
- **Throughput contribution margin** Is revenue minus direct materials cost for a given period of time.
- **Only strictly variable costs which are usually only direct materials are considered Inventory costs.** All other costs, even direct labor, are considered operating, or fixed, costs.
- **Theory of Constraints assumes that operating costs are fixed costs** because it regards them as difficult to change in the short run.
- **Theory of Constraints focuses on short-run maximization of throughput contribution margin** by managing operations at the constraint In order to improve the performance of production as a whole.
- Three items that are measured in the theory of constraints are throughput contribution, inventory (or investments), and operating expenses.
  - $\text{Throughput contribution} = \text{Sales revenue} - \text{Direct material costs}$
  - $\text{Inventory} = (\text{Materials costs in direct materials, Work-in-process, and Finished goods inventories}) + (\text{R \& D costs}) + (\text{Costs of equipment and buildings})$
  - $\text{Operating expenses} = \text{All costs of operations, not including direct materials}$

## TOC vs. ABC (complementary analytical tools)

	TOC	ABC
Main Objective	Short-term focus: through put margin analysis based on materials and materials-related costs	Long-term focus; analysis of all product costs, concerned with strategic pricing and profit planning
Resource constraints	Included explicitly, a principal focus of TOC	Not included explicitly
Cost drivers	No direct utilization of cost drivers	Develop an understanding of cost drivers at all levels
Major Use	Optimization of production flow and short-term product mix	Strategic pricing and profit planning

## Capacity management and analysis

### Intro

A key issue in costing is choosing the capacity level for computing the allocation of manufacturing overhead. Determining the correct level of capacity to use is a difficult strategic decision for managers. The choice of capacity level used to allocate overhead can have a great effect on product cost information used by managers.

### Excess capacity vs. too little capacity

If a company has capacity in excess of what it needs, then it will incur large costs of unused capacity. Likewise, if a company has too little capacity to meet demand, then it may have trouble filling customer orders.

### Four choices to determine the output level

In general, a company has four choices to determine the output level. Two relate to what the plant can **supply**; and two relate to the **demand** to the plant's output. These are called **denominator-level capacity concepts**, because they describe the denominators that can be used in the calculation of per unit overhead costs.

### Supply Denominator-Level Concepts

Theoretical or Ideal (perfect ) capacity  
Practical (or currently attainable) capacity

### Demand Denominator-Level Concepts

Master budget capacity utilization (or expected actual capacity utilization)  
Normal capacity utilization

## Contemporary Productivity Approaches (Technique / Description)

### Automation/robots

Uses reprogrammable, multifunctional robots (machines) designed to manipulate materials, parts, tools, or specialized devices through variable programmed motions  
Applies robots to the performance of a variety of repetitive tasks

### **Capacity management and analysis (capacity planning)**

Represents an important decision-making area involving strategic, tactical, and operational aspects

Includes an iterative procedure that:

Reviews long-term demand forecasts

Translates forecasts into capacity requirements

Matches the capacity requirements to present facilities Identifies mismatches between capacity requirements and projected availability

Devises plans to overcome mismatches and selects the best alternative

### **Computer-aided design (CAD)**

Uses computers in product development, analysis, and design modification to improve the quality and performance of the product

Usually entails the drawing or physical layout steps of engineering design

### **Computer-aided manufacturing (CAM)**

Applies the computer to the planning, control, and operation of a production facility

### **Computer- integrated manufacturing (CIM)**

Involves a manufacturing system that completely integrates all factory and office functions within a company via a computer-based information network

Uses computers to control the integration and flow of information between design, engineering, manufacturing, logistics, warehousing and distribution, customers and suppliers, sales and marketing activities, and accounting

Facilitates hour-by-hour manufacturing management

### **Concurrent engineering (simultaneous engineering)**

Integrates product or service design with input from all business units and functions throughout a product's or service's life cycle.

Emphasizes upstream prevention versus downstream correction.

Attempts to balance the needs of all parties in product or service design while maintaining customer requirements

### **Flexible manufacturing system (FMS)**

Uses a computerized network of automated equipment that produces one or more groups of parts or variations of a product in a flexible manner

## **Value-chain analysis**

### **Definition**

#### **Value chain**

The sequence of business functions in which usefulness is added to the products of services of a company.

#### **Value-chain analysis**

A strategic analysis tool used to

- identify where value to customers can be increased or costs reduced, and
- to better understand the firm's linkages with suppliers, customers, and other firms in the industry.
  - Because the value chain identifies and connects the organization's strategic activities, value chain analysis improves the firm's knowledge of its relations with customers; suppliers, and competitors.
- It also facilitates the strategic determination of the phase(s) of the industry's Value chain in which the firm should operate.
- to focus on those activities that are consistent with its overall strategy.

- help an organization gain competitive advantage by identifying what steps or activities do and do not increase the value to the customers.
  - Once those areas are identified, the organization can increase the related benefits, or reduce (even eliminate) non value-added activities. The increase in value to the customer and/or the decrease in production costs will make the company more competitive..
- offers an excellent opportunity to integrate strategic planning and management accounting to guide the firm to survival and growth.

### **The business functions in the value chain are**

- **Research and development**—generating and experimenting with ideas related to new products, services, or processes.
- **Design of products, services, and processes**—the detailed planning and engineering of products, services, or processes.
- **Production**—acquiring, coordinating, and assembling resources to produce a product or deliver a service.
- **Marketing**—promoting and selling products or services to customers or prospective customers.
- **Distribution**—delivering products or services to customers.
- **Customer service**—providing after-sale support to customers.

### **Steps in Value Chain Analysis**

There are **three steps in value chain analysis**:

1) **Identify the activities that add value to the finished product.** These activities depend upon the industry and what the company does (manufacturing, resale, etc.). They will be whatever activities this firm and firms in its industry perform in the processes of designing a product or service, manufacturing the product, marketing it and providing customer service after the sale.

2) **Identify the cost driver** or cost drivers for each activity, and

3) **Develop a competitive advantage by adding value to the customer or reducing the costs of the activity.**

### **Value chain and supply chain analysis**

**Supply chain** describes the flow of goods, services, and information from the initial sources of materials and services to the delivery of products to consumers, regardless of whether those activities occur in the same organization or in other organizations.

Cost management is most effective when it integrates and coordinates activities across all companies in the supply chain as well as across each business function in an individual company's value chain. Attempts are made to restructure all cost areas to be more cost-effective.

Value chain and supply chain analysis performed by the management accounting function can contribute to the achievement of key success factors. When each business function adds value and all business functions are coordinated and well integrated, it contributes to cost control, high quality, timely response, and innovation.

**Value engineering** is a systematic evaluation of all aspects of the value-chain business functions, with the objective of reducing costs while satisfying customer needs. Value engineering via improvement in product and process designs is a principal technique that companies use to achieve target costs per unit.

## Value-added concepts

### Intro

Process value analysis is a comprehensive understanding of how an organization generates its output. It involves a determination of which activities that use resources are value-adding or nonvalue-adding and how the latter may be reduced or eliminated.

### Definition

#### High-value-added activity

**A high-value-added activity** increases significantly the value of the product or service to the customers. Removal of a high-value-added activity decreases perceptively the value of the product or service to the customer. Such an activity may be mandated (e.g., a regulatory requirement) or discretionary.

#### **High-value-added activities are those:**

- That are necessary or required to meet customer requirements or expectations.
- That enhance purchased materials or components of a product.
- That contribute to customer satisfaction.
- That are critical steps in a business process.
- That are performed to resolve or eliminate quality problems.
- That are performed upon request of a satisfied customer.
- That you would do more of, if time permitted.

**Examples :** Inserting a flange into a part, pouring molten metal into a mold, and preparing a field for planting are examples of high-value-added activities. Installing software to protect a computer from spam is a high-value-added activity to customers annoyed by bombardments of unwanted e-mail. Designing, processing, and delivering products and services are high-value-added activities.

**Value-added cost** A value-added cost is incurred to perform a value-added activity without waste. It is a cost that customers perceive as adding value, or utility, to a product or service. Examples are costs of materials, direct labor, tools, and machinery.

#### Low-value-added activity

**A low-value-added activity** consumes time, resources, or space, but adds little in satisfying customer needs. If eliminated, customer value or satisfaction decreases imperceptively or remains unchanged. Moving parts between processes, waiting time, repairing, and rework are examples of low-value-added activities.

#### **Low-value-added activities are those that:**

- Can be eliminated without affecting the form, fit, or function of the product or service.
- Begin with prefix "re" (such as rework or returned goods).
- Result in waste and add little or no value to the product or service.
- Are performed due to inefficiencies or errors in the process stream.
- Are duplicated in another department or add unnecessary steps to the business process.
- Are performed to monitor quality problems.
- Are performed due to a request of an unhappy or dissatisfied customer.
- Produce an unnecessary or unwanted output.
- If given the option, you would prefer to do less of.

**A nonvalue-added cost** is caused by a nonvalue-added activity or inefficient performance of a value-added activity. It is a cost that customers do not perceive as adding value, or utility, to a product or service. Examples of nonvalue-added costs are costs of rework, scrap, expediting, and breakdown maintenance.

### **A Classification of High-Value-Added and Low-Value-Added Activities**

Activity	High-Value-Added	Low-Value-Added
Designing product	X	
Setting up		X
Waiting		X
Moving		X
Processing	X	
Reworking		X
Repairing		X
Storing		X
Inspecting		X
Delivering product	X	

### **Examples**

Value-added costs: Materials and labor for regular repairs

Nonvalue-added costs: Rework costs, expediting costs caused by work delays, breakdown maintenance of equipment

Gray area: Materials handling costs, Materials procurement and inspection costs, Preventive maintenance of equipment

Classifications of value-added, nonvalue-added, and gray area costs are often not clear-cut. Other classifications of some of the cost categories are also plausible. For example, some students may include materials handling, materials procurement, and inspection costs and preventive maintenance as value-added costs (costs that customers perceive as adding value and as being necessary for good repair service) rather than as in the gray area. Preventive maintenance, for instance, might be regarded as value-added because it helps prevent nonvalueadding breakdown maintenance.

The selection of value-added activities in each place of the value chain reflects the firm's determination of its competitive advantage and its choice of competitive strategy. For example, different design strategies require different activities and costs. A firm might choose to be the low-cost producer of an undifferentiated product rather than compete on the basis of superior product quality.

## **Activity-based management (ABM)**

### **Intro**

The linkage of product costing and continuous improvement of processes is activity-based management (ABM). ABM redirects and improves the use of resources to increase the value created for customers and other stakeholders. It encompasses activity analysis, cost driver analysis, and quality performance measurement.

- Kaizen is the Japanese word for the continuous pursuit of improvement in every aspect of organizational operations. For example, a budget prepared on the kaizen principle projects costs based on future improvements. The possibility of such improvements must be determined, and the cost of implementation and the savings there from must be estimated.

### **Definition**

Management decisions and activity analysis that use activity-based costing information to satisfy customers and improve operational control, management control and profitability.

### Activity-Based Management (ABM)

- manages activities to improve the value of products or services to customers and increase the firm's competitiveness and profitability.
  - ABM draws on ABC as its major source of information and focuses on the efficiency and effectiveness of key business processes and activities.
- Using ABM, management can pinpoint avenues for improving operations, reducing costs, or increasing values to customers.
- By identifying resources spent on customers, products, and activities, ABM improves management's focus on the firm's critical success factors and enhances its competitive advantage.

### ABM applications can be classified into two categories: operational ABM and strategic ABM.

- **Operational ABM** enhances operation efficiency and asset utilization and lowers costs; its focuses are on doing things right and performing activities more efficiently.
  - Operational ABM applications use management techniques such as activity management, business process reengineering, total quality management, and performance measurement.
- **Strategic ABM** attempts to alter the demand for activities and increase profitability through improved activity efficiency.
  - Strategic ABM focuses on choosing appropriate activities for the operation, eliminating nonessential activities and selecting the most profitable customers. Strategic ABM applications use management techniques such as process design, customer profitability analysis, and value chain analysis.

### Advantages and Disadvantages of ABM

#### ABM has the following advantages over traditional cost management techniques:

- Uses continuous improvement to maintain the firm's competitive advantage
- Allocates more resources to activities, products, and customers that add more value, strategically redirecting management focus
- Eliminates non-value-added activities.
- Measures process effectiveness and identifies areas to reduce costs or increase customer value.
- Works well with just-in-time processes.
- Ties performance measurement to ABC to provide consistent incentives for using ABC.

#### ABM has the following disadvantages when compared to traditional cost management:

- Changing to ABC/ABM will result in different pricing, process design, manufacturing technology, and product design decisions, and the company must be prepared to support managers who embrace these methods and discourage managers who continue to use the older methods.
- ABC/ABM is not used for external financial reporting, and needing to prepare reports using traditional methods may influence management decision making enough to dilute the impact of ABC/ABM.
- Implementing ABC/ABM is expensive and time-consuming, so a cost-benefit analysis should be done to identify all hidden costs and benefits.

## Process analysis and business process reengineering

### Intro

Technological advances have increased the popularity of business process reengineering. Process improvements and productivity gains achieved through total quality management (TQM) are generally incremental gains achieved by tweaking a system and reducing inputs. In contrast, process reengineering and business process reengineering offer deeper, more sweeping gains.

## Definition

### Process

A **process** is how something is accomplished in a firm. It is a set of activities directed toward the same objective. A process is an activity or a group of interrelated activities that takes an input of materials and/or resources, adds value to it, and provides an output to internal or external customers.

### Reengineering

Is process innovation and core process redesign. Instead of improving existing procedures, it finds new ways of doing things. Thus, reengineering should be contrasted with **process improvement**.

### Process improvement

Consists of incremental but constant changes that improve efficiency.

### Process reengineering

Process reengineering diagrams a process in detail, evaluates and questions the process [low, and then completely redesigns the process to eliminate unnecessary steps, reduce opportunities for errors, and reduce costs. All activities that do not add value are eliminated.

### Process analysis

a collection of analytic methods that can be used to examine and measure the basic elements for a process to operate. It can also identify those processes with the greatest need for improvement.

### Process analysis looks at the linkage of quality, productivity, and process improvements:

- Productivity implies trying to improve upon what already exists.
- Improving productivity requires continuous quality improvement.
- Continuous improvement necessitates ongoing organizational learning, process improvements, and reengineering.

These continuous productivity improvements, then can help an organization be competitive in the long term.

### Business process reengineering (BPR)

Is a complete rethinking of how business functions are performed to provide value to customers, that is, radical innovation instead of mere improvement, and a disregard for current jobs, hierarchies, and reporting relationships.

Business process reengineering (BPR) is the fundamental analysis and radical redesign of business processes within and between enterprises to achieve dramatic improvements in performance (for example, cost, quality, speed, and service). BPR promotes the idea that sometimes wiping the slate clean and radically redesigning and reorganizing an enterprise is necessary to lower costs and increase the quality of a product or service.

### BPR involves changes that are:

**Fundamental** — BPR forces people to look at tacit rules and assumptions underlying the way they currently do business. Firms must answer two questions: Why do we do what we do? Why do we do it the way we do it?

**Radical** — BPR is about reinvention, not improvement or modification. A radical redesign means disregarding existing processes and inventing new ways of doing work.

**Dramatic** — BPR is not for the faint at heart. It should be used when the need for “heavy blasting” is required to alleviate a dire situation. If you need only a slight bump in process improvement, there is no need to reengineer.

**Process** — BPR is about a process orientation with a heavy emphasis on the chain of activities that take input and create output of value to the customer.

Accordingly, BPR techniques eliminate many traditional controls. They exploit modern technology to improve productivity and decrease the number of clerical workers. Thus, the emphasis is on developing controls that are automated and self-correcting and require minimal human intervention.

The emphasis therefore shifts to monitoring internal control so management can determine when an operation may be out of control and corrective action is needed. Most BPR techniques also assume that humans will be motivated to work actively in improving operations when they are full participants in the process.

Monitoring-assesses the quality of internal control over time. Management considers whether internal control is properly designed and operating as intended and modifies it to reflect changing conditions, Monitoring may be in the form of separate, periodic evaluations or of ongoing monitoring. Ongoing monitoring occurs as part of routine operations. It includes management and supervisory review, comparisons, reconciliations, and other actions by personnel as part of their regular activities.

A major disadvantage of business process reengineering is that as processes are changed to be more efficient, the internal controls that were established previously can be ignored or overlooked and may not be replaced with new controls.

## **Benchmarking**

### **Definition**

a continuous, systematic process of measuring products, services, and practices against the best levels of performance. Thus helping an organization to be competitive.

Benchmarking is an ongoing process that entails quantitative and qualitative measurement of the difference between the company's performance of an activity and the performance by the best in the world. The benchmark organization need not be a competitor.

### **Mechanism**

It analyzes and measures the key outputs of a business process or function against the best and also identifies the underlying key actions and root causes that contribute to the performance difference.

Many people think of benchmarking as simply capturing best-in-class information, but the practice has a much wider application. Quite often, best-in-class levels are comparisons to external benchmarks of industry leaders. However, they may also be based on internal benchmarking information or measures from other organizations (outside an industry) that have similar processes.

### **Benchmarking phases**

- 1) Select and prioritize benchmarking projects.
- 2) The next phase is to organize benchmarking (cross functional) teams.
- 3) Documenting own work process: determining relevant benchmarking measurements
- 3) Researching and identifying best-in-class performance
- 4) Analyzing benchmarking data: The data analysis phase entails identifying performance gaps, understanding the reasons they exist; and prioritizing the key activities that will facilitate the behavioral and process changes needed to implement the benchmarking study's recommendations.
- 5) The implementation phase (Leadership is most important).

### **Benchmarking and Creating Competitive Advantage**

Benchmarking studies in various forms (best practice, functional, process, and competitive) were freely conducted, generally without a context. Invalid comparisons were often made (for example, comparing the growth of a highly leveraged company to one internally financed from earnings, or comparing the growth of a company in a low-cost environment to one in Silicon Valley). Given such misapplications, most of these benchmarking studies were not particularly cost-effective. However, well-designed and properly applied benchmarking can be a powerful tool in helping an organization to be competitive.

Through benchmarking, a firm identifies best-in-class levels and conducts a study to determine how those levels can be adopted and lead to improved performance. It provides a rational method for setting performance goals and gaining market leadership; important decisions are based on facts and data, rather than on emotions. Because benchmarking is based on what the best are doing, it provides an accurate assessment of what needs to change.

## Cost of quality analysis

The costs of quality (COQ) refer to the costs incurred to prevent, or the costs arising as a result of, producing a low-quality product. Costs of quality are classified into four categories; examples for each category are listed in the next Exhibit.

1. Prevention costs-costs incurred to preclude the production of products that do not conform to specifications.
2. Appraisal costs-costs incurred to detect which of the individual units of products do not conform to specifications.
3. Internal failure costs-costs incurred on a defective product before it is shipped to customers.
4. External failure costs-costs incurred on a defective product after it is shipped to customers.

### Items Pertaining to Costs-at-Quality Reports

Prevention Costs	Appraisal Costs	Internal Failure Costs	External Failure Costs
Design engineering	Inspection	Spoilage	Customer support
Process engineering	Online product	Rework	Manufacturing/
Supplier evaluations	manufacturing	Scrap	process
Preventive equipment	and process	Machine repairs	engineering
maintenance	inspection	Manufacturing/	for external
Quality training	Product testing	process	failures
Testing of new		engineering on	Warranty repair
materials		internal failures	costs
			Liability claims

SMA 4R lists four categories of **costs of quality**: prevention, appraisal, internal failure, and external failure. An organization should attempt to minimize its total cost of quality.

a. **Conformance costs** include prevention and appraisal, which are both financial measures of internal performance.

- 1) **Prevention** attempts to avoid defective output. These costs include preventive maintenance, employee training, review of equipment design, and evaluation of suppliers.
  - Prevention costs are the costs of quality system design, implementation, and maintenance, including audits of the quality system itself. Examples include quality planning, review of new products, surveys of supplier capabilities, team meetings for quality, and training for quality, as well as related to ensuring the quality or quality improvement of the product: market research, product testing, and product design.
- 2) **Appraisal** embraces such activities as statistical quality control programs, inspection, and testing.
  - Appraisal costs are the costs of auditing processes for quality, including formal and informal measurements and evaluations of quality levels and setting quality standards and performance requirements. Examples include inspection and testing of raw materials, work-in-process and finished goods testing, calibration of equipment, and audits of operations or services. In addition, they address more externally focused costs such as monitoring market reaction and competitors' products.

b. **Nonconformance costs** include costs of internal failure (a financial measure of internal performance) and external failure costs (a financial measure of customer satisfaction).

- 1) **Internal failure** costs occur when defective products are detected before shipment.

a) Examples are scrap, rework, tooling changes, downtime, redesign of products or processes, lost output, reinspection and retesting, expediting of operations after delays, lost learning opportunities, and searching for and correcting problems.

Internal failure costs include the costs involved with defective products and components that are caught before shipping them to the customer. Examples include scrap, rework, spoilage, retesting, and reinspection. They also include systemic problems such as the inability to meet the design, manufacturing, and service standards identified for the product.

2) The costs of **external failure** or **lost opportunity** include lost profits from a decline in market share as dissatisfied customers make no repeat purchases, return products for refunds, cancel orders, and communicate their dissatisfaction to others.

a) Thus, external failure costs are incurred for customer service complaints; rejection, return, repair, or recall of products or services; warranty obligations; products liability claims; and customer losses.

b) **Environmental costs** are also external failure costs, e.g., fines for nonadherence to environmental law and loss of customer goodwill.

External failure costs are the costs involved with shipping a defective product to a customer. Examples include customer complaints, returns, product recalls, and warranty claims.

Overall, these costs relate to an inability to meet customer perceptions for product quality and service.

i) To minimize environmental damage and its resulting costs, the International Organization for Standardization has issued **ISO 14000** standards to promote the reduction of environmental damage by an organization's products, services, and operations and to develop environmental auditing and performance evaluation systems.

## Continuous improvement concepts

The term **kaizen** is a Japanese word that means "improvement." As used in business, it implies "continuous improvement," or slow but constant incremental improvements being made in all areas of business operations. Small-scale improvements are considered to be less risky than a major overhaul of a system or process. The slow accumulation of small developments in quality and efficiency can, over time, lead to very high quality and very low costs. **Kaizen** needs to be a part of the corporate culture. It requires conscious effort to think about ways that tasks could be done better. This can be difficult to maintain and takes years to show results, but if done properly, it confers a sustained competitive advantage.

**Kaizen** also has something to say about standards in manufacturing. If you recall, we said that standard costs may be either **Ideal standards**, attainable only under the best possible conditions, or **practical, expected costs**, which are challenging to attain, but attainable under normal conditions. Toyota, the company most recognized for its use of **kaizen**, would say that standards are temporary and not absolutes. Improvement is always possible, and the goal is to attain the **ideal standard**. Even though practical standards are being attained, the ultimate goal is still not being achieved.

**Ideal standards have been adopted by some companies that apply continuous improvement and other total quality management principles.**

A company may use **target costing** along with **kaizen** principles to determine what its ideal standard costs are. This puts the focus on the market because it starts with a **target price** based on the market price. The market determines the target price, and the company must attain the target cost in order to realize its desired profit margin for the product. The Ideal standard is thus defined as the target cost, or the standard cost that will enable the company to attain its desired cost and desired profit margin. Using **Kaizen** principles, the company figures out how it can manufacture the product for the target cost. The standard is achieved through development of new manufacturing methods and techniques that entail continuous improvement Or the ongoing search for new ways to reduce costs.

Implementing ideal standards and quality improvements is the heart of the **kaizen** concept. **Kaizen** challenges people to imagine the ideal condition and strive to make the necessary improvements to achieve that ideal.

# Glossary

(based on ICMA suggested reading list)

**Abnormal spoilage.** Spoilage that would not arise under efficient operating conditions; it is not inherent in a particular production process.

**absolute quality conformance (robust quality approach)** Conformance that requires all products or services to meet the target value exactly with no variation

**Absorption costing.** Method of inventory costing in which all variable manufacturing costs and all fixed manufacturing costs are included as inventoriable costs.

**Absorption costing** A costing method that includes all manufacturing costs—direct materials, direct labor, and both variable and fixed manufacturing overhead—in the cost of a product

**Absorption costing** A costing method that includes all manufacturing costs—direct materials, direct labor, and both variable and fixed manufacturing overhead—in unit product costs.

**Account analysis** A method for analyzing cost behavior in which an account is classified as either variable or fixed based on the analyst's prior knowledge of how the cost in the account behaves.

**Activity.** An event, task, or unit of work with a specified purpose.

**Activity** An event that causes the consumption of overhead resources in an organization.

**activity analysis** The development of a detailed description of the specific activities performed in the firm's operations

**Activity base** A measure of whatever causes the incurrence of a variable cost. For example, the total cost of X-ray film in a hospital will increase as the number of X-rays taken increases. Therefore, the number of X-rays is the activity base that explains the total cost of X-ray film.

**Activity-based costing (ABC).** Approach to costing that focuses on individual activities as the fundamental cost objects. It uses the costs of these activities as the basis for assigning costs to other cost objects such as products or services.

**activity-based costing (ABC)** A costing approach that assigns resource costs to cost objects based on activities performed for the cost objects

**Activity-based costing (ABC)** A costing method based on activities that is designed to provide managers with cost information for strategic and other decisions that potentially affect capacity and therefore fixed as well as variable costs.

**Activity-based management (ABM).** Method of management decision-making that uses activity-based costing information to improve customer satisfaction and profitability.

**activity-based management (ABM)** Uses activity analysis and activity-based costing to help managers identify the value of activities and to make strategic performance management decisions—adding and deleting products, adjusting process capacities, adjusting prices, removing costs and complexities, and more

**Activity-based management (ABM)** A management approach that focuses on managing activities as a way of eliminating waste and reducing delays and defects.

**activity consumption cost driver** Measures how much of an activity a cost object uses  
**Actual cost.** Cost incurred (a historical or past cost), as distinguished from a budgeted or forecasted cost.

**Activity cost pool** A “bucket” in which costs are accumulated that relate to a single activity measure in an activity-based costing system.

**Activity measure** An allocation base in an activity-based costing system; ideally, a measure of the amount of activity that drives the costs in an activity cost pool.

**Actual costing.** A costing system that traces direct costs to a cost object by using the actual direct-cost rates times the actual quantities of the direct-cost inputs and allocates indirect costs based on the actual indirect-cost rates times the actual quantities of the cost allocation bases.

**actual costing system** A costing process that uses actual costs incurred for direct materials, direct labor, and factory overhead

**actual factory overhead** Costs incurred in an accounting period for indirect materials, indirect labor, and other indirect factory costs, including factory rent, insurance, property tax, depreciation repairs and maintenance, power, light, heat, and employer payroll taxes for factory personnel

**Actual indirect-cost rate.** Actual total indirect costs in a cost pool divided by the actual total quantity of the cost-allocation base for that cost pool.

**additional processing costs or separable costs** Costs that occur after the split-off point and can be identified directly with individual products

**Adjusted allocation-rate approach.** Restates all overhead entries in the general ledger and subsidiary ledgers using actual cost rates rather than budgeted cost rates.

**Administrative costs** All executive, organizational, and clerical costs associated with the general management of an organization rather than with manufacturing or selling.

**allocation bases** The cost drivers used to allocate costs

**Allocation base** A measure of activity such as direct labor-hours or machine-hours that is used to assign costs to cost objects.

**Appraisal costs.** Costs incurred to detect which of the individual units of products do not conform to specifications.

**appraisal (detection) costs** Expenditures devoted to the measurement and analysis of data to determine conformity of outputs to specifications

**average cost** The total of manufacturing cost (materials, labor, and overhead) divided by the number of units of output

**average cost method** A method that uses units of output to allocate joint costs to joint products

**Average cost.** See *unit cost*.

**Avoidable cost** A cost that can be eliminated (in whole or in part) by choosing one alternative over another in a decision. This term is synonymous with *relevant cost* and *differential cost*.

**Backflush costing.** Costing system that omits recording some of the journal entries relating to the stages from purchase of direct material to the sale of finished goods.

**backflush costing** A method that charges current production costs (using standard costs) directly to finished goods inventory without accounting for the flows in and out of work-in-process

**Batch-level costs.** The costs of activities related to a group of units of products or services rather than to each individual unit of product or service.

**batch-level activity** An activity performed for each batch of products or services

**Batch-level activities** Activities that are performed each time a batch of goods is handled or processed, regardless of how many units are in the batch. The amount of resource consumed depends on the number of batches run rather than on the number of units in the batch.

**Benchmarking.** The continuous process of comparing the levels of performance in producing products and services and executing activities against the best levels of performance in competing companies or in companies having similar processes. (244)

**benchmarking** A process by which a firm identifies its critical success factors, studies the best practices of other firms (or other business units within a firm) for achieving these critical success factors, and then implements improvements in the firm's processes to match or beat the performance of those competitors

**Benchmarking** A systematic approach to identifying the activities with the greatest potential for improvement.

**bill of materials** A detailed list of the components of the manufactured product

**Bill of materials** A document that shows the quantity of each type of direct material required to make a product.

**Bottleneck.** An operation where the work to be performed approaches or exceeds the capacity available to do it.

**Bottleneck** A machine or some other part of a process that limits the total output of the entire system.

**Breakeven point (BEP).** Quantity of output sold at which total revenues equal total costs, that is where the operating income is zero.

**Break-even point** The level of sales at which profit is zero.

**breakeven point** The point at which revenues equal total costs and profit is zero

**budgeted capacity utilization** The planned (forecasted) output for the coming period, usually a year

**Budgeted cost.** Predicted or forecasted cost (future cost) as distinguished from an actual or historical cost.

**Budgeted indirect-cost rate.** Budgeted annual indirect costs in a cost pool divided by the budgeted annual quantity of the cost allocation base.

**Business function costs.** The sum of all costs (variable and fixed) in a particular business function of the value chain.

**business analysis** Evaluates the firm's overall performance by using the balanced scorecard, financial ratio analysis and economic value added

**business process improvement** A management method by which managers and workers commit to a program of continuous improvement in quality and other critical success factors

**Byproducts.** Products from a joint production process that have low total sales values compared with the total sales value of the main product or of joint products. (578)

**by-products** Products in a joint production process whose total sales values are minor in comparison with the sales value of the joint products

**Carrying costs.** Costs that arise while holding inventory of goods for sale.

**Chief Financial Officer (CFO)** The member of the top management team who is responsible for providing timely and relevant data to support planning and control activities and for preparing financial statements for external users.

**Committed fixed costs** Investments in facilities, equipment, and basic organizational structure that can't be significantly reduced even for short periods of time without making fundamental changes.

**Common cost.** Cost of operating a facility, activity, or like cost object that is shared by two or more users.

**Common cost** A cost that is incurred to support a number of cost objects but that cannot be traced to them individually. For example, the wage cost of the pilot of a 747 airliner is a common cost of all of the passengers on the aircraft. Without the pilot, there would be no flight and no passengers. But no part of the pilot's wage is caused by any one passenger taking the flight.

**Common fixed cost** A fixed cost that supports more than one business segment, but is not traceable in whole or in part to any one of the business segments.

**Complete reciprocated costs.** The support department's own costs plus any interdepartmental cost allocations. Also called the *artificial costs* of the support department.

**concurrent engineering** An engineering method that integrates product design with manufacturing and marketing throughout the product's life cycle; also called simultaneous engineering

**Conformance quality.** Refers to the performance of a product or service relative to its design and product specifications.

**Constant gross-margin percentage NRV method.** Method that allocates joint costs to joint products in such a way that the overall gross-margin percentage is identical for the individual products.

**continuous improvement** (The Japanese word is *kaizen*.) A management technique in which managers and workers commit to a program of continuous improvement in quality and other critical success factors

**constraints** Those activities that slow the product's total cycle time

**Constraint** Anything that prevents an organization or individual from getting more of what it wants.

**Constraint** A limitation under which a company must operate, such as limited available machine time or raw materials, that restricts the company's ability to satisfy demand.

**Contribution approach** An income statement format that organizes costs by their behavior. Costs are separated into variable and fixed categories rather than being separated according to organizational functions.

**Contribution income statement.** Income statement that groups costs into variable costs and fixed costs to highlight the contribution margin.

**contribution income statement** Focuses on variable costs and fixed costs, in contrast to the conventional income statement, which focuses on product costs and nonproduct costs

**contribution margin income statement** An income statement based on contribution margin that is developed for each profit center and for each relevant group of profit centers

**Contribution margin.** Total revenues minus total variable costs.

**Contribution margin** The amount remaining from sales revenues after all variable expenses have been deducted

**Contribution margin per unit.** Selling price minus the variable cost per unit.

**Contribution margin percentage.** Contribution margin per unit divided by selling price. Also called *contribution margin ratio*.

**contribution margin ratio** The ratio of the unit contribution margin to unit sales price,  $(p - v) / p$

**Contribution margin ratio (CM ratio)** A ratio computed by dividing contribution margin by dollar sales.

**Contribution margin ratio.** See *contribution margin percentage*.

**Controllable cost.** Any cost that is primarily subject to the influence of a given responsibility center manager for a given period.

**controllable cost** A cost that a manager or employee has discretion in choosing to incur or can significantly influence the amount of within a given, usually short, period of time

**controllable fixed costs** Fixed costs that the profit center manager can influence in approximately a year or less

**controllable margin** A margin determined by subtracting short-term controllable fixed costs from the contribution margin

**Controller.** The financial executive primarily responsible for management accounting and financial accounting. Also called *chief accounting officer*.

**Controller** The member of the top management team who is responsible for providing relevant and timely data to managers and for preparing financial statements for external users. The controller reports to the CFO.

**conversion cost** Direct labor and overhead combined into a single amount

**Conversion costs.** All manufacturing costs other than direct material costs.

**Cost.** Resource sacrificed or forgone to achieve a specific objective.

**cost** Incurred when a resource is used for some purpose

**Cost accounting.** Measures, analyzes, and reports financial and nonfinancial information relating to the costs of acquiring or using resources in an organization. It provides information for both management accounting and financial accounting.

**Cost Accounting Standards Board (CASB).** Government agency that has the exclusive authority to make, put into effect, amend, and rescind cost accounting standards and interpretations thereof designed to achieve uniformity and consistency in regard to measurement, assignment, and allocation of costs to government contracts within the United States.

**Cost accumulation.** Collection of cost data in some organized way by means of an accounting system.

**Cost allocation.** Assignment of indirect costs to a particular cost object.

**cost allocation** The process of assigning indirect costs to cost pools and cost objects

**Cost-allocation base.** A factor that links in a systematic way an indirect cost or group of indirect costs to a cost object.

**Cost-application base.** Cost-allocation base when the cost object is a job, product, or customer.

**Cost assignment.** General term that encompasses both (1) tracing accumulated costs that have a direct relationship to a cost object and (2) allocating accumulated costs that have an indirect relationship to a cost object.

**cost assignment** The process of assigning costs to cost pools or from cost pools to cost objects

**Cost behavior** The way in which a cost reacts to changes in the level of activity.

**Cost-benefit approach.** Approach to decision-making and resource allocation based on a comparison of the expected benefits from attaining company goals and the expected costs.

**Cost center.** Responsibility center where the manager is accountable for costs only.

**cost center** A firm's production or support unit that provides the best quality product or service at the lowest cost

**Cost center** A business segment whose manager has control over cost but has no control over revenue or investments in operating assets.

**Cost driver.** A variable, such as the level of activity or volume, that causally affects costs over a given time span.

**Cost driver** A factor, such as machine-hours, beds occupied, computer time, or flight-hours, that causes overhead costs.

**cost driver** Any factor that causes a change in the cost of an activity

**cost driver analysis** The examination, quantification, and explanation of the effects of cost drivers

**cost element** An amount paid for a resource consumed by an activity and included in a cost pool

**cost estimation** The development of a well-defined relationship between a cost object and its cost drivers for the purpose of predicting the cost

**Cost estimation.** The attempt to measure a past relationship based on data from past costs and the related level of an activity.

**Cost function.** Mathematical description of how a cost changes with changes in the level of an activity relating to that cost.

**Cost hierarchy.** Categorization of indirect costs into different cost pools on the basis of the different types of cost drivers, or cost-allocation bases, or different degrees of difficulty in determining cause-and-effect (or benefits received) relationships.

**costing** The process of accumulating, classifying, and assigning direct materials, direct labor, and factory overhead costs to products, services, or projects

**Cost incurrence.** Describes when a resource is consumed (or benefit forgone) to meet a specific objective.

**Cost management.** The approaches and activities of managers to use resources to increase value to customers and to achieve organizational goals.

**cost management** the development and use of cost management information

**cost management information** The information developed and used to implement the organization's strategy. It consists of financial information about costs and revenues, and nonfinancial information about customer retention, productivity, quality, and other key success factors for the organization

**cost leadership** A strategy in which a firm outperforms competitors by producing products or services at the lowest cost

**cost life cycle** The sequence of activities within the firm that begins with research and development, followed by design, manufacturing, marketing/distribution, and customer service

**Cost object.** Anything for which a measurement of costs is desired.

**cost object** Any product, service, customer, activity, or organizational unit to which costs are accumulated for some management purpose

**Cost object** Anything for which cost data are desired. Examples of cost objects are products, customers, jobs, and parts of the organization such as departments or divisions.

**Cost of goods manufactured.** Cost of goods brought to completion, whether they were started before or during the current accounting period.

**cost of goods manufactured** The cost of goods that were finished and transferred out of Work-in-Process Inventory account during a given period

**Cost of goods manufactured** The manufacturing costs associated with the goods that were finished during the period.

**cost of goods sold** The cost of the product transferred to the income statement when inventory is sold

**Cost pool.** A grouping of individual cost items.

**cost pools** The meaningful groups into which costs are collected

**costs of conformance** Prevention and appraisal costs

**costs of nonconformance** Internal failure costs and external failure costs

**Cost predictions.** Forecasts about future costs.

**Cost tracing.** Describes the assignment of direct costs to a particular cost object.

**Cost of capital** The average rate of return a company must pay to its long-term creditors and shareholders for the use of their funds.

**Costs of quality (COQ).** Costs incurred to prevent, or the costs arising as a result of, the production of a low-quality product.

**cost of quality (COQ)** A comprehensive reporting framework for classification of quality-related costs

**cost of quality (COQ) report** A report that shows the costs of prevention, appraisal, internal, and external failures. An important type of cost of quality report is the quality matrix, which shows the different quality costs for each operating and support function

**cost-plus method** A method that determines the transfer price based on the seller's costs plus a gross profit percentage determined by comparing the seller's sales to unrelated parties

**Cost structure** The relative proportion of fixed, variable, and mixed costs in an organization.

**Cost-volume-profit (CVP) analysis.** Examines the behavior of total revenues, total costs, and operating income as changes occur in the units sold, the selling price, the variable cost per unit, or the fixed costs of a product.

**cost-volume-profit (CVP) analysis** A method for analyzing how various operating decisions and marketing decisions will affect net income

**Cost-volume-profit (CVP) graph** A graphical representation of the relationships between an organization's revenues, costs, and profits on the one hand and its sales volume on the other hand.

**Current cost.** Asset measure based on the cost of purchasing an asset today identical to the one currently held, or the cost of purchasing an asset that provides services like the one currently held if an identical asset cannot be purchased.

**Customer-level activities** Activities that are carried out to support customers but that are not related to any specific product.

**cycle time** The amount of time between receipt of a customer order and shipment of the order

**denominator activity level** The output (activity) level used to establish the predetermined fixed overhead application rate; generally defined as *practical capacity*; also called the denominator volume

**denominator volume** The output (activity) level used to calculate the predetermined fixed overhead application rate; generally defined as *practical capacity*; also called the denominator activity level

**departmental overhead rate** An overhead rate calculated for a single production department

**Denominator level.** The denominator in the budgeted fixed overhead rate computation.

**design analysis** A common form of value engineering in which the design team prepares several possible designs of the product, each having similar features with different levels of performance and different costs

**desired rate of return** The minimum rate of return the investing firm requires for an investment

**differential cost** A cost that differs for each decision option and is therefore relevant

**Differential cost** Any cost that differs between alternatives in a decision-making situation. This term is synonymous with *avoidable cost* and *relevant cost*.

**Differential cost.** Difference in total cost between two alternatives.

**Differential cost** A difference in cost between two alternatives. Also see *Incremental cost*.

**Differential cost** Any cost that differs between alternatives in a decision-making situation. This term is synonymous with *avoidable cost* and *relevant cost*.

**Differential revenue.** Difference in total revenue between two alternatives.

**Differential revenue** The difference in revenue between two alternatives

**direct cost** A cost conveniently and economically traced directly to a cost pool or a cost object

**Direct cost** A cost that can be easily and conveniently traced to a specified cost object.

**Direct costing.** See *variable costing*.

**Direct costs of a cost object.** Costs related to the particular cost object that can be traced to that object in an economically feasible (cost-effective) way.

**direct labor cost** The labor used to manufacture the product or to provide the service

**Direct labor** Factory labor costs that can be easily traced to individual units of product. Also called *touch labor*

**direct labor efficiency variance** The difference between the actual hours worked and the standard hours allowed for the units manufactured, multiplied by the standard wage rate

**Direct manufacturing labor costs.** Include the compensation of all manufacturing labor that can be traced to the cost object (work in process and then finished goods) in an economically feasible way.

**Direct material costs.** Acquisition costs of all materials that eventually become part of the cost object (work in process and then finished goods), and that can be traced to the cost object in an economically feasible way.

**direct materials cost** The cost of the materials in the product and a reasonable allowance for scrap and defective units

**Direct materials** Materials that become an integral part of a finished product and whose costs can be conveniently traced to it.

**Direct materials inventory.** Direct materials in stock and awaiting use in the manufacturing process.

**Direct method.** Cost allocation method that allocates each support department's costs to operating departments only.

**direct method** Service department cost allocation accomplished by using the service flows *only to production departments* and determining each production department's share of that service

**Discretionary costs.** Arise from periodic (usually annual) decisions regarding the maximum amount to be incurred and have no measurable cause-and-effect relationship between output and resources used.

**Discretionary fixed costs** Those fixed costs that arise from annual decisions by management to spend on certain fixed cost items, such as advertising and research.

**dual allocation** A cost allocation method that separates fixed and variable costs and traces variable service department costs to the user departments; fixed costs are allocated based on either equal shares among departments or a predetermined budgeted proportion

**Dual-rate method.** Allocation method that classifies costs in each cost pool into two pools (a variable-cost pool and a fixed cost pool) with each pool using a different cost-allocation base.

**Duration driver** A measure of the amount of time required to perform an activity.

**Engineered costs.** Costs that result from a cause-and-effect relationship between the cost driver, output, and the (direct or indirect) resources used to produce that output.

**Engineering approach** A detailed analysis of cost behavior based on an industrial engineer's evaluation of the inputs that are required to carry out a particular activity and of the prices of those inputs.

**Equivalent units.** Derived amount of output units that (a) takes the quantity of each input (factor of production) in units completed and in incomplete units of work in process and (b) converts the quantity of input into the amount of completed output units that could be produced with that quantity of input.

**Equivalent units** The product of the number of partially completed units and their percentage of completion with respect to a particular cost. Equivalent units are the number of complete whole units that could be obtained from the materials and effort contained in partially completed units.

**equivalent units** The number of the same or similar completed units that could have been produced given the amount of work actually performed on both completed and partially completed units

**Equivalent units of production (weighted-average method)** The units transferred to the next department (or to finished goods) during the period plus the equivalent units in the department's ending work in process inventory.

**executional cost drivers** Factors that the firm can manage in the short term to reduce costs such as workforce involvement, design of the production process, and supplier relationships

**External failure costs.** Costs incurred on defective products after they are shipped to customers.

**external failure costs** Costs associated with defective/poor quality outputs detected after being delivered to customers

**Factory overhead costs.** See *indirect manufacturing costs*.

**facility-level activity** An activity performed to support operations of products in general

**factory overhead** All the indirect manufacturing costs commonly combined into a single cost pool in a manufacturing firm

**factory overhead applied** The amount of overhead assigned to a cost object using a predetermined factory overhead rate

**Financial accounting.** Measures and records business transactions and provides financial statements that are based on generally accepted accounting principles. It focuses on reporting to external parties such as investors and banks.

**Financial accounting** The phase of accounting concerned with providing information to stockholders, creditors, and others outside the organization.

**Finished goods inventory.** Goods completed but not yet sold.

**Finished goods** Units of product that have been completed but have not yet been sold to customers.

**finished goods inventory** The cost of goods that are ready for sale

**Finished goods** Units of product that have been completed but not yet sold to customers.

**First-in, first-out (FIFO) process-costing method.** Method of process costing that assigns the cost of the previous accounting period's equivalent units in beginning work-in-process inventory to the first units completed and transferred out of the process, and assigns the cost of equivalent units worked on during the current period first to complete beginning inventory, next to start and complete new units, and finally to units in ending work-in-process inventory.

**FIFO method** A process costing method for calculating the unit cost that includes only costs incurred and work performed during the current period

**FIFO method** A process costing method in which equivalent units and unit costs relate only to work done during the current period.

**First-stage allocation** The process by which overhead costs are assigned to activity cost pools in an activity-based costing system.

**Fixed cost.** Cost that remains unchanged in total for a given time period, despite wide changes in the related level of total activity or volume.

**fixed cost** The portion of the total cost that does not change with a change in the quantity of the cost driver, within the relevant range and a given time period (e.g., one year)

**Fixed cost** A cost that remains constant, in total, regardless of changes in the level of activity within the relevant range. If a fixed cost is expressed on a per unit basis, it varies inversely with the level of activity.

**fixed overhead application rate** A term used for product costing purposes; the rate at which fixed overhead is charged to production per unit of activity (or output)

**Full costs of the product.** The sum of all variable and fixed costs in all business functions of the value chain (R&D, design, production, marketing, distribution, and customer service).

**functional analysis** A common type of value engineering in which the performance and cost of each major function or feature of the product is examined

**goalpost conformance** Conformance to a quality specification expressed as a specified range around a target value

**Gross margin percentage.** Gross margin divided by revenues.

**High-low method.** Method used to estimate a cost function that uses only the highest and lowest observed values of the cost driver within the relevant range and their respective costs.

**high-low method** A method using algebra to determine a *unique* estimation line between representative high and low points in a given data set

**High-low method** A method of separating a mixed cost into its fixed and variable elements by analyzing the change in cost between the high and low activity levels.

**high-value-added activity** Increases the value of the product or service to the customer

**historical cost** The book value of current assets plus the net book value of long-lived assets

**Homogeneous cost pool.** Cost pool in which all the costs have the same or a similar cause-and-effect or benefits-received relationship with the cost-allocation base.

**Hybrid-costing system.** Costing system that blends characteristics from both job-costing systems and process-costing systems.

**Incremental cost.** Additional total cost incurred for an activity.

**Incremental cost** An increase in cost between two alternatives. Also see *Differential cost*.

**Incremental analysis** An analytical approach that focuses only on those costs and revenues that change as a result of a decision.

**Incremental cost-allocation method.** Method that ranks the individual users of a cost object in the order of users most responsible for the common cost and then uses this ranking to allocate cost among those users.

**Incremental revenue.** Additional total revenue from an activity.

**Incremental revenue-allocation method.** Method that ranks individual products in a bundle according to criteria determined by management (for example, sales), and then uses this ranking to allocate bundled revenues to the individual products.

**indirect cost** A cost that is not conveniently or economically traceable to a specific cost pool or cost object

**Indirect cost** A cost that cannot be easily and conveniently traced to a specified cost object.

**Indirect costs of a cost object.** Costs related to the particular cost object that cannot be traced to that object in an economically feasible (cost-effective) way.

**Indirect manufacturing costs.** All manufacturing costs that are related to the cost object (work in process and then finished goods) but that cannot be traced to that cost object in an economically feasible way. Also called *manufacturing overhead costs* and *factory overhead costs*.

**indirect labor cost** Supervision, quality control, inspection, purchasing and receiving, and other labor-related manufacturing support costs

**Indirect labor** The labor costs of janitors, supervisors, materials handlers, and other factory workers that cannot be conveniently traced to particular products.

**indirect materials cost** The cost of materials used in manufacturing that are not easily or economically traceable to the finished product

**Indirect materials** Small items of material such as glue and nails that may be an integral part of a finished product, but whose costs cannot be easily or conveniently traced to it

**Insourcing.** Process of producing goods or providing services within the organization rather than purchasing those same goods or services from outside vendors.

**Inspection point.** Stage of the production process at which products are examined to determine whether they are acceptable or unacceptable units.

**Internal failure costs.** Costs incurred on defective products before they are shipped to customers.

**internal failure costs** Costs associated with defective processes or defective products detected before delivery to customers

**Inventoriable costs.** All costs of a product that are considered as assets in the balance sheet when they are incurred and that become cost of goods sold only when the product is sold.

**Inventoriable costs** Synonym for *product costs*

**Job.** A unit or multiple units of a distinct product or service.

**Job-cost record.** Source document that records and accumulates all the costs assigned to a specific job, starting when work begins. Also called *job-cost sheet*.

**Job-cost sheet.** See *job-cost record*.

**Job cost sheet** A form prepared for a job that records the materials, labor, and manufacturing overhead costs charged to that job.

**job cost sheet** A cost sheet that records and summarizes the costs of direct materials, direct labor, and factory overhead for a particular job

**Job-costing system.** Costing system in which the cost object is a unit or multiple units of a distinct product or service called a job.

**job costing** A product costing system that accumulates and assigns costs to a specific job

**Job-order costing** A costing system used in situations where many different products, jobs, or services are produced each period.

**Joint costs.** Costs of a production process that yields multiple products simultaneously.

**Joint costs** Costs that are incurred up to the split-off point in a process that produces joint \products.

**joint products** Products from the same production process that have relatively substantial sales values

**Joint products.** Two or more products that have high total sales values compared with the total sales values of other products yielded by a joint production process.

**Joint products** Two or more products that are produced from a common input.

**Just-in-time (JIT) production.** Demand-pull manufacturing system in which each component in a production line is produced as soon as, and only when, needed by the next step in the production line. Also called *lean production*.

**just-in-time (JIT) system** A comprehensive production and inventory system that purchases or produces materials and parts only as needed and just in time to be used at each stage of the production process

**Just-in-time (JIT)** A production and inventory control system in which materials are purchased and units are produced only as needed to meet actual customer demand.

**Just-in-time (JIT) purchasing.** The purchase of materials (or goods) so that they are delivered just as needed for production (or sales).

**kanban** A set of control cards used to signal the need for materials and products to move from one operation to the next in an assembly line

**Labor-time sheet.** Source document that contains information about the amount of labor time used for a specific job in a specific department.

**Lean accounting.** Costing method that supports creating value for the customer by costing the entire value stream, not individual products or departments, thereby eliminating waste in the accounting process.

**lean accounting** The accounting technique that uses value streams to measure the financial benefits of a firm's progress in implementing lean manufacturing

**Lean production.** See *just-in-time (JIT) production*.

**life-cycle costing** A method used to identify and monitor the costs of a product throughout its life cycle

**Life-cycle costing.** System that tracks and accumulates business function costs of the value chain attributable to each product from initial R&D to final customer service and support.

**Linear cost behavior** Cost behavior is said to be linear whenever a straight line is a reasonable approximation for the relation between cost and activity

**Linear cost function.** Cost function in which the graph of total costs versus the level of a single activity related to that cost is a straight line within the relevant range.

**Locked-in costs.** Costs that have not yet been incurred but, based on decisions that have already been made, will be incurred in the future. Also called *designed-in costs*.

**low-value-added activity** Consumes time, resources, or space, but adds little to satisfying customer needs

**Main product.** Product from a joint production process that has a high total sales value compared with the total sales values of all other products of the joint production process.

**Make-or-buy decisions.** Decisions about whether a producer of goods or services will insource (produce goods or services within the firm) or outsource (purchase them from outside vendors).

**Make or buy decision** A decision concerning whether an item should be produced internally or purchased from an outside supplier.

**Management accounting.** Measures, analyzes, and reports financial and nonfinancial information that helps managers make decisions to fulfill the goals of an organization. It focuses on internal reporting.

**management accounting** A profession that involves partnering in management decision making, devising planning and performance management systems, and providing expertise in financial reporting and control to assist management in the formulation and implementation of an organization's strategy

**management accounting and control system** An organization's core performance-measurement system

**Management control system.** Means of gathering and using information to aid and coordinate the planning and control decisions throughout an organization and to guide the behavior of its managers and employees.

**management control** The evaluation of mid-level managers by upper-level managers

**Managerial accounting** The phase of accounting concerned with providing information to managers for use within the organization.

**Manufacturing cells.** Grouping of all the different types of equipment used to make a given product.

**Manufacturing cycle efficiency (MCE).** Value-added manufacturing time divided by manufacturing cycle time.

**manufacturing cycle efficiency (MCE)** The ratio of processing time to total cycle time

**Manufacturing cycle time.** See *manufacturing lead time*.

**Manufacturing lead time.** Duration between the time an order is received by manufacturing to the time a finished good is produced. Also called *manufacturing cycle time*.

**Manufacturing overhead allocated.** Amount of manufacturing overhead costs allocated to individual jobs, products, or services based on the budgeted rate multiplied by the actual quantity used of the cost-allocation base. Also called *manufacturing overhead applied*.

**Manufacturing overhead applied.** See *manufacturing overhead allocated*.

**Manufacturing overhead budget** A detailed plan showing the production costs, other than direct materials and direct labor, that will be incurred over a specified time period.

**Manufacturing overhead costs.** See *indirect manufacturing costs*.

**Manufacturing overhead** All manufacturing costs except direct materials and direct labor.

**Manufacturing-sector companies.** Companies that purchase materials and components and convert them into various finished goods.

**Margin** Net operating income divided by sales.

**Margin of safety.** Amount by which budgeted (or actual) revenues exceed breakeven revenues.

**margin of safety** The excess of forecasted sales over breakeven sales

**Margin of safety** The excess of budgeted (or actual) dollar sales over the break-even dollar sales.

**margin of safety ratio** A useful measure for comparing the risk of two or more alternative products

**master (static) budget variance** The difference between actual operating income and the master budget operating income for a period; also called the **operating-income variance**

**Master-budget capacity utilization.** The expected level of capacity utilization for the current budget period (typically one year).

**Materials requirements planning (MRP).** Push-through system that manufactures finished goods for inventory on the basis of demand forecasts.

**materials inventory** Materials used in the manufacturing process or to provide the service

**materials requisition** A department supervisor uses this to request materials for production

**Materials requisition form** A document that specifies the type and quantity of materials to be drawn from the storeroom and that identifies the job that will be charged for the cost of those materials.

**materials usage ratio** The ratio of the quantity used to the quantity purchased

**Materials-requisition record.** Source document that contains information about the cost of direct materials used on a specific job and in a specific department.

**Matrix method.** See *reciprocal method*.

**Merchandising-sector companies.** Companies that purchase and then sell tangible products without changing their basic form.

**mixed cost** A cost that includes both variable and fixed cost components

**Mixed cost.** A cost that has both fixed and variable elements. Also called a *semivariable cost*.

**Mixed cost** A cost that contains both variable and fixed cost elements.

**Multiple predetermined overhead rates** A costing system with multiple overhead cost pools and a different predetermined overhead rate for each cost pool, rather than a single predetermined overhead rate for the entire company. Each production department may be treated as a separate overhead cost pool.

**Net income.** Operating income plus nonoperating revenues (such as interest revenue) minus nonoperating costs (such as interest cost) minus income taxes.

**Net realizable value (NRV) method.** Method that allocates joint costs to joint products on the basis of final sales value minus separable costs of total production of the joint products during the accounting period.

**net realizable value (NRV)** The estimated sales value of the product at the split-off point is determined by subtracting the additional processing and selling costs beyond the split-off point from the ultimate sales value of the product

**Net operating income** Income before interest and income taxes have been deducted

**Nonlinear cost function.** Cost function in which the graph of total costs based on the level of a single activity is not a straight line within the relevant range.

**Nonvalue-added cost.** A cost that, if eliminated, would not reduce the actual or perceived value or utility (usefulness) customers obtain from using the product or service.

**noncontrollable fixed costs** Costs that are not controllable within a year's time, usually including facilities-related costs such as depreciation, taxes, and insurance

**non-value-added activity** An activity that does not contribute to customer value or to the organization's needs

**Non-value-added activities** Activities that consume resources but do not add value for which customers are willing to pay.

**normal capacity** The expected average demand per year over an intermediate term, for example, the upcoming three to five years

**Normal capacity utilization.** The level of capacity utilization that satisfies average customer demand over a period (say, two to three years) that includes seasonal, cyclical, and trend factors.

**Normal costing.** A costing system that traces direct costs to a cost object by using the actual direct-cost rates times the actual quantities of the direct-cost inputs and that allocates indirect costs based on the budgeted indirect-cost rates times the actual quantities of the cost-allocation bases.

**Normal cost system** A costing system in which overhead costs are applied to a job by multiplying a predetermined overhead rate by the actual amount of the allocation base incurred by the job.

**normal costing system** A costing process that uses actual costs for direct materials and direct labor and applies factory overhead to various jobs using a predetermined basis

**Normal spoilage.** Spoilage inherent in a particular production process that arises even under efficient operating conditions.

**normal spoilage** An unacceptable unit that occurs under efficient operating conditions; spoilage that is inherent in the manufacturing process

**Operating assets** Cash, accounts receivable, inventory, plant and equipment, and all other assets held for operating purposes.

**Operating department.** Department that directly adds value to a product or service. Also called a *production department* in manufacturing companies.

**Operating income.** Total revenues from operations minus cost of goods sold and operating costs (excluding interest expense and income taxes).

**operation costing** A hybrid costing system that uses job costing to assign direct materials costs to jobs and process costing to assign conversion costs to products or services

**Operation costing** A hybrid costing system used when products have some common characteristics and some individual characteristics.

**Operation-costing system.** Hybrid-costing system applied to batches of similar, but not identical, products. Each batch of products is often a variation of a single design, and it proceeds through a sequence of operations, but each batch does not necessarily move through the same operations as other batches. Within each operation, all product units use identical amounts of the operation's resources.

**Opportunity cost.** The contribution to operating income that is forgone or rejected by not using a limited resource in its next-best alternative use.

**opportunity cost** The benefit lost when choosing one option precludes receiving the benefits from an alternative option

**Opportunity cost** The potential benefit that is given up when one alternative is selected over another.

**order-filling costs** Expenditures for freight, warehousing, packing and shipping, and collections

**order-getting costs** Expenditures to advertise and promote the product

**Organization-sustaining activities** Activities that are carried out regardless of which customers are served, which products are produced, how many batches are run, or how many units are made.

**Out-of-pocket costs** Actual cash outlays for salaries, advertising, repairs, and similar costs.

**Output unit-level costs.** The costs of activities performed on each individual unit of a product or service.

**Outsourcing.** Process of purchasing goods and services from outside vendors rather than producing the same goods or providing the same services within the organization.

**Overabsorbed indirect costs.** See *overallocated indirect costs*.

**overapplied overhead** The amount of factory overhead applied that exceeds the actual factory overhead cost

**overhead** All the indirect costs commonly combined into a single cost pool

**overhead application or allocation** A process of allocating overhead costs to cost objects

**overtime premium** The excess wage rate over the standard hourly wage rate

**Overallocated indirect costs.** Allocated amount of indirect costs in an accounting period is greater than the actual (incurred) amount in that period. Also called *overapplied indirect costs* and *overabsorbed indirect costs*.

**Overapplied indirect costs.** See *overallocated indirect costs*.

**Overapplied overhead** A credit balance in the Manufacturing Overhead account that occurs when the amount of overhead cost applied to Work in Process exceeds the amount of overhead cost actually incurred during a period. (p. 109)

**Overhead application** The process of charging manufacturing overhead cost to job cost sheets and to the Work in Process account.

**Period costs.** All costs in the income statement other than cost of goods sold.

**period costs** All nonproduct expenditures for managing the firm and selling the product

**Period costs** Costs that are taken directly to the income statement as expenses in the period in which they are incurred or accrued.

**physical measure method** A method that uses a physical measure such as pounds, gallons, yards, or units of volume produced at the split-off point to allocate the joint costs to joint products

**planning and decision making** Budgeting and profit planning, cash flow management, and other decisions related to operations

**plantwide overhead rate** A single overhead rate used throughout the entire production facility

**Plantwide overhead rate** A single predetermined overhead rate that is used throughout a plant.

**Physical-measure method.** Method that allocates joint costs to joint products on the basis of the relative weight, volume, or other physical measure at the splitoff point of total production of these products during the accounting period.

**Practical capacity.** The level of capacity that reduces theoretical capacity by unavoidable operating interruptions such as scheduled maintenance time, shutdowns for holidays, and so on.

**practical capacity** Theoretical capacity reduced by normal output losses due to personal time, normal maintenance, and so on; the measure of capacity used to estimate cost-driver rates under ABC and TDABC systems

**predetermined factory overhead rate** An estimated rate used to apply factory overhead cost to a cost object

**Predetermined overhead rate** A rate used to charge manufacturing overhead cost to jobs that is established in advance for each period. It is computed by dividing the estimated total manufacturing overhead cost for the period by the estimated total amount of the allocation base for the period.

**Prevention costs.** Costs incurred to preclude the production of products that do not conform to specifications.

**prevention costs** Costs incurred to keep quality defects from occurring

**prime costs** The sum of direct materials and direct labor

**principal-agent model** A conceptual model that contains the key elements that contracts must have to achieve the desired objectives

**process costing** A costing system that accumulates product or service costs by process or department and then assigns them to a large number of nearly identical products

**Process costing** A costing system used in situations where a single, homogeneous product (such as cement or flour) is produced for long periods of time

**Previous-department costs.** See *transferred-in costs*.

**Prime costs.** All direct manufacturing costs.

**Prime cost** Direct materials cost plus direct labor cost.

**Process-costing system.** Costing system in which the cost object is masses of identical or similar units of a product or service.

**Process costing** A costing method used when essentially homogeneous products are produced on a continuous basis.

**Processing department** An organizational unit where work is performed on a product and where materials, labor, or overhead costs are added to the product

**Product.** Any output that has a positive total sales value (or an output that enables an organization to avoid incurring costs).

**Product cost.** Sum of the costs assigned to a product for a specific purpose.

**product costs** Under GAAP, the costs necessary to complete the product (direct materials, direct labor, and factory overhead)

**Product costs** All costs that are involved in acquiring or making a product. In the case of manufactured goods, these costs consist of direct materials, direct labor, and manufacturing overhead. Also see *Inventoriable costs*.

**Product-cost cross-subsidization.** Costing outcome where one undercosted (overcosted) product results in at least one other product being overcosted (undercosted).

**Product differentiation.** Organization's ability to offer products or services perceived by its customers to be superior and unique relative to the products or services of its competitors.

**Product overcosting.** A product consumes a low level of resources but is reported to have a high cost per unit.

**Product undercosting.** A product consumes a high level of resources but is reported to have a low cost per unit.

**production cost report** A report that summarizes the physical units and equivalent units of a department, the costs incurred during the period, and the costs assigned to units completed and to units in ending work-in-process inventories

**product-level activity** An activity performed to support the production of a specific product or service

**Product-level activities** Activities that relate to specific products that must be carried out regardless of how many units are produced and sold or batches run.

**Production-denominator level.** The denominator in the budgeted manufacturing fixed overhead rate computation.

**Production department.** See *operating department*.

**Proration.** The spreading of underallocated manufacturing overhead or overallocated manufacturing overhead among ending work in process, finished goods, and cost of goods sold.

**Purchasing costs.** Cost of goods acquired from suppliers including incoming freight or transportation costs.

**Quality.** The total features and characteristics of a product made or a service performed according to specifications to satisfy customers at the time of purchase and during use.

**quality** Defined as customer satisfaction with the total experience of a product or service, that is, the difference between customer expectations and actual performance of the product or service

**Quantitative factors.** Outcomes that are measured in numerical terms.

**Raw materials** Materials that are used to make a product.

**Reciprocal method.** Cost allocation method that fully recognizes the mutual services provided among all support departments. Also called *matrix method*.

**reciprocal method** A cost allocation method that considers all reciprocal flows between service departments through simultaneous equations

**Reengineering.** The fundamental rethinking and redesign of business processes to achieve improvements in critical measures of performance, such as cost, quality, service, speed, and customer satisfaction.

**Refined costing system.** Costing system that reduces the use of broad averages for assigning the cost of resources to cost objects (jobs, products, services) and provides better measurement of the costs of indirect resources used by different cost objects—no matter how differently various cost objects use indirect resources.

**Relevant costs.** Expected future costs that differ among alternative courses of action being considered.

**relevant cost** A cost with two properties: it differs for each decision option and it will be incurred in the future

**Relevant cost** A cost that differs between alternatives in a decision. This term is synonymous with *avoidable cost* and *differential cost*.

**relevant range** The range of the cost driver in which the actual value of the cost driver is expected to fall, and for which the relationship is assumed to be approximately linear

**Relevant range.** Band of normal activity level or volume in which there is a specific relationship between the level of activity or volume and the cost in question.

**Relevant range** The range of activity within which assumptions about variable and fixed cost behavior are valid.

**Relevant range** The range of activity within which assumptions about variable and fixed cost behavior are reasonably valid.

**Relevant revenues.** Expected future revenues that differ among alternative courses of action being considered.

**replacement cost** The current cost to replace the assets at the current level of service and functionality

**Research and development.** Generating and experimenting with ideas related to new products, services, or processes.

**resource** An economic element applied or used to perform activities

**resource-capacity planning** Procedures used to ensure adequate but not excessive supply of capacity-related resources

**resource consumption cost driver** An activity or characteristic that consumes resources

**Revenue center.** Responsibility center where the manager is accountable for revenues only.

**revenue drivers** The factors that affect sales volume, such as price changes, promotions, discounts, customer service, changes in product features, delivery dates, and other value added factors

**Revenue driver.** A variable, such as volume, that causally affects revenues.

**Revenues.** Inflows of assets (usually cash or accounts receivable) received for products or services provided to customers.

**Rework.** Units of production that do not meet the specifications required by customers for finished units that are subsequently repaired and sold as good finished units.

**rework** A produced unit that must be reworked into a good unit that can be sold in regular channels

**salary** A fixed payment

**sales value at split-off method** A method that allocates joint costs to joint products on the basis of their relative sales values at the split-off point

**Sales value at splitoff method.** Method that allocates joint costs to joint products on the basis of the relative total sales value at the splitoff point of the total production of these products during the accounting period.

**Sarbanes-Oxley Act of 2002** Legislation enacted to protect the interests of stockholders who invest in publicly traded companies by improving the reliability and accuracy of the disclosures provided to them.

**Schedule of cost of goods manufactured** A schedule showing the direct materials, direct labor, and manufacturing overhead costs incurred during a period and the portion of those costs that are assigned to Work in Process and Finished Goods.

**Scrap.** Residual material left over when making a product.

**scrap** Residual output that has little or no value

**Second-stage allocation** The process by which activity rates are used to apply costs to products and customers in activity-based costing.

**Segment margin** A segment's contribution margin less its traceable fixed costs. It represents the margin available after a segment has covered all of its own traceable costs.

**Sell or process further decision** A decision as to whether a joint product should be sold at the split-off point or sold after further processing.

**Semivariable cost.** See *mixed cost*.

**Separable costs.** All costs (manufacturing, marketing, distribution, and so on) incurred beyond the splitoff point that are assignable to each of the specific products identified at the splitoff point.

**Sequential allocation method.** See *step-down method*.

**Sequential tracking.** Approach in a product-costing system in which recording of the journal entries occurs in the same order as actual purchases and progress in production.

**Service department.** See *support department*.

**split-off point** The first point in a joint production process at which individual products can be identified

**Split-off point** That point in the manufacturing process where some or all of the joint products can be recognized as individual products.

**Splitoff point.** The juncture in a joint-production process when two or more products become separately identifiable.

**Single-rate method.** Allocation method that allocates costs in each cost pool to cost objects using the same rate per unit of a single allocation base.

**Source document.** An original record that supports journal entries in an accounting system.

**Spoilage.** Units of production that do not meet the specifications required by customers for good units and that are discarded or sold at reduced prices.

**spoilage** An unaccepted unit that is discarded or sold for disposal value

**Stand-alone cost-allocation method.** Method that uses information pertaining to each user of a cost object as a separate entity to determine the cost-allocation weights.

**Stand-alone revenue-allocation method.** Method that uses product-specific information on the products in the bundle as weights for allocating the bundled revenues to the individual products.

**Standard.** A carefully determined price, cost, or quantity that is used as a benchmark for judging performance. It is usually expressed on a per unit basis.

**Standard cost.** A carefully determined cost of a unit of output.

**standard cost** The cost a firm should incur for an operation

**Standard cost card** A detailed listing of the standard amounts of inputs and their costs that are required to produce a unit of a specific product.

**standard cost sheet** A listing of the standard price and quantity of each manufacturing cost element for the production of one unit of a product

**standard cost system** One in which standard, not actual, costs flow through the formal accounting records

**Standard costing.** Costing system that traces direct costs to output produced by multiplying the standard prices or rates by the standard quantities of inputs allowed for actual outputs produced and allocates overhead costs on the basis of the standard overhead-cost rates times the standard quantities of the allocation bases allowed for the actual outputs produced.

**Standard cost per unit** The standard quantity allowed of an input per unit of a specific product, multiplied by the standard price of the input.

**Standard hours per unit** The amount of direct labor time that should be required to complete a single unit of product, including allowances for breaks, machine downtime, cleanup, rejects, and other normal inefficiencies.

**Standard price per unit** The price that should be paid for an input. The price should be net of discounts and should include any shipping costs.

**Standard quantity per unit** The amount of an input that should be required to complete a single unit of product, including allowances for normal waste, spoilage, rejects, and other normal inefficiencies.

**Standard rate per hour** The labor rate that should be incurred per hour of labor time, including employment taxes and fringe benefits.

**Standard input.** A carefully determined quantity of input required for one unit of output.

**Standard price.** A carefully determined price that a company expects to pay for a unit of input.

**Statement of cash flows** A financial statement that highlights the major activities that directly and indirectly impact cash flows and hence affect the overall cash balance.

**Step cost function.** A cost function in which the cost remains the same over various ranges of the level of activity, but the cost increases by discrete amounts (that is, increases in steps) as the level of activity changes from one range to the next.

**step cost** A cost that varies with the cost driver, but in discrete steps; also called semi-fixed cost

**Step-variable cost** The cost of a resource that is obtained in large chunks and that increases and decreases only in response to fairly wide changes in activity.

**step method** A cost allocation method that uses a sequence of steps in allocating service department costs to production departments

**Step-down method.** Cost allocation method that partially recognizes the mutual services provided among all support departments. Also called *sequential allocation method*.

**Stockout costs.** Costs that result when a company runs out of a particular item for which there is customer demand. The company must act to meet that demand or suffer the costs of not meeting it.

**Strategic cost management.** Describes cost management that specifically focuses on strategic issues.

**strategic budget expenditures** Planned spending on projects and initiatives that lead to long-term value and competitive advantage

**strategic control system** The processes and procedures organizations use to monitor progress toward strategic goals of the organization

**strategic cost management** The development of cost management information to facilitate the principal management function, strategic management

**strategic management** The development and implementation of a sustainable competitive position

**structural cost drivers** Strategic plans and decisions that have a long-term effect with regard to issues such as scale, experience, technology, and complexity

**Suboptimal decision making.** Decisions in which the benefit to one subunit is more than offset by the costs or loss of benefits to the organization as a whole. Also called *incongruent decision making* or *dysfunctional decision making*.

**Sunk costs.** Past costs that are unavoidable because they cannot be changed no matter what action is taken.

**sunk costs** Costs that have been incurred in the past or committed for the future, and are therefore irrelevant for decision-making purposes

**Sunk cost** Any cost that has already been incurred and that cannot be changed by any decision made now or in the future.

**Super-variable costing.** See *throughput costing*.

**Supply chain.** Describes the flow of goods, services, and information from the initial sources of materials and services to the delivery of products to consumers, regardless of whether those activities occur in the same organization or in other organizations.

**Supply chain management** A management approach that coordinates business processes across companies to better serve end consumers.

**Support department.** Department that provides the services that assist other internal departments (operating departments and other support departments) in the company. Also called a *service department*.

**Target cost per unit.** Estimated long-run cost per unit of a product or service that enables the company to achieve its target operating income per unit when selling at the target price. Target cost per unit is derived by subtracting the target operating income per unit from the target price.

**target costing** The desired cost for a product as determined on the basis of a given competitive price, so the product will earn a desired profit

**Target costing** The process of determining the maximum allowable cost for a new product and then developing a prototype that can be profitably made for that maximum target cost figure.

**Target operating income per unit.** Operating income that a company aims to earn per unit of a product or service sold.

**Target price.** Estimated price for a product or service that potential customers will pay.

**Target profit analysis** Estimating what sales volume is needed to achieve a specific target profit.

**Theoretical capacity.** The level of capacity based on producing at full efficiency all the time.

**theoretical capacity** A measure of capacity (output or activity) that assumes 100 percent efficiency; maximum possible output (or activity)

**theory of constraints (TOC)** An analysis of operations that improves profitability and cycle time by identifying the bottleneck in the operation and determining the most profitable product mix given the bottleneck

**Theory of constraints (TOC).** Describes methods to maximize operating income when faced with some bottleneck and some non bottleneck operations.

**Theory of Constraints (TOC)** A management approach that emphasizes the importance of managing constraints.

**Throughput costing.** Method of inventory costing in which only variable direct material costs are included as inventoriable costs. Also called *super-variable costing*.

**Throughput margin.** Revenues minus the direct material costs of the goods sold.

**throughput margin** A TOC measure of product profitability; it equals price less materials cost, including all purchased components and materials handling costs

**Throughput time** The amount of time required to turn raw materials into completed products.

**time ticket** A sheet showing the time an employee worked on each job, the pay rate, and the total cost chargeable to each job

**Time ticket** A document that is used to record the amount of time an employee spends on various activities.

**total contribution margin** The unit contribution margin multiplied by the number of units sold

**total manufacturing cost** The sum of materials used, labor, and overhead for the period

**total quality management (TQM)** The unyielding and continuous effort by everyone in the organization to understand, meet, and exceed customer expectations

**Traceable fixed cost** A fixed cost that is incurred because of the existence of a particular business segment and that would be eliminated if the segment were eliminated.

**Transaction driver** A simple count of the number of times an activity occurs.

**transferred-in costs** The costs of work performed in the earlier department that are transferred into the present department

**Transferred-in costs.** Costs incurred in previous departments that are carried forward as the product's costs when it moves to a subsequent process in the production cycle. Also called *previous department costs*.

**two-stage cost allocation** A procedure that assigns a firm's resource costs, namely resource costs, to cost pools and then to cost objects

**Underabsorbed indirect costs.** See *underallocated indirect costs*.

**Underallocated indirect costs.** Allocated amount of indirect costs in an accounting period is less than the actual (incurred) amount in that period. Also called *underapplied indirect costs* or *underabsorbed indirect costs*. (118)

**Underapplied indirect costs.** See *underallocated indirect costs*. (118)

**underapplied overhead** The amount that actual factory overhead exceeds the factory overhead applied

**Underapplied overhead** A debit balance in the Manufacturing Overhead account that occurs when the amount of overhead cost actually incurred exceeds the amount of overhead cost applied to Work in Process during a period.

**Unit cost.** Cost computed by dividing total cost by the number of units. Also called *average cost*.

**unit-based pool** A basis for determining a bonus according to the performance of the manager's unit

**unit contribution margin** The difference between unit sales price and unit variable cost; it is a measure of the change in profit for a unit change in sales

**unit cost** The total manufacturing cost (materials, labor, and overhead) divided by the number of units of output

**unit-level activity** An activity performed for each unit of the cost object

**Unit-level activities** Activities that are performed each time a unit is produced.

**units accounted for** The sum of the units transferred out and ending inventory units

**units to account for** The sum of the beginning inventory units and the number of units started during the period

**Unused capacity.** The amount of productive capacity available over and above the productive capacity employed to meet consumer demand in the current period.

**value activities** Firms in an industry perform activities to design, manufacture, and provide customer service.

**value-added activity** An activity that contributes to customer value and satisfaction or satisfies an organizational need

**Value-added cost.** A cost that, if eliminated, would reduce the actual or perceived value or utility (usefulness) customers obtain from using the product or service.

**value chain** An analytic tool firms use to identify the specific steps required to provide a product or service to the customer

**Value chain** The major business functions that add value to a company's products and services such as research and development, product design, manufacturing, marketing, distribution, and customer service.

**value-chain analysis** A strategic analysis tool used to identify where value to customers can be increased or costs reduced, and to better understand the firm's linkages with suppliers, customers, and other firms in the industry

**Value chain.** The sequence of business functions in which customer usefulness is added to products or services of a company.

**value engineering** Used in target costing to reduce product cost by analyzing the trade-offs between different types of product functionality and total product cost

**Value engineering.** Systematic evaluation of all aspects of the value chain, with the objective of reducing costs and achieving a quality level that satisfies customers.

**Value streams.** All valued-added activities needed to design, manufacture, and deliver a given product or product line to customers.

**Variable cost.** Cost that changes in total in proportion to changes in the related level of total activity or volume.

**Variable expense ratio** A ratio computed by dividing variable expenses by dollar sales

**variable cost** The change in total cost associated with each change in the quantity of the cost driver

**Variable costing.** Method of inventory costing in which only all variable manufacturing costs are included as inventoriable costs. Also called *direct costing*.

**Variable costing** A costing method that includes only variable manufacturing costs—direct materials, direct labor, and variable manufacturing overhead—in unit product costs.

**variable-cost method** In transfer pricing, the transfer price equals the variable cost of the selling unit

**Variance.** The difference between actual result and expected performance.

**variances** The differences between budgeted and actual amounts, for either financial or nonfinancial measures

**weighted-average method** A method for calculating unit cost that includes all costs, both those incurred during the current period and those incurred in the prior period that are shown as the beginning work-in-process inventory of the current period

**work cells** Small groups of related manufacturing processes organized in clusters to assemble parts of finished products

**work-in-process inventory** Contains all costs put into the manufacture of products that are started but not complete at the financial statement date

**Work-in-process inventory.** Goods partially worked on but not yet completed. Also called *work in progress*.

**Work in progress.** See *work-in-process inventory*.

**Work in process** Units of product that are only partially complete and will require further work before they are ready for sale to a customer.

**Weighted-average process-costing method.** Method of process costing that assigns the equivalent-unit cost of the work done to date (regardless of the accounting period in which it

was done) to equivalent units completed and transferred out of the process and to equivalent units in ending work-in-process inventory.

**Weighted-average method** A process costing method that blends together units and costs from both the current and prior periods.

**Work-measurement method.** See *industrial engineering method*.

# Self Assessment Quiz

## 7.5 VALUE-CHAIN ANALYSIS

### Supply Chain Management

**Supply Chain** (usually encompasses more than one firm)

#### Definition

Supply chain describes the flow of goods, services, and information from the initial sources of materials and services to the delivery of products to consumers, *regardless* of whether those activities occur in the same organization or in other organizations.<sup>(H)</sup>

#### Supply Chain Management

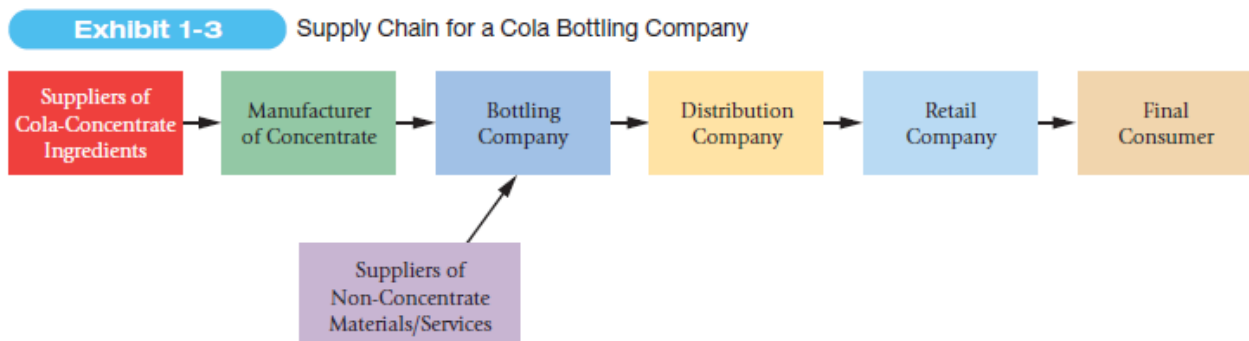

#### Definition

The term supply chain management is commonly used to refer to the coordination of business processes across companies to better serve end consumers.<sup>(G)</sup>

Customers want companies to use the value chain and supply chain to deliver ever improving levels of performance regarding critical success factors:

- Lower Cost with Increased efficiency
- High levels of quality
- Constant innovation.

Supply-chain analysis and coordination should **extend to all parties** in the chain, from initial sources of materials to retailers.

#### Goals of Supply Chain Management

- Maximizing customer value and
- Achieving a sustainable competitive advantage.

#### Supply chain activities

- product development,
- sourcing,
- production,
- logistics, and
- the information systems needed to coordinate these activities.

### Benefits of effective supply chain management

- generally improve performance and reduce costs
- Coordination has special relevance to inventory management: By sharing information among all parties:
  - demand uncertainty is reduced at each level, with consequent decreases of inventory at each level,
  - fewer stockouts at the retail level,
  - avoidance of overproduction and rush orders
    - reduction of excess manufacturing by the manufacturer and thus reduction of excess finished goods inventories, and
    - carry lower inventories, thus reducing the amount of cash tied up in inventories for all.
- fewer rush and expedited orders.

### Issues and problems supply chain management

- communications problems,
- trust issues,
- incompatible information systems, and
- the required increases in personnel resources and financial resources.

## 7. Efficient accounting processes (Gleim p.236)

### Benefits of Improving accounting processes

Increase a company's ability to minimize the costs of these processes while also maximizing their usefulness.

### Areas for improvement

- 1) Accounts payable,
- 2) Cash cycle,
- 3) Closing and reconciliation processes, and
- 4) Data analysis.

### Techniques for creating a future vision for finance function

- **Benchmarking**
  - visits to organizations that are functioning at high levels of efficiency and effectiveness in the processes being considered for redesigning.
  - Then develop standards against which their vision for the finance function can be measured.
- **Current use assessment (customer-centered approach)**
  - identifies the outputs and activities that are depended on by users (Internal customers)
  - gather information for a "wish list" of information the users would like to receive.

## Steps needed to improve accounting processes

### 1.Process walk-throughs (understanding current process)

Is the first step is to gather information about how things are currently being done, this done through:

- conduct a process walk-through, a member of the process redesign team meets with the process owner and each participant in the process in order to gain a thorough understanding of how the work gets done from beginning to end for the purpose of uncovering opportunities for improvement.
- document existing processes
  - listing the sequence of events in the process
  - documenting time required to complete each step, forms used as inputs, reports used as outputs, identification of who performs each step, controls currently in place, where errors typically occur in the process.
  - Every input and output should be challenged through investigating steps to avoid any duplication of effort.
  - Process mapping may be used to provide a visual map of the way information, documents, and work is routed through a process.

### **Benefits of Process walk-throughs**

- Identifying waste and over-capacity
  - duplication of effort,
  - tasks being done that are not necessary
  - output that is not being used
- Identify the root cause of errors
  - same data is being keyed in multiple times, not only is the duplication of effort wasteful, but there is inherent risk that it will be keyed in differently.

**2.Process Design** to cover every aspect of the internal customers' (users') needs.

### **3. Risk-Benefit Evaluation**

- The greater the changes being made, the less the organization can be sure of a successful outcome.
- If the risks are determined to be too great, a return to the process design step may be necessary.

### **4.Planning and Implementing the Redesign**

- The initiative for finance redesign often comes from senior management, so it is a top-down implementation.
- It requires engaging people in the change, if the changes are extensive, they will need to be phased in to allow the employees and the rest of the organization time to adjust to their impact.

### **5.Process Training**

- Done on an individual basis to fully take advantage of the systems being used.

### **Reducing the Accounting Close Cycle**

Significant improvements can be made in the time required to close the general ledger at the end of each month, quarter, and fiscal year. "Soft closes" can be used for month-end closes while reserving the more detailed closing activities and allocations for quarter-end and year-end closes.

- Use of a standardized chart of accounts and general ledger application across all company locations is important for speed in closing.
- Bank reconciliations can be done daily without waiting for the month-end statement by accessing transactions online.
- Depreciation can be calculated a few days before the end of the period.
- Using standard checklist of journal entries that are needed in the closing.
- Mandating standardized accounting procedures.

### **Centralization of Accounting as a Shared Service**

Centralization of all accounting processes (Reorganizing responsibilities along functional lines instead of geographical lines) using a single consolidated accounting system is the best way to resolve closing problems created by accounting decentralization.

### **Benefits of Shared Service**

- specific types of transactions such as accounts payable, accounts receivable, and general ledger can be organized along functional lines,
- utilizing a smaller number of highly-trained people.
- The result is usually fewer errors.
- tasks can be assigned to a smaller number of managers who are in closer proximity, resulting in greater efficiency.
- accounting errors can be researched more easily.

## **Enterprise Resource Planning (ERP) -successor to Manufacturing Resource Planning-**

### **Characteristics of ERP**

- *Integrated* applications that is used to collect, store, manage and interpret data across the organization.
  - ERP systems integrate not only production information but also the sales, marketing, customer service and all accounting functions
- Often the information is available in real-time.
- ERP systems track all of a firm's resources (cash, raw materials, and fixed assets, for example) as well as the status of its commitments (orders, purchase orders, and payroll, for example).
- ran on mainframe computers (high cost for non- cloud-based ERP).
  - cloud-based ERP systems allows smaller and mid-sized businesses to access only what they need and to reduce their investment in hardware and IT personnel.
- enabling supply chain management solutions and support e-commerce applications.

### **Benefits of ERP**

- Reduction in operational costs.
  - Communication is improved across departments, leading to greater efficiencies in production, planning, and decision-making that can lead to lower production costs, lower marketing expenses, and other efficiencies.
- Inventory management facilitated.
  - Inventories can be managed more effectively to keep them at optimal levels.
- Day-to-day operations are facilitated through real-time information.
  - facilitates decision-making and control
- Resource planning as a part of strategic planning is simplified.

## **Learning Outcome Statements**

### **Part 1 – Section D.4. Supply Chain Management**

**The candidate should be able to:**

- a. explain supply chain management
- b. define lean manufacturing and describe its central purpose
- c. identify and describe the operational benefits of implementing lean manufacturing
- f. identify and describe the operational benefits of enterprise resource planning (ERP)

### **Part 1. D.5. Business process improvement**

- n. identify and discuss ways to make accounting operations more efficient, including process walk-throughs, process training, identification of waste and over capacity, identifying the root cause of errors, reducing the accounting close cycle (fast close), and shared services

Last updated 1/Dec/2014

[1] Gleim #: 1.2.17 -- Source: CMA 692 3-5

The terms direct cost and indirect cost are commonly used in accounting. A particular cost might be considered a direct cost of a manufacturing department but an indirect cost of the product produced in the manufacturing department. Classifying a cost as either direct or indirect depends upon

- A. The behavior of the cost in response to volume changes.
  - B. Whether the cost is expensed in the period in which it is incurred.
  - C. The cost object to which the cost is being related.
  - D. Whether an expenditure is unavoidable because it cannot be changed regardless of any action taken.
- Answer (A) is **incorrect**. Behavior in response to volume changes is a factor only if the cost object is a product.
  - Answer (B) is **incorrect**. The timing of an expense is not a means of classifying a cost as direct or indirect.
  - Answer (C) is **correct**. A direct cost can be specifically associated with a single cost object in an economically feasible way. An indirect cost cannot be specifically associated with a single cost object. Thus, the specific cost object influences whether a cost is direct or indirect. For example, a cost might be directly associated with a single plant. The same cost, however, might not be directly associated with a particular department in the plant.
  - Answer (D) is **incorrect**. Both direct and indirect costs can be either avoidable or unavoidable, depending upon the cost object.

[2] Gleim #: 1.2.18 -- Source: CMA 697 3-1

Which one of the following best describes direct labor?

- A. A prime cost.
  - B. A period cost.
  - C. A product cost.
  - D. Both a product cost and a prime cost.
- Answer (A) is **incorrect**. Direct labor is also a product cost.
  - Answer (B) is **incorrect**. A period cost is expensed when incurred. Direct labor cost is inventoriable.
  - Answer (C) is **incorrect**. Direct labor is also a prime cost.

- Answer (D) is **correct**. Direct labor is both a product cost and a prime cost. Product costs are incurred to produce units of output and are deferred to future periods to the extent that output is not sold. Prime costs are defined as direct materials and direct labor.

**[3] Gleim #: 1.2.19 -- Source: CMA 693 3-5**

Inventoriable costs

- A. Include only the prime costs of manufacturing a product.
  - B. Include only the conversion costs of manufacturing a product.
  - C. Are expensed when products become part of finished goods inventory.
  - D. Are regarded as assets before the products are sold.
- Answer (A) is **incorrect**. Overhead costs as well as prime costs (direct materials and labor) are included in inventory.
  - Answer (B) is **incorrect**. Materials costs are also included.
  - Answer (C) is **incorrect**. Inventory costs are expensed when the goods are sold, not when they are transferred to finished goods.
  - Answer (D) is **correct**. Under an absorption costing system, inventoriable (product) costs include all costs necessary for good production. These include direct materials and conversion costs (direct labor and overhead). Both fixed and variable overhead is included in inventory under an absorption costing system. Inventoriable costs are treated as assets until the products are sold because they represent future economic benefits. These costs are expensed at the time of sale.

**[4] Gleim #: 1.2.20 -- Source: CMA 694 3-3**

In cost terminology, conversion costs consist of

- A. Direct and indirect labor.
  - B. Direct labor and direct materials.
  - C. Direct labor and factory overhead.
  - D. Indirect labor and variable factory overhead.
- Answer (A) is **incorrect**. All factory overhead is included in conversion costs, not just indirect labor.
  - Answer (B) is **incorrect**. Direct materials are not an element of conversion costs; they are a prime cost.

- Answer (C) is **correct**. Conversion costs consist of direct labor and factory overhead. These are the costs of converting raw materials into a finished product.
- Answer (D) is **incorrect**. Direct labor is also an element of conversion costs.

**[5] Gleim #: 1.2.21 -- Source: CMA 696 3-18**

Conversion costs do **not** include

- A. Depreciation.
- B. Direct materials.
- C. Indirect labor.
- D. Indirect materials.

- Answer (A) is **incorrect**. Depreciation is a factory overhead cost and therefore is a conversion cost.
- Answer (B) is **correct**. Conversion costs are necessary to convert raw materials into finished products. They include all manufacturing costs, for example, direct labor and factory overhead, other than direct materials.
- Answer (C) is **incorrect**. Indirect labor is a factory overhead cost and therefore is a conversion cost.
- Answer (D) is **incorrect**. Indirect materials are factory overhead costs and therefore are conversion costs.

**[6] Gleim #: 1.2.22 -- Source: CMA 1296 3-3**

Conversion cost pricing

- A. Places minimal emphasis on the cost of materials used in manufacturing a product.
  - B. Could be used when the customer furnishes the material used in manufacturing a product.
  - C. Places heavy emphasis on indirect costs and disregards consideration of direct costs.
  - D. Places heavy emphasis on direct costs and disregards consideration of indirect costs.
- Answer (A) is **incorrect**. Conversion cost pricing does not place any emphasis on raw materials cost.
  - Answer (B) is **correct**. Conversion costs consist of direct labor and factory overhead, the costs of converting raw materials into finished goods. Normally, a company does not consider only conversion costs in making pricing decisions, but if the customer were to furnish the raw materials, conversion cost pricing would be appropriate.

- Answer (C) is **incorrect**. Direct labor is an element of conversion costs.
- Answer (D) is **incorrect**. Factory overhead is an indirect cost that is an element of conversion costs.

**[7] Gleim #: 1.2.23 -- Source: CMA 678 4-7**

The term “prime costs” refers to

- A. Manufacturing costs incurred to produce units of output.
  - B. All costs associated with manufacturing other than direct labor costs and raw material costs.
  - C. The sum of direct labor costs and all factory overhead costs.
  - D. The sum of raw material costs and direct labor costs.
- Answer (A) is **incorrect**. Manufacturing costs incurred to produce output are inventoriable costs.
  - Answer (B) is **incorrect**. All costs associated with manufacturing other than direct labor costs and raw material costs are overhead costs.
  - Answer (C) is **incorrect**. The sum of direct labor and overhead is conversion cost.
  - Answer (D) is **correct**. Prime costs are raw material costs and direct labor costs.

**[8] Gleim #: 1.2.24 -- Source: CMA 1292 3-1**

Costs are allocated to cost objects in many ways and for many reasons. Which one of the following is a purpose of cost allocation?

- A. Evaluating revenue center performance.
  - B. Measuring income and assets for external reporting.
  - C. Budgeting cash and controlling expenditures.
  - D. Aiding in variable costing for internal reporting.
- Answer (A) is **incorrect**. A revenue center is evaluated on the basis of revenue generated, without regard to costs.
  - Answer (B) is **correct**. Cost allocation is the process of assigning and reassigning costs to cost objects. It is used for those costs that cannot be directly associated with a specific cost object. Cost allocation is often used for purposes of measuring income and assets for external reporting purposes. Cost allocation is less meaningful for internal purposes because responsibility accounting systems emphasize controllability, a process often ignored in cost allocation.

- Answer (C) is **incorrect**. Cost allocation is not necessary for cash budgeting and controlling expenditures.
- Answer (D) is **incorrect**. Allocations are not needed for variable costing, which concerns direct, not indirect, costs.

**[9] Gleim #: 1.2.25 -- Source: CMA 1293 3-1**

Cost drivers are

- A. Activities that cause costs to increase as the activity increases.
  - B. Accounting techniques used to control costs.
  - C. Accounting measurements used to evaluate whether or not performance is proceeding according to plan.
  - D. A mechanical basis, such as machine hours, computer time, size of equipment, or square footage of factory, used to assign costs to activities.
- 
- Answer (A) is **correct**. A cost driver is “a measure of activity, such as direct labor hours, machine hours, beds occupied, computer time used, flight hours, miles driven, or contracts, that is a causal factor in the incurrence of cost to an entity” (IMA). It is a basis used to assign costs to cost objects.
  - Answer (B) is **incorrect**. Cost drivers are measures of activities that cause the incurrence of costs.
  - Answer (C) is **incorrect**. Cost drivers are not accounting measurements but measures of activities that cause costs.
  - Answer (D) is **incorrect**. Although cost drivers may be used to assign costs, they are not necessarily mechanical. For example, a cost driver for pension benefits is employee salaries.

**[11] Gleim #: 1.2.27 -- Source: CMA 694 3-1**

Which one of the following is **least** likely to be an objective of a cost accounting system?

- A. Product costing.
  - B. Department efficiency.
  - C. Inventory valuation.
  - D. Sales commission determination.
- 
- Answer (A) is **incorrect**. Product costing is an objective of a cost accounting system.
  - Answer (B) is **incorrect**. Department efficiency is an objective of a cost accounting system.

- Answer (C) is **incorrect**. Inventory valuation is an objective of a cost accounting system.
- Answer (D) is **correct**. A cost accounting system has numerous objectives, including product costing, assessing departmental efficiency, inventory valuation, income determination, and planning, evaluating, and controlling operations. Determining sales commissions is not an objective of a cost accounting system because such commissions are based on sales, not costs.

**[17] Gleim #: 1.2.33 -- Source: CMA 0205 2-12**

A firm calculates that its annual cost to hold excess goods in order to avoid any chance of running out of inventory is \$50,000. This \$50,000 is an example of a

- A. Prime cost.
- B. Quality cost.
- C. Carrying cost.
- D. Stockout cost.

- Answer (A) is **incorrect**. Prime cost is the sum of direct materials and direct labor.
- Answer (B) is **incorrect**. Quality cost is the cost of assuring a product meets standards of quality; quality costs consist of prevention costs, appraisal costs, internal failure costs, and external failure costs.
- Answer (C) is **correct**. The costs of holding or storing inventory are carrying costs. Examples include the costs of capital, insurance, warehousing, breakage, and obsolescence.
- Answer (D) is **incorrect**. Stockout cost is either the lost revenue from a missed sale or the express shipping costs of making a product available on an urgent basis.

**[18] Gleim #: 1.2.34 -- Source: CMA 0205 2-13**

Roberta Johnson is the manager of Sleep-Well Inn, one of a chain of motels located throughout the U.S. An example of an operating cost at Sleep-Well that is both direct and fixed is

- A. Johnson's salary.
- B. Water.
- C. Toilet tissue.
- D. Advertising for the Sleep-Well Inn chain.

- Answer (A) is **correct**. Direct costs are ones that can be associated with a particular cost object in an economically feasible way, that is, they can be traced to that object. Fixed costs are those that remain unchanged in total over the relevant range of production. A motel manager's salary is traceable to the single location she manages, and it remains fixed over a set period of time regardless of the number of guests.
- Answer (B) is **incorrect**. Water is a variable cost.
- Answer (C) is **incorrect**. Toilet tissue is a variable cost.
- Answer (D) is **incorrect**. Advertising for the whole chain is not a direct cost of Roberta Johnson's location.

**[19] Gleim #: 1.2.35 -- Source: CMA 0205 2-16**

Mello Joy produces 200,000 units of a good that has the following costs:

Direct material costs	\$2,000,000
Direct manufacturing labor costs	1,000,000
Indirect manufacturing labor costs	600,000

Mello Joy's per unit prime costs and conversion costs, respectively, are

- A. \$8 and \$15.
  - B. \$8 and \$18.
  - C. \$10 and \$8.
  - D. \$15 and \$8.
- Answer (A) is **incorrect**. Reversing the correct calculations results in \$8 and \$15.
  - Answer (B) is **incorrect**. Reversing the correct calculations and improperly combining all three cost elements for one of the calculations results in \$8 and \$18.
  - Answer (C) is **incorrect**. The amount of \$10 for prime cost results from failing to include direct labor.

- Answer (D) is **correct**. Prime cost consists of direct materials and direct labor. Conversion cost consists of direct labor and manufacturing overhead. The per unit calculations are as follows:

Direct materials	\$2,000,000	Direct labor	\$1,000,000
Direct labor	<u>1,000,000</u>	Manufacturing overhead	<u>600,000</u>
Total prime costs	\$3,000,000	Total conversion costs	\$1,600,000
Divided by: production level	÷ 200,000	Divided by: production level	÷ 200,000
Per unit prime cost	\$ 15	Per unit conversion cost	\$ 8

**[22] Gleim #: 1.2.38 -- Source: CMA 693 3-1**

The allocation of costs to particular cost objects allows a firm to analyze all of the following **except**

- Whether a particular department should be expanded.
  - Why the sales of a particular product have increased.
  - Whether a product line should be discontinued.
  - Why a particular product should be purchased rather than manufactured in-house.
- Answer (A) is **incorrect**. Cost allocation permits a company to determine the profitability of a department and to make decisions relative to expanding or contracting its operations.
  - Answer (B) is **correct**. Cost allocation is an internal matter that does not affect demand (except to the extent it results in a change in price).
  - Answer (C) is **incorrect**. Cost allocation permits a company to determine the profitability of a product line and to decide whether to discontinue that line.
  - Answer (D) is **incorrect**. Make-or-buy decisions depend on cost analyses.

**[26] Gleim #: 1.2.42 -- Source: CMA 685 5-6**

A cost incurred for the benefit of more than one cost objective is

- A variable cost.
- A conversion cost.
- A prime cost.
- A common cost.

- Answer (A) is **incorrect**. A variable cost is one that varies directly with production activity.
- Answer (B) is **incorrect**. Conversion cost is the cost of labor and overhead incurred to convert raw materials into a finished product.
- Answer (C) is **incorrect**. Prime costs are the costs of materials and labor that are directly traceable to a cost objective.
- Answer (D) is **correct**. A cost incurred for the benefit of more than one cost objective is known as a common cost. Allocation of common costs is a persistent problem in responsibility accounting. For example, how should the costs of corporate headquarters be allocated to the segments of a conglomerate? Common cost is also a synonym for joint cost. In this sense, common costs are incurred in the production of two or more inseparable products (e.g., costs of refining petroleum into gasoline, diesel fuel, kerosene, lubricating oils, etc.) up to the point at which the products become separable (the split-off point).

**[27] Gleim #: 1.2.43 -- Source: CMA 685 5-1**

A cost that always can be directly traced to a cost object is

- A. A variable cost.
  - B. An indirect cost.
  - C. A conversion cost.
  - D. A prime cost.
- Answer (A) is **incorrect**. Some overhead costs are variable but cannot be directly traced to a particular product.
  - Answer (B) is **incorrect**. It includes costs that cannot be directly traced.
  - Answer (C) is **incorrect**. It includes costs that cannot be directly traced.
  - Answer (D) is **correct**. Prime costs are direct materials and direct labor. They are directly identifiable elements of production costs and are directly traceable to the product.

**[28] Gleim #: 1.2.44 -- Source: CMA 678 4-6**

Conversion costs are

- A. Manufacturing costs incurred to produce units of output.
- B. All costs associated with manufacturing other than direct labor costs and raw material costs.
- C. The sum of direct labor costs and all factory overhead costs.
- D. The sum of raw materials costs and direct labor costs.

- Answer (A) is **incorrect**. Manufacturing costs incurred to produce units of output are inventoriable (product) costs.
- Answer (B) is **incorrect**. All costs associated with manufacturing other than direct labor costs and raw materials costs are overhead costs. Conversion costs consist of both direct labor and overhead.
- Answer (C) is **correct**. Conversion costs are the direct labor, indirect materials, and factory overhead incurred to convert raw materials and transferred-in goods in a cost center to finished goods.
- Answer (D) is **incorrect**. Raw materials costs and direct labor costs are prime costs.

**[32] Gleim #: 1.2.48 -- Source: CMA 0408 2-079**

In practice, items such as wood screws and glue used in the production of school desks and chairs would most likely be classified as

- A. Direct labor.
- B. Factory overhead.
- C. Direct materials.
- D. Period costs.

- Answer (A) is **incorrect**. Direct labor is the cost of human labor that can practicably be traced to the product.
- Answer (B) is **correct**. Those tangible inputs to the manufacturing process that cannot practicably be traced to the product, such as wood screws and glue used in the production of school desks and chairs, are referred to as indirect costs. Indirect costs are one of the three components of manufacturing overhead, the other two being indirect labor and factory operating costs.
- Answer (C) is **incorrect**. Direct materials are those tangible inputs to the manufacturing process that can practicably be traced to the product.

- Answer (D) is **incorrect**. Period costs are those costs that are expensed as incurred rather than capitalized as part of the cost of inventory.

**[33] Gleim #: 1.2.49 -- Source: CMA 0408 2-081**

A review of Plunkett Corporation's accounting records for last year disclosed the following selected information:

Variable costs:

Direct materials used	\$ 56,000
Direct labor	179,100
Manufacturing overhead	154,000
Selling costs	108,400

Fixed costs:

Manufacturing overhead	267,000
Selling costs	121,000
Administrative costs	235,900

In addition, the company suffered a \$27,700 uninsured factory fire loss during the year. What were Plunkett's product costs and period costs for last year?

	<u>Product</u>	<u>Period</u>
A.	\$235,100	\$914,000
B.	\$497,500	\$651,600
C.	\$656,100	\$493,000
D.	\$683,800	\$465,300

- Answer (A) is **incorrect**. The amounts of \$235,100 and \$914,000 result from treating overhead as a period, rather than a product, cost.
- Answer (B) is **incorrect**. The amounts of \$497,500 and \$651,600 are the totals, respectively, of the variable and fixed, not the product and period, costs.

- Answer (C) is **correct**. Product costs, also called inventoriable costs, are capitalized as part of finished goods inventory. They eventually become a component of cost of goods sold. Period costs are expensed as incurred, i.e., they are not capitalized in finished goods inventory and are thus excluded from cost of goods sold. Plunkett's product and period costs can be calculated as follows:

	Product Costs	Period Costs
Direct materials	\$ 56,000	
Direct labor	179,100	
Variable overhead	154,000	
Fixed overhead	267,000	
Variable selling costs		\$108,400
Fixed selling costs		121,000
Administrative costs		235,900
Uninsured loss		27,700
Totals	<u>\$656,100</u>	<u>\$493,000</u>

- Answer (D) is **incorrect**. This combination of costs results from improperly classifying the uninsured loss as a product cost.

**[34] Gleim #: 1.2.50 -- Source: CMA 0408 2-083**

Which one of the following items would **not** be considered a manufacturing cost?

- Cream for an ice cream maker.
- Sales commissions for a car manufacturer.
- Plant property taxes for an ice cream maker.
- Tires for an automobile manufacturer.

- Answer (A) is **incorrect**. Cream is a direct material for an ice cream maker.
- Answer (B) is **correct**. Manufacturing costs consist of direct materials, direct labor, and manufacturing overhead. The cream, plant property taxes, and tires are all integral to the production of the final product and so are properly classified as manufacturing costs. Sales commissions, however, are not incurred until after the product has been manufactured. They are properly classified as a selling expense.
- Answer (C) is **incorrect**. The taxes on a manufacturing facility are a cost of producing the product.

- Answer (D) is **incorrect**. Tires are part of the final product of an automobile manufacturer, resulting in them being properly classified as direct materials and thus manufacturing costs.

**[35] Gleim #: 1.2.51 -- Source: CMA 0408 2-084**

Finley Painters Co., a painting contractor, maintains a job-order cost system. Job costs are accumulated by tracking the actual cost of paint and other materials used on each job, as well as the actual cost of wages earned by the painters on each job. In addition, overhead is applied to each job by using a predetermined rate based on the actual painters' wages. Leonard Wayne, painter, earned \$168 today by working on Job 08-45. In computing prime cost and conversion cost for Job 08-45, how would the wages earned today by Wayne be classified?

- A. As a component of both prime and conversion cost.
  - B. As a component of prime cost but not as a component of conversion cost.
  - C. As a component of conversion cost but not as a component of prime cost.
  - D. As a component of neither prime cost nor conversion cost.
- Answer (A) is **correct**. Manufacturing costs are often grouped into the following classifications: prime cost, which equals direct materials plus direct labor (i.e., those costs directly attributable to a product), and conversion cost, which equals direct labor plus manufacturing overhead (i.e., the costs of converting raw materials into the finished product). The wages earned by a painter working for a painting contractor are thus properly classified as both a prime cost and a conversion cost.
  - Answer (B) is **incorrect**. The wages earned by a painter working for a painting contractor are properly classified as both a prime cost and a conversion cost.
  - Answer (C) is **incorrect**. The wages earned by a painter working for a painting contractor are properly classified as both a prime cost and a conversion cost.
  - Answer (D) is **incorrect**. The wages earned by a painter working for a painting contractor are properly classified as both a prime cost and a conversion cost.

**[36] Gleim #: 1.2.52 -- Source: CMA 0408 2-089**

Indirect and common costs often make up a significant portion of the cost of a product. All of the following are reasons for indirect cost allocation to cost objects **except** to

- A. Reduce total costs identified with products.
- B. Measure income and assets for external reporting purposes.
- C. Justify costs for reimbursement purposes.
- D. Provide information for economic decision making.

- Answer (A) is **correct**. The total costs identified with products are unaffected by the treatment of indirect and common costs. The ability to identify a cost with a product is determined by traceability.
- Answer (B) is **incorrect**. Product costing for external financial reporting purposes are dictated by GAAP.
- Answer (C) is **incorrect**. Reimbursement policies are established contractually.
- Answer (D) is **incorrect**. Sound indirect cost allocation methods can improve the conditions for decision making.

[3] Gleim #: 1.3.56 -- Source: CMA 694 3-5

Which one of the following categories of cost is most likely **not** considered a component of fixed factory overhead?

- A. Rent.
- B. Property taxes.
- C. Depreciation.
- D. Power.

- Answer (A) is **incorrect**. Rent is an example of fixed factory overhead.
- Answer (B) is **incorrect**. Property taxes are an example of fixed factory overhead.
- Answer (C) is **incorrect**. Depreciation is an example of fixed factory overhead.
- Answer (D) is **correct**. A fixed cost is one that remains unchanged within the relevant range for a given period despite fluctuations in activity. Such items as rent, property taxes, depreciation, and supervisory salaries are normally fixed costs because they do not vary with changes in production. Power costs, however, are at least partially variable because they increase as usage increases.

[4] Gleim #: 1.3.57 -- Source: CMA 692 3-1

The controller of JoyCo has requested a quick estimate of the manufacturing supplies needed for the Morton Plant for the month of July when production is expected to be 470,000 units to meet the ending inventory requirements and sales of 475,000 units. JoyCo's budget analyst has the following actual data for the last 3 months:

<u>Month</u>	<u>Production in Units</u>	<u>Manufacturing Supplies</u>
March	450,000	\$723,060
April	540,000	853,560
May	480,000	766,560

Using these data and the high-low method to develop a cost estimating equation, the estimate of needed manufacturing supplies for July would be

- A. \$652,500
- B. \$681,500
- C. \$749,180
- D. \$752,060

- Answer (A) is **incorrect**. The total variable costs for March equal \$652,500.
- Answer (B) is **incorrect**. The variable portion of the total costs is \$681,500.
- Answer (C) is **incorrect**. The amount of \$749,180 is a nonsense answer.
- Answer (D) is **correct**. The fixed and variable portions of mixed costs may be estimated by identifying the highest and the lowest costs within the relevant range. The difference in cost divided by the difference in activity is the variable rate. Once the variable rate is found, the fixed portion is determinable. April and March provide the highest and lowest amounts. The difference in production was 90,000 units (540,000 April – 450,000 March), and the difference in the cost of supplies was \$130,500 (\$853,560 – \$723,060). Hence, the unit variable cost was \$1.45 ( $\$130,500 \div 90,000$  units). The total variable costs for March must have been \$652,500 (450,000 units  $\times$  \$1.45 VC per unit), and the fixed cost must therefore have been \$70,560 ( $\$723,060 - \$652,500$ ). The probable costs for July equal \$681,500 (470,000 units  $\times$  \$1.45 VC per unit), plus \$70,560 of fixed costs, a total of \$752,060.

**[7] Gleim #: 1.3.60 -- Source: CMA 1292 3-11**

Butteco has the following cost components for 100,000 units of product for the year:

Direct materials	\$200,000
Direct labor	100,000
Manufacturing overhead	200,000
Selling and administrative expense	150,000

All costs are variable except for \$100,000 of manufacturing overhead and \$100,000 of selling and administrative expenses. The total costs to produce and sell 110,000 units for the year are

- A. \$650,000
- B. \$715,000
- C. \$695,000
- D. \$540,000

- Answer (A) is **incorrect**. The cost at a production level of 100,000 units is \$650,000.
- Answer (B) is **incorrect**. The amount of \$715,000 assumes a variable unit cost of \$6.50 with no fixed costs.

- Answer (C) is **correct**. Direct materials unit costs are strictly variable at \$2 ( $\$200,000 \div 100,000$  units). Similarly, direct labor has a variable unit cost of \$1 ( $\$100,000 \div 100,000$  units). The \$200,000 of manufacturing overhead for 100,000 units is 50%. The variable unit cost is \$1. Selling costs are \$100,000 fixed and \$50,000 variable for production of 100,000 units, and the variable unit selling expenses is \$.50 ( $\$50,000 \div 100,000$  units). The total unit variable cost is therefore \$4.50 ( $\$2 + \$1 + \$1 + \$.50$ ). Fixed costs are \$200,000. At a production level of 110,000 units, variable costs are \$495,000 ( $110,000 \text{ units} \times \$4.50$ ). Hence, total costs are \$695,000 ( $\$495,000 + \$200,000$ ).
- Answer (D) is **incorrect**. Total costs are \$695,000 based on a unit variable cost of \$4.50 each.

**[8] Gleim #: 1.3.61 -- Source: CMA 694 3-9**

The difference between variable costs and fixed costs is

- A. Variable costs per unit fluctuate and fixed costs per unit remain constant.
  - B. Variable costs per unit are fixed over the relevant range and fixed costs per unit are variable.
  - C. Total variable costs are variable over the relevant range and fixed in the long term, while fixed costs never change.
  - D. Variable costs per unit change in varying increments, while fixed costs per unit change in equal increments.
- Answer (A) is **incorrect**. Variable costs are fixed per unit; they do not fluctuate. Fixed costs per unit change as production changes.
  - Answer (B) is **correct**. Fixed costs remain unchanged within the relevant range for a given period despite fluctuations in activity, but per unit fixed costs do change as the level of activity changes. Thus, fixed costs are fixed in total but vary per unit as activity changes. Total variable costs vary directly with activity. They are fixed per unit, but vary in total.
  - Answer (C) is **incorrect**. All costs are variable in the long term.
  - Answer (D) is **incorrect**. Unit variable costs are fixed in the short term.

**[9] Gleim #: 1.3.62 -- Source: CMA 1282 4-101**

Which of the following is the best example of a variable cost?

- A. The corporate president's salary.
- B. Cost of raw material.
- C. Interest charges.
- D. Property taxes.

- Answer (A) is **incorrect**. The president's salary usually does not vary with production levels.
- Answer (B) is **correct**. Variable costs vary directly with the level of production. As production increases or decreases, material cost increases or decreases, usually in a direct relationship.
- Answer (C) is **incorrect**. Interest charges are independent of production levels. They are called "fixed" costs and are elements of overhead.
- Answer (D) is **incorrect**. Property taxes are independent of production levels. They are called "fixed" costs and are elements of overhead.

**[15] Gleim #: 1.3.68 -- Source: CMA 0205 2-17**

Parker Company pays each member of its sales staff a salary as well as a commission on each unit sold. For the coming year, Parker plans to increase all salaries by 5% and to keep unchanged the commission paid on each unit sold. Because of increased demand, Parker expects the volume of sales to increase by 10%. How will the total cost of sales salaries and commissions change for the coming year?

- A. Increase by 5% or less.
- B. Increase by more than 5% but less than 10%.
- C. Increase by 10%.
- D. Increase by more than 10%.

- Answer (A) is **incorrect**. The salaries alone will increase by 5%.
- Answer (B) is **correct**. Sales salaries will increase by exactly 5%. The per-unit commission amount will remain constant, but sales commissions in total are expected to increase by 10%. Thus, total sales salaries and commissions will increase somewhere between 5% and 10%.
- Answer (C) is **incorrect**. Since the sales salaries are increasing by only 5%, the combination of salaries and commissions cannot be greater than 20%.

- Answer (D) is **incorrect**. The combination of the 5% increase in salaries and the 10% increase in commissions cannot exceed 10%.

**[16] Gleim #: 1.3.69 -- Source: CMA 0205 2-23**

Ace, Inc., estimates its total materials handling costs at two production levels as follows:

<u>Cost</u>	<u>Gallons</u>
\$160,000	80,000
\$132,000	60,000

What is the estimated total cost for handling 75,000 gallons?

- A. \$146,000
- B. \$150,000
- C. \$153,000
- D. \$165,000

- Answer (A) is **incorrect**. The amount of \$146,000 results from incorrectly assuming that, because 75,000 is halfway between the high and low levels of production given, the cost will be halfway between \$160,000 and \$132,000.
- Answer (B) is **incorrect**. The variable portion when improperly calculating only at the highest level of production is \$150,000.
- Answer (C) is **correct**. The high-low method can be applied to calculate the two portions of a mixed cost. The numerator is the difference between the cost at the highest level of activity and the cost at the lowest level ( $\$160,000 - \$132,000 = \$28,000$ ). The denominator is the difference between the highest level of activity from the lowest level ( $80,000 - 60,000 = 20,000$ ). The variable portion of the total mixed cost is derived by dividing these two figures ( $\$28,000 \div 20,000 = \$1.40$  per gallon). The fixed portion can be calculated by inserting the appropriate values for either the high or low level as follows:

$$\begin{aligned}\text{Fixed portion} &= \text{Total cost} - \text{Variable portion} \\ &= \$160,000 - (80,000 \times \$1.40) \\ &= \$160,000 - \$112,000 \\ &= \$48,000\end{aligned}$$

The total handling cost for a production level of 75,000 can now be determined:  $\$48,000 + (75,000 \times \$1.40) = \$153,000$ .

- Answer (D) is **incorrect**. The variable portion when improperly calculating only at the lowest level of production is \$165,000.

[18] Gleim #: 1.3.71 -- Source: CMA 693 3-4

A fixed cost that would be considered a direct cost is

- A. A cost accountant's salary when the cost objective is a unit of product.
  - B. The rental cost of a warehouse to store inventory when the cost objective is the Purchasing Department.
  - C. A production supervisor's salary when the cost objective is the Production Department.
  - D. Board of directors' fees when the cost objective is the Marketing Department.
- Answer (A) is **incorrect**. A cost accountant's salary cannot be directly associated with a single product. Cost accountants work with many different products during a pay period.
  - Answer (B) is **incorrect**. Warehouse rent is not directly traceable to the Purchasing Department. Other departments have influence over the level of inventories stored.
  - Answer (C) is **correct**. A direct cost is one that can be specifically associated with a single cost objective in an economically feasible way. Thus, a production supervisor's salary can be directly associated with the department (s)he supervises.
  - Answer (D) is **incorrect**. Directors' fees cannot be directly associated with the Marketing Department. Directors provide benefits to all departments within a corporation.

[19] Gleim #: 1.3.72 -- Source: CMA 697 3-2

Which one of the following is correct regarding a relevant range?

- A. Total variable costs will not change.
  - B. Total fixed costs will not change.
  - C. Actual fixed costs usually fall outside the relevant range.
  - D. The relevant range cannot be changed after being established.
- Answer (A) is **incorrect**. Variable costs will change in total, but unit variable costs will be constant.
  - Answer (B) is **correct**. The relevant range is the range of activity over which unit variable costs and total fixed costs are constant. The incremental cost of one additional unit of production will be equal to the variable cost.
  - Answer (C) is **incorrect**. Actual fixed costs should not vary greatly from budgeted fixed costs for the relevant range.

- Answer (D) is **incorrect**. The relevant range can change whenever production activity changes; the relevant range is merely an assumption used for budgeting and control purposes.

**[20] Gleim #: 1.3.73 -- Source: CMA 0408 2-085**

Taylor Company is determining the cost behavior of several items in order to budget for the upcoming year. Past trends have indicated the following dollars were spent at three different levels of output:

	Unit Levels		
	10,000	12,000	15,000
Cost A	\$25,000	\$29,000	\$35,000
Cost B	10,000	15,000	15,000
Cost C	15,000	18,000	22,500

In establishing a budget for 14,000 units, Taylor should treat Costs A, B, and C, respectively, as

- Semivariable, fixed, and variable.
- Variable, fixed, and variable.
- Semivariable, semivariable, and semivariable.
- Variable, semivariable, and semivariable.

- Answer (A) is **correct**. To properly understand the nature of a cost, its behavior in total and on a per-unit basis can be examined. Dividing the total costs incurred by the activity levels yields the following per-unit results:

	10,000	12,000	15,000
Cost A	\$2.50	\$2.42	\$2.33
Cost B	1.00	1.25	1.00
Cost C	1.50	1.50	1.50

Cost A increases disproportionately across the relevant range in total and decreases proportionately on a per-unit basis; A is thus a semivariable cost. Cost C increases steadily across the relevant range in total but remains constant on a per-unit basis; C is thus a variable cost.

- Answer (B) is **incorrect**. Cost A is semivariable.
- Answer (C) is **incorrect**. Cost C is variable.
- Answer (D) is **incorrect**. Cost A is semivariable and Cost C is variable.

**[21] Gleim #: 1.3.74 -- Source: CMA 0408 2-086**

Which one of the following refers to a cost that remains the same as the volume of activity decreases within the relevant range?

- A. Average cost per unit.
- B. Variable cost per unit.
- C. Unit fixed cost.
- D. Total variable cost.

- Answer (A) is **incorrect**. Average total cost per unit declines steadily as production volume increases over the relevant range.
- Answer (B) is **correct**. Variable cost per unit remains constant in the short run regardless of the level of production. This is in contrast with variable costs in total, which vary directly and proportionally with changes in volume.
- Answer (C) is **incorrect**. Fixed cost per unit varies indirectly with the activity level.
- Answer (D) is **incorrect**. Variable costs in total vary directly and proportionally with changes in volume.

**[22] Gleim #: 1.3.75 -- Source: CMA 0408 2-087**

Fowler Co. provides the following summary of its total budgeted production costs at three production levels:

	Volume in Units		
	1,000	1,500	2,000
Cost A	\$1,420	\$2,130	\$2,840
Cost B	1,550	2,200	2,900
Cost C	1,000	1,000	1,000
Cost D	1,630	2,445	3,260

The cost behavior of each of the Costs A through D, respectively, is

- A. Semivariable, variable, fixed, and variable.
- B. Variable, semivariable, fixed, and semivariable.
- C. Variable, fixed, fixed, and variable.
- D. Variable, semivariable, fixed, and variable.

- Answer (A) is **incorrect**. Cost A is variable.
- Answer (B) is **incorrect**. Cost D is variable.
- Answer (C) is **incorrect**. Cost B is semivariable.
- Answer (D) is **correct**. To properly understand the nature of a cost, its behavior in total and on a per-unit basis can be examined. Dividing the total costs incurred by the activity levels yields the following per-unit results:

	<u>1,000</u>	<u>1,500</u>	<u>2,000</u>
Cost A	\$1.42	\$1.42	\$1.42
Cost B	1.55	1.47	1.45
Cost C	1.00	0.67	0.50
Cost D	1.63	1.63	1.63

Costs A and D increase steadily across the relevant range in total but remain constant on a per-unit basis; they are thus variable costs. Cost B increases disproportionately across the relevant range in total and decreases disproportionately on a per-unit basis; B is thus a semivariable cost.

**[23] Gleim #: 1.3.76 -- Source: CMA 0408 2-090**

The relevant range refers to the activity levels over which

- Cost relationships hold constant.
  - Costs fluctuate.
  - Production varies.
  - Relevant costs are incurred.
- Answer (A) is **correct**. The relevant range defines the limits within which per-unit variable costs remain constant and fixed costs are not changeable. It is synonymous with the short run. The relevant range is established by the efficiency of a company's current manufacturing plant, its agreements with labor unions and suppliers, etc.
  - Answer (B) is **incorrect**. The relevant range refers to the activity levels over which cost relationships hold constant.
  - Answer (C) is **incorrect**. Production varies over both the relevant range (the short run) and the long run.
  - Answer (D) is **incorrect**. Relevant costs are those pertaining to a particular decision.

**[24] Gleim #: 1.3.77 -- Source: CMA 0408 2-091**

Cell Company has discovered that the cost of processing customer invoices is strictly variable within the relevant range. Which one of the following statements concerning the cost of processing customer invoices is **incorrect**?

- A. The total cost of processing customer invoices will increase as the volume of customer invoices increases.
  - B. The cost per unit for processing customer invoices will decline as the volume of customer invoices increases.
  - C. The cost of processing the 100th customer invoice will be the same as the cost of processing the first customer invoice.
  - D. The average cost per unit for processing a customer invoice will equal the incremental cost of processing one more customer invoice.
- Answer (A) is **incorrect**. Since the cost in question is strictly variable within the relevant range, the total cost will increase as the volume increases.
  - Answer (B) is **correct**. Variable cost per unit remains constant in the short run regardless of the level of production.
  - Answer (C) is **incorrect**. Since the cost in question is strictly variable within the relevant range, the unit cost remains the same.
  - Answer (D) is **incorrect**. Since the cost in question is strictly variable within the relevant range, the average cost per unit is the same as the incremental cost.

**[25] Gleim #: 1.3.78 -- Source: CMA 0408 2-092**

When identifying fixed and variable costs, which one of the following is a typical assumption concerning cost behavior?

- A. General and administrative costs are assumed to be variable costs.
  - B. Cost behavior is assumed to be realistic for all levels of activity from zero to maximum capacity.
  - C. Total costs are assumed to be linear when plotted on a graph.
  - D. The relevant time period is assumed to be 5 years.
- Answer (A) is **incorrect**. General and administrative costs are not assumed to be variable.
  - Answer (B) is **incorrect**. Maximum capacity varies depending on the current productive facilities.

- Answer (C) is **correct**. Total costs, being a mixture of fixed and variable costs, are assumed to be linear.
- Answer (D) is **incorrect**. The relevant time period varies for each organization.

**[26] Gleim #: 1.3.79 -- Source: CMA 0408 2-093**

A management accountant is about to prepare graphs of total variable cost and per-unit variable cost for use in a short-term planning model. Dollars will be depicted on the vertical axis; activity will be shown on the horizontal axis. How will these graphs appear under completion?

	<u>Total Variable Cost</u>	<u>Per-Unit Variable Cost</u>
A.	Straight line, sloping upward to the right.	Straight line, parallel to the horizontal axis.
B.	Curvilinear, sloping upward to the right.	A line that basically parallels the horizontal axis, first decreasing and then increasing.
C.	Straight line, sloping upward to the right.	Straight line, sloping upward to the right.
D.	Straight line, parallel to the horizontal axis.	Straight line, sloping upward to the right.

- Answer (A) is **correct**. Variable costs in total vary directly and proportionally with changes in volume. This is depicted as a straight line sloping upward to the right. Variable cost per unit, however, remains constant in the short run regardless of the level of production. This is depicted as a horizontal line.
- Answer (B) is **incorrect**. Total variable cost is depicted as a straight line.
- Answer (C) is **incorrect**. Per-unit variable cost is depicted as a horizontal line.
- Answer (D) is **incorrect**. Per-unit variable cost is depicted as a horizontal line.

**[27] Gleim #: 1.3.80 -- Source: CMA 0408 2-095**

Lar Company has found that its total electricity cost has both a fixed component and a variable component within the relevant range. The variable component seems to vary directly with the number of units produced. Which one of the following statements concerning Lar's electricity cost is **incorrect**?

- A. The total electricity cost will increase as production volume increases.
- B. The total electricity cost per unit of production will increase as production volume increases.
- C. The variable electricity cost per unit of production will remain constant as production volume increases.
- D. The fixed electricity cost per unit of production will decline as production volume increases.

- Answer (A) is **incorrect**. The total electricity cost will increase as production volume increases.
- Answer (B) is **correct**. Because of the fixed portion, the per-unit cost of a mixed, or semivariable, cost will decrease as production volume increases.
- Answer (C) is **incorrect**. The variable portion of total cost will remain constant on a per-unit basis as production volume increases.
- Answer (D) is **incorrect**. The fixed portion of total cost will decrease on a per-unit basis as production volume increases.

**[36] Gleim #: 1.3.89 -- Source: CMA 0408 2-050**

Over the past several years, McFadden Industries has experienced the following regarding the company's shipping expenses:

Fixed costs	\$16,000
Average shipment	15 pounds
Cost per pound	\$.50

Shown below are McFadden's budget data for the coming year.

Number of units shipped	8,000
Number of sales orders	800
Number of shipments	800
Total sales	\$1,200,000
Total pounds shipped	9,600

McFadden's expected shipping costs for the coming year are

- A. \$4,800
- B. \$16,000
- C. \$20,000
- D. \$20,800

- Answer (A) is **incorrect**. The amount of \$4,800 is only the variable portion of total shipping cost.
- Answer (B) is **incorrect**. The amount of \$16,000 is only the fixed portion of total shipping cost.
- Answer (C) is **incorrect**. The amount of \$20,000 results from multiplying the per-pound shipping rate by the number of units, rather than the number of pounds, shipped.
- Answer (D) is **correct**. McFadden expects to ship 9,600 pounds of product at a rate of \$0.50 per pound for a total of \$4,800. Add this variable cost to the \$16,000 of fixed costs to arrive at a total of \$20,800 expected shipping costs for the year.

[1] Gleim #: 1.4.90 -- Source: CMA 696 3-19

If the beginning balance for May of the materials inventory account was \$27,500, the ending balance for May is \$28,750, and \$128,900 of materials were used during the month, the materials purchased during the month cost

- A. \$101,400
- B. \$127,650
- C. \$130,150
- D. \$157,650

- Answer (A) is **incorrect**. The amount of \$101,400 assumes zero ending inventory.
- Answer (B) is **incorrect**. The amount of \$127,650 results from reversing the treatment of beginning and ending inventories.
- Answer (C) is **correct**. Purchases equals usage adjusted for the inventory change. Hence, purchases equals \$130,150 (\$128,900 used – \$27,500 BI + \$28,750 EI).
- Answer (D) is **incorrect**. The amount of \$157,650 assumes zero beginning inventory.

[3] Gleim #: 1.4.92 -- Source: CMA 0205 2-14

The profit and loss statement of Madengrad Mining includes the following information for the current fiscal year:

Sales	\$160,000
Gross profit	48,000
Year-end finished goods inventory	58,300
Opening finished goods inventory	60,190

The cost of goods manufactured by Madengrad for the current fiscal year is

- A. \$46,110
- B. \$49,890
- C. \$110,110
- D. \$113,890

- Answer (A) is **incorrect**. Improperly beginning with gross profit instead of sales results in \$46,110.

- Answer (B) is **incorrect**. Improperly beginning with gross profit instead of sales, then improperly subtracting ending finished goods and adding beginning finished goods results in \$49,890.
- Answer (C) is **correct**. Madengrad's cost of goods manufactured can be calculated as follows:

Sales	\$160,000
Less: gross profit	<u>(48,000)</u>
Cost of goods sold	\$112,000
Add: ending finished goods	<u>58,300</u>
Goods available for sale	\$170,300
Less: beginning finished goods	<u>(60,190)</u>
Cost of goods manufactured	<u><u>\$110,110</u></u>

- Answer (D) is **incorrect**. Improperly subtracting ending finished goods and adding beginning finished goods results in \$113,890.

**[Fact Pattern #1]**

Madtrack Company's beginning and ending inventories for the month of November are

Production data for the month of November follows:

	<u>November 1</u>	<u>November 30</u>		
Direct materials	\$ 67,000	\$ 62,000	Direct labor	\$200,000
Work-in-process	145,000	171,000	Actual factory overhead	132,000
Finished goods	85,000	78,000	Direct materials purchased	163,000
			Transportation in	4,000
			Purchase returns and allowances	2,000

Madtrack uses one overhead control account and charges overhead to production at 70% of direct labor cost. The company does not formally recognize over- or underapplied overhead until year end.

**[4] Gleim #: 1.4.93 -- Source: CMA 1295 3-19**

(Refers to Fact Pattern #1)

Madtack Company's prime cost for November is

- A. \$370,000
- B. \$168,000
- C. \$363,000
- D. \$170,000

- Answer (A) is **correct**. Prime costs are the combined costs of direct materials and direct labor.

Beginning materials inventory	\$ 67,000
Add: purchases	163,000
Add: transportation in	4,000
Less: purchase returns	<u>(2,000)</u>
Materials available	\$232,000
Less: ending materials inventory	<u>(62,000)</u>
Materials used in production	<u>\$170,000</u>
Direct materials	\$170,000
Direct labor	<u>200,000</u>
Total prime costs	<u>\$370,000</u>

- Answer (B) is **incorrect**. The amount of \$168,000 equals purchases of materials adjusted for the change in inventories.
- Answer (C) is **incorrect**. The amount of \$363,000 incorporates the change in finished goods inventories.
- Answer (D) is **incorrect**. The amount of \$170,000 equals the materials used.

**[5] Gleim #: 1.4.94 -- Source: CMA 1295 3-20**

(Refers to Fact Pattern #1)

Madtack Company's total manufacturing cost for November is

- A. \$502,000
- B. \$503,000
- C. \$363,000
- D. \$510,000

- Answer (A) is **incorrect**. The amount of \$502,000 is based on actual overhead.
- Answer (B) is **incorrect**. The amount of \$503,000 incorporates the change in finished goods inventories.
- Answer (C) is **incorrect**. The amount of \$363,000 excludes overhead but includes the change in finished goods inventory.
- Answer (D) is **correct**. Total manufacturing cost is the sum of direct materials cost, direct labor cost, and manufacturing overhead.

Beginning materials	\$ 67,000
Add: purchases	163,000
Add: transportation in	4,000
Less: purchase returns	<u>(2,000)</u>
Materials available	\$232,000
Less: ending materials	<u>(62,000)</u>
Materials used in production	<u>\$170,000</u>
Direct materials	\$170,000
Direct labor	200,000
Manufacturing overhead (DL × 70%)	<u>140,000</u>
Total manufacturing costs	<u><u>\$510,000</u></u>

**[6] Gleim #: 1.4.95 -- Source: CMA 1295 3-21**

(Refers to Fact Pattern #1)

Madtack Company's cost of goods transferred to finished goods inventory for November is

- A. \$469,000
- B. \$477,000
- C. \$495,000
- D. \$484,000

- Answer (A) is **incorrect**. The amount of \$469,000 uses actual overhead and adjusts the figures for the change in finished goods inventory.
- Answer (B) is **incorrect**. The amount of \$477,000 includes the change in finished goods inventory in the calculation.
- Answer (C) is **incorrect**. The amount of \$495,000 uses materials purchased rather than materials used and also fails to adjust properly for transportation in.

- Answer (D) is **correct**. This solution requires a series of computations. Total manufacturing cost is the sum of direct materials cost, direct labor cost, and manufacturing overhead.

Beginning materials	\$ 67,000
Add: purchases	163,000
Add: transportation in	4,000
Less: purchase returns	<u>(2,000)</u>
Materials available	\$232,000
Less: ending materials	<u>(62,000)</u>
Materials used in production	<u>\$170,000</u>
Direct materials	\$170,000
Direct labor	200,000
Manufacturing overhead (DL × 70%)	<u>140,000</u>
Total manufacturing costs	<u>\$510,000</u>
Total manufacturing costs	\$510,000
Add: beginning work-in-process	145,000
Less: ending work-in-process	<u>(171,000)</u>
Costs transferred to finished goods	<u>\$484,000</u>

**[7] Gleim #: 1.4.96 -- Source: CMA 1295 3-22**

(Refers to Fact Pattern #1)

Madtrack Company's cost of goods sold for November is

- A. \$484,000
- B. \$491,000
- C. \$502,000
- D. \$476,000

- Answer (A) is **incorrect**. The amount of \$484,000 is the cost of goods manufactured.

- Answer (B) is **correct**. This solution requires a series of computations. Total manufacturing cost is the sum of direct materials cost, direct labor cost, and manufacturing overhead.

Beginning materials	\$ 67,000
Add: purchases	163,000
Add: transportation in	4,000
Less: purchase returns	<u>(2,000)</u>
Materials available	\$232,000
Less: ending materials	<u>(62,000)</u>
Materials used in production	<u><u>\$170,000</u></u>
 Direct materials	 \$170,000
Direct labor	200,000
Manufacturing overhead (DL × 70%)	<u>140,000</u>
Total manufacturing costs	<u><u>\$510,000</u></u>
 Total manufacturing costs	 \$510,000
Add: beginning work-in-process	145,000
Less: ending work-in-process	<u>(171,000)</u>
Costs transferred to finished goods	<u><u>\$484,000</u></u>
 Beginning finished goods inventory	 \$ 85,000
Add: cost of goods manufactured	<u>484,000</u>
Goods available for sale	\$569,000
Less: ending finished goods inventory	<u>(78,000)</u>
Cost of goods sold	<u><u>\$491,000</u></u>

- Answer (C) is **incorrect**. The amount of \$502,000 is based on cost of goods manufactured of \$495,000.
- Answer (D) is **incorrect**. The amount of \$476,000 is based on actual overhead costs and fails to adjust for the change in finished goods inventories.

---

**[Fact Pattern #2]**

Alex Company had the following inventories at the beginning and end of the month of January:

	<u>January 1</u>	<u>January 31</u>
Finished goods	\$125,000	\$117,000
Work-in-process	235,000	251,000
Direct materials	134,000	124,000

The following additional manufacturing data were available for the month of January:

Direct materials purchased	\$189,000
Purchase returns and allowances	1,000
Transportation-in	3,000
Direct labor	300,000
Actual factory overhead	175,000

Alex Company applies factory overhead at a rate of 60% of direct labor cost, and any overapplied or underapplied factory overhead is deferred until the end of the year, December 31.

---

**[8] Gleim #: 1.4.97 -- Source: CMA 690 4-1**

(Refers to Fact Pattern #2)

Alex Company's prime cost for January was

- A. \$199,000
- B. \$501,000
- C. \$489,000
- D. \$201,000

- Answer (A) is **incorrect**. Direct materials used without adjustments for purchase returns and transportation-in equals \$199,000.

- Answer (B) is **correct**. Prime cost is defined as those costs directly traceable to specific units of production, specifically direct labor and direct materials. According to the following statement of cost of goods manufactured, total prime cost was \$501,000.

Beginning direct materials inventory	\$ 134,000
Add: purchases	189,000
Less: purchase returns	(1,000)
Add: transportation-in	<u>3,000</u>
Total direct materials available	\$ 325,000
Less: ending direct materials inventory	<u>(124,000)</u>
Direct materials used	\$ 201,000
Direct labor	<u>300,000</u>
Total prime costs	<u><u>\$ 501,000</u></u>

- Answer (C) is **incorrect**. Direct materials purchased plus direct labor equals \$489,000.
- Answer (D) is **incorrect**. Direct materials used equals \$201,000.

**[9] Gleim #: 1.4.98 -- Source: CMA 690 4-3**

(Refers to Fact Pattern #2)

Alex Company's cost of goods manufactured for January was

- A. \$665,000
- B. \$681,000
- C. \$673,000
- D. \$657,000

- Answer (A) is **correct**. The cost of the goods manufactured is the cost of goods completed during the year. For a retailer, the equivalent is purchases. The COGM for Alex is \$665,000.

Beginning direct materials inventory	\$ 134,000
Add: purchases	189,000
Less: purchase returns	(1,000)
Add: transportation-in	<u>3,000</u>
Total direct materials available	\$ 325,000
Less: ending direct materials inventory	<u>(124,000)</u>
Direct materials used	\$ 201,000
Direct labor	300,000
Factory overhead (\$300,000 × 60%)	<u>180,000</u>
Total manufacturing cost	\$681,000
Add: beginning work-in-process	\$235,000
Less: ending work-in-process	<u>(\$251,000)</u>
Cost of goods manufactured	<u><u>\$665,000</u></u>

- Answer (B) is **incorrect**. Total manufacturing costs equal \$681,000.
- Answer (C) is **incorrect**. The cost of goods sold is \$673,000.
- Answer (D) is **incorrect**. Adding ending inventory and subtracting beginning inventory in the COGS calculation results in \$657,000.

**[10] Gleim #: 1.4.99 -- Source: CMA 690 4-4**

(Refers to Fact Pattern #2)

Alex Company's cost of goods sold for January was

- A. \$697,000
- B. \$681,000
- C. \$673,000
- D. \$657,000

- Answer (A) is **incorrect**. Prime cost, plus overhead applied, plus (instead of minus) the change in the work-in-process equals \$697,000.
- Answer (B) is **incorrect**. Prime cost plus overhead applied equals \$681,000.

- Answer (C) is **correct**. The calculation of the cost of goods sold requires the preparation of a partial income statement:

Beginning direct materials inventory	\$ 134,000
Add: purchases	189,000
Less: purchase returns	(1,000)
Add: transportation-in	<u>3,000</u>
Total direct materials available	\$ 325,000
Less: ending direct materials inventory	<u>(124,000)</u>
Direct materials used	\$ 201,000
Direct labor	300,000
Factory overhead (\$300,000 × 60%)	<u>180,000</u>
Total manufacturing cost	\$681,000
Add: beginning work-in-process	\$235,000
Less: ending work-in-process	<u>(\$251,000)</u>
Cost of goods manufactured	\$665,000
Add: beginning finished goods inventory	<u>\$125,000</u>
Goods available for sale	\$790,000
Less: ending finished goods inventory	<u>(117,000)</u>
Cost of goods sold	<u><u>\$673,000</u></u>

- Answer (D) is **incorrect**. Adding ending inventory and subtracting beginning inventory in the COGS calculation results in \$657,000.

**[11] Gleim #: 1.4.100 -- Source: CMA 690 4-5**

(Refers to Fact Pattern #2)

Alex Company's balance in factory overhead control for January was

- A. \$5,000 debit - overapplied.
  - B. \$5,000 credit - underapplied.
  - C. \$5,000 debit - underapplied.
  - D. \$5,000 credit - overapplied.
- Answer (A) is **incorrect**. Overapplied overhead results in a credit to overhead control.
  - Answer (B) is **incorrect**. Overhead is overapplied.
  - Answer (C) is **incorrect**. Overhead is overapplied.

- Answer (D) is **correct**. The factory overhead control account should have a debit of \$175,000 for the actual costs incurred and a credit for the \$180,000 (60% of direct labor) applied to production. Thus, the net effect is a \$5,000 credit balance resulting from the overapplication of overhead.

**[12] Gleim #: 1.4.101 -- Source: CMA 0205 2-15**

The schedule of cost of goods manufactured of Gruber Fittings, Inc., shows the following balances for its fiscal year end:

Direct manufacturing labor	\$ 280,000
Manufacturing overhead	375,000
Ending work-in-process inventory	230,000
Raw materials used in production	450,000
Cost of goods manufactured	1,125,000

The value of the work-in-process inventory at the beginning of the fiscal year was

- A. \$625,000
- B. \$250,000
- C. \$210,000
- D. \$20,000

- Answer (A) is **incorrect**. Failing to subtract manufacturing overhead results in \$625,000.
- Answer (B) is **correct**. The standard calculation for cost of goods manufactured can be applied “back into” Gruber Fittings’ beginning work-in-process inventory amount:

Direct materials	\$ 450,000
Direct labor	280,000
Manufacturing overhead	<u>375,000</u>
Total manufacturing costs	\$1,105,000
Add: beginning work-in-process	250,000
Less: ending work-in-process	<u>(230,000)</u>
Cost of goods manufactured	<u><u>\$1,125,000</u></u>

- Answer (C) is **incorrect**. Improperly adding direct materials, direct labor, overhead, and ending work-in-process, then subtracting cost of goods manufactured results in \$210,000.
- Answer (D) is **incorrect**. Failing to subtract ending work-in-process inventory results in \$20,000.

[13] Gleim #: 1.4.102 -- Source: CMA 0408 2-060

Given the following data for Scurry Company, what is the cost of goods sold?

Beginning inventory of finished goods	\$100,000
Cost of goods manufactured	700,000
Ending inventory of finished goods	200,000
Beginning work-in-process inventory	300,000
Ending work-in-process inventory	50,000

- A. \$500,000
- B. \$600,000
- C. \$800,000
- D. \$950,000

- Answer (A) is **incorrect**. The amount of \$500,000 results from failing to include beginning finished goods inventory.
- Answer (B) is **correct**. Scurry's cost of goods sold can be calculated as follows:

Beginning inventory of finished goods	\$ 100,000
Add: cost of goods manufactured	700,000
Less: ending inventory of finished goods	<u>(200,000)</u>
Cost of goods sold	<u><u>\$ 600,000</u></u>

- Answer (C) is **incorrect**. The amount of \$800,000 results from failing to subtract ending finished goods inventory.
- Answer (D) is **incorrect**. The amount of \$950,000 results from improperly including work-in-process inventories.

**[14] Gleim #: 1.4.103 -- Source: CMA 0408 2-080**

Kimber Company has the following unit cost for the current year:

Raw material	\$20.00
Direct labor	25.00
Variable manufacturing overhead	10.00
Fixed manufacturing overhead	<u>15.00</u>
Total unit cost	<u><u>\$70.00</u></u>

Fixed manufacturing cost is based on an annual activity level of 8,000 units. Based on these data, the total manufacturing cost expected to be incurred to manufacture 9,000 units in the current year is

- A. \$560,000
- B. \$575,000
- C. \$615,000
- D. \$630,000

- Answer (A) is **incorrect**. The amount of \$560,000 is the total manufacturing cost for the 8,000 unit level of production.
- Answer (B) is **incorrect**. The amount of \$575,000 results from improperly adjusting total fixed overhead cost, and failing to adjust variable costs, for the new level of production.
- Answer (C) is **correct**. Kimber's total manufacturing cost for the 9,000 unit production level can be calculated as follows:

	Activity Level		Per Unit Cost		Total Costs
Raw material	9,000	×	\$20	=	\$180,000
Direct labor	9,000	×	25	=	225,000
Variable overhead	9,000	×	10	=	90,000
Fixed overhead	8,000	×	15	=	<u>120,000</u>
					<u><u>\$615,000</u></u>

- Answer (D) is **incorrect**. The amount of \$630,000 results from improperly adjusting total fixed overhead cost for the new level of production.

[18] Gleim #: 1.4.107 -- Source: CMA 690 4-2

(Refers to Fact Pattern #2)

Alex Company's total manufacturing cost for January was

- A. \$681,000
- B. \$665,000
- C. \$489,000
- D. \$673,000

- Answer (A) is **correct**. The sum of direct materials used, direct labor, and factory overhead applied (60% of direct labor) is \$681,000.

Beginning direct materials inventory	\$ 134,000
Add: purchases	189,000
Less: purchase returns	(1,000)
Add: transportation-in	<u>3,000</u>
Total direct materials available	\$ 325,000
Less: ending direct materials inventory	<u>(124,000)</u>
Direct materials used	\$ 201,000
Direct labor	300,000
Factory overhead (\$300,000 × 60%)	<u>180,000</u>
Total manufacturing cost	<u><u>\$681,000</u></u>

- Answer (B) is **incorrect**. The cost of goods manufactured equals \$665,000.
- Answer (C) is **incorrect**. The direct materials purchased plus direct labor equals \$489,000.
- Answer (D) is **incorrect**. The cost of goods sold equals \$673,000.

[1] Gleim #: 1.5.108 -- Source: CMA 678 4-10

Committed costs are

- A. Costs that management decides to incur in the current period to enable the company to achieve objectives other than the filling of orders placed by customers.
  - B. Costs that are likely to respond to the amount of attention devoted to them by a specified manager.
  - C. Costs that are governed mainly by past decisions that established the present levels of operating and organizational capacity and that only change slowly in response to small changes in capacity.
  - D. Amortization of costs that were capitalized in previous periods.
- Answer (A) is **incorrect**. Costs incurred in a current period to achieve objectives other than the filling of orders by customers are known as discretionary costs.
  - Answer (B) is **incorrect**. Costs that are likely to respond to the amount of attention devoted to them by a specified manager are controllable costs.
  - Answer (C) is **correct**. Committed costs are those that are required as a result of past decisions.
  - Answer (D) is **incorrect**. Amortization of costs capitalized in previous periods is depreciation.

[2] Gleim #: 1.5.109 -- Source: CMA 678 4-11

Discretionary costs are costs that

- A. Management decides to incur in the current period to enable the company to achieve objectives other than the filling of orders placed by customers.
  - B. Are likely to respond to the amount of attention devoted to them by a specified manager.
  - C. Are governed mainly by past decisions that established the present levels of operating and organizational capacity and that only change slowly in response to small changes in capacity.
  - D. Will be unaffected by current managerial decisions.
- Answer (A) is **correct**. Discretionary costs are those that are incurred in the current period at the “discretion” of management and are not required to fill orders by customers.

- Answer (B) is **incorrect**. Costs that are likely to respond to the amount of attention devoted to them by a specified manager are controllable costs.
- Answer (C) is **incorrect**. Costs required as a result of past decisions are committed costs.
- Answer (D) is **incorrect**. Costs unaffected by managerial decisions are costs such as committed costs and depreciation that were determined by decisions of previous periods.

**[3] Gleim #: 1.5.110 -- Source: CMA 678 4-12**

Controllable costs are costs that

- A. Management decides to incur in the current period to enable the company to achieve objectives other than the filling of orders placed by customers.
  - B. Are likely to respond to the amount of attention devoted to them by a specified manager.
  - C. Fluctuate in total in response to small changes in the rate of utilization of capacity.
  - D. Will be unaffected by current managerial decisions.
- Answer (A) is **incorrect**. Costs incurred in a current period to achieve objectives other than the filling of orders by customers are known as discretionary costs.
  - Answer (B) is **correct**. Controllable costs can be affected by the efforts of a manager.
  - Answer (C) is **incorrect**. Costs that fluctuate with small changes in volume are variable costs.
  - Answer (D) is **incorrect**. Costs that are unaffected by managerial decisions are costs such as committed costs and depreciation that was determined by decisions of previous periods.

**[4] Gleim #: 1.5.111 -- Source: CMA 1292 3-4**

In joint-product costing and analysis, which one of the following costs is relevant when deciding the point at which a product should be sold to maximize profits?

- A. Separable costs after the split-off point.
- B. Joint costs to the split-off point.
- C. Sales salaries for the period when the units were produced.
- D. Purchase costs of the materials required for the joint products.

- Answer (A) is **correct**. Joint products are created from processing a common input. Joint costs are incurred prior to the split-off point and cannot be identified with a particular joint product. As a result, joint costs are irrelevant to the timing of sale. However, separable costs incurred after the split-off point are relevant because, if incremental revenues exceed the separable costs, products should be processed further, not sold at the split-off point.
- Answer (B) is **incorrect**. Joint costs have no effect on the decision as to when to sell a product.
- Answer (C) is **incorrect**. Sales salaries for the production period do not affect the decision.
- Answer (D) is **incorrect**. Purchase costs are joint costs.

**[7] Gleim #: 1.5.114 -- Source: CMA Sample Q3-6**

When compared with normal spoilage, abnormal spoilage

- A. Arises more frequently from factors that are inherent in the manufacturing process.
  - B. Is given the same accounting treatment as normal spoilage.
  - C. Is generally thought to be more controllable by production management than normal spoilage.
  - D. Is not typically influenced by the “tightness” of production standards.
- Answer (A) is **incorrect**. Normal spoilage arises more frequently from factors that are inherent in the manufacturing process.
  - Answer (B) is **incorrect**. Abnormal spoilage costs are treated as a loss, and normal spoilage costs are inventoried.
  - Answer (C) is **correct**. Spoiled goods are defective items that cannot be feasibly reworked. Traditional cost accounting systems distinguish between normal and abnormal spoilage because, in some operations, a degree of spoilage is viewed as inevitable. Normal spoilage occurs under normal, efficient operating conditions. It is spoilage that is uncontrollable in the short run and therefore should be expressed as a function of good output (treated as a product cost). Accordingly, normal spoilage is assigned to all good units in process costing systems, that is, all units that have passed the inspection point at which the spoilage was detected. If normal spoilage is attributable to a specific job, only the disposal value of the normally spoiled goods is removed from work-in-process, thereby assigning the cost of normal spoilage to the good units remaining in the specific job. Abnormal spoilage is not expected to occur under normal, efficient operating conditions. The cost of abnormal spoilage should be separately identified and reported. Abnormal spoilage is typically treated as a period cost (a loss) because it is unusual.

- Answer (D) is **incorrect**. The tighter the standards, the more likely that any spoilage will be deemed to be abnormal.

**[8] Gleim #: 1.5.115 -- Source: CMA 696 3-17**

The upper limit of a company's productive output capacity given its existing resources is called

- A. Excess capacity.
- B. Cycle-time capacity.
- C. Practical capacity.
- D. Theoretical capacity.

- Answer (A) is **incorrect**. Excess capacity is unused capacity.
- Answer (B) is **incorrect**. Manufacturing lead (cycle) time is the sum of setup time and manufacturing time for a customer order. It is a component of customer response time.
- Answer (C) is **correct**. Practical capacity is the maximum level at which output is produced efficiently, with an allowance for unavoidable interruptions, for example, for holidays and scheduled maintenance. Because this level will be higher than expected capacity, its use will ordinarily result in underapplied fixed factory overhead.
- Answer (D) is **incorrect**. Theoretical capacity makes no allowance for unavoidable interruptions.

**[9] Gleim #: 1.5.116 -- Source: CMA 1290 3-1**

Practical capacity as a plant capacity concept

- A. Assumes all personnel and equipment will operate at peak efficiency and total plant capacity will be used.
  - B. Does not consider idle time caused by inadequate sales demand.
  - C. Includes consideration of idle time caused by both limited sales orders and human and equipment inefficiencies.
  - D. Is the production volume that is necessary to meet sales demand for the next year.
- Answer (A) is **incorrect**. Theoretical capacity assumes all personnel and equipment will operate at peak efficiency and total plant capacity will be used.

- Answer (B) is **correct**. Practical capacity is the maximum level at which output is produced efficiently. It includes consideration of idle time caused by human and equipment inefficiencies but not by inadequate sales demand. Practical capacity exceeds the other commonly used denominator levels included in the calculation of the fixed factory overhead rate. Because practical capacity will almost always exceed the actual use of capacity, it will result in an unfavorable production volume variance. Moreover, this variance (the difference between budgeted fixed overhead and the fixed overhead applied based on standard input allowed for the actual output) will be greatest given a practical capacity measure. The unfavorable production volume variance is charged to income summary, so the effect of using a larger denominator volume is the more rapid write-off of fixed overhead (practical capacity may be used for federal income tax purposes).
- Answer (C) is **incorrect**. Practical capacity ignores demand.
- Answer (D) is **incorrect**. The production volume to meet a given production level may be more or less than practical capacity. Horngren, Foster, and Datar call this volume the master-budget volume.

**[10] Gleim #: 1.5.117 -- Source: CMA 691 3-27**

A controllable expense

- A. Is an expected future expense that will be different under various alternatives.
  - B. Is an expense whose actual amount will not normally differ from the standard (budget) amount.
  - C. Is one that is directly influenced at a given level of managerial authority within a given time period.
  - D. Is an expense that will remain semivariable in total over the relevant range in a given time period.
- Answer (A) is **incorrect**. An expected future expense that will be different under various alternatives is a differential (incremental) cost.
  - Answer (B) is **incorrect**. An expense whose actual amount will not normally differ from the standard (budget) amount is a controlled expense, not a controllable expense.
  - Answer (C) is **correct**. Controllable expenses are directly regulated by a manager of a responsibility center at a given level of production within a given time span.
  - Answer (D) is **incorrect**. Whether a cost is controllable or not is not determined by its behavior.

**[11] Gleim #: 1.5.118 -- Source: CMA 1295 3-27**

A cost that bears an observable and known relationship to a quantifiable activity base is a(n)

- A. Engineered cost.
- B. Indirect cost.
- C. Sunk cost.
- D. Target cost.

- Answer (A) is **correct**. A cost that bears an observable and known relationship to a quantifiable activity base is known as an engineered cost. Engineered costs have a clear relationship to output. Direct materials would be an example of an engineered cost.
- Answer (B) is **incorrect**. An indirect cost does not have a clear relationship to output.
- Answer (C) is **incorrect**. A sunk cost is the result of a past irrevocable action; it is not important to future decisions.
- Answer (D) is **incorrect**. A target cost is the maximum allowable cost of a product and is calculated before the product is designed or produced.

**[12] Gleim #: 1.5.119 -- Source: CMA 680 4-5**

The cost associated with abnormal spoilage ordinarily is charged to

- A. Inventory.
- B. A material variance account.
- C. Manufacturing overhead.
- D. A special loss account.

- Answer (A) is **incorrect**. Normal spoilage, not abnormal spoilage, costs are charged to inventory.
- Answer (B) is **incorrect**. Material variance accounts are only charged for the variances in material usage or material price, not the spoilage of product.
- Answer (C) is **incorrect**. While charging abnormal spoilage to manufacturing overhead is an occasional practice, it is not the ordinary practice.
- Answer (D) is **correct**. Abnormal spoilage is usually charged to a special loss account because it is not expected to occur under normal, efficient operating conditions. Because it is unusual, it should be separately reported as a period cost.

**[13] Gleim #: 1.5.120 -- Source: CMA 1277 5-5**

An imputed cost is

- A. The difference in total costs that results from selecting one alternative instead of another.
- B. A cost that cannot be avoided because it has already been incurred.
- C. A cost that does not entail any dollar outlay but is relevant to the decision-making process.
- D. A cost that continues to be incurred even though there is no activity.

- Answer (A) is **incorrect**. The difference in total costs that results from selecting one alternative instead of another is an incremental cost.
- Answer (B) is **incorrect**. A cost that cannot be avoided because it has already been incurred is a sunk cost.
- Answer (C) is **correct**. An imputed cost does not entail any dollar outlay but is relevant to the decision-making process.
- Answer (D) is **incorrect**. A cost that continues to be incurred even though there is no activity is a fixed cost.

**[14] Gleim #: 1.5.121 -- Source: CMA 694 3-8**

Committed costs are costs that

- A. Were capitalized and amortized in prior periods.
- B. Management decides to incur in the current period that do not have a clear cause and effect relationship between inputs and outputs.
- C. Result from a clear measurable relationship between inputs and outputs.
- D. Establish the current level of operating capacity and cannot be altered in the short run.

- Answer (A) is **incorrect**. Committed costs have not been amortized.
- Answer (B) is **incorrect**. Discretionary costs are those that do not have a clear cause and effect relationship between inputs and outputs.
- Answer (C) is **incorrect**. Engineered costs are those that have a measurable relationship between inputs and outputs.

- Answer (D) is **correct**. Committed costs result when a going concern holds fixed assets such as property, plant, and equipment. The related committed costs include depreciation, long-term lease payments, and insurance. Such costs establish the present level of operating capacity and cannot be altered in the short run.

**[15] Gleim #: 1.5.122 -- Source: CMA 690 5-27**

Costs that arise from periodic budgeting decisions that have no strong input-output relationship are commonly called

- A. Committed costs.
- B. Discretionary costs.
- C. Opportunity costs.
- D. Differential costs.

- Answer (A) is **incorrect**. Committed costs are fixed costs arising from the possession of plant and equipment and a basic organization. These costs are affected primarily by long-run decisions as to a company's desired capacity.
- Answer (B) is **correct**. Discretionary costs are characterized by uncertainty about the relationship between input (the costs) and the value of the related output. Advertising and research are examples. They should be contrasted with engineered costs, that is, costs having a clear input-output relationship (e.g., the cost of direct materials).
- Answer (C) is **incorrect**. Opportunity cost is the return available from the next best use of a resource.
- Answer (D) is **incorrect**. Differential (incremental) costs are those that vary among decision options.

**[Fact Pattern #1]**

Huron Industries has recently developed two new products, a cleaning unit for video discs and a disc duplicator for reproducing movies taken with a video camera. However, Huron has only enough plant capacity to introduce one of these products during the current year. The company controller has gathered the following data to assist management in deciding which product should be selected for production.

Huron's fixed overhead includes rent and utilities, equipment depreciation, and supervisory salaries. Selling and administrative expenses are not allocated to products.

	Disc Duplicator	Cleaning Unit
Raw materials	\$ 44.00	\$ 36.00
Machining at \$12 per hr.	18.00	15.00
Assembly at \$10 per hr.	30.00	10.00
Variable overhead at \$8 per hr.	36.00	18.00
Fixed overhead at \$4 per hr.	18.00	9.00
Total cost	<u>\$ 146.00</u>	<u>\$ 88.00</u>
Suggested selling price	\$ 169.95	\$ 99.98
Actual research and development costs	\$240,000	\$175,000
Proposed advertising and promotion costs	\$500,000	\$350,000

**[16] Gleim #: 1.5.123 -- Source: CMA 1294 3-1**

(Refers to Fact Pattern #1)

For Huron's disc duplicator, the unit costs for raw materials, machining, and assembly represent

- A. Conversion costs.
- B. Separable costs.
- C. Committed costs.
- D. Prime costs.

- Answer (A) is **incorrect**. Conversion costs consist of direct labor and overhead.
- Answer (B) is **incorrect**. Separable costs are incurred beyond the point at which jointly produced items become separately identifiable.
- Answer (C) is **incorrect**. Committed costs result when an entity holds fixed assets; examples include long-term lease payments and depreciation.
- Answer (D) is **correct**. Raw materials and direct labor (such as machining and assembly) are a manufacturer's prime costs.

**[17] Gleim #: 1.5.124 -- Source: CMA 1294 3-3**

(Refers to Fact Pattern #1)

The total overhead cost of \$27.00 for Huron's video disc cleaning unit is a

- A. Carrying cost.
- B. Discretionary cost.
- C. Sunk cost.
- D. Mixed cost.

- Answer (A) is **incorrect**. A carrying cost is the cost of carrying inventory; examples are insurance and rent on warehouse facilities.
- Answer (B) is **incorrect**. A discretionary cost (a managed or program cost) results from a periodic decision about the total amount to be spent. It is also characterized by uncertainty about the relationship between input and the value of the related output. Examples are advertising and R&D costs.
- Answer (C) is **incorrect**. A sunk cost is a past cost or a cost that the entity has irrevocably committed to incur. Because it is unavoidable, it is not relevant to future decisions.
- Answer (D) is **correct**. A mixed cost is a combination of fixed and variable elements. Consequently, the \$27 of total overhead cost is mixed because it contains both fixed overhead and variable overhead.

**[18] Gleim #: 1.5.125 -- Source: CMA 1294 3-4**

(Refers to Fact Pattern #1)

Research and development costs for Huron's two new products are

- A. Conversion costs.
- B. Sunk costs.
- C. Relevant costs.
- D. Avoidable costs.

- Answer (A) is **incorrect**. Conversion costs are composed of direct labor and factory overhead, that is, costs incurred to convert materials into a finished product.
- Answer (B) is **correct**. Before they are incurred, R&D costs are often considered to be discretionary. However, Huron's R&D costs have already been incurred. Thus, they are sunk costs. A sunk cost is a past cost or a cost that the entity has irrevocably committed to incur. Because it is unavoidable, it is not relevant to future decisions.

- Answer (C) is **incorrect**. Relevant costs are expected future costs that vary with the action taken. A cost that has already been incurred is not relevant to future decisions.
- Answer (D) is **incorrect**. Avoidable costs may be eliminated by not engaging in an activity or by performing it more efficiently.

**[19] Gleim #: 1.5.126 -- Source: CMA 1294 3-5**

(Refers to Fact Pattern #1)

The advertising and promotion costs for the product selected by Huron will be

- A. Discretionary costs.
- B. Opportunity costs.
- C. Committed costs.
- D. Incremental costs.

- Answer (A) is **correct**. A discretionary cost (a managed or program cost) results from a periodic decision about the total amount to be spent. It is also characterized by uncertainty about the relationship between input and the value of the related output. Examples are advertising and R&D costs.
- Answer (B) is **incorrect**. An opportunity cost is the maximum benefit forgone by using a scarce resource for a given purpose. It is the benefit provided by the next best use of a particular resource.
- Answer (C) is **incorrect**. Committed costs are those for which management has made a long-term commitment. They typically result when a firm holds fixed assets. Examples include long-term lease payments and depreciation.
- Answer (D) is **incorrect**. Incremental costs are the differences in costs between two decision choices.

**[20] Gleim #: 1.5.127 -- Source: CMA 1294 3-6**

(Refers to Fact Pattern #1)

The costs included in Huron's fixed overhead are

- A. Joint costs.
- B. Committed costs.
- C. Opportunity costs.
- D. Prime costs.

- Answer (A) is **incorrect**. Joint (common) costs are incurred in the production of two or more inseparable products up to the point at which the products become separable.
- Answer (B) is **correct**. Committed costs are those for which management has made a long-term commitment. They typically result when a firm holds fixed assets. Examples include long-term lease payments and depreciation. Committed costs are typically fixed costs.
- Answer (C) is **incorrect**. An opportunity cost is the maximum benefit forgone by using a scarce resource for a given purpose; it is the benefit provided by the next best use of a particular resource.
- Answer (D) is **incorrect**. Prime costs are composed of raw material and direct labor costs.

**[28] Gleim #: 1.5.135 -- Source: CMA 0408 2-082**

Johnson waits two hours in line to buy a ticket to an NCAA Final Four Tournament. The opportunity cost of buying the \$200 ticket is

- A. Johnson's best alternative use of the \$200.
  - B. Johnson's best alternative use of the 2 hours it took to wait in line.
  - C. The value of the \$200 to the ticket agent.
  - D. Johnson's best alternative use of both the \$200 and the 2 hours spent in line.
- Answer (A) is **incorrect**. The best alternative use of the time it took to wait in line was also an opportunity cost.
  - Answer (B) is **incorrect**. The best alternative use of the cash outlay was also an opportunity cost.
  - Answer (C) is **incorrect**. The value perceived by the ticket agent is not relevant to Johnson's opportunity cost.
  - Answer (D) is **correct**. Opportunity cost, also called implicit cost, is the maximum benefit forgone by using a scarce resource for a given purpose and not for the next-best alternative. An example is the wages forgone by attending college instead of working full-time. Opportunity costs are contrasted with outlay costs, which require actual cash disbursements.

**[Fact Pattern #2]**

Gleason Co. has two products, a frozen dessert and ready-to-bake breakfast rolls, ready for introduction. However, plant capacity is limited, and only one product can be introduced at present. Therefore, Gleason has conducted a market study, at a cost of \$26,000, to determine which product will be more profitable. The results of the study follow.

<u>Sales of Desserts at \$1.80/unit</u>		<u>Sales of Rolls at \$1.20/unit</u>	
<u>Volume</u>	<u>Probability</u>	<u>Volume</u>	<u>Probability</u>
250,000	.30	200,000	.20
300,000	.40	250,000	.50
350,000	.20	300,000	.20
400,000	.10	350,000	.10

The costs associated with the two products have been estimated by Gleason's cost accounting department and are as follows:

	<u>Dessert</u>	<u>Rolls</u>
Ingredients per unit	\$ .40	\$ .25
Direct labor per unit	.35	.30
Variable overhead per unit	.40	.20
Production tooling*	48,000	25,000
Advertising	30,000	20,000

\*Gleason treats production tooling as a current operating expense rather than capitalizing it as a fixed asset.

**[29] Gleim #: 1.5.136 -- Source: CMA 687 5-26**

(Refers to Fact Pattern #2)

The advertising expense estimated by Gleason for the introduction of the new products is an example of a(n)

- A. Conversion cost.
- B. Discretionary cost.
- C. Committed cost.
- D. Opportunity cost.

- Answer (A) is **incorrect**. Conversion costs are incurred for labor and overhead.

- Answer (B) is **correct**. Discretionary costs refer to fixed costs that are not absolutely necessary to operate in the current period. The level of these costs is subject to a decision made by management each period. A key characteristic of discretionary costs is that there is no clearly measurable relationship between input (the costs) and output. Advertising is a good example of a discretionary fixed cost.
- Answer (C) is **incorrect**. Committed costs are those fixed costs arising from the possession of plant and equipment and a basic organization. These costs are affected primarily by long-run decisions as to a company's desired capacity.
- Answer (D) is **incorrect**. An opportunity cost represents the maximum revenue that could have been earned on the next best alternative use of a resource.

[1] Gleim #: 1.6.137 -- Source: CMA 1296 3-18

Which one of the following alternatives correctly classifies the business application to the appropriate costing system?

	<u>Job Costing System</u>	<u>Process Costing System</u>
A.	Wallpaper manufacturer	Oil refinery
B.	Aircraft assembly	Public accounting firm
C.	Paint manufacturer	Retail banking
D.	Print shop	Beverage manufacturer

- Answer (A) is **incorrect**. A wallpaper manufacturer would use a process costing system.
- Answer (B) is **incorrect**. A public accounting firm would use a job costing system.
- Answer (C) is **incorrect**. A paint manufacturer would use a process costing system.
- Answer (D) is **correct**. A job costing system is used when products differ from one customer to the next, that is, when products are heterogeneous. A process costing system is used when similar products are mass produced on a continuous basis. A print shop, for example, would use a job costing system because each job will be unique. Each customer provides the specifications for the product desired. A beverage manufacturer, however, would use a process costing system because homogeneous units are produced continuously.

[2] Gleim #: 1.6.138 -- Source: CMA 1290 3-12

Which one of the following considers the impact of fixed overhead costs?

- A. Full absorption costing.
- B. Marginal costing.
- C. Direct costing.
- D. Variable costing.

- Answer (A) is **correct**. Full absorption costing treats fixed factory overhead costs as product costs. Thus, inventory and cost of goods sold include (absorb) fixed factory overhead.
- Answer (B) is **incorrect**. Marginal costing considers only the incremental costs of producing an additional unit of product. In most cases marginal costs are variable costs.
- Answer (C) is **incorrect**. Direct (variable) costing treats only variable costs as product costs.

- Answer (D) is **incorrect**. Direct (variable) costing treats only variable costs as product costs.

**[3] Gleim #: 1.6.139 -- Source: CMA 1295 3-26**

An accounting system that collects financial and operating data on the basis of the underlying nature and extent of the cost drivers is

- A. Direct costing.
- B. Activity-based costing.
- C. Cycle-time costing.
- D. Variable costing.

- Answer (A) is **incorrect**. Direct costing is a system that treats fixed costs as period costs; in other words, production costs consist only of variable costs, while fixed costs are expensed as incurred.
- Answer (B) is **correct**. An activity-based costing (ABC) system identifies the causal relationship between the incurrence of cost and the underlying activities that cause those costs. Under an ABC system, costs are applied to products on the basis of resources consumed (drivers).
- Answer (C) is **incorrect**. Cycle time is the period from the time a customer places an order to the time that product is delivered.
- Answer (D) is **incorrect**. Variable costing is the same as direct costing, which expenses fixed costs as incurred.

**[4] Gleim #: 1.6.140 -- Source: CMA 1295 3-15**

Because this allocation method recognizes that service departments often provide each other with interdepartmental service, it is theoretically considered to be the most accurate method for allocating service department costs to production departments. This method is the

- A. Direct method.
- B. Variable method.
- C. Reciprocal method.
- D. Linear method.

- Answer (A) is **incorrect**. The direct method does not recognize the fact that service departments might provide services to each other; all costs are assigned directly to production departments.

- Answer (B) is **incorrect**. The variable method is a nonsense term as used here.
- Answer (C) is **correct**. The three most common methods of allocating service department costs are the direct method, the step method, and the reciprocal method (also called the simultaneous equations method). The reciprocal method is theoretically the preferred method because it recognizes reciprocal services among service departments.
- Answer (D) is **incorrect**. The linear method is not one of the methods used to allocate departmental costs.

---

**[Fact Pattern #1]**

Huron Industries has recently developed two new products, a cleaning unit for video discs and a disc duplicator for reproducing movies taken with a video camera. However, Huron has only enough plant capacity to introduce one of these products during the current year. The company controller has gathered the following data to assist management in deciding which product should be selected for production.

Huron's fixed overhead includes rent and utilities, equipment depreciation, and supervisory salaries. Selling and administrative expenses are not allocated to products.

	Disc Duplicator	Cleaning Unit
Raw materials	\$ 44.00	\$ 36.00
Machining at \$12 per hr.	18.00	15.00
Assembly at \$10 per hr.	30.00	10.00
Variable overhead at \$8 per hr.	36.00	18.00
Fixed overhead at \$4 per hr.	18.00	9.00
Total cost	<u>\$ 146.00</u>	<u>\$ 88.00</u>
Suggested selling price	\$ 169.95	\$ 99.98
Actual research and development costs	\$240,000	\$175,000
Proposed advertising and promotion costs	\$500,000	\$350,000

---

**[5] Gleim #: 1.6.141 -- Source: CMA 1294 3-2**

(Refers to Fact Pattern #1)

The difference between the \$99.98 suggested selling price for Huron's video disc cleaning unit and its total unit cost of \$88.00 represents the unit's

- A. Contribution margin ratio.
- B. Gross profit.
- C. Contribution.
- D. Gross profit margin ratio.

- Answer (A) is **incorrect**. Contribution margin ratio is the ratio of contribution margin (sales – variable costs) to sales.
- Answer (B) is **correct**. Gross profit is the difference between sales price and the full absorption cost of goods sold.
- Answer (C) is **incorrect**. Contribution (margin) is the difference between unit selling price and unit variable costs. Fixed costs are not considered.
- Answer (D) is **incorrect**. The gross profit margin ratio equals gross profit divided by sales.

**[6] Gleim #: 1.6.142 -- Source: CMA 696 3-15**

In target costing,

- A. The market price of the product is taken as a given.
  - B. Only raw materials, labor, and variable overhead cannot exceed a threshold target.
  - C. Only raw materials cannot exceed a threshold target.
  - D. Raw materials are recorded directly to cost of goods sold.
- Answer (A) is **correct**. Target costing begins with a target price, which is the expected market price given the company's knowledge of its customers and competitors. Subtracting the unit target profit margin determines the long-term target cost. If this cost is lower than the full cost, the company may need to adopt comprehensive cost-cutting measures. For example, in the furniture industry, certain price points are popular with buyers: a couch might sell better at \$400 than at \$200 because consumers question the quality of a \$200 couch and thus will not buy the lower-priced item. The result is that furniture manufacturers view \$400 as the target price of a couch, and the cost must be lower.
  - Answer (B) is **incorrect**. All product cost categories are addressed by target costing.
  - Answer (C) is **incorrect**. All product cost categories are addressed by target costing.
  - Answer (D) is **incorrect**. The manner in which raw materials costs are accounted for is irrelevant.

[7] Gleim #: 1.6.143 -- Source: CMA 1296 3-29

Life-cycle costing

- A. Is sometimes used as a basis for cost planning and product pricing.
  - B. Includes only manufacturing costs incurred over the life of the product.
  - C. Includes only manufacturing cost, selling expense, and distribution expense.
  - D. Emphasizes cost savings opportunities during the manufacturing cycle.
- Answer (A) is **correct**. Life-cycle costing estimates a product's revenues and expenses over its expected life cycle. This approach is especially useful when revenues and related costs do not occur in the same periods. It emphasizes the need to price products to cover all costs, not just those for production. Hence, costs are determined for all value-chain categories: upstream (R&D, design), manufacturing, and downstream (marketing, distribution, and customer service). The result is to highlight upstream and downstream costs in the cost planning process that often receive insufficient attention.
  - Answer (B) is **incorrect**. The life-cycle model includes the upstream (R&D and design) and downstream (marketing, distribution, and customer service) elements of the value chain as well as manufacturing costs.
  - Answer (C) is **incorrect**. The life-cycle model includes the upstream (R&D and design) and downstream (marketing, distribution, and customer service) elements of the value chain as well as manufacturing costs.
  - Answer (D) is **incorrect**. Life-cycle costing emphasizes the significance of locked-in costs, target costing, and value engineering for pricing and cost control. Thus, cost savings at all stages of the life cycle are important.

[8] Gleim #: 1.6.144 -- Source: CMA 1273 4-1

Which of the following statements is true for a firm that uses variable costing?

- A. The cost of a unit of product changes because of changes in number of units manufactured.
  - B. Profits fluctuate with sales.
  - C. An idle facility variation is calculated.
  - D. Product costs include variable administrative costs.
- Answer (A) is **incorrect**. The cost of a unit of product changing owing to a change in the number of units manufactured is a characteristic of absorption costing systems.

- Answer (B) is **correct**. In a variable costing system, only the variable costs are recorded as product costs. All fixed costs are expensed in the period incurred. Because changes in the relationship between production levels and sales levels do not cause changes in the amount of fixed manufacturing cost expensed, profits more directly follow the trends in sales.
- Answer (C) is **incorrect**. Idle facility variation is a characteristic of absorption costing systems.
- Answer (D) is **incorrect**. Neither variable nor absorption costing includes administrative costs in inventory.

**[9] Gleim #: 1.6.145 -- Source: CMA 697 3-3**

Which method of inventory costing treats direct manufacturing costs and manufacturing overhead costs, both variable and fixed, as inventoriable costs?

- A. Direct costing.
- B. Variable costing.
- C. Absorption costing.
- D. Conversion costing.

- Answer (A) is **incorrect**. Variable (direct) costing does not inventory fixed overhead.
- Answer (B) is **incorrect**. Variable (direct) costing does not inventory fixed overhead.
- Answer (C) is **correct**. Absorption (full) costing considers all manufacturing costs to be inventoriable as product costs. These costs include variable and fixed manufacturing costs, whether direct or indirect. The alternative to absorption is known as variable (direct) costing.
- Answer (D) is **incorrect**. Conversion costs include direct labor and overhead but not direct materials.

**[10] Gleim #: 1.6.146 -- Source: CMA 1295 3-28**

The difference between the sales price and total variable costs is

- A. Gross operating profit.
- B. Net profit.
- C. The breakeven point.
- D. The contribution margin.

- Answer (A) is **incorrect**. Gross operating profit is the net result after deducting all manufacturing costs from sales, including both fixed and variable costs.

- Answer (B) is **incorrect**. Net profit is the remainder after deducting from revenue all costs, both fixed and variable.
- Answer (C) is **incorrect**. The breakeven point is the level of sales that equals the sum of fixed and variable costs.
- Answer (D) is **correct**. The contribution margin is calculated by subtracting all variable costs from sales revenue. It represents the portion of sales that is available for covering fixed costs and profit.

**[11] Gleim #: 1.6.147 -- Source: CMA 694 3-19**

Which one of the following is **least** likely to be involved in establishing standard costs for evaluation purposes?

- A. Budgetary accountants.
- B. Industrial engineers.
- C. Top management.
- D. Quality control personnel.

- Answer (A) is **incorrect**. Budgetary accountants are involved in the setting of standard costs.
- Answer (B) is **incorrect**. Industrial engineers are involved in the setting of standard costs.
- Answer (C) is **correct**. A standard cost is an estimate of what a cost should be under normal operating conditions based on studies by accountants and engineers. In addition, line management is usually involved in the setting of standard costs as are quality control personnel. Top management would not be involved because cost estimation is a lower level operating activity. Participation by affected employees in all control systems permits all concerned to understand both performance levels desired and the measurement criteria being applied.
- Answer (D) is **incorrect**. Quality control personnel are involved in the setting of standard costs.

**[12] Gleim #: 1.6.148 -- Source: CMA 1291 3-11**

A difference between standard costs used for cost control and budgeted costs

- A. Can exist because standard costs must be determined after the budget is completed.
- B. Can exist because standard costs represent what costs should be, whereas budgeted costs represent expected actual costs.
- C. Can exist because budgeted costs are historical costs, whereas standard costs are based on engineering studies.
- D. Cannot exist because they should be the same amounts.

- Answer (A) is **incorrect**. Standard costs are determined independently of the budget.
- Answer (B) is **correct**. Standard costs are predetermined, attainable unit costs. Standard cost systems isolate deviations (variances) of actual from expected costs. One advantage of standard costs is that they facilitate flexible budgeting. Accordingly, standard and budgeted costs should not differ when standards are currently attainable. However, in practice, budgeted (estimated actual) costs may differ from standard costs when operating conditions are not expected to reflect those anticipated when the standards were developed.
- Answer (C) is **incorrect**. Budgeted costs are expected future costs, not historical costs.
- Answer (D) is **incorrect**. Budgeted and standard costs should in principle be the same, but in practice they will differ when standard costs are not expected to be currently attainable.

**[13] Gleim #: 1.6.149 -- Source: CMA 695 3-10**

A standard costing system is most often used by a firm in conjunction with

- A. Management by objectives.
  - B. Target (hurdle) rates of return.
  - C. Participative management programs.
  - D. Flexible budgets.
- Answer (A) is **incorrect**. MBO is a behavioral, communication-oriented, responsibility approach to employee self-direction. Although MBO can be used with standard costs, the two are not necessarily related.
  - Answer (B) is **incorrect**. Rates of return relate to revenues as well as costs, but a standard costing system concerns costs only.
  - Answer (C) is **incorrect**. Participative management stresses multidirectional communication. It has no relationship to standard costs.

- Answer (D) is **correct**. A standard cost is an estimate of what a cost should be under normal operating conditions based on accounting and engineering studies. Comparing actual and standard costs permits an evaluation of the effectiveness of managerial performance. Because of the impact of fixed costs in most businesses, a standard costing system is usually not effective unless the company also has a flexible budgeting system. Flexible budgeting uses standard costs to prepare budgets for multiple activity levels.

**[15] Gleim #: 1.6.151 -- Source: CMA 694 3-6**

The term “gross margin” for a manufacturing firm refers to excess of sales over

- A. Cost of goods sold, excluding fixed indirect manufacturing costs.
  - B. All variable costs, including variable selling and administrative expenses.
  - C. Cost of goods sold, including fixed indirect manufacturing costs.
  - D. Manufacturing costs, excluding fixed manufacturing costs.
- Answer (A) is **incorrect**. Fixed indirect manufacturing costs are included in the calculation of gross margin.
  - Answer (B) is **incorrect**. Fixed costs are also included in the calculation of gross margin.
  - Answer (C) is **correct**. Gross margin or gross profit is the excess of sales over cost of goods sold, calculated on a full absorption basis. Cost of goods sold would include all manufacturing costs, both fixed and variable.
  - Answer (D) is **incorrect**. Fixed costs are also included in the calculation of gross margin.

**[18] Gleim #: 1.6.154 -- Source: CMA Sample Q3-2**

Consider the following information for Richardson Company for the prior year:

- The company produced 1,000 units and sold 900 units, both as budgeted.
- There were no beginning or ending work-in-process inventories and no beginning finished goods inventory.
- Budgeted and actual fixed costs were equal, all variable manufacturing costs were affected by production volume only, and all variable selling costs were affected by sales volume only.
- Budgeted per unit revenues and costs were as follows:

	<u>Per unit</u>
Sales price	\$100
Direct materials	30
Direct labor	20
Other variable manufacturing costs	10
Fixed selling costs	5
Variable selling costs	12
Fixed selling costs (\$33,600 total)	4
Fixed administrative costs (\$1,800 total)	2

The contribution margin earned by Richardson for the prior year was

- A. \$25,200
- B. \$28,000
- C. \$31,500
- D. \$35,000

- Answer (A) is **correct**. Contribution margin equals revenues minus all variable costs. Given no WIP and no beginning finished goods, the contribution margin was \$25,200 [900 units × (\$100 – \$30 – \$20 – \$10 – \$12)]. The variable costs of producing the units not sold are embedded in ending inventory rather than expensed as part of cost of goods sold. The fixed costs are thus excluded from computation of the contribution margin.
- Answer (B) is **incorrect**. The amount of \$28,000 results from assuming the sale of 1,000 units.
- Answer (C) is **incorrect**. The amount of \$31,500 results from assuming a UCM of \$35. This computation includes fixed unit selling costs of \$5 but excludes the \$12 per unit variable selling costs.
- Answer (D) is **incorrect**. The amount of \$35,000 results from assuming a UCM of \$35 and sales of 1,000 units.

[1] Gleim #: 2.1.1 -- Source: CMA 696 3-29

Lucy Sportswear manufactures a specialty line of T-shirts using a job-order costing system. During March, the following costs were incurred in completing job ICU2: direct materials, \$13,700; direct labor, \$4,800; administrative, \$1,400; and selling, \$5,600. Overhead was applied at the rate of \$25 per machine hour, and job ICU2 required 800 machine hours. If job ICU2 resulted in 7,000 good shirts, the cost of goods sold per unit would be

- A. \$6.50
- B. \$6.30
- C. \$5.70
- D. \$5.50

- Answer (A) is **incorrect**. The amount of \$6.50 includes selling and administrative expenses.
- Answer (B) is **incorrect**. The amount of \$6.30 includes selling costs.
- Answer (C) is **incorrect**. The amount of \$5.70 includes administrative expenses.
- Answer (D) is **correct**. Cost of goods sold is based on the manufacturing costs incurred in production but does not include selling or general and administrative expenses. Manufacturing costs equal \$38,500 [ $\$13,700 \text{ DM} + \$4,800 \text{ DL} + (800 \text{ hours} \times \$25) \text{ OH}$ ]. Thus, per-unit cost is \$5.50 ( $\$38,500 \div 7,000 \text{ units}$ ).

[6] Gleim #: 2.1.6 -- Source: CMA 0205 2-22

Kepler Optics makes lenses for telescopes. Because Kepler will only sell lenses of the highest quality, the normal spoilage during a reporting period is 1,000 units. At the beginning of the current reporting period, Kepler had 2,200 units in inventory, and during the period, production was started and completed on 4,000 units. Units in inventory at the end of the current reporting period were 1,500, and the units transferred out were 3,000. During this period, the abnormal spoilage for Kepler's lens production was

- A. 700 units.
- B. 1,000 units.
- C. 1,700 units.
- D. 3,200 units.

- Answer (A) is **correct**. Kepler's abnormal spoilage for the period can be calculated as follows:

Beginning work-in-process	2,200
Add: started and completed	4,000
Less: transferred out	(3,000)
Less: ending work-in-process	<u>(1,500)</u>
Total spoilage for period	1,700
Less: normal spoilage	<u>(1,000)</u>
Abnormal spoilage for period	<u><u>700</u></u>

- Answer (B) is **incorrect**. The normal spoilage for the period is 1,000 units.
- Answer (C) is **incorrect**. The total spoilage for the period is 1,700 units.
- Answer (D) is **incorrect**. Failing to subtract the ending work-in-process to arrive at total spoilage results in 3,200 units.

[7] Gleim #: 2.1.7 -- Source: CIA 593 IV-6

A manufacturing firm may experience both normal and abnormal spoilage in its operations. The costs of both normal and abnormal spoilage are accounted for in the accounting records. The costs associated with any abnormal spoilage are

- Assigned to the good units transferred to finished goods.
  - Allocated between the units transferred to finished goods and those remaining in work-in-process.
  - Charged to the manufacturing overhead control account.
  - Charged to a special abnormal spoilage loss account.
- Answer (A) is **incorrect**. Assigning spoilage costs to finished goods is an appropriate method of accounting for normal spoilage traceable to a job or process.
  - Answer (B) is **incorrect**. Allocating spoilage costs between finished goods and work-in-process is an appropriate method of accounting for normal spoilage traceable to a job or process, provided the units in process have passed the inspection point.
  - Answer (C) is **incorrect**. Charging spoilage costs to manufacturing overhead is an appropriate method of accounting for normal spoilage, assuming the allowance for normal spoilage is incorporated into the predetermined overhead rate.
  - Answer (D) is **correct**. Abnormal spoilage should be written-off to a special account that is separately reported in the income statement. Costs associated with abnormal spoilage are not inventoried and are therefore treated as a loss in the period of detection.

[9] Gleim #: 2.1.9 -- Source: CMA 0408 2-129

Darden Manufacturing, a calendar-year corporation, had \$17,000 of spoilage during April that production management characterized as abnormal. The spoilage was incurred on Job No. 532, which was sold 3 months later for \$459,000. Which of the following correctly describes the impact of the spoilage on Darden's unit manufacturing cost for Job No. 532 and on the year's operating income?

	Unit Manufacturing Cost	Operating Income
A.	Increase	No effect
B.	Increase	Decrease
C.	No effect	Decrease
D.	No effect	Not enough information to judge

- Answer (A) is **incorrect**. Under job-order costing, the difference between the disposal value of the spoiled goods and the value of the goods in work-in-process control must be recognized as a loss.
- Answer (B) is **incorrect**. Under job-order costing, unit manufacturing cost is unaffected by abnormal spoilage.
- Answer (C) is **correct**. Under job-order costing, unit manufacturing cost is unaffected by abnormal spoilage. Also, the difference between the disposal value of the spoiled goods and the value of the goods in work-in-process control must be recognized as a loss, which will decrease operating income.
- Answer (D) is **incorrect**. Under job-order costing, the difference between the disposal value of the spoiled goods and the value of the goods in work-in-process control must be recognized as a loss.

**[Fact Pattern #1]**

Levittown Company employs a process cost system for its manufacturing operations. All direct materials are added at the beginning of the process and conversion costs are added proportionately. Levittown's production quantity schedule for November is reproduced in the next column.

Work-in-process November 1 (60% complete as to conversion costs)	1,000
Units started during November	<u>5,000</u>
Total units to account for	<u>6,000</u>
Units completed and transferred out from beginning inventory	1,000
Units started and completed during November	3,000
Work-in-process on November 30 (20% complete as to conversion costs)	<u>2,000</u>
Total units accounted for	<u>6,000</u>

**[9] Gleim #: 2.2.18 -- Source: CMA 1286 4-14**

(Refers to Fact Pattern #1)

Using the FIFO method, Levittown's equivalent units for direct materials for November are

- A. 5,000 units.
- B. 6,000 units.
- C. 4,400 units.
- D. 3,800 units.

- Answer (A) is **correct**. The computation of equivalent units for a period using the FIFO method of process costing includes only the conversion costs and material added to the product in that period and excludes any work done in previous periods. Accordingly, FIFO equivalent units include work and material to complete BWIP, plus work and material to complete units started this period, minus work and material needed to complete EWIP. Given that all materials are added at the beginning of the process, only those units started during November would have received materials in that month. Because 5,000 units were started, the equivalent units for direct materials equal 5,000.
- Answer (B) is **incorrect**. The total units to account for is 6,000.
- Answer (C) is **incorrect**. The number of units completed and transferred out from BI plus units started and completed in November plus 20% of work-in-process on November 30 equals 4,400 (1,000 + 3,000 + 400).

- Answer (D) is **incorrect**. The equivalent units for direct materials is not 3,800. Only those units started during November would have received materials in that month. Therefore, equivalent units for direct materials equal 5,000.

**[10] Gleim #: 2.2.19 -- Source: CMA 1286 4-15**

(Refers to Fact Pattern #1)

Using the FIFO method, Levittown's equivalent units for conversion costs for November are

- A. 3,400 units.
- B. 3,800 units.
- C. 4,000 units.
- D. 4,400 units.

- Answer (A) is **incorrect**. The units started and completed during November plus the 20% of work-in-process complete as to conversion costs equals 3,400 units (3,000 + 400).
- Answer (B) is **correct**. Given that BWIP (1,000 units) was already 60% complete, 400 equivalent units were needed for completion. In addition, 3,000 units were started and completed during the period. The 2,000 units in EWIP equal 400 equivalent units since they are 20% complete. Total equivalent units are 3,800 (400 + 3,000 + 400).
- Answer (C) is **incorrect**. The number of units started and completed in November and the units completed and transferred out from BI equals 4,000 units (3,000 + 1,000).
- Answer (D) is **incorrect**. The number of units started and completed in November, plus the units completed and transferred out from BI, plus the 20% of work-in-process complete as to conversion costs equals 4,400 units (3,000 + 1,000 + 400).

**[11] Gleim #: 2.2.20 -- Source: CMA 1286 4-16**

(Refers to Fact Pattern #1)

Using the weighted-average method, Levittown's equivalent units for direct materials for November are

- A. 3,400 units.
- B. 4,400 units.
- C. 5,000 units.
- D. 6,000 units.

- Answer (A) is **incorrect**. Units started and completed in November plus 20% of ending work-in-process equals 3,400 units ( $3,000 + 400$ ).
- Answer (B) is **incorrect**. The number of units started and completed in November plus units completed and transferred out from BI plus 20% of ending work-in-process equals 4,400 units ( $3,000 + 1,000 + 400$ ).
- Answer (C) is **incorrect**. The number of units started in November is 5,000.
- Answer (D) is **correct**. The difference between the weighted-average and FIFO methods of process costing is how BWIP is handled. FIFO makes a distinction between the costs in BWIP and the costs of goods started this period. Weighted average does not. Thus, when there is no BWIP, there is no difference between the two costing methods. Because 6,000 units have been started (1,000 BWIP + 5,000 started this period), and all materials are added at the beginning of the process, equivalent units for materials equal 6,000.

**[12] Gleim #: 2.2.21 -- Source: CMA 1286 4-17**

(Refers to Fact Pattern #1)

Using the weighted-average method, Levittown's equivalent units for conversion costs for November are

- A. 3,400 units.
- B. 3,800 units.
- C. 4,000 units.
- D. 4,400 units.

- Answer (A) is **incorrect**. The number of 3,400 units consist of the units started and completed in November plus the 20% of work-in-process complete as to conversion costs ( $3,000 + 400$ ).
- Answer (B) is **incorrect**. The number of 3,800 units equal the 400 units in BWIP needed for completion plus the units started and completed in November plus the 20% of work-in-process complete as to conversion costs ( $400 + 3,000 + 400$ ).
- Answer (C) is **incorrect**. The number of 4,000 units equal the units completed and transferred out from BI plus units started and completed during November ( $1,000 + 3,000$ ).
- Answer (D) is **correct**. Under the weighted-average method, work in the previous period on the beginning inventories is included along with the work added this period. Thus, the only difference between the FIFO calculations and the weighted-average calculation is the equivalent units for the beginning inventory. The 4,000 completed units (1,000 BWIP + 3,000 started this period) equal 4,000 equivalent units. The 2,000 units in EWIP are equivalent to 400 units ( $2,000 \text{ units} \times 20\% \text{ complete}$ ). Thus, there are 4,400 conversion cost equivalent units.

---

**[Fact Pattern #2]**

Kimbeth Manufacturing uses a process cost system to manufacture Dust Density Sensors for the mining industry. The following information pertains to operations for the month of May.

	<u>Units</u>
Beginning work-in-process inventory, May 1	16,000
Started in production during May	100,000
Completed production during May	92,000
Ending work-in-process inventory, May 31	24,000

The beginning inventory was 60% complete for materials and 20% complete for conversion costs. The ending inventory was 90% complete for materials and 40% complete for conversion costs.

Costs pertaining to the month of May are as follows:

- Beginning inventory costs are materials, \$54,560; direct labor, \$20,320; and overhead, \$15,240.
- Costs incurred during May are materials used, \$468,000; direct labor, \$182,880; and overhead, \$391,160.

---

**[23] Gleim #: 2.2.32 -- Source: CMA 695 3-1**

(Refers to Fact Pattern #2)

Using the first-in, first-out (FIFO) method, Kimbeth's equivalent units of production (EUP) for materials are

- A. 97,600 units.
- B. 104,000 units.
- C. 107,200 units.
- D. 108,000 units.

- Answer (A) is **incorrect**. This number of units omits the 6,400 EUP added to beginning work-in-process.

- Answer (B) is **correct**. Under FIFO, EUP are based solely on work performed during the current period. The EUP equals the sum of the work done on the beginning work-in-process inventory, units started and completed in the current period, and the ending work-in-process inventory. Given that beginning work-in-process was 60% complete as to materials, the current period is charged for 6,400 EUP ( $16,000 \text{ units} \times 40\%$ ). Because 92,000 units were completed during the period, 76,000 ( $92,000 - 16,000 \text{ in BWIP}$ ) must have been started and completed during the period. They represent 76,000 EUP. Finally, the EUP for ending work-in-process equal 21,600 ( $24,000 \text{ units} \times 90\%$ ). Thus, total EUP for May are 104,000 ( $6,400 + 76,000 + 21,600$ ).
- Answer (C) is **incorrect**. This number of units assumes beginning work-in-process was 40% complete.
- Answer (D) is **incorrect**. This number of units equals the sum of the physical units in beginning work-in-process and the physical units completed.

**[24] Gleim #: 2.2.33 -- Source: CMA 695 3-2**

(Refers to Fact Pattern #2)

Using the FIFO method, Kimbeth's equivalent units of production for conversion costs are

- A. 85,600 units.
- B. 88,800 units.
- C. 95,200 units.
- D. 98,400 units.

- Answer (A) is **incorrect**. This number of units omits the work done on beginning work-in-process.
- Answer (B) is **incorrect**. This number of units omits the work done on ending work-in-process.
- Answer (C) is **incorrect**. This number of units assumes the beginning work-in-process was 40% complete as to conversion costs.
- Answer (D) is **correct**. The beginning inventory was 20% complete as to conversion costs. Hence, 12,800 EUP ( $16,000 \text{ units} \times 80\%$ ) were required for completion. EUP for units started and completed equaled 76,000 [ $(92,000 \text{ completed units} - 16,000 \text{ units in BWIP}) \times 100\%$ ]. The work done on ending work-in-process totaled 9,600 EUP ( $24,000 \text{ units} \times 40\%$ ). Thus, total EUP for May are 98,400 ( $12,800 + 76,000 + 9,600$ ).

[25] Gleim #: 2.2.34 -- Source: CMA 695 3-3

(Refers to Fact Pattern #2)

Using the FIFO method, Kimbeth's equivalent unit cost of materials for May is

- A. \$4.12
- B. \$4.50
- C. \$4.60
- D. \$4.80

- Answer (A) is **incorrect**. The amount of \$4.12 is based on EUP calculated under the weighted-average method.
- Answer (B) is **correct**. Under the FIFO method, EUP for materials equal 104,000  $[(16,000 \text{ units in BWIP} \times 40\%) + (76,000 \text{ units started and completed} \times 100\%) + (24,000 \text{ units in EWIP} \times 90\%)]$ . Consequently, the equivalent unit cost of materials is \$4.50 (\$468,000 total materials cost in May  $\div$  104,000 EUP).
- Answer (C) is **incorrect**. The amount of \$4.60 is the weighted-average cost per equivalent unit.
- Answer (D) is **incorrect**. The amount of \$4.80 omits the 6,400 EUP added to beginning work-in-process.

[26] Gleim #: 2.2.35 -- Source: CMA 695 3-4

(Refers to Fact Pattern #2)

Using the FIFO method, Kimbeth's equivalent unit conversion cost for May is

- A. \$5.65
- B. \$5.83
- C. \$6.00
- D. \$6.20

- Answer (A) is **incorrect**. The amount of \$5.65 is based on EUP calculated under the weighted-average method.
- Answer (B) is **correct**. Under the FIFO method, EUP for conversion costs equal 98,400  $[(16,000 \text{ units in BWIP} \times 80\%) + (76,000 \text{ units started and completed} \times 100\%) + (24,000 \text{ units in EWIP} \times 40\%)]$ . Conversion costs incurred during the current period equal \$574,040 (\$182,880 DL + \$391,160 FOH). Hence, the equivalent unit cost for conversion costs is \$5.83 (\$574,040  $\div$  98,400).
- Answer (C) is **incorrect**. The amount of \$6.00 is the cost per equivalent unit calculated under the weighted-average method.

- Answer (D) is **incorrect**. The amount of \$6.20 results from combining conversion costs for May with those in beginning work-in-process and dividing by 98,400 EUP.

**[27] Gleim #: 2.2.36 -- Source: CMA 695 3-5**

(Refers to Fact Pattern #2)

Using the FIFO method, Kimbeth's total cost of units in the ending work-in-process inventory at May 31 is

- A. \$153,168
- B. \$154,800
- C. \$155,328
- D. \$156,960

- Answer (A) is **correct**. The FIFO costs per equivalent unit for materials and conversion costs are \$4.50 and \$5.83, respectively. EUP for materials in ending work-in-process equal 21,600 ( $24,000 \times 90\%$ ). Thus, total FIFO materials cost is \$97,200 ( $21,600 \text{ EUP} \times \$4.50$ ). EUP for conversion costs in ending work-in-process equal 9,600 ( $24,000 \times 40\%$ ). Total conversion costs are therefore \$55,968 ( $9,600 \text{ EUP} \times \$5.83$ ). Consequently, total work-in-process costs are \$153,168 ( $\$97,200 + \$55,968$ ).
- Answer (B) is **incorrect**. The amount of \$154,800 is based on a FIFO calculation for materials and a weighted-average calculation for conversion costs.
- Answer (C) is **incorrect**. The amount of \$155,328 is based on a weighted-average calculation for materials and a FIFO calculation for conversion costs.
- Answer (D) is **incorrect**. The amount of \$156,960 is the weighted-average cost of ending work-in-process.

**[28] Gleim #: 2.2.37 -- Source: CMA 695 3-6**

(Refers to Fact Pattern #2)

Using the weighted-average method, Kimbeth's equivalent unit cost of materials for May is

- A. \$4.12
- B. \$4.50
- C. \$4.60
- D. \$5.02

- Answer (A) is **incorrect**. The amount of \$4.12 equals materials costs for May divided by weighted-average EUP.

- Answer (B) is **incorrect**. The amount of \$4.50 is the equivalent unit cost based on the FIFO method.
- Answer (C) is **correct**. The weighted-average method averages the work done in the prior period with the work done in the current period. There are two layers of units to analyze: those completed during the period, and those still in ending inventory. The units completed totaled 92,000. The 24,000 ending units are 90% complete as to materials, so EUP equal 21,600. Hence, total EUP for materials are 113,600 (92,000 + 21,600). The total materials costs incurred during the period and accumulated in beginning work-in-process is \$522,560 (\$468,000 + \$54,560). Thus, weighted-average unit cost is \$4.60 (\$522,560 ÷ 113,600 EUP).
- Answer (D) is **incorrect**. The amount of \$5.02 is based on a FIFO calculation of equivalent units and a weighted-average calculation of costs.

**[29] Gleim #: 2.2.38 -- Source: CMA 695 3-7**

(Refers to Fact Pattern #2)

Using the weighted-average method, Kimbeth's equivalent unit conversion cost for May is

- A. \$5.65
- B. \$5.83
- C. \$6.00
- D. \$6.20

- Answer (A) is **incorrect**. The amount of \$5.65 omits the conversion costs in beginning work-in-process.
- Answer (B) is **incorrect**. The amount of \$5.83 is the equivalent unit conversion cost based on FIFO.
- Answer (C) is **correct**. The weighted-average method does not distinguish between the work done in the prior period and the work done in the current period. Accordingly, the 92,000 completed units represent 92,000 weighted-average EUP. The 24,000 units in ending work-in-process are 40% complete as to conversion costs, so they equal 9,600 EUP. Hence, total EUP for conversion costs are 101,600 (92,000 + 9,600). The sum of the conversion costs accumulated in beginning work-in-process and incurred during the period is \$609,600 (\$20,320 + \$15,240 + \$182,880 + \$391,160). Thus, weighted-average unit cost is \$6.00 (\$609,600 ÷ 101,600 EUP).
- Answer (D) is **incorrect**. The amount of \$6.20 is based on a FIFO calculation of equivalent units and a weighted-average calculation of costs.

---

**[Fact Pattern #3]**

Goggle-eyed Old Snapping Turtle, a sporting goods manufacturer, buys wood as a direct material for baseball bats. The Forming Department processes the baseball bats, and the bats are then transferred to the Finishing Department where a sealant is applied. The Forming Department began manufacturing 10,000 “Casey Sluggers” during the month of May. There was no beginning inventory.

Costs for the Forming Department for the month of May were as follows:

Direct materials	\$33,000
Conversion costs	<u>17,000</u>
Total	<u>\$50,000</u>

A total of 8,000 bats were completed and transferred to the Finishing Department; the remaining 2,000 bats were still in the forming process at the end of the month. All of the Forming Department’s direct materials were placed in process, but, on average, only 25% of the conversion cost was applied to the ending work-in-process inventory.

---

**[30] Gleim #: 2.2.39 -- Source: CMA 696 3-3**

(Refers to Fact Pattern #3)

The cost of the units transferred to Snapping Turtle’s Finishing Department is

- A. \$50,000
- B. \$40,000
- C. \$53,000
- D. \$42,400

- Answer (A) is **incorrect**. A portion of the total costs is still in work-in-process.
- Answer (B) is **incorrect**. The amount of \$40,000 assumes that work-in-process is 100% complete as to conversion costs.
- Answer (C) is **incorrect**. The amount of \$53,000 exceeds the actual costs incurred during the period. Given no beginning inventory, the amount transferred out cannot exceed the costs incurred during the period.

- Answer (D) is **correct**. The total equivalent units for raw materials equals 10,000 because all materials for the ending work-in-process had already been added to production. Hence, the materials cost per unit was \$3.30 ( $\$33,000 \div 10,000$ ). For conversion costs, the total equivalent units equals 8,500 [8,000 completed + (2,000 in EWIP  $\times$  25%)]. Thus, the conversion cost was \$2.00 per unit ( $\$17,000 \div 8,500$ ). The total cost transferred was therefore \$42,400 [8,000 units  $\times$  ( $\$3.30 + \$2.00$ )].

**[31] Gleim #: 2.2.40 -- Source: CMA 696 3-4**

(Refers to Fact Pattern #3)

The cost of the work-in-process inventory in Snapping Turtle's Forming Department at the end of May is

- A. \$10,000
- B. \$2,500
- C. \$20,000
- D. \$7,600

- Answer (A) is **incorrect**. The amount of \$10,000 assumes that work-in-process inventory is 100% complete as to conversion costs.
- Answer (B) is **incorrect**. The amount of \$2,500 assumes that work-in-process inventory is 100% complete as to conversion costs and that 500 bats are in inventory.
- Answer (C) is **incorrect**. The amount of \$20,000 assumes that work-in-process is 100% complete as to conversion costs and that 6,000 units were transferred out.
- Answer (D) is **correct**. The equivalent units for raw materials would be 10,000 (8,000 + 2,000) since the work-in-process is 100% complete as to materials. Therefore, dividing the \$33,000 by 10,000 units results in a unit cost for materials of \$3.30. The equivalent units for conversion costs would be 8,500 units [8,000 + (2,000 units  $\times$  .25)]. Dividing the \$17,000 of conversion costs by 8,500 equivalent units results in a unit cost of \$2 per bat. Therefore, the total cost of goods transferred out would be \$5.30, consisting of \$3.30 for materials and \$2 for conversion costs. Multiplying \$5.30 times the 8,000 bats completed results in a total transfer of \$42,400. Consequently, the cost of the ending work-in-process must have been \$7,600 (\$50,000 total costs incurred – \$42,400).

**[34] Gleim #: 2.2.43 -- Source: CMA 690 4-10**

During the month of May, Mercer Company completed 50,000 units costing \$600,000, exclusive of spoilage allocation. Of these completed units, 25,000 were sold during the month. An additional 10,000 units, costing \$80,000, were 50% complete at May 31. All units are inspected between the completion of manufacturing and transfer to finished goods inventory. Normal spoilage for the month was \$20,000, and abnormal spoilage of \$50,000 was also incurred during the month. The portion of total spoilage that should be charged against revenue in May is

- A. \$50,000
- B. \$20,000
- C. \$70,000
- D. \$60,000

- Answer (A) is **incorrect**. The amount of \$50,000 is abnormal spoilage.
- Answer (B) is **incorrect**. The amount of \$20,000 equals normal spoilage for the month.
- Answer (C) is **incorrect**. The amount of \$70,000 is the sum of normal spoilage and abnormal spoilage.
- Answer (D) is **correct**. Normal spoilage is an inventoriable cost of production that is charged to cost of goods sold when the units are sold. Abnormal spoilage is a period cost recognized when incurred. The \$50,000 of abnormal spoilage is therefore expensed during May. In addition, 50% of the normal spoilage is debited to cost of goods sold because 50% ( $25,000 \div 50,000$ ) of the units completed were sold during the period. No spoilage is allocated to work-in-process because inspection occurs after completion. Thus, the normal spoilage expensed during the month is \$10,000 ( $\$20,000 \times 50\%$ ). Total spoilage charged against revenue is \$60,000 ( $\$50,000 + \$10,000$ ).

---

**[Fact Pattern #4]**

Marlan Manufacturing produces a product that passes through two departments. The units from the molding department are completed in the assembly department. The units are completed in assembly by adding the remaining direct materials when the units are 60% complete with respect to conversion costs. Conversion costs are added proportionately in assembly. The production activity in the assembly department for the current month is presented as follows. Marlan uses the FIFO (first-in, first-out) inventory method in its process cost system.

Beginning inventory units (25% complete with respect to conversion costs)	8,000
Units transferred in from the molding department during the month	<u>42,000</u>
Units to account for	<u><u>50,000</u></u>
Units completed and transferred to finished goods inventory	38,000
Ending inventory units (40% complete with respect to conversion costs)	<u>12,000</u>
Units accounted for	<u><u>50,000</u></u>

---

**[36] Gleim #: 2.2.45 -- Source: CMA 692 3-2**

(Refers to Fact Pattern #4)

The equivalent units transferred from Marlan's molding department to the assembly department for the current month are

- A. 30,000 units.
  - B. 38,000 units.
  - C. 40,800 units.
  - D. 42,000 units.
- Answer (A) is **incorrect**. The number of units started and completed during the period was 30,000.
  - Answer (B) is **incorrect**. The number of units transferred out, not to, the assembly department was 38,000.
  - Answer (C) is **incorrect**. The equivalent units for conversion costs equals 40,800.
  - Answer (D) is **correct**. This problem seemingly asks a technical question, but in reality was designed to test the candidate's alertness. The equivalent units transferred from the molding department are simply the total units transferred from the molding department (42,000 units).

**[37] Gleim #: 2.2.46 -- Source: CMA 692 3-4**

(Refers to Fact Pattern #4)

The equivalent units in Marlan's assembly department for conversion costs for the current month are

- A. 34,800 units.
- B. 40,800 units.
- C. 42,800 units.
- D. 43,200 units.

- Answer (A) is **incorrect**. The number of 34,800 units assumes the beginning inventory was 100% complete.
- Answer (B) is **correct**. The equivalent units for conversion costs equal total units to account for, minus work done on beginning inventory, minus work not done on ending inventory. Hence, the equivalent units for conversion costs equal 40,800 units  $[50,000 \text{ units} - (25\% \times 8,000 \text{ units}) - (60\% \times 12,000 \text{ units})]$ .
- Answer (C) is **incorrect**. Conversion-cost EUP based on the weighted-average method is 42,800 units.
- Answer (D) is **incorrect**. The ending inventory was 40% complete, resulting in subtracting 60%, not 40%, of the 12,000 items in ending inventory to determine work not on ending inventory.

**[38] Gleim #: 2.2.47 -- Source: CMA 692 3-3**

(Refers to Fact Pattern #4)

The equivalent units in Marlan's assembly department for direct materials for the current month are

- A. 30,000 units.
- B. 38,000 units.
- C. 40,800 units.
- D. 42,000 units.

- Answer (A) is **incorrect**. The number of 30,000 units ignores the 8,000 units in process at the beginning of the period.

- Answer (B) is **correct**. Direct materials are added when the units are 60% complete as to conversion costs. The beginning inventory of 8,000 units was only 25% complete at the start of the period, and 42,000 units were transferred in. Given that the ending inventory of 12,000 units was only 40% complete, neither beginning nor ending inventory had received direct materials in the assembly department. Accordingly, the equivalent units in the assembly department for direct materials must have been 38,000 units (8,000 units BI + 42,000 units transferred in – 12,000 units EI).
- Answer (C) is **incorrect**. Equivalent units for conversion costs, not direct materials, is 40,800.
- Answer (D) is **incorrect**. The 42,000 units were transferred in during the month. Not all received an input of direct materials.

**[39] Gleim #: 2.2.48 -- Source: CMA 0408 2-356**

A major advantage of the first-in, first-out (FIFO) process-costing method over the weighted-average process-costing method is

- A. The simplicity of the FIFO method.
  - B. That inventories are eliminated from consideration in the FIFO method.
  - C. That current-period cost per unit is highlighted under the FIFO method.
  - D. That only ending inventory costs need to be separately computed when using the FIFO method.
- Answer (A) is **incorrect**. FIFO process costing is no simpler than weighted-average process costing.
  - Answer (B) is **incorrect**. Elimination of inventories is a feature of backflush, not process, costing.
  - Answer (C) is **correct**. First-in, first-out (FIFO) process costing involves backing out beginning inventory costs when computing work performed. This has the effect of highlighting the most recent costs.
  - Answer (D) is **incorrect**. Beginning inventory costs must be separately computed so they can be backed out.

**[40] Gleim #: 2.2.49 -- Source: CMA 0408 2-126**

Mack, Inc., uses a weighted-average process costing system. Direct materials and conversion costs are incurred evenly during the production process. During the month of October, the following costs were incurred:

Direct materials	\$39,700
Conversion costs	70,000

The work-in-process inventory as of October 1 consisted of 5,000 units, valued at \$4,300, that were 20% complete. During October, 27,000 units were transferred out. Inventory as of October 31 consisted of 3,000 units that were 50% complete. The weighted-average inventory cost per unit completed in October was

- A. \$3.51
- B. \$3.88
- C. \$3.99
- D. \$4.00

- Answer (A) is **incorrect**. The amount of \$3.51 results from including 80% of the 5,000 units in beginning work-in-process (4,000) to the EUP for October.
- Answer (B) is **incorrect**. The amount of \$3.88 results from including 20% of the beginning work-in-process (\$860) to the total cost to be distributed.
- Answer (C) is **incorrect**. The amount of \$3.99 is the per-unit cost on the FIFO basis.
- Answer (D) is **correct**. In determining Mack's weighted-average cost per unit, the first step is to calculate the equivalent units of production (EUP). The same EUP amount can be used for both materials and conversion:

Transferred out (27,000 units × 100%)	27,000
Ending work-in-process (3,000 units × 50%)	<u>1,500</u>
Total	<u><u>28,500</u></u>

Total costs to be distributed are calculated as follows:

Embedded in beginning work-in-process	\$ 4,300
Current month -- direct materials	39,700
Current month -- conversion costs	<u>70,000</u>
Total	<u><u>\$114,000</u></u>

The total cost per unit is thus \$4.00 (\$114,000 ÷ 28,500).

**[Fact Pattern #5]**

During December, Krause Chemical Company had the following selected data concerning the manufacture of Xyzine, an industrial cleaner:

Production Flow	Physical Units
Completed and transferred to the next department	100
Add: ending work-in-process inventory	10 (40% complete as to conversion)
	<u>          </u>
Total units to account for	110
Less: beginning work-in-process inventory	(20) (60% complete as to conversion)
	<u>          </u>
Units started during December	<u>90</u>

All material is added at the beginning of processing in this department, and conversion costs are added uniformly during the process. The beginning work-in-process inventory had \$120 of raw material and \$180 of conversion costs incurred. Material added during December was \$540 and conversion costs of \$1,484 were incurred. Krause uses the weighted-average process-costing method.

**[41] Gleim #: 2.2.50 -- Source: CMA 0408 2-127**

(Refers to Fact Pattern #5)

Under the weighted-average method, Krause's total raw material costs in the ending work-in-process inventory for December is

- A. \$120
- B. \$72
- C. \$60
- D. \$36

- Answer (A) is **incorrect**. The amount of \$120 is the total materials costs embedded in beginning work-in-process.
- Answer (B) is **incorrect**. The amount of \$72 results from improperly multiplying the \$120 beginning work-in-process materials costs by the 60% completion percentage for conversion.

- Answer (C) is **correct**. All materials are added at the beginning of this department, meaning that all units are 100% complete for purposes of materials immediately upon entering this department. The equivalent units of production (EUP) for materials for units transferred out is therefore 100 (100 units  $\times$  100%). Under the weighted-average method, the EUP of ending work-in-process must also be included. This number is 10 (10 units  $\times$  100%), which, added to the 100 transferred out, makes a total weighted-average EUP of 110. The numerator of the per-unit cost calculation must likewise contain both costs embedded in beginning work-in-process (\$120) and those added during the month (\$540), for a total of \$660. The weighted-average per-unit cost is therefore \$6.00 (\$660  $\div$  110).
- Answer (D) is **incorrect**. The amount of \$36 results from improperly taking one-third of the \$120 embedded in beginning work-in-process.

**[42] Gleim #: 2.2.51 -- Source: CMA 0408 2-136**

(Refers to Fact Pattern #5)

Under the weighted-average method, Krause's total conversion cost assigned to units transferred to the next department in December was

- A. \$1,664
- B. \$1,600
- C. \$1,513
- D. \$1,484

- Answer (A) is **incorrect**. The amount of \$1,644 is the total value of all units for the month, not just transferred out.
- Answer (B) is **correct**. Units transferred out of a department are by definition 100% complete for purposes of conversion costs for that department. The equivalent units of production (EUP) for conversion for units transferred out is therefore 100 (100 units  $\times$  100%). Under the weighted-average method, the EUP of ending work-in-process must also be included. This number is 4 (10 units  $\times$  40%), which, added to the 100 transferred out, makes a total weighted-average EUP of 104. Under the weighted-average method, the numerator of the per-unit cost calculation must contain both costs embedded in beginning work-in-process (\$180) and those added during the month (\$1,484), for a total of \$1,664. The weighted-average per-unit cost is therefore \$16.00 (\$1,664  $\div$  104). The 100 EUP transferred out times the \$16.00 unit cost equals \$1,600 total under the weighted-average method.
- Answer (C) is **incorrect**. The amount of \$1,513 includes all of the ending work-in-process rather than the percentage completed
- Answer (D) is **incorrect**. The amount of \$1,484 is the value of only costs added during the month.

**[43] Gleim #: 2.2.52 -- Source: CMA 0408 2-137**

(Refers to Fact Pattern #5)

Under the first-in, first-out (FIFO) method, Krause's equivalent units of production used to calculate conversion costs for December was

- A. 110 units.
- B. 104 units.
- C. 100 units.
- D. 92 units.

- Answer (A) is **incorrect**. The EUP for materials is 110 units.
- Answer (B) is **incorrect**. The EUP using the weighted-average method is 104 units.
- Answer (C) is **incorrect**. The number of units transferred out is 100 units.
- Answer (D) is **correct**. Units transferred out of a department are by definition 100% complete for purposes of conversion costs for that department. The equivalent units of production (EUP) for conversion for units transferred out is therefore 100 (100 units  $\times$  100%). Under the FIFO method, the EUP of ending work-in-process must also be included. This number is 4 (10 units  $\times$  40%), which, added to the 100 transferred out, gives an EUP of 104. This is the EUP that would be used under the weighted-average method, but for FIFO beginning work-in-process must be taken out. For conversion, this is 12 units (20 units  $\times$  60%), making a total FIFO-basis EUP for the month of 92 (104 – 12).

**[44] Gleim #: 2.2.53 -- Source: CMA 0408 2-130**

A company that uses a process costing system inspects its goods at the 60% stage of completion. If the firm's ending work-in-process inventory is 80% complete, how would the firm account for its normal and abnormal spoilage?

- A. Both normal and abnormal spoilage costs would be added to the cost of the good units completed during the period.
- B. Both normal and abnormal spoilage costs would be written off as an expense of the period.
- C. Normal spoilage costs would be added to the cost of the good units completed during the period; in contrast, abnormal spoilage costs would be written off as a loss.
- D. Normal spoilage costs would be allocated between the cost of good units completed during the period and the ending work-in-process inventory. In contrast, abnormal spoilage costs would be written off as a loss.

- Answer (A) is **incorrect**. Under process costing, as with job-order costing, the cost of a normal level of spoilage is left in cost of goods sold; abnormal spoilage is recognized separately as a loss.
- Answer (B) is **incorrect**. Under process costing, as with job-order costing, the cost of a normal level of spoilage is left in cost of goods sold; abnormal spoilage is recognized separately as a loss.
- Answer (C) is **incorrect**. The cost of the period's normal spoilage must be allocated among all the units worked on during the period, both those finished and those remaining in work-in-process.
- Answer (D) is **correct**. Under process costing, as with job-order costing, the cost of a normal level of spoilage is left in cost of goods sold. Thus, the cost of the period's normal spoilage must be allocated among all the units worked on during the period, both those finished and those remaining in work-in-process. Abnormal spoilage is recognized separately as a loss.

**[45] Gleim #: 2.2.54 -- Source: CMA 0408 2-131**

When considering normal and abnormal spoilage, which one of the following is theoretically the best accounting method for spoilage in a process-costing system?

- A. Both normal and abnormal spoilage cost should be charged to a separate expense account.
  - B. Normal spoilage cost should be charged to good units and abnormal spoilage cost should be charged to a separate expense account.
  - C. Both normal and abnormal spoilage costs should be charged to good units.
  - D. Normal spoilage costs should be charged to a separate expense account and abnormal spoilage cost should be charged to good units.
- 
- Answer (A) is **incorrect**. The cost of a normal level of spoilage is left in cost of goods sold.
  - Answer (B) is **correct**. Under process costing, as with job-order costing, the cost of a normal level of spoilage is left in cost of goods sold; abnormal spoilage is recognized separately as a loss.
  - Answer (C) is **incorrect**. Abnormal spoilage is recognized separately as a loss.
  - Answer (D) is **incorrect**. The best accounting method is the opposite (normal spoilage charged to good units, abnormal spoilage charged to a separate expense account).

**[46] Gleim #: 2.2.55 -- Source: CMA 0408 2-132**

Southwood Industries uses a process-costing system and inspects its goods at the end of manufacturing. The inspection as of June 30 revealed the following information for the month of June:

Good units completed	16,000
Normal spoilage (units)	300
Abnormal spoilage (units)	100

Unit costs were: materials, \$3.50 and conversion costs, \$6.00. The number of units that Southwood would transfer to its finished goods inventory and the related cost of these units are

	<u>Units Transferred</u>	<u>Cost</u>
A.	16,000	\$152,000
B.	16,000	\$154,850
C.	16,000	\$155,800
D.	16,300	\$154,850

- Answer (A) is **incorrect**. The amount of \$152,000 results from failing to include normal spoilage.
- Answer (B) is **correct**. Only salable goods (16,000) are transferred to finished goods inventory. Under process costing, the full cost of normal spoilage is borne by good units. Thus, the total dollar amount transferred to finished goods was \$154,800  $[(16,000 + 300) \times \$9.50]$ .
- Answer (C) is **incorrect**. The amount of \$155,800 results from improperly including abnormal spoilage.
- Answer (D) is **incorrect**. The figure 16,300 results from improperly including spoiled goods in the quantity transferred to finished goods.

[47] Gleim #: 2.2.56 -- Source: CMA 0408 2-133

Colt Company uses a first-in, first-out (FIFO) process cost system to account for the cost of producing a chemical compound. As part of production, Material B is added when the goods are 80% complete. Beginning work-in-process inventory for the current month was 20,000 units, 90% complete. During the month, 70,000 units were started in process, and 65,000 of these units were completed. There were no lost or spoiled units. If the ending inventory was 60% complete, the total equivalent units for Material B for the month was

- A. 65,000 units.
- B. 70,000 units.
- C. 85,000 units.
- D. 90,000 units.

- Answer (A) is **correct**. Beginning work-in-process, being 90% complete, already had Material B added, so it is not counted in the EUP calculation for Material B for the month. By the same token, ending work-in-process, being only 60% complete, had not yet had Material B added, and thus it is also not counted in the EUP calculation for Material B. The EUP for Material B is therefore only the 65,000 units started and completed during the month.
- Answer (B) is **incorrect**. The figure 70,000 is the number of units started during the month.
- Answer (C) is **incorrect**. The figure 85,000 results from improperly including the 20,000 units from beginning work-in-process inventory.
- Answer (D) is **incorrect**. The figure 90,000 is the total units to account for.

**[48] Gleim #: 2.2.57 -- Source: CMA 0408 2-134**

Oster Manufacturing uses a weighted-average process costing system and has the following costs and activity during October:

Materials	\$40,000
Conversion cost	<u>32,500</u>
Total beginning work-in-process inventory	<u><u>\$72,500</u></u>
Materials	\$ 700,000
Conversion cost	<u>617,500</u>
Total production costs -- October	<u><u>\$1,317,500</u></u>

Production completed	60,000 units
Work-in-process, October 31	20,000 units

All materials are introduced at the start of the manufacturing process, and conversion cost is incurred uniformly throughout production. Conversations with plant personnel reveal that, on average, month-end in-process inventory is 25% complete. Assuming no spoilage, how should Oster's October manufacturing cost be assigned?

	<u>Production Completed</u>	<u>Work-in- Process</u>
A.	\$1,042,500	\$347,500
B.	\$1,095,000	\$222,500
C.	\$1,155,000	\$235,000
D.	\$1,283,077	\$106,923

- Answer (A) is **incorrect**. This combination is based on using total work-in-process units rather than the 5,000 equivalent units.
- Answer (B) is **incorrect**. This combination does not include beginning work-in-process costs for calculation of EUP.

- Answer (C) is **correct**. When determining unit costs under weighted-average, the numerator consists both of costs that were added in prior periods and those added during the current period. Likewise, the denominator consists both of units completed during the period and the equivalent units of production (EUP) of those remaining in ending work-in-process. Since materials are added at the beginning of the process, both production populations are 100% complete with respect to materials costs:

EUP calculations for material costs:

Production completed	$60,000 \times 100\% = 60,000$
Work-in-process	$20,000 \times 100\% = 20,000$

EUP for conversion costs is calculated as follows:

EUP calculations for conversion costs:

Production completed	$60,000 \times 100\% = 60,000$
Work-in-process	$20,000 \times 25\% = 5,000$

For October, therefore, Oster's unit cost calculations are as follows:

Unit cost calculations for materials:

$$\frac{\$40,000 + \$700,000}{60,000 + 20,000} = \$9.25 \text{ per EU}$$

Unit cost calculations for conversion:

$$\frac{\$32,500 + \$617,500}{60,000 + 5,000} = \$10.00 \text{ per EU}$$

The value of production completed in October is therefore  $[(60,000 \text{ units} \times \$9.25) + (60,000 \text{ units} \times \$10.00) = \$1,155,000]$ , and the value of ending work-in-process is  $[(20,000 \text{ units} \times \$9.25) + (5,000 \text{ units} \times \$10.00) = \$235,000]$ .

- Answer (D) is **incorrect**. This combination uses the percentage of ending work-in-process completed for the cost per equivalent unit calculation of material costs. Materials were added at the beginning of the process, so they were 100% complete as to materials.

**[49] Gleim #: 2.2.58 -- Source: CMA 0408 2-135**

San Jose, Inc., uses a weighted-average process costing system. All materials are introduced at the start of manufacturing, and conversion cost is incurred evenly throughout production. The company started 70,000 units during May and had the following work-in-process inventories at the beginning and end of the month:

May 1      30,000 units, 40% complete  
May 31      24,000 units, 25% complete

Assuming no spoilage or defective units, the total equivalent units used to assign costs for May are

	<u>Materials</u>	<u>Conversion Cost</u>
A.	70,000	70,000
B.	82,000	82,000
C.	100,000	70,000
D.	100,000	82,000

- Answer (A) is **incorrect**. The figure 70,000 results from accounting for only the units started during the month.
- Answer (B) is **incorrect**. The figure 82,000 results from improperly applying the 25% completion percentage to materials as well as conversion.
- Answer (C) is **incorrect**. The figure 70,000 for conversion results from accounting for only the units started during the month and failing to weight the units in ending work-in-process inventory.
- Answer (D) is **correct**. San Jose had 30,000 units in beginning work-in-process inventory and started 70,000 during the month, for a total of 100,000 units to be accounted for. Since all materials are introduced at the start of manufacturing, all 100,000 units are 100% complete with respect to materials costs. Equivalent units of production for conversion costs can be determined as follows:

Beginning WIP	30,000	units × 100% =	30,000
Started and completed	46,000	units × 100% =	46,000
Ending WIP	<u>24,000</u>	units × 25% =	<u>6,000</u>
Totals	<u>100,000</u>	units	<u>82,000</u>

**[50] Gleim #: 2.2.59 -- Source: CMA 0408 2-138**

Jones Corporation uses a first-in, first-out (FIFO) process costing system. Jones has the following unit information for the month of August:

	<u>Units</u>
Beginning work-in-process inventory:	
100% complete for materials,	
75% complete for conversion cost	10,000
Units complete and transferred out	90,000
Ending work-in-process inventory:	
100% complete for materials,	
60% complete for conversion costs	8,000

The number of equivalent units of production for conversion costs for the month of August is

- A. 87,300
- B. 88,000
- C. 92,300
- D. 92,700

- Answer (A) is **correct**. Jones had 8,000 units in ending work-in-process inventory and transferred out 90,000 during the month, for a total of 98,000 units to be accounted for. Since Jones completed 90,000 units during the month and had 10,000 in beginning work-in-process, 80,000 of those completed were started during the month. Under a FIFO system, only the work necessary to complete units in beginning inventory is counted toward equivalent units of production (EUP). Jones's EUP can be determined as follows:

Beginning WIP	10,000	units × 25% =	2,500
Started and completed	80,000	units × 100% =	80,000
Ending WIP	<u>8,000</u>	units × 60% =	<u>4,800</u>
Totals	<u>98,000</u>	units	<u>87,300</u>

- Answer (B) is **incorrect**. The figure 88,000 is the number of units started during the month.
- Answer (C) is **incorrect**. The figure 92,300 results from weighting beginning work-in-process for the completion percentage rather than the percentage needed to complete.
- Answer (D) is **incorrect**. The figure 87,300 is the EUP using the FIFO method.

**[51] Gleim #: 2.2.60 -- Source: CMA 0408 2-139**

Waller Co. uses a weighted-average process-costing system. Material B is added at two different points in the production of shirms, 40% is added when the units are 20% completed, and the remaining 60% of Material B is added when the units are 80% completed. At the end of the quarter, there are 22,000 shirms in process, all of which are 50% completed. With respect to Material B, the ending shirms in process represent how many equivalent units?

- A. 4,400
- B. 8,800
- C. 11,000
- D. 22,000

- Answer (A) is **incorrect**. The figure 4,400 results from multiplying by the 20% completion stage rather than the 40% material usage.
- Answer (B) is **correct**. All 22,000 units in ending work-in-process have had 40% of Material B added, since they have all passed the 20% completion point and none have reached the 80% completion point. Equivalent units of production for Material B are thus 8,800 ( $22,000 \times 40\%$ ).
- Answer (C) is **incorrect**. The figure 11,000 results from multiplying by the 50% completion stage rather than the 40% material usage.
- Answer (D) is **incorrect**. The figure 22,000 results from treating all the units in ending work-in-process as being complete for materials.

[1] Gleim #: 2.3.61 -- Source: CMA 0408 2-146

A profitable company with five departments uses plantwide overhead rates for its highly diversified operation. The firm is studying a change to either allocating overhead by using departmental rates or using activity-based costing (ABC). Which one of these two methods will likely result in the use of a greater number of cost allocation bases and more accurate costing results?

	<u>Greater Number of Allocation Bases</u>	<u>More Accurate Costing Results</u>
A.	Departmental	Departmental
B.	Departmental	ABC
C.	ABC	Departmental
D.	ABC	ABC

- Answer (A) is **incorrect**. ABC leads to both more allocation bases than departmental overhead rates and to more accurate costing results.
- Answer (B) is **incorrect**. While departmental overhead rates lead to more allocation bases than does a single plantwide rate, ABC involves many more allocation bases.
- Answer (C) is **incorrect**. While departmental overhead rates lead to more accurate costing than a single plantwide rate, ABC leads to even more accurate costing.
- Answer (D) is **correct**. Under activity-based costing (ABC), the number of allocation bases increases dramatically over those of a traditional (volume-based) costing accumulation system. First, every activity must be allocated to an indirect cost pool using resource drivers ("1st-stage allocations"), and every indirect cost pool must be allocated to final products using activity drivers ("2nd-stage allocations"). This use of a larger number of allocation pools and bases leads to more accurate costing results.

**[2] Gleim #: 2.3.62 -- Source: CMA 0408 2-147**

Young Company is beginning operations and is considering three alternative ways in which to allocate manufacturing overhead to individual units produced. Young can use a plantwide rate, departmental rates, or activity-based costing. Young will produce many types of products in its single plant, and not all products will be processed through all departments. In which one of the following independent situations would reported net income for the first year be the same regardless of which overhead allocation method had been selected?

- A. All production costs approach those costs that were budgeted.
  - B. The sales mix does not vary from the mix that was budgeted.
  - C. All manufacturing overhead is a fixed cost.
  - D. All ending inventory balances are zero.
- Answer (A) is **incorrect**. Accurate budgeting has no bearing on the net income figure produced by various costing systems.
  - Answer (B) is **incorrect**. A zero variance in the sales mix is not the only factor bearing on net income.
  - Answer (C) is **incorrect**. The behavior of overhead is not the only factor bearing on net income.
  - Answer (D) is **correct**. When there is no beginning finished goods inventory, the only difference in net income arising from the use of variant costing methods is the treatment of costs that show up on the balance sheet because they are buried in the various ending inventories. In Young's case, therefore, an identical net income figure across the three different costing system options can only be guaranteed when there are no ending inventories.

**[8] Gleim #: 2.3.68 -- Source: CMA 696 3-16**

The series of activities in which customer usefulness is added to the product is the definition of

- A. A value chain.
- B. Process value analysis.
- C. Integrated manufacturing.
- D. Activity-based costing.

- Answer (A) is **correct**. Value-chain analysis for assessing competitive advantage is an integral part of the strategic planning process. Value-chain analysis is a continuous process of gathering, evaluating, and communicating information for business decision making. A value chain depicts how customer value accumulates along a chain of activities that lead to an end product or service. A value chain consists of the activities required to research and develop, design, produce, market, deliver, and support its product. Extended value-chain analysis expands the view of the parties involved to include those upstream (e.g., suppliers) and downstream (e.g., customers).
- Answer (B) is **incorrect**. Process value analysis relates to a single process.
- Answer (C) is **incorrect**. Computer-integrated manufacturing uses computers to control all aspects of manufacturing in a single location.
- Answer (D) is **incorrect**. Activity-based costing identifies the activities associated with cost incurrence and the drivers of those activities. Costs are then assigned to cost objects based on the demands they make on activities.

**[9] Gleim #: 2.3.69 -- Source: CMA 1296 3-28**

The use of activity-based costing (ABC) normally results in

- A. Substantially greater unit costs for low-volume products than is reported by traditional product costing.
  - B. Substantially lower unit costs for low-volume products than is reported by traditional product costing.
  - C. Decreased setup costs being charged to low-volume products.
  - D. Equalizing setup costs for all product lines.
- Answer (A) is **correct**. ABC differs from traditional product costing because it uses multiple allocation bases and therefore allocates overhead more accurately. The result is that ABC often charges low-volume products with more overhead than a traditional system. For example, the cost of machine setup may be the same for production runs of widely varying sizes. This relationship is reflected in an ABC system that allocates setup costs on the basis of the number of setups. However, a traditional system using an allocation base such as machine hours may underallocate setup costs to low-volume products. Many companies adopting ABC have found that they have been losing money on low-volume products because costs were actually higher than originally thought.
  - Answer (B) is **incorrect**. Low-volume products are usually charged with greater unit costs under ABC.
  - Answer (C) is **incorrect**. Greater setup costs are usually charged to low-volume products under ABC.

- Answer (D) is **incorrect**. Setup costs will not be equalized unless setup time is equal for all products.

---

**[Fact Pattern #1]**

Zeta Company is preparing its annual profit plan. As part of its analysis of the profitability of individual products, the controller estimates the amount of overhead that should be allocated to the individual product lines from the information given in the next column:

	Wall Mirrors	Specialty Windows
Units produced	25	25
Material moves per product line	5	15
Direct labor hours per unit	200	200
Budgeted materials handling costs		\$50,000

---

**[12] Gleim #: 2.3.72 -- Source: CMA 694 3-25**

(Refers to Fact Pattern #1)

Under a costing system that allocates overhead on the basis of direct labor hours, Zeta Company's materials handling costs allocated to one unit of wall mirrors would be

- A. \$1,000
- B. \$500
- C. \$2,000
- D. \$5,000

- Answer (A) is **correct**. If direct labor hours are used as the allocation base, the \$50,000 of costs is allocated over 400 hours of direct labor. Multiplying the 25 units of each product times 200 hours results in 5,000 labor hours for each product, or a total of 10,000 hours. Dividing \$50,000 by 10,000 hours results in a cost of \$5 per direct labor hour. Multiplying 200 hours times \$5 results in an allocation of \$1,000 of overhead per unit of product.
- Answer (B) is **incorrect**. The amount of \$500 is the allocation based on number of material moves.
- Answer (C) is **incorrect**. The amount of \$2,000 assumes that all the overhead is allocated to the wall mirrors.
- Answer (D) is **incorrect**. The amount of \$5,000 assumes overhead of \$250,000.

[13] Gleim #: 2.3.73 -- Source: CMA 694 3-26

(Refers to Fact Pattern #1)

Under activity-based costing (ABC), Zeta's materials handling costs allocated to one unit of wall mirrors would be

- A. \$1,000
- B. \$500
- C. \$1,500
- D. \$2,500

- Answer (A) is **incorrect**. The amount of \$1,000 uses direct labor as the allocation basis.
- Answer (B) is **correct**. An activity-based costing (ABC) system allocates overhead costs on the basis of some causal relationship between the incurrence of cost and activities. Because the moves for wall mirrors constitute 25% ( $5 \div 20$ ) of total moves, the mirrors should absorb 25% of the total materials handling costs. Thus, \$12,500 ( $\$50,000 \times 25\%$ ) is allocated to mirrors. The remaining \$37,500 is allocated to specialty windows. Dividing the \$12,500 by 25 units produces a cost of \$500 per unit of mirrors.
- Answer (C) is **incorrect**. The amount of \$1,500 is the allocation per unit of specialty windows.
- Answer (D) is **incorrect**. The amount of \$2,500 is not based on the number of material moves.

[14] Gleim #: 2.3.74 -- Source: CMA 693 3-2

Because of changes that are occurring in the basic operations of many firms, all of the following represent trends in the way indirect costs are allocated **except**

- A. Treating direct labor as an indirect manufacturing cost in an automated factory.
  - B. Using throughput time as an application base to increase awareness of the costs associated with lengthened throughput time.
  - C. Preferring plant-wide application rates that are applied to machine hours rather than incurring the cost of detailed allocations.
  - D. Using several machine cost pools to measure product costs on the basis of time in a machine center.
- Answer (A) is **incorrect**. Computerization has decreased the amount of direct labor to the point that some companies are treating direct labor as an indirect factory overhead cost.

- Answer (B) is **incorrect**. Throughput time (the rate of production over a stated time), clearly drives (influences) costs.
- Answer (C) is **correct**. With the automation of factories and the corresponding emphasis on activity-based costing (ABC), companies are finding new ways of allocating indirect factory overhead. One change is that plant-wide application rates are being used less often because a closer matching of costs with cost drivers provides better information to management. ABC results in a more accurate application of indirect costs because it provides more refined data. Instead of a single cost goal for a process, a department, or even an entire plant, an indirect cost pool is established for each identified activity. The related cost driver, the factor that changes the cost of the activity, also is identified.
- Answer (D) is **incorrect**. Multiple cost pools are preferable. They permit a better matching of indirect costs with cost drivers.

**[17] Gleim #: 2.3.77 -- Source: CMA 1293 3-15**

Multiple or departmental overhead rates are considered preferable to a single or plantwide overhead rate when

- A. Manufacturing is limited to a single product flowing through identical departments in a fixed sequence.
  - B. Various products are manufactured that do not pass through the same departments or use the same manufacturing techniques.
  - C. Cost drivers, such as direct labor, are the same over all processes.
  - D. Individual cost drivers cannot accurately be determined with respect to cause-and-effect relationships.
- 
- Answer (A) is **incorrect**. One rate may be cost beneficial when a single product proceeds through homogeneous processes.
  - Answer (B) is **correct**. Multiple rates are appropriate when a process differs substantially among departments or when products do not go through all departments or all processes. The trend in cost accounting is toward activity-based costing, which divides production into numerous activities and identifies the cost driver(s) most relevant to each. The result is a more accurate tracing of costs.
  - Answer (C) is **incorrect**. If cost drivers are the same for all processes, multiple rates are unnecessary.
  - Answer (D) is **incorrect**. Individual cost drivers for all relationships must be known to use multiple application rates.

**[18] Gleim #: 2.3.78 -- Source: CMA 696 3-30**

New-Rage Cosmetics has used a traditional cost accounting system to apply quality control costs uniformly to all products at a rate of 14.5% of direct labor cost. Monthly direct labor cost for Satin Sheen makeup is \$27,500. In an attempt to distribute quality control costs more equitably, New-Rage is considering activity-based costing. The monthly data shown in the chart below have been gathered for Satin Sheen makeup.

Activity	Cost Driver	Cost Rates	Quantity for Satin Sheen
Incoming material inspection	Type of material	\$11.50 per type	12 types
In-process inspection	Number of units	\$0.14 per unit	17,500 units
Product certification	Per order	\$77 per order	25 orders

The monthly quality control cost assigned to Satin Sheen makeup using activity-based costing (ABC) is

- A. \$88.64 per order.
- B. \$525.50 lower than the cost using the traditional system.
- C. \$8,500.50
- D. \$525.50 higher than the cost using the traditional system.

- Answer (A) is **incorrect**. The ABC assignment of \$4,513 is at a rate of \$180.52 for each of the 25 orders.
- Answer (B) is **incorrect**. ABC yields a higher allocation.
- Answer (C) is **incorrect**. The total is \$4,513 on the ABC basis.
- Answer (D) is **correct**. ABC identifies the causal relationship between the incurrence of cost and activities, determines the drivers of the activities, establishes cost pools related to the drivers and activities, and assigns costs to ultimate cost objects on the basis of the demands (resources or drivers consumed) placed on the activities by those cost objects. Hence, ABC assigns overhead costs based on multiple allocation bases or cost drivers. Under the traditional, single-base system, the amount allocated is \$3,987.50 ( $\$27,500 \times 14.5\%$ ). Under ABC, the amount allocated is \$4,513 [ $(12 \times \$11.50) + (17,500 \times \$0.14) + (25 \times \$77)$ ], or \$525.50 more than under the traditional system.

[21] Gleim #: 2.3.81 -- Source: CMA 0205 2-24

Sanscom Corporation utilizes an activity-based costing system for applying costs to its two products, P and Q. In the assembly department, material handling costs vary directly with the number of parts inserted into the product. Machinery is recalibrated and oiled each weekend regardless of the number of parts inserted during the previous week. Both material handling and machinery maintenance costs are charged to the product on the basis of the number of parts inserted. Due to reengineering of the production process for Product P, the number of insertion parts per finished unit has been reduced. How will the redesign of the production process for Product P affect the activity-based cost of Product Q?

- A. Material handling cost per Q will remain unchanged, and machinery maintenance cost per Q unit will remain unchanged.
  - B. Material handling cost per Q unit will increase, and machinery maintenance cost per Q unit will remain unchanged.
  - C. Material handling cost per Q will remain unchanged, and machinery maintenance cost per Q unit will increase.
  - D. Material handling cost per Q unit will increase, and machinery maintenance cost per Q unit will increase.
- Answer (A) is **incorrect**. The spreading of fixed costs over fewer units of input will cause Q's machinery maintenance cost to increase.
  - Answer (B) is **incorrect**. Material handling cost on a per-unit basis for Q is unaffected by the newly gained efficiency in the process for P.
  - Answer (C) is **correct**. The material handling cost (a variable cost) for both products remains unchanged on a per-unit basis. However, the newly gained efficiency in the production of Product P means the machinery maintenance cost (a fixed cost) of the assembly department is being spread over fewer units of input, so per-unit fixed costs (for both products) will increase.
  - Answer (D) is **incorrect**. The per-unit material handling cost for Q, a variable cost, will not change as a result of the newly gained efficiency in the process for P.

**[22] Gleim #: 2.3.82 -- Source: CMA 0408 2-096**

When using activity-based costing techniques, which one of the following departmental activities would be expected to use machine hours as a cost driver to allocate overhead costs to production?

- A. Plant cafeteria.
- B. Machine setups.
- C. Material handling.
- D. Robotics painting.

- Answer (A) is **incorrect**. Machine hours are irrelevant to the cafeteria.
- Answer (B) is **incorrect**. The number of times the machinery has to be set up bears no relationship to the number of hours of use.
- Answer (C) is **incorrect**. Materials handling is not related to machine hours.
- Answer (D) is **correct**. Machine hours are a direct measure of the level of use of a robotic painting operation.

**[23] Gleim #: 2.3.83 -- Source: CMA 0408 2-125**

A company is considering the implementation of an activity-based costing and management program. The company

- A. Should focus on manufacturing activities and avoid implementation with service-type functions.
- B. Would probably find a lack of software in the marketplace to assist with the related recordkeeping.
- C. Would normally gain added insights into causes of cost.
- D. Would likely use fewer cost pools than it did under more traditional accounting methods.

- Answer (A) is **incorrect**. Activity-based costing is suitable for service-type functions.
- Answer (B) is **incorrect**. Software exists to help firms implement activity-based management.
- Answer (C) is **correct**. One of the benefits of activity-based costing is the discovery of cost relationships that went unnoticed under traditional accounting methods.
- Answer (D) is **incorrect**. Activity-based costing generally results in many more cost pools than under traditional accounting methods.

**[24] Gleim #: 2.3.84 -- Source: CMA 0408 2-140**

All of the following are likely to be used as a cost allocation base in activity-based costing **except** the

- A. Number of different materials used to manufacture the product.
- B. Units of materials used to manufacture the product.
- C. Number of vendors supplying the materials used to manufacture the product.
- D. Cost of materials used to manufacture the product.

- Answer (A) is **incorrect**. The number of different materials used to manufacture a product can be a cost driver. Different materials often require different setups and thus a proportional amount of employee time.
- Answer (B) is **incorrect**. The units of materials used to manufacture a product can be a cost driver. Units of material used directly reflects the amount of employee time spent on the production process.
- Answer (C) is **incorrect**. The number of vendors supplying the materials used to manufacture the product can be a cost driver. Each supplier requires servicing by buyers and other personnel, and thus the number of suppliers directly reflects the level of production activity.
- Answer (D) is **correct**. Activity-based costing is founded on the idea that drivers for indirect cost assignment should be based on some level of activity. Cost of materials does not directly reflect a level of a given activity.

**[25] Gleim #: 2.3.85 -- Source: CMA 0408 2-141**

Pelder Products Company manufactures two types of engineering diagnostic equipment used in construction. The two products are based on different technologies, x-ray and ultrasound, but are manufactured in the same factory. Pelder has computed the manufacturing cost of the x-ray and ultrasound products by adding together direct materials, direct labor, and overhead cost applied based on the number of direct labor hours. The factory has three overhead departments that support the single production line that makes both products. Budgeted overhead spending for the departments is as follows:

Department			
Engineering design	Material handling	Setup	Total
\$6,000	\$5,000	\$3,000	<u>\$14,000</u>

Pelder's budgeted manufacturing activities and costs for the period are as follows:

Activity	Product	
	X-Ray	Ultrasound
Units produced and sold	50	100
Direct materials used	\$5,000	\$8,000
Direct labor hours used	100	300
Direct labor cost	\$4,000	\$12,000
Number of parts used	400	600
Number of engineering changes	2	1
Number of product setups	8	7

The budgeted cost to manufacture one ultrasound machine using the activity-based costing method is

- A. \$225
- B. \$264
- C. \$293
- D. \$305

- Answer (A) is **incorrect**. The amount of \$225 results from using x-ray direct labor rather than ultrasound direct labor.

- Answer (B) is **correct**. Charges for direct materials and direct labor are traceable to each type of machine (\$8,000 and \$12,000 respectively for the ultrasound). The departmental costs must be allocated based on each machine's proportional driver level. Engineering design costs can be allocated to the ultrasound machine at a rate of 33.3% [ $1 \div (1 + 2)$ ], material handling at a rate of 60% [ $600 \div (600 + 400)$ ], and setup at a rate of 46.7% [ $7 \div (7 + 8)$ ]. Pelder's cost for a single ultrasound machine can thus be calculated as follows:

	For 100 Units
Direct materials (\$8,000)	\$ 80
Direct labor (\$12,000)	120
Engineering changes ( $\$6,000 \times 33.3\%$ )	20
Material handling ( $\$5,000 \times 60\%$ )	30
Setup ( $\$3,000 \times 46.7\%$ )	14
Total	<u><u>\$264</u></u>

- Answer (C) is **incorrect**. The amount of \$293 results from improperly using the units of production to allocate the engineering, handling, and setup costs.
- Answer (D) is **incorrect**. The amount of \$305 results from improperly using direct labor hours to allocate the engineering, handling, and setup costs.

**[26] Gleim #: 2.3.86 -- Source: CMA 0408 2-142**

The Chocolate Baker specializes in chocolate baked goods. The firm has long assessed the profitability of a product line by comparing revenues to the cost of goods sold. However, Barry White, the firm's new accountant, wants to use an activity-based costing system that takes into consideration the cost of the delivery person. Listed below are activity and cost information relating to two of Chocolate Baker's major products.

	<u>Muffins</u>	<u>Cheesecake</u>
Revenue	\$53,000	\$46,000
Cost of goods sold	26,000	21,000
Delivery Activity:		
Number of deliveries	150	85
Average length of delivery	10 minutes	15 minutes
Cost per hour for delivery	\$20.00	\$20.00

Using activity-based costing, which one of the following statements is correct?

- A. The muffins are \$2,000 more profitable.
  - B. The cheesecakes are \$75 more profitable.
  - C. The muffins are \$1,925 more profitable.
  - D. The muffins have a higher profitability as a percentage of sales and therefore are more advantageous.
- Answer (A) is **incorrect**. Muffins exceed cheesecake by \$2,000 only at the gross margin, not the total profitability, level.
  - Answer (B) is **incorrect**. The total delivery cost for muffins exceeds that of cheesecake by \$75.

- Answer (C) is **correct**. White's first step is to calculate the gross margin on the two products:

	<u>Muffins</u>	<u>Cheesecake</u>
Revenues	\$53,000	\$46,000
Cost of goods sold	(26,000)	(21,000)
Gross margin	<u>\$27,000</u>	<u>\$25,000</u>

The next step is to calculate total delivery cost for each product:

	<u>Muffins</u>	<u>Cheesecake</u>
Number of deliveries	150	85
Times: minutes per delivery	$\times \underline{10}$	$\times \underline{15}$
Total delivery minutes	1,500	1,275
Divided by: minutes per hour	$\div \underline{60}$	$\div \underline{60}$
Total delivery hours	25.00	21.25
Times: delivery cost per hour	$\times \underline{\$20}$	$\times \underline{\$20}$
Total delivery cost	<u>\$500</u>	<u>\$425</u>

The operating profits on these two products, and the difference between them, can now be determined:

Muffins:	$\$27,000 - \$500 =$	\$26,500
Cheesecake:	$\$25,000 - \$425 =$	<u>\$24,575</u>
Excess		<u>\$ 1,925</u>

- Answer (D) is **incorrect**. Muffins ( $\$26,500 \div \$53,000 = 50.0\%$ ) have a lower profitability percentage than cheesecake ( $\$24,575 \div \$46,000 = 53.4\%$ ).

**[Fact Pattern #2]**

Atmel, Inc. manufactures and sells two products. Data with regard to these products are given below.

	<u>Product A</u>	<u>Product B</u>
Units produced and sold	30,000	12,000
Machine hours required per unit	2	3
Receiving orders per product line	50	150
Production orders per product line	12	18
Production runs	8	12
Inspections	20	30

Total budgeted machine hours are 100,000. The budgeted overhead costs are shown below.

Receiving costs	\$450,000
Engineering costs	300,000
Machine setup costs	25,000
Inspection costs	<u>200,000</u>
Total budgeted overhead costs	<u><u>\$975,000</u></u>

**[27] Gleim #: 2.3.87 -- Source: CMA 0408 2-143**

(Refers to Fact Pattern #2)

Using activity-based costing, Atmel's per unit overhead cost allocation of receiving costs for Product A is

- A. \$3.75
- B. \$10.75
- C. \$19.50
- D. \$28.13

- Answer (A) is **correct**. The first step in performing an activity-based costing assignment is to divide the dollar amount of the indirect cost activity in question by the number of units of the appropriate allocation base. Total receiving costs for both products amounted to \$450,000. Between them, Products A and B had 200 (50 + 150) receiving orders. Thus, the allocation rate is \$2,250 per order ( $\$450,000 \div 200$  orders). The amount allocated to Product A is \$112,500 (50 orders  $\times$  \$2,250). Dividing this amount by the number of units of Product A (30,000) results in a per-unit receiving cost of \$3.75.

- Answer (B) is **incorrect**. The amount of \$10.75 is the total per-unit assigned indirect cost for Product A, not just receiving cost.
- Answer (C) is **incorrect**. The amount of \$19.50 results from simply dividing the total budgeted overhead by half the budgeted machine hours.
- Answer (D) is **incorrect**. The amount of \$28.13 is the per-unit receiving cost for Product B.

**[28] Gleim #: 2.3.88 -- Source: CMA 0408 2-156**

(Refers to Fact Pattern #2)

Atmel's cost driver for engineering costs is the number of production orders per product line. Using activity-based costing, the engineering cost per unit for Product B is

- A. \$4.00
- B. \$10.00
- C. \$15.00
- D. \$29.25

- Answer (A) is **incorrect**. The per-unit engineering cost for Product A is \$4.00.
- Answer (B) is **incorrect**. The amount of \$10.00 is the inspection cost, not the engineering cost, per unit.
- Answer (C) is **correct**. The first step in performing an activity-based costing assignment is to divide the dollar amount of the indirect cost activity in question by the number of units of the appropriate allocation base. Total engineering costs for both products amounted to \$300,000. Between them, Products A and B had 30 (12 + 18) production orders. Thus, the allocation rate is \$10,000 per order ( $\$300,000 \div 30$  orders). The amount allocated to Product B is \$180,000 (18 orders  $\times$  \$10,000). Dividing this amount by the number of units of Product B (12,000) results in a per-unit engineering cost of \$15.00.
- Answer (D) is **incorrect**. The amount of \$29.25 results from allocating the total \$975,000 using two bases and then dividing by the units of Product B [ $975,000 \times (12 \div 20) \times (18 \div 30) = 351,000 \div 12,000 = 29.25$ ], which is incorrect.

[1] Gleim #: 2.4.89 -- Source: CMA 1296 3-29

Life-cycle costing

- A. Is sometimes used as a basis for cost planning and product pricing.
  - B. Includes only manufacturing costs incurred over the life of the product.
  - C. Includes only manufacturing cost, selling expense, and distribution expense.
  - D. Emphasizes cost savings opportunities during the manufacturing cycle.
- Answer (A) is **correct**. Life-cycle costing estimates a product's revenues and expenses over its expected life cycle. This approach is especially useful when revenues and related costs do not occur in the same periods. It emphasizes the need to price products to cover all costs, not just those for production. Hence, costs are determined for all value-chain categories: upstream (R&D, design), manufacturing, and downstream (marketing, distribution, and customer service). The result is to highlight upstream and downstream costs in the cost planning process that often receive insufficient attention.
  - Answer (B) is **incorrect**. The life-cycle model includes the upstream (R&D and design) and downstream (marketing, distribution, and customer service) elements of the value chain as well as manufacturing costs.
  - Answer (C) is **incorrect**. The life-cycle model includes the upstream (R&D and design) and downstream (marketing, distribution, and customer service) elements of the value chain as well as manufacturing costs.
  - Answer (D) is **incorrect**. Life-cycle costing emphasizes the significance of locked-in costs, target costing, and value engineering for pricing and cost control. Thus, cost savings at all stages of the life cycle are important.

[2] Gleim #: 2.4.90 -- Source: CMA 697 3-5

Target pricing

- A. Is more effective when applied to mature, long-established products.
  - B. Considers short-term variable costs and excludes fixed costs.
  - C. Is often used when costs are difficult to control.
  - D. Is a pricing strategy used to create competitive advantage.
- Answer (A) is **incorrect**. Target pricing is used on products that have not yet been developed.
  - Answer (B) is **incorrect**. Target pricing considers all costs in the value chain.

- Answer (C) is **incorrect**. Target pricing can be used in any situation, but it is most likely to succeed when costs can be well controlled.
- Answer (D) is **correct**. Target pricing and costing may result in a competitive advantage because it is a customer-oriented approach that focuses on what products can be sold at what prices. It is also advantageous because it emphasizes control of costs prior to their being locked in during the early links in the value chain. The company sets a target price for a potential product reflecting what it believes consumers will pay and competitors will do. After subtracting the desired profit margin, the long-run target cost is known. If current costs are too high to allow an acceptable profit, cost-cutting measures are implemented or the product is abandoned. The assumption is that the target price is a constraint.

**[3] Gleim #: 2.4.91 -- Source: CMA 696 3-15**

In target costing,

- A. The market price of the product is taken as a given.
  - B. Only raw materials, labor, and variable overhead cannot exceed a threshold target.
  - C. Only raw materials cannot exceed a threshold target.
  - D. Raw materials are recorded directly to cost of goods sold.
- Answer (A) is **correct**. Target costing begins with a target price, which is the expected market price given the company's knowledge of its customers and competitors. Subtracting the unit target profit margin determines the long-term target cost. If this cost is lower than the full cost, the company may need to adopt comprehensive cost-cutting measures. For example, in the furniture industry, certain price points are popular with buyers: A couch might sell better at \$400 than at \$200 because consumers question the quality of a \$200 couch and thus will not buy the lower-priced item. The result is that furniture manufacturers view \$400 as the target price of a couch, and the cost must be lower.
  - Answer (B) is **incorrect**. All product cost categories are addressed by target costing.
  - Answer (C) is **incorrect**. All product cost categories are addressed by target costing.
  - Answer (D) is **incorrect**. The manner in which raw materials costs are accounted for is irrelevant.

**[8] Gleim #: 2.4.96 -- Source: CMA 0205 2-25**

Claremont Company has been asked to evaluate the profitability of a product that it manufactured and sold from Year 7 through Year 10. The product had a one-year warranty from date of sale. The following information appears in the financial records.

Research, development, and design cost	Manufacturing and distribution costs	Warranty costs	Warranty cost
<u>Yr 5 &amp; Yr 6</u>	<u>Yr 7 - Yr 10</u>	<u>Yr 7 - Yr 10</u>	<u>Yr 11</u>
\$5,000,000	\$7,000,000	\$200,000	\$100,000

The life-cycle cost for this product is

- A. \$10,000,000
- B. \$12,000,000
- C. \$12,200,000
- D. \$12,300,000

- Answer (A) is **incorrect**. The amount of \$10,000,000 is not supported by the information given.
- Answer (B) is **incorrect**. The amount of \$12,000,000 improperly excludes future warranty costs.
- Answer (C) is **incorrect**. The amount of \$12,200,000 improperly excludes the \$100,000 of warranty costs for Year 11.
- Answer (D) is **correct**. Life-cycle costing takes into account costs incurred at all stages of the value-chain, not just manufacturing. The life-cycle cost for this product is thus \$12,300,000 (\$5,000,000 + \$7,000,000 + \$200,000 + \$100,000).

[1] Gleim #: 3.1.1 -- Source: CMA 1273 4-1

Which of the following statements is true for a firm that uses variable costing?

- A. The cost of a unit of product changes because of changes in number of units manufactured.
- B. Profits fluctuate with sales.
- C. An idle facility variation is calculated.
- D. Product costs include variable administrative costs.

- Answer (A) is **incorrect**. The cost of a unit of product changing owing to a change in the number of units manufactured is a characteristic of absorption costing systems.
- Answer (B) is **correct**. In a variable costing system, only the variable costs are recorded as product costs. All fixed costs are expensed in the period incurred. Because changes in the relationship between production levels and sales levels do not cause changes in the amount of fixed manufacturing cost expensed, profits more directly follow the trends in sales.
- Answer (C) is **incorrect**. Idle facility variation is a characteristic of absorption costing systems.
- Answer (D) is **incorrect**. Neither variable nor absorption costing includes administrative costs in inventory.

[2] Gleim #: 3.1.2 -- Source: CMA 1273 4-2

When a firm prepares financial reports by using absorption costing,

- A. Profits will always increase with increases in sales.
  - B. Profits will always decrease with decreases in sales.
  - C. Profits may decrease with increased sales even if there is no change in selling prices and costs.
  - D. Decreased output and constant sales result in increased profits.
- Answer (A) is **incorrect**. Profit is a function of both sales and production, so it will not always move in the same direction as sales.
  - Answer (B) is **incorrect**. Profit is a function of both sales and production, so it will not always move in the same direction as sales.

- Answer (C) is **correct**. In an absorption costing system, fixed overhead costs are included in inventory. When sales exceed production, more overhead is expensed under absorption costing due to fixed overhead carried over from the prior inventory. If sales increase over production, more than one period's overhead is recognized as expense. Accordingly, if the increase in overhead expensed is greater than the contribution margin of the increased units sold, profit may be lower with an increased level of sales.
- Answer (D) is **incorrect**. Decreased output will increase the unit cost of items sold. Fixed overhead per unit will increase.

**[3] Gleim #: 3.1.3 -- Source: CMA 697 3-3**

Which method of inventory costing treats direct manufacturing costs and manufacturing overhead costs, both variable and fixed, as inventoriable costs?

- A. Direct costing.
- B. Variable costing.
- C. Absorption costing.
- D. Conversion costing.

- Answer (A) is **incorrect**. Variable (direct) costing does not inventory fixed overhead.
- Answer (B) is **incorrect**. Variable (direct) costing does not inventory fixed overhead.
- Answer (C) is **correct**. Absorption (full) costing considers all manufacturing costs to be inventoriable as product costs. These costs include variable and fixed manufacturing costs, whether direct or indirect. The alternative to absorption is known as variable (direct) costing.
- Answer (D) is **incorrect**. Conversion costs include direct labor and overhead but not direct materials.

**[4] Gleim #: 3.1.4 -- Source: CMA 1295 3-28**

The difference between the sales price and total variable costs is

- A. Gross operating profit.
- B. Net profit.
- C. The breakeven point.
- D. The contribution margin.

- Answer (A) is **incorrect**. Gross operating profit is the net result after deducting all manufacturing costs from sales, including both fixed and variable costs.

- Answer (B) is **incorrect**. Net profit is the remainder after deducting from revenue all costs, both fixed and variable.
- Answer (C) is **incorrect**. The breakeven point is the level of sales that equals the sum of fixed and variable costs.
- Answer (D) is **correct**. The contribution margin is calculated by subtracting all variable costs from sales revenue. It represents the portion of sales that is available for covering fixed costs and profit.

**[5] Gleim #: 3.1.5 -- Source: CMA 696 3-20**

The contribution margin is the excess of revenues over

- A. Cost of goods sold.
- B. Manufacturing cost.
- C. Direct cost.
- D. All variable costs.

- Answer (A) is **incorrect**. Revenues minus cost of goods sold is gross profit (margin).
- Answer (B) is **incorrect**. Nonmanufacturing variable costs are also part of the calculation.
- Answer (C) is **incorrect**. A direct cost is a cost that can be feasibly associated with a single cost object.
- Answer (D) is **correct**. Contribution margin is the excess of revenues over all variable costs (including both manufacturing and nonmanufacturing variable costs) that vary with an output-related cost driver. The contribution margin equals the revenues that contribute toward covering the fixed costs and providing a net income.

**[6] Gleim #: 3.1.6 -- Source: CMA 697 3-10**

Which one of the following statements is true regarding absorption costing and variable costing?

- A. Overhead costs are treated in the same manner under both costing methods.
  - B. If finished goods inventory increases, absorption costing results in higher income.
  - C. Variable manufacturing costs are lower under variable costing.
  - D. Gross margins are the same under both costing methods.
- Answer (A) is **incorrect**. Fixed overhead is treated differently under the two methods.

- Answer (B) is **correct**. Under variable costing, inventories are charged only with the variable costs of production. Fixed manufacturing costs are expensed as period costs. Absorption costing charges to inventory all costs of production. If finished goods inventory increases, absorption costing results in higher income because it capitalizes some fixed costs that would have been expensed under variable costing. When inventory declines, variable costing results in higher income because some fixed costs capitalized under the absorption method in prior periods are expensed in the current period.
- Answer (C) is **incorrect**. Variable costs are the same under either method.
- Answer (D) is **incorrect**. Gross margins will be different. Fixed factory overhead is expensed under variable costing and capitalized under the absorption method.

**[7] Gleim #: 3.1.7 -- Source: CMA 1292 3-26**

Jansen, Inc., pays bonuses to its managers based on operating income. The company uses absorption costing, and overhead is applied on the basis of direct labor hours. To increase bonuses, Jansen's managers may do all of the following **except**

- A. Produce those products requiring the most direct labor.
  - B. Defer expenses such as maintenance to a future period.
  - C. Increase production schedules independent of customer demands.
  - D. Decrease production of those items requiring the most direct labor.
- Answer (A) is **incorrect**. Producing more of the products requiring the most direct labor will permit more fixed overhead to be capitalized in the inventory account.
  - Answer (B) is **incorrect**. Deferring expenses such as maintenance will increase income in the current period (but may result in long-range losses caused by excessive down-time).
  - Answer (C) is **incorrect**. Increasing production without a concurrent increase in demand applies more fixed costs to inventory.
  - Answer (D) is **correct**. Under an absorption costing system, income can be manipulated by producing more products than are sold because more fixed manufacturing overhead will be allocated to the ending inventory. When inventory increases, some fixed costs are capitalized rather than expensed. Decreasing production, however, will result in lower income because more of the fixed manufacturing overhead will be expensed.

[8] Gleim #: 3.1.8 -- Source: CMA 1292 3-6

The costing method that is properly classified for both external and internal reporting purposes is

	External Reporting	Internal Reporting
A. Activity-based costing	No	Yes
B. Job-order costing	No	Yes
C. Variable costing	No	Yes
D. Process costing	No	No

- Answer (A) is **incorrect**. ABC is appropriate for external as well as internal purposes.
- Answer (B) is **incorrect**. Job-order costing is acceptable for external reporting purposes.
- Answer (C) is **correct**. Activity-based costing, job-order costing, process costing, and standard costing can all be used for both internal and external purposes. Variable costing is not acceptable under GAAP for external reporting purposes.
- Answer (D) is **incorrect**. Process costing is acceptable for external reporting purposes.

[9] Gleim #: 3.1.9 -- Source: CMA 1292 3-5

Absorption costing and variable costing are two different methods of assigning costs to units produced. Of the four cost items listed below, identify the one that is **not** correctly accounted for as a product cost.

	Part of Product Cost Under	
	Absorption Costing	Variable Costing
A. Manufacturing supplies	Yes	Yes
B. Insurance on factory	Yes	No
C. Direct labor cost	Yes	Yes
D. Packaging and shipping costs	Yes	Yes

- Answer (A) is **incorrect**. Manufacturing supplies are variable costs inventoried under both methods.
- Answer (B) is **incorrect**. Factory insurance is a fixed manufacturing cost inventoried under absorption costing but written off as a period cost under variable costing.
- Answer (C) is **incorrect**. Direct labor cost is a product cost under both methods.

- Answer (D) is **correct**. Under absorption costing, all manufacturing costs, both fixed and variable, are treated as product costs. Under variable costing, only variable costs of manufacturing are inventoried as product costs. Fixed manufacturing costs are expensed as period costs. Packaging and shipping costs are not product costs under either method because they are incurred after the goods have been manufactured. Instead, they are included in selling and administrative expenses for the period.

**[10] Gleim #: 3.1.10 -- Source: CMA 0205 2-18**

Which one of the following is an advantage of using variable costing?

- A. Variable costing complies with the U.S. Internal Revenue Code.
  - B. Variable costing complies with generally accepted accounting principles.
  - C. Variable costing makes cost-volume relationships more easily apparent.
  - D. Variable costing is more relevant to long-run pricing strategies.
- Answer (A) is **incorrect**. Absorption costing is required for tax purposes.
  - Answer (B) is **incorrect**. GAAP reporting requires absorption costing.
  - Answer (C) is **correct**. Under variable costing, only the variable costs of manufacturing attach to the units of output; fixed costs are expensed in the period in which they are incurred. Thus, the variations in cost directly attributable to changes in production level are immediately apparent under variable costing.
  - Answer (D) is **incorrect**. Long-run pricing is dependent upon decisions about fixed costs, which are not the focus of variable costing.

**[11] Gleim #: 3.1.11 -- Source: CMA 0205 2-19**

Huntington Corporation pays bonuses to its managers based on operating income, as calculated under variable costing. It is now 2 months before year end, and earnings have been depressed for some time. Which one of the following actions should Wanda Richards, production manager, definitely implement if she desires to maximize her bonus for this year?

- A. Step up production so that more manufacturing costs are deferred into inventory.
- B. Cut \$2.3 million of advertising and marketing costs.
- C. Postpone \$1.8 million of discretionary equipment maintenance until next year.
- D. Implement, with the aid of the controller, an activity-based costing and activity-based management system.

- Answer (A) is **incorrect**. The perverse incentive to “produce for inventory” only works under absorption costing.
- Answer (B) is **incorrect**. The production manager has no control over advertising and marketing costs.
- Answer (C) is **correct**. Because the production manager wishes to maximize her bonus for the coming year, the action she must take will necessarily have most of its effect in the short run. The action she should take to achieve this goal is to defer costs under her control until the following period.
- Answer (D) is **incorrect**. Activity-based costing and activity-based management require time, effort, and resources in the short run and only show benefits over the long run.

**[13] Gleim #: 3.1.13 -- Source: CMA 0408 2-094**

Which one of the following is the best reason for using variable costing?

- A. Fixed factory overhead is more closely related to the capacity to produce than to the production of specific units.
  - B. All costs are variable in the long term.
  - C. Variable costing is acceptable for income tax reporting purposes.
  - D. Variable costing usually results in higher operating income than if a company uses absorption costing.
- 
- Answer (A) is **correct**. Fixed factory overhead is more closely related to the capacity to produce than to the production of specific units. Variable costing thus more accurately depicts the variations in cost resulting from changes in the level of output.
  - Answer (B) is **incorrect**. While it is true that “all costs are variable in the long term,” this is not a reason to use variable costing.
  - Answer (C) is **incorrect**. Variable costing is unacceptable for either income tax or external financial reporting purposes.
  - Answer (D) is **incorrect**. Variable costing only results in higher operating income if sales exceed production.

**[14] Gleim #: 3.1.14 -- Source: CMA 0408 2-101**

If a manufacturing company uses variable costing to cost inventories, which of the following costs are considered inventoriable costs?

- A. Only raw material, direct labor, and variable manufacturing overhead costs.
- B. Only raw material, direct labor, and variable and fixed manufacturing overhead costs.
- C. Only raw material, direct labor, variable manufacturing overhead, and variable selling and administrative costs.
- D. Only raw material and direct labor costs.

- Answer (A) is **correct**. Under variable costing, only variable costs (direct materials, direct labor, and variable overhead) are considered product costs.
- Answer (B) is **incorrect**. Under variable costing, fixed overhead is not treated as a product cost.
- Answer (C) is **incorrect**. Under variable costing, variable S&A is not treated as a product cost.
- Answer (D) is **incorrect**. Under variable costing, variable overhead is also treated as a product cost.

**[15] Gleim #: 3.1.15 -- Source: CMA 0408 2-102**

Manchester Airlines is in the process of preparing a contribution margin income statement that will allow a detailed look at its variable costs and profitability of operations. Which one of the following cost combinations should be used to evaluate the variable cost per flight of the company's Boston-Las Vegas flights?

- A. Flight crew salary, fuel, and engine maintenance.
- B. Fuel, food service, and airport landing fees.
- C. Airplane depreciation, baggage handling, and airline marketing.
- D. Communication system operation, food service, and ramp personnel.

- Answer (A) is **incorrect**. Flight crew salaries do not vary with the number of trips or miles (fixed cost).
- Answer (B) is **correct**. Fuel, food service, and airport landing fees are all variable and traceable to individual flights.
- Answer (C) is **incorrect**. Marketing costs for the airline cannot be traced to individual trips.

- Answer (D) is **incorrect**. Communication system operation and ramp personnel do not vary with the number of trips or miles (fixed cost).

**[16] Gleim #: 3.1.16 -- Source: CMA 0408 2-103**

Xylon Company uses direct (variable) costing for internal reporting and absorption costing for the external financial statements. A review of the firm's internal and external disclosures will likely find

- A. A difference in the treatment of fixed selling and administrative costs.
  - B. A higher inventoriable unit cost reported to management than to the shareholders.
  - C. A contribution margin rather than gross margin in the reports released to shareholders.
  - D. Internal income figures that vary closely with sales and external income figures that are influenced by both units sold and productive output.
- Answer (A) is **incorrect**. Fixed S&A expenses are treated as period costs under both systems.
  - Answer (B) is **incorrect**. Depending on the firm's cost structure, higher unit costs can occur under either system.
  - Answer (C) is **incorrect**. Gross margin, not contribution margin, will appear in the reports prepared under the rules for external financial reporting.
  - Answer (D) is **correct**. Under variable costing, only costs that vary with the level of production are treated as product costs. Thus, internal income figures will vary closely with sales. Under absorption costing, all production costs (both variable and fixed) are treated as product costs. Thus, external income figures are influenced by both units sold and productive output.

**[17] Gleim #: 3.1.17 -- Source: CMA 0408 2-105**

Which of the following correctly shows the treatment of (1) factory insurance, (2) direct labor, and (3) finished goods shipping costs under absorption costing and variable costing?

	<u>Absorption Costing</u>		<u>Variable Costing</u>	
	Product	Period	Product	Period
	<u>Cost</u>	<u>Cost</u>	<u>Cost</u>	<u>Cost</u>
A.	1, 2	3	2	1, 3
B.	2	1, 3	1, 2	3
C.	1, 2	3	1	2, 3
D.	1	2, 3	2, 3	1

- Answer (A) is **correct**. Factory insurance (item 1) is a factory operating cost, one of the three components of manufacturing overhead (the other two being indirect materials and indirect labor). Since it is a manufacturing cost, it must be treated as a product cost under absorption costing, and since it is fixed over the relevant range, it must be treated as a period cost under variable costing. Direct labor (item 2) is treated as a product cost under both systems. Finished goods shipping (item 3) is a variable selling and administrative cost, and, as such, is treated as a period cost under both systems.
- Answer (B) is **incorrect**. Factory insurance (a fixed manufacturing cost) must be treated as a product cost under absorption costing and as a period cost under variable costing.
- Answer (C) is **incorrect**. Factory insurance (a fixed manufacturing cost) must be treated as a period cost under variable costing.
- Answer (D) is **incorrect**. Direct labor is treated as a product cost under both systems, and finished goods shipping is also treated as a period cost under both systems.

**[18] Gleim #: 3.1.18 -- Source: CMA 0408 2-113**

When comparing absorption costing with variable costing, the difference in operating income can be explained by the difference between the

- Units sold and the units produced, multiplied by the unit sales price.
- Ending inventory in units and the beginning inventory in units, multiplied by the budgeted fixed manufacturing cost per unit.
- Ending inventory in units and the beginning inventory in units, multiplied by the unit sales price.
- Units sold and the units produced, multiplied by the budgeted variable manufacturing cost per unit.

- Answer (A) is **incorrect**. Inventory is valued according to accumulated costs, not selling price.
- Answer (B) is **correct**. Absorption and variable costing differ in their treatment of fixed overhead: It is capitalized as inventory under absorption costing and not under variable costing. Thus, the difference in operating income between the two can be calculated as the difference between the ending inventory in units and the beginning inventory in units, multiplied by the budgeted fixed manufacturing cost per unit.
- Answer (C) is **incorrect**. Inventory is valued according to accumulated costs, not selling price.
- Answer (D) is **incorrect**. The difference between absorption and variable costing is accounted for by fixed, not variable, manufacturing costs.

**[19] Gleim #: 3.1.19 -- Source: CMA 0408 2-116**

Dawn Company has significant fixed overhead costs in the manufacturing of its sole product, auto mufflers. For internal reporting purposes, in which one of the following situations would ending finished goods inventory be higher under direct (variable) costing rather than under absorption costing?

- A. If more units were produced than were sold during a given year.
  - B. If more units were sold than were produced during a given year.
  - C. In all cases when ending finished goods inventory exists.
  - D. None of these situations.
- 
- Answer (A) is **incorrect**. The monetary value of ending inventory is never higher under direct costing than under absorption costing because fewer costs are capitalized under direct costing.
  - Answer (B) is **incorrect**. The monetary value of ending inventory is never higher under direct costing than under absorption costing because fewer costs are capitalized under direct costing.
  - Answer (C) is **incorrect**. The monetary value of ending inventory is never higher under direct costing than under absorption costing because fewer costs are capitalized under direct costing.
  - Answer (D) is **correct**. The monetary value of ending inventory is never higher under direct costing than under absorption costing because fewer costs are capitalized under direct costing.

---

**[Fact Pattern #1]**

At the end of its fiscal year, Jubal Manufacturing recorded the data below:

Prime cost	\$800,000
Variable manufacturing overhead	100,000
Fixed manufacturing overhead	160,000
Variable selling and other expenses	80,000
Fixed selling and other expenses	40,000

---

**[1] Gleim #: 3.2.20 -- Source: CMA 1286 4-18**

(Refers to Fact Pattern #1)

If Jubal uses variable costing, the inventoriable costs for the fiscal year are

- A. \$800,000
- B. \$900,000
- C. \$980,000
- D. \$1,060,000

- Answer (A) is **incorrect**. The amount of \$800,000 equals only the prime costs.
- Answer (B) is **correct**. The only costs capitalized are the variable costs of manufacturing. Prime costs (direct materials and direct labor) are variable.

Prime costs (direct materials and direct labor)	\$800,000
Variable manufacturing overhead	<u>100,000</u>
Total inventoriable costs	<u><u>\$900,000</u></u>

- Answer (C) is **incorrect**. The amount of \$980,000 includes the variable selling and other expenses.
- Answer (D) is **incorrect**. The amount of \$1,060,000 equals inventoriable costs under absorption costing.

**[2] Gleim #: 3.2.21 -- Source: CMA 1286 4-19**

(Refers to Fact Pattern #1)

Using absorption (full) costing, Jubal's inventoriable costs are

- A. \$800,000
- B. \$900,000
- C. \$1,060,000
- D. \$1,180,000

- Answer (A) is **incorrect**. The amount of \$800,000 equals only prime costs.
- Answer (B) is **incorrect**. The amount of \$900,000 equals inventoriable costs under variable costing.
- Answer (C) is **correct**. The absorption method is required for financial statements prepared according to GAAP. It charges all costs of production to inventories. The prime costs of \$800,000, variable manufacturing overhead of \$100,000, and the fixed manufacturing overhead of \$160,000 are included. They total \$1,060,000.
- Answer (D) is **incorrect**. The amount of \$1,180,000 includes the fixed and variable selling and other expenses.

---

**[Fact Pattern #2]**

Osawa, Inc., planned and actually manufactured 200,000 units of its single product during its first year of operations. Variable manufacturing costs were \$30 per unit of product. Planned and actual fixed manufacturing costs were \$600,000, and selling and administrative costs totaled \$400,000. Osawa sold 120,000 units of product at a selling price of \$40 per unit.

---

**[4] Gleim #: 3.2.23 -- Source: CMA 1285 4-14**

(Refers to Fact Pattern #2)

Osawa's operating income using absorption (full) costing is

- A. \$200,000
- B. \$440,000
- C. \$600,000
- D. \$840,000

- Answer (A) is **incorrect**. The amount of \$200,000 is the operating income under variable costing.

- Answer (B) is **correct**. Absorption costing net income is computed as follows:

Sales (120,000 units × \$40)	\$4,800,000
Variable production costs (200,000 units × \$30)	\$6,000,000
Fixed production costs	<u>600,000</u>
Total production costs	\$6,600,000
Ending inventory (80,000 units × \$33)	<u>(2,640,000)</u>
Cost of goods sold	<u>(3,960,000)</u>
Gross profit	\$ 840,000
Selling and administrative expenses	<u>(400,000)</u>
Operating income	<u><u>\$ 440,000</u></u>

- Answer (C) is **incorrect**. The amount of \$600,000 is the operating income that results from capitalizing \$240,000 fixed manufacturing costs and \$160,000 of selling and administrative costs (the \$160,000 is incorrect as all selling and administrative costs should be expensed).
- Answer (D) is **incorrect**. The amount of \$840,000 is the gross profit under absorption costing, i.e., before selling and administrative expenses.

**[5] Gleim #: 3.2.24 -- Source: CMA 1285 4-15**

(Refers to Fact Pattern #2)

Osawa's operating income for the year using variable costing is

- A. \$200,000
- B. \$440,000
- C. \$800,000
- D. \$600,000

- Answer (A) is **correct**. The contribution margin from manufacturing (sales – variable costs) is \$10 (\$40 – \$30) per unit sold, or \$1,200,000 (120,000 units × \$10). The fixed costs of manufacturing (\$600,000) and selling and administrative costs (\$400,000) are deducted from the contribution margin to arrive at an operating income of \$200,000. The difference between the absorption income of \$440,000 and the \$200,000 of variable costing income is attributable to capitalization of the fixed manufacturing costs under the absorption method. Because 40% of the goods produced are still in inventory (80,000 ÷ 200,000), 40% of the \$600,000 in fixed costs, or \$240,000, was capitalized under the absorption method. That amount was expensed under the variable costing method.

- Answer (B) is **incorrect**. The amount of \$440,000 is the operating income under absorption costing.
- Answer (C) is **incorrect**. The amount of \$800,000 is the operating income if fixed costs of manufacturing are not deducted.
- Answer (D) is **incorrect**. The amount of \$600,000 is the operating income that results from capitalizing 40% of both fixed manufacturing costs and selling and administrative costs.

---

**[Fact Pattern #3]**

The following is taken from Fortech Company's records for the fiscal year just ended:

Direct materials used	\$300,000
Direct labor	100,000
Variable manufacturing overhead	50,000
Fixed manufacturing overhead	80,000
Selling and admin. costs--variable	40,000
Selling and admin. costs--fixed	20,000

---

**[6] Gleim #: 3.2.25 -- Source: CMA 1286 4-18**

(Refers to Fact Pattern #3)

If Fortech Company uses variable costing, the inventoriable costs for the fiscal year are

- A. \$400,000
- B. \$450,000
- C. \$490,000
- D. \$530,000

- Answer (A) is **incorrect**. The amount of \$400,000 does not include \$50,000 of variable manufacturing overhead.
- Answer (B) is **correct**. Under variable costing, the only costs that are capitalized are the variable costs of manufacturing. These include

Direct materials used	\$300,000
Direct labor	100,000
Variable manufacturing overhead	<u>50,000</u>
Total inventoriable costs	<u><u>\$450,000</u></u>

- Answer (C) is **incorrect**. The \$40,000 of variable selling and administrative costs should not be included in the inventoriable costs.
- Answer (D) is **incorrect**. The amount of \$530,000 is the inventoriable cost under absorption (full) costing.

**[7] Gleim #: 3.2.26 -- Source: CMA 1286 4-19**

(Refers to Fact Pattern #3)

Using absorption (full) costing, Fortech Company's inventoriable costs are

- A. \$400,000
- B. \$450,000
- C. \$530,000
- D. \$590,000

- Answer (A) is **incorrect**. The amount of \$400,000 does not include \$80,000 of fixed manufacturing overhead and \$50,000 of variable manufacturing overhead.
- Answer (B) is **incorrect**. The amount of \$450,000 is the inventoriable cost under variable costing.
- Answer (C) is **correct**. The absorption method is required for financial statements prepared according to GAAP. It charges all costs of production to inventories. The variable cost of materials of \$300,000, direct labor of \$100,000, variable manufacturing overhead of \$50,000, and the fixed manufacturing overhead of \$80,000 are included. They total \$530,000.
- Answer (D) is **incorrect**. The amount of \$590,000 includes the fixed and variable selling and administrative costs.

---

**[Fact Pattern #4]**

Estimated unit costs for Cole Lab using full absorption costing and operating at a production level of 12,000 units per month:

<u>Cost Item</u>	<u>Estimated Unit Cost</u>
Direct material	\$32
Direct labor	20
Variable manufacturing overhead	15
Fixed manufacturing overhead	6
Variable selling	3
Fixed selling	4

---

**[8] Gleim #: 3.2.27 -- Source: CMA 1283 4-1**

(Refers to Fact Pattern #4)

Cole Lab's estimated conversion costs per unit are

- A. \$35
- B. \$41
- C. \$44
- D. \$48

- Answer (A) is **incorrect**. The amount of \$35 properly includes direct labor but improperly includes only the variable portion of manufacturing overhead.
- Answer (B) is **correct**. Conversion costs consist of labor plus fixed and variable manufacturing overhead. The total is \$41 (\$20 + \$15 + \$6).
- Answer (C) is **incorrect**. The amount of \$44 properly includes direct labor and both components of manufacturing overhead but improperly includes a portion of selling expenses.
- Answer (D) is **incorrect**. The amount of \$48 properly includes direct labor and both components of manufacturing overhead but improperly includes selling expenses.

**[9] Gleim #: 3.2.28 -- Source: CMA 1283 4-2**

(Refers to Fact Pattern #4)

Cole Lab's estimated prime costs per unit are

- A. \$73
- B. \$32
- C. \$67
- D. \$52

- Answer (A) is **incorrect**. The amount of \$73 properly includes direct materials and direct labor but improperly includes manufacturing overhead.
- Answer (B) is **incorrect**. The amount of \$32 properly includes direct materials but improperly excludes direct labor.
- Answer (C) is **incorrect**. The amount of \$67 properly includes direct materials and direct labor but improperly includes a portion of manufacturing overhead.
- Answer (D) is **correct**. Prime costs consist of direct materials and direct labor. The total is \$52 (\$32 + \$20).

---

**[Fact Pattern #5]**

Farber Company employs a normal (nonstandard) absorption cost system. The following information is from the financial records of the company for the year.

- Total manufacturing costs were \$2,500,000.
  - Cost of goods manufactured was \$2,425,000.
  - Applied factory overhead was 30% of total manufacturing costs.
  - Factory overhead was applied to production at a rate of 80% of direct labor cost.
  - Work-in-process inventory at January 1 was 75% of work-in-process inventory at December 31.
-

**[10] Gleim #: 3.2.29 -- Source: CMA 1285 4-26**

(Refers to Fact Pattern #5)

Total cost of direct material used by Farber Company for the year is

- A. \$750,000
- B. \$812,500
- C. \$937,500
- D. \$1,150,000

- Answer (A) is **incorrect**. The amount of \$750,000 is factory overhead ( $30\% \times \$2,500,000$ ).
- Answer (B) is **correct**. Factory overhead is 30% of total manufacturing costs, or \$750,000. Direct labor is \$937,500 ( $750,000 \div 0.8$ ). Thus, raw materials must account for the remaining \$812,500 ( $\$2,500,000 - \$750,000 - \$937,500$ ).
- Answer (C) is **incorrect**. The amount of \$937,500 is the direct labor cost.
- Answer (D) is **incorrect**. The amount of \$1,150,000 is calculated using a direct labor cost of \$600,000, which is incorrectly calculated by multiplying, instead of dividing, factory overhead by 80%.

**[11] Gleim #: 3.2.30 -- Source: CMA 1285 4-27**

(Refers to Fact Pattern #5)

The carrying value of Farber Company's work-in-process inventory at December 31 is

- A. \$300,000.
- B. \$225,000.
- C. \$100,000.
- D. \$75,000.

- Answer (A) is **correct**. Cost of goods manufactured (\$2,425,000) equals total manufacturing costs (\$2,500,000) plus beginning work-in-process (75% of EWIP) minus ending work-in-process. The ending work-in-process is \$300,000.

$$\begin{aligned}\$2,500,000 + .75 \text{ EWIP} - \text{EWIP} &= \$2,425,000 \\ \$2,500,000 - .25 \text{ EWIP} &= \$2,425,000 \\ \text{EWIP} &= \$75,000 \div .25 \\ \text{EWIP} &= \$300,000\end{aligned}$$

- Answer (B) is **incorrect**. The amount of \$225,000 is the value of work-in-process inventory at January 1.

- Answer (C) is **incorrect**. The amount of \$100,000 is calculated without taking the ending work-in-process inventory into account.
- Answer (D) is **incorrect**. The amount of \$75,000 equals total manufacturing costs of goods manufactured. However, the cost of goods manufactured equals total manufacturing costs plus BWIP minus EWIP.

**[12] Gleim #: 3.2.31 -- Source: CMA 1285 4-25**

(Refers to Fact Pattern #5)

Farber Company's total direct labor cost for the year is

- A. \$750,000
- B. \$600,000
- C. \$909,375
- D. \$937,500

- Answer (A) is **incorrect**. The amount of \$750,000 equals the factory overhead.
- Answer (B) is **incorrect**. The amount of \$600,000 is calculated by multiplying factory overhead of \$750,000 by 80%.
- Answer (C) is **incorrect**. The amount of \$909,375 is calculated by applying 30% to costs of goods manufactured, not total manufacturing costs, to determine factory overhead.
- Answer (D) is **correct**. Total manufacturing cost of \$2,500,000 is composed of raw materials, direct labor, and factory overhead. Factory overhead is 30% of total manufacturing costs, or \$750,000. If factory overhead is 80% of direct labor cost, direct labor cost is \$937,500 ( $\$750,000 \div 80\%$ ).

**[Fact Pattern #6]**

Valyn Corporation employs an absorption costing system for internal reporting purposes; however, the company is considering using variable costing. Data regarding Valyn's planned and actual operations for the calendar year are presented below.

	<u>Planned Activity</u>	<u>Actual Activity</u>
Beginning finished goods inventory in units	35,000	35,000
Sales in units	140,000	125,000
Production in units	140,000	130,000

The planned per-unit cost figures shown in the schedule were based on the estimated production and sale of 140,000 units for the year. Valyn uses a predetermined manufacturing overhead rate for applying manufacturing overhead to its product; thus, a combined manufacturing overhead rate of \$9.00 per unit was employed for absorption costing purposes. Any over- or underapplied manufacturing overhead is closed to the cost of goods sold account at the end of the reporting year.

	<u>Planned Costs</u>		<u>Incurred Costs</u>
	<u>Per Unit</u>	<u>Total</u>	
Direct materials	\$12.00	\$1,680,000	\$1,560,000
Direct labor	9.00	1,260,000	1,170,000
Variable manufacturing overhead	4.00	560,000	520,000
Fixed manufacturing overhead	5.00	700,000	715,000
Variable selling expenses	8.00	1,120,000	1,000,000
Fixed selling expenses	7.00	980,000	980,000
Variable administrative expenses	2.00	280,000	250,000
Fixed administrative expenses	3.00	420,000	425,000
<b>Total</b>	<u><b>\$50.00</b></u>	<u><b>\$7,000,000</b></u>	<u><b>\$6,620,000</b></u>

The beginning finished goods inventory for absorption costing purposes was valued at the previous year's planned unit manufacturing cost, which was the same as the current year's planned unit manufacturing cost. There are no work-in-process inventories at either the beginning or the end of the year. The planned and actual unit selling price for the current year was \$70.00 per unit.

**[13] Gleim #: 3.2.32 -- Source: CMA 1290 3-24**

(Refers to Fact Pattern #6)

The value of Valyn Corporation's actual ending finished goods inventory on the absorption costing basis was

- A. \$900,000
- B. \$1,200,000
- C. \$1,220,000
- D. \$1,350,000

- Answer (A) is **incorrect**. Ending inventory was \$1,200,000.
- Answer (B) is **correct**. Under the absorption method, unit cost is \$30 (\$12 direct materials + \$9 direct labor + \$4 variable overhead + \$5 fixed overhead). Given beginning inventory of 35,000 units, the ending inventory equals 40,000 units (35,000 BI + 130,000 produced – 125,000 sold). Hence, ending inventory was \$1,200,000 (40,000 units × \$30).
- Answer (C) is **incorrect**. Ending inventory was \$1,200,000.
- Answer (D) is **incorrect**. Ending inventory was \$1,200,000.

**[14] Gleim #: 3.2.33 -- Source: CMA 1290 3-28**

(Refers to Fact Pattern #6)

Valyn Corporation's total fixed costs expensed this year on the absorption costing basis were

- A. \$2,095,000
- B. \$2,120,000
- C. \$2,055,000
- D. \$2,030,000

- Answer (A) is **correct**. Under the absorption method, all selling and administrative fixed costs are charged to the current period. Accordingly, \$980,000 of selling expenses and \$425,000 of actual fixed administrative expenses were expensed during the year. The fixed manufacturing costs must be calculated after giving consideration to the increase in inventory during the period (some fixed costs were capitalized) and to the underapplied overhead. The beginning finished goods inventory included 35,000 units, each of which had absorbed \$5 of fixed manufacturing overhead. Each unit produced during the year also absorbed \$5 of fixed manufacturing overhead. Given that 125,000 of those units were sold, cost of goods sold was debited for \$625,000 of fixed overhead (125,000 units  $\times$  \$5). At year end, the underapplied overhead was also added to cost of goods sold. Because production was expected to be 140,000 units, the overhead application rate for the \$700,000 of planned fixed manufacturing overhead was \$5 per unit. Only 130,000 units were manufactured. Hence, \$650,000 (130,000 units  $\times$  \$5) of overhead was applied to units in process. Because inventory increased from 35,000 to 40,000 units (35,000 BI + 130,000 produced – 125,000 sold), \$25,000 (5,000-unit increase  $\times$  \$5) of the applied fixed manufacturing overhead for the period was inventoried, not expensed. Actual overhead was \$715,000, so the underapplied overhead was \$65,000 (\$715,000 – \$650,000). This amount was charged to cost of goods sold at year end. The total of the fixed costs expensed was therefore \$2,095,000 (\$980,000 selling expenses + \$425,000 administrative expenses + \$625,000 standard manufacturing overhead costs of units sold + \$65,000 underapplied overhead).
- Answer (B) is **incorrect**. The total fixed costs on the absorption costing basis were \$2,095,000.
- Answer (C) is **incorrect**. The total fixed costs on the absorption costing basis were \$2,095,000.
- Answer (D) is **incorrect**. The total fixed costs on the absorption costing basis were \$2,095,000.

**[15] Gleim #: 3.2.34 -- Source: CMA 1290 3-25**

(Refers to Fact Pattern #6)

The value of Valyn Corporation's actual ending finished goods inventory on the variable costing basis was

- A. \$1,400,000
- B. \$1,125,000
- C. \$1,000,000
- D. \$750,000

- Answer (A) is **incorrect**. Ending inventory was \$1,000,000.

- Answer (B) is **incorrect**. Ending inventory was \$1,000,000.
- Answer (C) is **correct**. Using variable costing, the unit cost of ending inventory is \$25 (\$12 direct materials + \$9 direct labor + \$4 variable overhead). Given beginning inventory of 35,000 units, the ending inventory equals 40,000 units (35,000 BI + 130,000 produced – 125,000 sold). Thus, ending inventory was \$1,000,000 (40,000 units × \$25).
- Answer (D) is **incorrect**. Ending inventory was \$1,000,000.

**[16] Gleim #: 3.2.35 -- Source: CMA 1290 3-29**

(Refers to Fact Pattern #6)

Valyn Corporation's absorption costing operating income was

- A. Higher than variable costing operating income because actual production exceeded actual sales.
  - B. Lower than variable costing operating income because actual production exceeded actual sales.
  - C. Lower than variable costing operating income because actual production was less than planned production.
  - D. Lower than variable costing operating income because actual sales were less than planned sales.
- Answer (A) is **correct**. Absorption costing results in a higher income figure than variable costing whenever production exceeds sales because absorption costing capitalizes some fixed factory overhead as part of inventory. These costs are expensed during the period incurred under variable costing. Consequently, variable costing recognizes greater expenses and lower income when production exceeds sales. The reverse is true when sales exceed production. In that case, the absorption method results in a lower income because some fixed costs of previous periods absorbed by the beginning inventory are expensed in the current period as cost of goods sold. Variable costing income is never burdened with fixed costs of previous periods.
  - Answer (B) is **incorrect**. An increase in inventory results in a higher income under absorption costing.
  - Answer (C) is **incorrect**. The important relationship is between actual production and actual sales, not between actual and planned production.
  - Answer (D) is **incorrect**. Planned sales do not determine actual income.

**[17] Gleim #: 3.2.36 -- Source: CMA 1290 3-26**

(Refers to Fact Pattern #6)

Valyn Corporation's actual manufacturing contribution margin calculated on the variable costing basis was

- A. \$4,375,000
- B. \$4,935,000
- C. \$4,910,000
- D. \$5,625,000

- Answer (A) is **incorrect**. The variable costing contribution margin was \$5,625,000.
- Answer (B) is **incorrect**. The variable costing contribution margin was \$5,625,000.
- Answer (C) is **incorrect**. The variable costing contribution margin was \$5,625,000.
- Answer (D) is **correct**. At \$70 per unit, actual sales revenue was \$8,750,000 for 125,000 units. Actual variable costs of manufacturing were \$25 per unit (\$12 + \$9 + \$4). The unit costs incurred for the actual production level of 130,000 units were the same as the unit costs for a planned production level of 140,000 units. These unit costs were the same for units manufactured in both the current and previous year. For example, total planned direct materials cost for 140,000 units was \$1,680,000, or \$12 per unit. The incurred unit cost was also \$12 (\$1,560,000 ÷ 130,000 units). Thus, total variable manufacturing cost was \$3,125,000 (125,000 units × \$25). Consequently, manufacturing contribution margin was \$5,625,000 (\$8,750,000 – \$3,125,000).

**[18] Gleim #: 3.2.37 -- Source: CMA 1290 3-27**

(Refers to Fact Pattern #6)

The total variable cost currently expensed by Valyn Corporation on the variable costing basis was

- A. \$4,375,000
- B. \$4,500,000
- C. \$4,325,000
- D. \$4,550,000

- Answer (A) is **correct**. The unit variable manufacturing cost was \$25 (\$12 direct materials + \$9 direct labor + \$4 variable overhead). Other variable costs included selling expenses (\$8 per unit) and administrative expenses (\$2 per unit). The unit selling and administrative costs actually incurred for sales of 125,000 units were the same as the planned unit costs. For example, actual unit variable selling expense was \$8 ( $\$1,000,000 \div 125,000$  units sold), which equaled the planned unit cost. Thus, total unit variable cost was \$35 (\$25 + \$8 + \$2). The total expensed was \$4,375,000 (125,000 units sold  $\times$  \$35).
- Answer (B) is **incorrect**. The total variable cost expensed on the variable costing basis was \$4,375,000.
- Answer (C) is **incorrect**. The total variable cost expensed on the variable costing basis was \$4,375,000.
- Answer (D) is **incorrect**. The total variable cost expensed on the variable costing basis was \$4,375,000.

[19] Gleim #: 3.2.38 -- Source: CMA 1290 3-30

(Refers to Fact Pattern #6)

The difference between Valyn Corporation's operating income calculated on the absorption costing basis and calculated on the variable costing basis was

- A. \$65,000
- B. \$25,000
- C. \$40,000
- D. \$90,000

- Answer (A) is **incorrect**. The difference between absorption costing and variable costing income was \$25,000.
- Answer (B) is **correct**. The difference is caused by the capitalization of some of the fixed manufacturing overhead. When inventories increase during the period, the absorption method capitalizes that overhead and transfers it to future periods. The variable costing method expenses it in the current period. Inventories increased by 5,000 units during the period, and each of those units would have included \$5 of fixed manufacturing overhead under absorption costing. Accordingly, \$25,000 of fixed manufacturing overhead would have been capitalized. Recognizing \$25,000 of fixed costs in the balance sheet instead of the income statement results in a \$25,000 difference in income between the two costing methods.
- Answer (C) is **incorrect**. The difference between absorption costing and variable costing income was \$25,000.

- Answer (D) is **incorrect**. The difference between absorption costing and variable costing income was \$25,000.

**[20] Gleim #: 3.2.39 -- Source: CMA 0408 2-037**

Troughton Company manufactures radio-controlled toy dogs. Summary budget financial data for Troughton for the current year are as follows:

Sales (5,000 units at \$150 each)	\$750,000
Variable manufacturing cost	400,000
Fixed manufacturing cost	100,000
Variable selling and administrative cost	80,000
Fixed selling and administrative cost	150,000

Troughton uses an absorption costing system with overhead applied based on the number of units produced, with a denominator level of activity of 5,000 units. Underapplied or overapplied manufacturing overhead is written off to cost of goods sold in the year incurred. The \$20,000 budgeted operating income from producing and selling 5,000 toy dogs planned for this year is of concern to Trudy George, Troughton's president. She believes she could increase operating income to \$50,000 (her bonus threshold) if Troughton produces more units than it sells, thus building up the finished goods inventory. How much of an increase in the number of units in the finished goods inventory would be needed to generate the \$50,000 budgeted operating income?

- A. 556 units.
- B. 600 units.
- C. 1,500 units.
- D. 7,500 units.

- Answer (A) is **incorrect**. The figure 556 results from using all costs, not just the fixed manufacturing costs.
- Answer (B) is **incorrect**. The figure 600 results from including fixed S&A expenses in the per-unit cost calculation.
- Answer (C) is **correct**. The president intends to engineer her bonus by "producing for inventory," that is, taking advantage of the fact that, under absorption costing, fixed costs can be piled up in ending inventory (this is why performance should be measured internally using variable costing). Each additional unit produced but left unsold adds to operating income its incremental amount of fixed production cost. Fixed production costs in Troughton's relevant range are \$20 per unit ( $\$100,000 \div 5,000$  units). Thus, to generate \$30,000 additional operating income, 1,500 units ( $\$30,000 \div \$20$ ) must be produced and moved to ending inventory.

- Answer (D) is **incorrect**. The figure 7,500 results from dividing fixed selling and administrative costs, rather than incremental operating income, by the \$20 per unit fixed production costs.

**[21] Gleim #: 3.2.40 -- Source: CMA 0408 2-104**

The marketing manager of Ames Company has learned the following about a new product that is being introduced by Ames: Sales of this product are planned at \$100,000 for the first year. Sales commission expense is budgeted at 8% of sales plus the marketing manager's incentive budgeted at an additional 1/2%. The preparation of a product brochure will require 20 hours of marketing salaried staff time at an average rate of \$100 per hour, and 10 hours at \$150 per hour for an outside illustrator's effort. The variable marketing cost for this new product will be

- A. \$8,000
- B. \$8,500
- C. \$10,000
- D. \$10,500

- Answer (A) is **incorrect**. The amount of \$8,000 results from failing to include the marketing manager's incentive.
- Answer (B) is **correct**. The variable marketing costs for the new product consist of sales commissions and the marketing manager's incentive ( $\$100,000 \times 8.5\% = \$8,500$ ).
- Answer (C) is **incorrect**. The amount of \$10,000 results from failing to include the marketing manager's incentive and from improperly including the salaried (i.e., fixed) marketing staff time.
- Answer (D) is **incorrect**. The amount of \$10,500 results from improperly including the salaried (i.e., fixed) marketing staff time.

---

**[Fact Pattern #7]**

Dremmon Corporation uses a standard cost accounting system. Data for the last fiscal year are as follows:

	<u>Units</u>
Beginning inventory of finished goods	100
Production during the year	700
Sales	750
Ending inventory of finished goods	50
	<u>Per Unit</u>
Product selling price	\$200
Standard variable manufacturing cost	90
Standard fixed manufacturing cost	20*
Budgeted selling and administrative costs (all fixed)	\$45,000

\*Denominator level of activity is 750 units for the year.

There were no price, efficiency, or spending variances for the year, and actual selling and administrative expenses equaled the budget amount. Any volume variance is written off to cost of goods sold in the year incurred. There are no work-in-process inventories.

---

**[22] Gleim #: 3.2.41 -- Source: CMA 0408 2-106**

(Refers to Fact Pattern #7)

If Dremmon uses absorption costing, its operating income earned in the last fiscal year was

- A. \$21,500
- B. \$27,000
- C. \$28,000
- D. \$30,000

- Answer (A) is **correct**. Dremmon's absorption-basis operating income can be calculated as follows:

Sales			\$150,000
Beginning inventory	100 units	@ \$110 =	\$11,000
Variable production costs	700 units	@ \$90 =	63,000
Fixed production costs	700 units	@ \$20 =	14,000
Volume variance writeoff	50 units	@ \$20 =	<u>1,000</u>
Goods available for sale			\$89,000
Less: ending inventory	50 units	@ \$110 =	<u>(5,500)</u>
Absorption cost of goods sold			<u>(83,500)</u>
Gross margin			\$ 66,500
Variable S&A expenses	None		0
Fixed S&A expenses	Fixed		<u>(45,000)</u>
Operating income			<u><u>\$ 21,500</u></u>

- Answer (B) is **incorrect**. The amount of \$27,000 results from including 100 units in ending inventory rather than 50.
- Answer (C) is **incorrect**. The amount of \$28,000 results from including 100 units in ending inventory rather than 50 and from failing to write off the \$1,000 overhead volume variance.
- Answer (D) is **incorrect**. The amount of \$30,000 results from failing to include fixed manufacturing costs in cost of goods sold and failing to subtract ending inventory.

**[23] Gleim #: 3.2.42 -- Source: CMA 0408 2-108**

(Refers to Fact Pattern #7)

If Dremmon uses variable costing, its operating income earned in the last fiscal year was

- A. \$21,500
- B. \$22,500
- C. \$28,000
- D. \$31,000

- Answer (A) is **incorrect**. The amount of \$21,500 is absorption-basis operating income.

- Answer (B) is **correct**. Dremmon's variable-basis operating income can be calculated as follows:

Sales				\$150,000
Beginning inventory	100 units	@	\$90 = \$ 9,000	
Variable production costs	700 units	@	\$90 = 63,000	
Volume variance writeoff	50 units	@	\$20 = <u>1,000</u>	
Goods available for sale				\$73,000
Less: ending inventory	50 units	@	\$90 = <u>(4,500)</u>	
Variable cost of goods sold				(68,500)
Variable S&A expenses	None			<u>0</u>
Contribution margin				\$ 81,500
Fixed production costs	700 units	@	\$20 = (14,000)	
Fixed S&A expenses	Fixed			<u>(45,000)</u>
Operating income				<u><u>\$ 22,500</u></u>

- Answer (C) is **incorrect**. The amount of \$28,000 results from including 100 units in ending inventory rather than 50 and from failing to write off the \$1,000 overhead volume variance.
- Answer (D) is **incorrect**. The amount of \$31,000 results from using 750 units for variable production costs, failing to write off the overhead volume variance, and valuing inventory at \$20 rather than \$90.

[24] Gleim #: 3.2.43 -- Source: CMA 0408 2-107

Chassen Company, a cracker and cookie manufacturer, has the following unit costs for the month of June:

Variable manufacturing cost	Variable marketing cost	Fixed manufacturing cost	Fixed marketing cost
\$5.00	\$3.50	\$2.00	\$4.00

A total of 100,000 units were manufactured during June, 10,000 of which remain in ending inventory. Chassen uses the first-in, first-out (FIFO) inventory method, and the 10,000 units are the only finished goods inventory at month end. Using the full absorption costing method, Chassen's finished goods inventory value would be

- A. \$50,000
- B. \$70,000
- C. \$85,000
- D. \$145,000

- Answer (A) is **incorrect**. The amount of \$50,000 results from including only the variable portion of manufacturing cost.
- Answer (B) is **correct**. Chassen's ending inventory consists of 10,000 units, made up of \$50,000 variable manufacturing cost ( $10,000 \times \$5$ ) and \$20,000 fixed manufacturing cost ( $10,000 \times \$2$ ).
- Answer (C) is **incorrect**. The amount of \$85,000 results from including only the variable portion of manufacturing cost and improperly including a portion of marketing cost.
- Answer (D) is **incorrect**. The amount of \$145,000 results from improperly including marketing costs.

**[25] Gleim #: 3.2.44 -- Source: CMA 0408 2-110**

Bethany Company has just completed the first month of producing a new product but has not yet shipped any of this product. The product incurred variable manufacturing costs of \$5,000,000, fixed manufacturing costs of \$2,000,000, variable marketing costs of \$1,000,000, and fixed marketing costs of \$3,000,000. If Bethany uses the variable cost method to value inventory, the inventory value of the new product will be

- A. \$5,000,000
- B. \$6,000,000
- C. \$8,000,000
- D. \$11,000,000

- Answer (A) is **correct**. Under variable costing, only variable manufacturing costs are capitalized as part of inventory. Thus, Bethany's ending inventory is valued at \$5,000,000.
- Answer (B) is **incorrect**. The amount of \$6,000,000 results from improperly including a portion of marketing costs.
- Answer (C) is **incorrect**. The amount of \$8,000,000 results from improperly including costs other than variable manufacturing costs.
- Answer (D) is **incorrect**. The amount of \$11,000,000 results from improperly including costs other than variable manufacturing costs.

---

**[Fact Pattern #8]**

Consider the following situation for Weisman Corporation for the prior year:

- The company produced 1,000 units and sold 900 units, both as budgeted.
- There were no beginning or ending work-in-process inventories and no beginning finished goods inventory.
- Budgeted and actual fixed costs were equal, all variable manufacturing costs are affected by volume of production only, and all variable selling costs are affected by sales volume only.
- Budgeted per unit revenues and costs were as follows.

	<u>Per Unit</u>
Sales price	\$100
Direct materials	30
Direct labor	20
Variable manufacturing overhead	10
Fixed manufacturing overhead	5
Variable selling costs	12
Fixed selling costs (\$3,600 total)	4
Fixed administrative costs (\$1,800 total)	2

---

**[26] Gleim #: 3.2.45 -- Source: CMA 0408 2-111**

(Refers to Fact Pattern #8)

If Weisman uses absorption costing, its operating income earned in the last fiscal year was

- A. \$13,600
- B. \$14,200
- C. \$15,300
- D. \$15,840

- Answer (A) is **incorrect**. The amount of \$13,600 results from using variable direct costing and using 1,000 units rather than 900 for variable selling and administrative costs.
- Answer (B) is **incorrect**. The amount of \$14,200 results from using the variable direct costing method and treating fixed selling and administrative costs as variable.

- Answer (C) is **correct**. Weisman's absorption-basis operating income can be calculated as follows:

Sales	900 units @ \$100 =	\$90,000
Beginning inventory		\$ 0
Variable production costs	1,000 units @ \$60 =	60,000
Fixed production costs	1,000 units @ \$5 =	<u>5,000</u>
Goods available for sale		\$65,000
Less: ending inventory	100 units @ \$65 =	<u>(6,500)</u>
Abs. cost of goods sold		<u>(58,500)</u>
Gross margin		\$31,500
Variable S&A expenses	900 units @ \$12 =	(10,800)
Fixed S&A expenses	900 units @ \$6 =	<u>(5,400)</u>
Operating income		<u><u>\$15,300</u></u>

- Answer (D) is **incorrect**. The amount of \$15,840 results from capitalizing 10% of fixed selling and administrative costs as inventory.

**[27] Gleim #: 3.2.46 -- Source: CMA 0408 2-112**

(Refers to Fact Pattern #8)

If Weisman uses variable costing, its operating income earned in the last fiscal year was

- A. \$13,600
- B. \$14,200
- C. \$14,800
- D. \$15,300

- Answer (A) is **incorrect**. The amount of \$13,600 results from improperly basing variable selling costs on 1,000 units instead of the 900 units actually sold.
- Answer (B) is **incorrect**. The amount of \$14,200 results from improperly treating fixed S&A expenses as variable.

- Answer (C) is **correct**. Weisman's variable-basis operating income can be calculated as follows:

Sales	900 units @ \$100 =	\$90,000
Beginning inventory		\$ 0
Variable production costs	1,000 units @ \$60 =	<u>60,000</u>
Goods available for sale		\$60,000
Less: ending inventory	100 units @ \$60 =	<u>(6,000)</u>
Var. cost of goods sold		(54,000)
Variable S&A expenses	900 units @ \$12 =	<u>(10,800)</u>
Contribution margin		\$ 25,200
Fixed production costs	1,000 units @ \$5 =	(5,000)
Fixed S&A expenses	900 units @ \$6 =	<u>(5,400)</u>
Operating income		<u><u>\$14,800</u></u>

- Answer (D) is **incorrect**. The amount of \$15,300 is absorption-basis operating income.

**[28] Gleim #: 3.2.47 -- Source: CMA 0408 2-114**

Mill Corporation had the following unit costs for the recently concluded calendar year:

	<u>Variable</u>	<u>Fixed</u>
Manufacturing	\$8.00	\$3.00
Nonmanufacturing	\$2.00	\$5.50

Inventory for Mill's sole product totaled 6,000 units on January 1 and 5,200 units on December 31. When compared to variable costing income, Mill's absorption costing income is

- A. \$2,400 lower.
- B. \$2,400 higher.
- C. \$6,800 lower.
- D. \$6,800 higher.

- Answer (A) is **correct**. The difference in operating income between the absorption-costing basis and the variable-costing basis can be calculated as the difference between the ending inventory in units and the beginning inventory in units ( $6,000 - 5,200 = 800$ ), multiplied by the budgeted fixed manufacturing cost per unit (\$3), for a total difference of \$2,400. Under absorption costing, this amount is embedded in ending inventory; under variable costing, on the other hand, it is expensed as a period cost. Thus, operating income under absorption costing will be lower whenever ending inventory contracts.
- Answer (B) is **incorrect**. If there is a balance in either beginning or ending inventory, operating income will be lower under absorption costing than under variable costing.
- Answer (C) is **incorrect**. The amount of \$6,800 results from multiplying the difference in beginning and ending inventory by all fixed costs rather than by only fixed manufacturing cost.
- Answer (D) is **incorrect**. The amount of \$6,800 results from multiplying the difference in beginning and ending inventory by all fixed costs rather than by only fixed manufacturing cost; also, if there is a balance in either beginning or ending inventory, operating income will be lower under absorption costing than under variable costing.

**[29] Gleim #: 3.2.48 -- Source: CMA 0408 2-115**

During the month of May, Robinson Corporation sold 1,000 units. The cost per unit for May was as follows:

	<u>Cost per Unit</u>
Direct materials	\$ 5.50
Direct labor	3.00
Variable manufacturing overhead	1.00
Fixed manufacturing overhead	1.50
Variable administrative costs	.50
Fixed administrative costs	<u>3.50</u>
Total	<u><u>\$15.00</u></u>

May's income using absorption costing was \$9,500. The income for May, if variable costing had been used, would have been \$9,125. The number of units Robinson produced during May was

- A. 750
- B. 925
- C. 1,075
- D. 1,250

- Answer (A) is **incorrect**. The figure of 750 is the difference, not the sum, of units sold and ending inventory.
- Answer (B) is **incorrect**. The figure of 925 results from using all fixed costs instead of only the fixed manufacturing costs and then subtracting the units sold rather than adding them.
- Answer (C) is **incorrect**. The figure of 1,075 results from using all fixed costs instead of only the fixed manufacturing costs.
- Answer (D) is **correct**. The difference between absorption-basis and variable-basis operating income ( $\$9,500 - \$9,125 = \$375$ ) is equal to the change in inventory for the period (in units) multiplied by fixed manufacturing cost per unit. Stated another way, the difference in operating incomes divided by fixed per-unit manufacturing cost equals the change in ending inventory ( $\$375 \div \$1.50 = 250$  units). Since 1,000 units were sold and ending inventory increased by 250 units, 1,250 units were produced ( $1,000 + 250$ ).

**[30] Gleim #: 3.2.49 -- Source: CMA 1294 4-4**

The following information relates to Clyde Corporation, which produced and sold 50,000 units during a recent accounting period:

Sales	\$850,000
Manufacturing costs:	
Fixed	210,000
Variable	140,000
Selling and administrative costs:	
Fixed	300,000
Variable	45,000
Income tax rate	40%

For the next accounting period, if production and sales are expected to be 40,000 units, the company should anticipate a contribution margin per unit of

- A. \$1.86
- B. \$3.10
- C. \$7.30
- D. \$13.30

- Answer (A) is **incorrect**. This is an after-tax amount based on the inclusion of all fixed costs in the calculation.
- Answer (B) is **incorrect**. This amount is erroneously based on the inclusion of all fixed costs in the calculation of the UCM.

- Answer (C) is **incorrect**. Including the \$300,000 of fixed S&A costs in the calculation of the UCM results in \$7.30.
- Answer (D) is **correct**. Unit contribution margin is the difference between unit selling price and unit variable cost. Unit selling price is \$17 ( $\$850,000 \div 50,000$  units), and unit variable cost is \$3.70 [ $(\$140,000 \text{ variable manufacturing cost} + \$45,000 \text{ variable S\&A cost}) \div 50,000$  units sold]. Accordingly, unit contribution margin is \$13.30 ( $\$17 - \$3.70$ ).

---

**[Fact Pattern #9]**

Kator Co. is a manufacturer of industrial components. One of their products that is used as a subcomponent in auto manufacturing is KB-96. This product has the following financial structure per unit:

Selling price	<u>\$150</u>
Direct materials	\$ 20
Direct labor	15
Variable manufacturing overhead	12
Fixed manufacturing overhead	30
Shipping and handling	3
Fixed selling and administrative	<u>10</u>
Total costs	<u><u>\$ 90</u></u>

Kator Co. has received a special, one-time order for 1,000 KB-96 parts.

---

**[31] Gleim #: 3.2.50 -- Source: CMA 1296 4-3**

(Refers to Fact Pattern #9)

During the next year, KB-96 sales are expected to be 10,000 units. All of the costs will remain the same except that fixed manufacturing overhead will increase by 20% and direct materials will increase by 10%. The selling price per unit for next year will be \$160. Based on this data, the contribution margin from KB-96 for next year will be

- A. \$620,000
- B. \$750,000
- C. \$1,080,000
- D. \$1,110,000

- Answer (A) is **incorrect**. The amount of \$620,000 includes all fixed costs.
- Answer (B) is **incorrect**. The amount of \$750,000 includes all manufacturing costs.

- Answer (C) is **correct**. Contribution margin equals sales minus variable costs. All variable costs will remain the same except that direct materials will increase to \$22 per unit ( $1.1 \times \$20$ ). Thus, total unit variable costs will be \$52 ( $\$22 + \$15 + \$12 + \$3$ ), and the contribution margin will be \$1,080,000 [10,000 units ( $\$160$  unit selling price – \$52)].
- Answer (D) is **incorrect**. The amount of \$1,110,000 assumes that the fixed costs and shipping and handling are the only relevant costs.

[2] Gleim #: 3.3.54 -- Source: CMA 1292 3-4

In joint-product costing and analysis, which one of the following costs is relevant when deciding the point at which a product should be sold to maximize profits?

- A. Separable costs after the split-off point.
  - B. Joint costs to the split-off point.
  - C. Sales salaries for the period when the units were produced.
  - D. Purchase costs of the materials required for the joint products.
- Answer (A) is **correct**. Joint products are created from processing a common input. Joint costs are incurred prior to the split-off point and cannot be identified with a particular joint product. As a result, joint costs are irrelevant to the timing of sale. However, separable costs incurred after the split-off point are relevant because, if incremental revenues exceed the separable costs, products should be processed further, not sold at the split-off point.
  - Answer (B) is **incorrect**. Joint costs have no effect on the decision as to when to sell a product.
  - Answer (C) is **incorrect**. Sales salaries for the production period do not affect the decision.
  - Answer (D) is **incorrect**. Purchase costs are joint costs.

---

**[Fact Pattern #1]**

Petro-Chem, Inc., is a small company that acquires high-grade crude oil from low-volume production wells owned by individuals and small partnerships. The crude oil is processed in a single refinery into Two Oil, Six Oil, and impure distillates. Petro-Chem does not have the technology or capacity to process these products further and sells most of its output each month to major refineries. There were no beginning inventories of finished goods or work-in-process on November 1. The production costs and output of Petro-Chem for November are shown in the next column.

Crude oil acquired and placed in production	\$5,000,000
Direct labor and related costs	2,000,000
Manufacturing overhead	3,000,000
Production and sales	

- Two Oil, 300,000 barrels produced; 80,000 barrels sold at \$20 each.
- Six Oil, 240,000 barrels produced; 120,000 barrels sold at \$30 each.
- Distillates, 120,000 barrels produced and sold at \$15 each.

---

**[3] Gleim #: 3.3.55 -- Source: CMA 1295 3-29**

(Refers to Fact Pattern #1)

The portion of Petro-Chem's joint production costs assigned to Six Oil based upon physical output would be

- A. \$3,636,000
- B. \$3,750,000
- C. \$1,818,000
- D. \$7,500,000

- Answer (A) is **correct**. The total production costs incurred are \$10,000,000, consisting of crude oil of \$5,000,000, direct labor of \$2,000,000, and manufacturing overhead of \$3,000,000. The total physical output was 660,000 barrels, consisting of 300,000 barrels of Two Oil, 240,000 barrels of Six Oil, and 120,000 barrels of distillates. Thus, the allocation (rounded) is \$3,636,000  $\{ [240,000 \div (300,000 + 240,000 + 120,000)] \times \$10,000,000 \}$ .
- Answer (B) is **incorrect**. The amount of \$3,750,000 is based on the physical quantity of units sold, not units produced.
- Answer (C) is **incorrect**. The figure of \$1,818,000 is the amount that would be assigned to distillates.

- Answer (D) is **incorrect**. Six Oil does not compose 75% of the total output in barrels.

**[4] Gleim #: 3.3.56 -- Source: CMA 1295 3-30**

(Refers to Fact Pattern #1)

The portion of Petro-Chem's joint production costs assigned to Two Oil based upon the relative sales value of output would be

- A. \$4,800,000
- B. \$4,000,000
- C. \$2,286,000
- D. \$2,500,000

- Answer (A) is **incorrect**. The amount of \$4,800,000 is the amount that would be assigned to Six Oil.
- Answer (B) is **correct**. The total production costs incurred are \$10,000,000, consisting of crude oil of \$5,000,000, direct labor of \$2,000,000, and manufacturing overhead of \$3,000,000. The total value of the output is as follows:

Two Oil (300,000 barrels × \$20)	\$ 6,000,000
Six Oil (240,000 barrels × \$30)	7,200,000
Distillates (120,000 barrels × \$15)	<u>1,800,000</u>
Total sales value	<u><u>\$15,000,000</u></u>

Because Two Oil composes 40% of the total sales value (\$6,000,000 ÷ \$15,000,000), it will be assigned 40% of the \$10,000,000 of joint costs, or \$4,000,000.

- Answer (C) is **incorrect**. The amount of \$2,286,000 is based on the relative sales value of units sold.
- Answer (D) is **incorrect**. The amount of \$2,500,000 is based on the physical quantity of barrels sold.

[5] Gleim #: 3.3.57 -- Source: CMA 1293 3-8

The principal disadvantage of using the physical quantity method of allocating joint costs is that

- A. Costs assigned to inventories may have no relationship to value.
  - B. Physical quantities may be difficult to measure.
  - C. Additional processing costs affect the allocation base.
  - D. Joint costs, by definition, should not be separated on a unit basis.
- Answer (A) is **correct**. Joint costs are most often assigned on the basis of relative sales values or net realizable values. Basing allocations on physical quantities, such as pounds, gallons, etc., is usually not desirable because the costs assigned may have no relationship to value. When large items have low selling prices and small items have high selling prices, the large items might always sell at a loss when physical quantities are used to allocate joint costs.
  - Answer (B) is **incorrect**. Physical quantities are usually easy to measure.
  - Answer (C) is **incorrect**. Additional processing costs will have no more effect on the allocation of joint costs based on physical quantities than any other base.
  - Answer (D) is **incorrect**. The purpose of allocating joint costs, under any method, is to separate such costs on a unit basis.

**[Fact Pattern #2]**

Travis Petroleum is a small company that acquires crude oil and manufactures it into three intermediate products, differing only in grade. The products are Grade One, Grade Two, and Grade Three. No beginning inventories of finished goods or work-in-process existed on November 1. The production costs for November were as follows (assume separable costs were negligible):

Crude oil acquired and put into production	\$4,000,000
Direct labor and related costs	2,000,000
Manufacturing overhead	3,000,000

The output and sales for November were as follows:

	<u>Grade One</u>	<u>Grade Two</u>	<u>Grade Three</u>
Barrels produced	300,000	240,000	120,000
Barrels sold	80,000	120,000	120,000
Prices per barrel sold	\$30	\$40	\$50

**[6] Gleim #: 3.3.58 -- Source: Publisher**

(Refers to Fact Pattern #2)

The portion of Travis' joint production costs assigned to Grade Two based upon physical output is (rounded to the nearest thousand dollars)

- A. \$3,273,000
- B. \$3,375,000
- C. \$1,636,000
- D. \$3,512,000

- Answer (A) is **correct**. Total joint production costs incurred were \$9,000,000 (\$4,000,000 + \$2,000,000 + \$3,000,000). The total physical output was 660,000 barrels (300,000 barrels of Grade One + 240,000 barrels of Grade Two + 120,000 barrels of Grade Three). Thus, on a physical output basis, Grade Two should be allocated \$3,273,000  $[(240,000 \div 660,000) \times \$9,000,000]$ .
- Answer (B) is **incorrect**. The amount of \$3,375,000 is based on the physical quantity of units sold, not units produced.

- Answer (C) is **incorrect**. The amount of \$1,636,000 is the amount assigned to Grade Three.
- Answer (D) is **incorrect**. The amount of \$3,512,000 is the amount assigned to Grade Two if the relative sales value method is used.

---

**[Fact Pattern #3]**

Atlas Foods produces the following three supplemental food products simultaneously through a refining process costing \$93,000.

The joint products, Alfa and Betters, have a final selling price of \$4 per pound and \$10 per pound, respectively, after additional processing costs of \$2 per pound of each product are incurred after the split-off point. Morefeed, a by-product, is sold at the split-off point for \$3 per pound.

Alfa	10,000 pounds of Alfa, a popular but relatively rare grain supplement having a caloric value of 4,400 calories per pound
Betters	5,000 pounds of Betters, a flavoring material high in carbohydrates with a caloric value of 11,200 calories per pound
Morefeed	1,000 pounds of Morefeed, used as a cattle feed supplement with a caloric value of 1,000 calories per pound

---

**[11] Gleim #: 3.3.63 -- Source: CMA 1293 3-3**

(Refers to Fact Pattern #3)

Assuming Atlas Foods inventories Morefeed, the by-product, the joint cost to be allocated to Alfa using the net realizable value method is

- A. \$3,000
- B. \$30,000
- C. \$31,000
- D. \$60,000

- Answer (A) is **incorrect**. The amount of \$3,000 is the value of the by-product.

- Answer (B) is **correct**. The NRV at split-off for each of the joint products must be determined. Given that Alfa has a \$4 selling price and an additional \$2 of processing costs, the value at the split-off is \$2 per pound. The total value at split-off for 10,000 pounds is \$20,000. Betters has a \$10 selling price and an additional \$2 of processing costs. Thus, the value at split-off is \$8 per pound. The total value of 5,000 pounds of Betters is therefore \$40,000. The 1,000 pounds of Morefeed has a split-off value of \$3 per pound, or \$3,000. Assuming that Morefeed (a by-product) is inventoried (recognized in the accounts when produced) and treated as a reduction of joint costs, the allocable joint cost is \$90,000 (\$93,000 – \$3,000). (NOTE: Several other methods of accounting for by-products are possible.) The total net realizable value of the main products is \$60,000 (\$20,000 Alfa + \$40,000 Betters). The allocation to Alfa is \$30,000 [ $(\$20,000 \div \$60,000) \times \$90,000$ ].
- Answer (C) is **incorrect**. The amount of \$31,000 fails to adjust the joint processing cost for the value of the by-product.
- Answer (D) is **incorrect**. The amount of \$60,000 is the amount allocated to Betters.

**[12] Gleim #: 3.3.64 -- Source: CMA 1293 3-4**

(Refers to Fact Pattern #3)

Assuming Atlas Foods inventories Morefeed, the by-product, the joint cost to be allocated to Alfa, using the physical quantity method is

- A. \$3,000
- B. \$30,000
- C. \$31,000
- D. \$60,000

- Answer (A) is **incorrect**. The figure of \$3,000 is the value of the by-product.
- Answer (B) is **incorrect**. The figure of \$30,000 is based on the net realizable value method.
- Answer (C) is **incorrect**. The figure of \$31,000 is based on the net realizable value method and fails to adjust the joint processing cost for the value of the by-product.
- Answer (D) is **correct**. Joint cost is \$93,000 and Morefeed has a split-off value of \$3,000 (1,000 pounds  $\times$  \$3 split-off value per pound). Assuming the latter amount is treated as a reduction in joint cost, the allocable joint cost is \$90,000. The total physical quantity (volume) of the two joint products is 15,000 pounds (10,000 Alfa + 5,000 Betters). Hence, \$60,000 of the net joint costs [ $(10,000 \div 15,000) \times \$90,000$ ] should be allocated to Alfa.

**[13] Gleim #: 3.3.65 -- Source: CMA 1293 3-5**

(Refers to Fact Pattern #3)

Assuming Atlas Foods inventories Morefeed, the by-product, the joint cost to be allocated to Betters using the weighted-quantity method based on caloric value per pound is

- A. \$39,208
- B. \$39,600
- C. \$40,920
- D. \$50,400

- Answer (A) is **incorrect**. The figure of \$39,208 is the amount allocated to Alfa if the 1,000,000 calories attributable to Morefeed is included in the computation.
- Answer (B) is **incorrect**. The figure of \$39,600 is the allocation to Alfa.
- Answer (C) is **incorrect**. The figure of \$40,920 is the allocation to Alfa if the sales value of the by-product is not treated as a reduction of joint cost.
- Answer (D) is **correct**. The net allocable joint cost is \$90,000, assuming the value of Morefeed is inventoried and treated as a reduction in joint costs. The caloric value of Alfa is 44,000,000 ( $4,400 \times 10,000$  pounds), the caloric value of Betters is 56,000,000 ( $11,200 \times 5,000$  pounds), and the total is 100,000,000. Of this total volume, Alfa makes up 44% and Betters 56%. Thus, \$50,400 ( $\$90,000 \times 56\%$ ) should be allocated to Betters.

**[14] Gleim #: 3.3.66 -- Source: CMA 1293 3-6**

(Refers to Fact Pattern #3)

Assuming Atlas Foods inventories Morefeed, the by-product, and that it incurs no additional processing costs for Alfa and Betters, the joint cost to be allocated to Alfa using the gross market value method is

- A. \$36,000
- B. \$40,000
- C. \$41,333
- D. \$50,000

- Answer (A) is **incorrect**. The amount of \$36,000 is based on 40%, not 4/9.

- Answer (B) is **correct**. The gross market value of Alfa is \$40,000 (10,000 pounds  $\times$  \$4), Better's has a total gross value of \$50,000 (5,000 pounds  $\times$  \$10), and Morefeed has a split-off value of \$3,000. If the value of Morefeed is inventoried and treated as a reduction in joint cost, the allocable joint cost is \$90,000 (\$93,000 – \$3,000). The total gross value of the two main products is \$90,000 (\$40,000 + \$50,000). Of this total value, \$40,000 should be allocated to Alfa  $[(\$40,000 \div \$90,000) \times \$90,000]$ .
- Answer (C) is **incorrect**. The amount of \$41,333 fails to adjust the joint cost by the value of the by-product.
- Answer (D) is **incorrect**. The amount of \$50,000 is the joint cost allocated to Better's.

**[15] Gleim #: 3.3.67 -- Source: CMA 1293 3-7**

(Refers to Fact Pattern #3)

Assuming Atlas Foods does not inventory Morefeed, the by-product, the joint cost to be allocated to Better's using the net realizable value method is

- A. \$30,000
- B. \$31,000
- C. \$52,080
- D. \$62,000

- Answer (A) is **incorrect**. The amount of \$30,000 is the amount allocated to Alfa when the by-product is inventoried.
- Answer (B) is **incorrect**. The amount of \$31,000 is the amount allocated to Alfa when the by-product is not inventoried.
- Answer (C) is **incorrect**. The amount of \$52,080 assumes that a weighting method using caloric value is used.
- Answer (D) is **correct**. The NRV of Alfa is \$20,000 [10,000 pounds  $\times$  (\$4 selling price – \$2 additional processing costs)], and the NRV of Better's is \$40,000 [5,000 pounds  $\times$  (\$10 selling price – \$2 additional processing costs)]. If the joint cost is not adjusted for the value of the by-production, the amount allocated to Better's is \$62,000  $\{[\$40,000 \div (\$20,000 + \$40,000)] \times \$93,000\}$ .

**[16] Gleim #: 3.3.68 -- Source: CMA 1296 3-30**

Lankip Company produces two main products and a by-product out of a joint process. The ratio of output quantities to input quantities of direct material used in the joint process remains consistent from month to month. Lankip has employed the physical-volume method to allocate joint production costs to the two main products. The net realizable value of the by-product is used to reduce the joint production costs before the joint costs are allocated to the main products. Data regarding Lankip's operations for the current month are presented in the chart below. During the month, Lankip incurred joint production costs of \$2,520,000. The main products are not marketable at the split-off point and, thus, have to be processed further.

	First Main Product	Second Main Product	By-product
Monthly output in pounds	90,000	150,000	60,000
Selling price per pound	\$30	\$14	\$2
Separable process costs	\$540,000	\$660,000	

The amount of joint production cost that Lankip would allocate to the Second Main Product by using the physical-volume method to allocate joint production costs would be

- A. \$1,200,000
  - B. \$1,260,000
  - C. \$1,500,000
  - D. \$1,575,000
- Answer (A) is **incorrect**. The amount of \$1,200,000 assumes that the by-product is charged with a portion of the net joint cost.
  - Answer (B) is **incorrect**. The amount of \$1,260,000 assumes that the by-product is charged with a portion of the gross joint cost.
  - Answer (C) is **correct**. The joint cost to be allocated is \$2,400,000 [\$2,520,000 total joint cost – (60,000 pounds of the by-product) × \$2]. Accordingly, the joint cost to be allocated to the Second Main Product on a physical-volume basis is \$1,500,000 {[150,000 pounds ÷ (90,000 pounds + 150,000 pounds) × \$2,400,000]}.
  - Answer (D) is **incorrect**. The amount of \$1,575,000 does not deduct by-product NRV from the joint cost.

**[17] Gleim #: 3.3.69 -- Source: CMA 0205 2-20**

Breegle Company produces three products (B-40, J-60, and H-102) from a single process. Breegle uses the physical volume method to allocate joint costs of \$22,500 per batch to the products. Based on the following information, which product(s) should Breegle continue to process after the split-off point in order to maximize profit?

	<u>B-40</u>	<u>J-60</u>	<u>H-102</u>
Physical units produced per batch	1,500	2,000	3,200
Sales value per unit at split-off	\$10.00	\$4.00	\$7.25
Cost per unit of further processing after split-off	3.05	1.00	2.50
Sales value per unit after further processing	12.25	5.70	9.75

- A. B-40 only.
- B. J-60 only.
- C. H-102 only.
- D. B-40 and H-102.

- Answer (A) is **incorrect**. B-40 generates an incremental loss after further processing.
- Answer (B) is **correct**. The decision to sell-or-process-further is determined by whether the incremental revenue from further processing exceeds the incremental cost. Only J-60 produces an incremental profit.

	<u>B-40</u>	<u>J-60</u>	<u>H-102</u>
Sales value after further processing	\$12.25	\$ 5.70	\$ 9.75
Less: sales value at split-off	<u>(10.00)</u>	<u>(4.00)</u>	<u>(7.25)</u>
Incremental revenue per unit	\$ 2.25	\$ 1.70	\$ 2.50
Less: cost to process further	<u>(3.05)</u>	<u>(1.00)</u>	<u>(2.50)</u>
Incremental profit per unit	<u><u>\$ (0.80)</u></u>	<u><u>\$ 0.70</u></u>	<u><u>\$ 0.00</u></u>

- Answer (C) is **incorrect**. H-102 only breaks even after further processing.
- Answer (D) is **incorrect**. B-40 and H-102 are the products that should not be processed further.

**[19] Gleim #: 3.3.71 -- Source: CMA 0408 2-117**

The primary purpose for allocating common costs to joint products is to determine

- A. The selling price of a by-product.
- B. Whether one of the joint products should be discontinued.
- C. The variance between budgeted and actual common costs.
- D. The inventory cost of joint products for financial reporting.

- Answer (A) is **incorrect**. The selling price of a by-product is determined by market forces outside the manufacturer's control, not by the manufacturer's cost structure.
- Answer (B) is **incorrect**. The decision to discontinue a joint product is based on the incremental profit from that product, not the allocation of common costs.
- Answer (C) is **incorrect**. A variance between budgeted and actual costs is scrutinized regardless of the method of allocating common costs.
- Answer (D) is **correct**. Joint products must be valued for external financial reporting purposes based on the full (absorption) cost of the product. Any common costs attributable to the joint production process must therefore be allocated on a systematic and rational basis.

**[20] Gleim #: 3.3.72 -- Source: CMA 0408 2-118**

The distinction between joint products and by-products is largely dependent on

- A. Historical costs.
- B. Prime costs.
- C. Market value.
- D. Salvage value.

- Answer (A) is **incorrect**. Historical cost is involved in both joint and by-product costing.
- Answer (B) is **incorrect**. Prime costs, that is, direct materials and direct labor, go into every production process; they do not distinguish joint products from by-products.
- Answer (C) is **correct**. A by-product is one of relatively small total value. The first question that must be answered in regard to by-products is: Do the benefits of further processing and bringing them to market exceed the costs; that is, is the incremental revenue worth the effort? Market price determines this. The same can essentially be said for the main products of the production process.
- Answer (D) is **incorrect**. Salvage value of equipment is not a useful criterion when setting prices for an ongoing production process.

**[21] Gleim #: 3.3.73 -- Source: CMA 0408 2-119**

In a production process where joint products are produced, the primary factor that will distinguish a joint product from a by-product is the

- A. Relative total sales value of the products.
- B. Relative total volume of the products.
- C. Relative ease of selling the products.
- D. Accounting method used to allocate joint costs.

- Answer (A) is **correct**. In a production process where joint products are produced, the primary factor that will distinguish a joint product from a by-product is the relative total sales value of the products.
- Answer (B) is **incorrect**. Volume is not always a reliable indicator of cost.
- Answer (C) is **incorrect**. Ease of selling products cannot be objectively measured and so is unsuitable as a basis for assigning costs.
- Answer (D) is **incorrect**. The accounting method cannot aid in distinguishing joint products from by-products.

**[22] Gleim #: 3.3.74 -- Source: CMA 0408 2-120**

All of the following are methods of allocating joint costs to joint products **except**

- A. Physical quantities method.
- B. Net realizable value method.
- C. Separable production cost method.
- D. Gross market value method.

- Answer (A) is **incorrect**. The physical quantities, or physical unit, method is one method of allocating joint costs to joint products.
- Answer (B) is **incorrect**. The net realizable value method is one method of allocating joint costs to joint products.
- Answer (C) is **correct**. No “separable production cost method” is recognized for allocating joint costs. The nature of the problem is such that all costs are joint and cannot be separated.
- Answer (D) is **incorrect**. The gross market value, or sales-value-at-split-off, method is one method of allocating joint costs to joint products.

---

**[Fact Pattern #4]**

Tucariz Company processes Duo into two joint products, Big and Mini. Duo is purchased in 1,000 gallon drums for \$2,000. Processing costs are \$3,000 to process the 1,000 gallons of Duo into 800 gallons of Big and 200 gallons of Mini. The selling price is \$9 per gallon for Big and \$4 per gallon for Mini. Big can be processed further into 600 gallons of Giant if \$1,000 of additional processing costs are incurred. Giant can be sold for \$17 per gallon.

---

**[23] Gleim #: 3.3.75 -- Source: CMA 0408 2-121**

(Refers to Fact Pattern #4)

If Tucariz uses the net realizable value method to allocate costs to the joint products, the total cost of producing Giant is

- A. \$5,600
- B. \$5,564
- C. \$5,520
- D. \$4,600

- Answer (A) is **correct**. First, the final sales prices are estimated:

Giant: 600 gallons @ \$17/gallon = \$10,200

Mini: 200 gallons @ \$ 4/gallon = \$ 800

From these amounts, separable costs are subtracted:

Giant: \$10,200 – \$1,000 = \$9,200

Mini: No separable costs

This yields a total net realizable value (NRV) for the entire production run of \$10,000 (\$9,200 Giant + \$800 Mini). The next step is to allocate the total joint costs of \$5,000 (\$2,000 input cost + \$3,000 processing cost) based on the proportion of the total NRV represented by each product:

Giant:  $\$5,000 \times (\$9,200 \div \$10,000) = \$4,600$

Mini:  $\$5,000 \times (\$ 800 \div \$10,000) = \$ 400$

The total cost of producing Giant using the estimated NRV method is therefore \$5,600 (\$4,600 allocated joint cost + \$1,000 separable cost).

- Answer (B) is **incorrect**. The amount of \$5,564 is not based on the net realizable value method.

- Answer (C) is **incorrect**. The amount of \$5,520 results from allocating the \$1,000 of additional cost between Giant and Mini; Mini should not absorb any of the additional processing costs.
- Answer (D) is **incorrect**. The amount of \$4,600 is only the allocated joint cost of Giant; it fails to add in the additional \$1,000 of separable costs.

**[24] Gleim #: 3.3.76 -- Source: CMA 0408 2-122**

(Refers to Fact Pattern #4)

If Tucariz uses the sales-value-at-split-off method to allocate joint costs to the final products, the per gallon cost (rounded to the nearest cent) of producing Big is

- A. \$5.63
- B. \$5.00
- C. \$4.50
- D. \$3.38

- Answer (A) is **correct**. First, the final sales prices are estimated:

Big: 800 gallons @ \$9/gallon = \$7,200

Mini: 200 gallons @ \$4/gallon = \$ 800

This yields a total sales value at split-off for the entire production run of \$8,000 (\$7,200 Big + \$800 Mini). The next step is to multiply the joint costs of \$5,000 (\$2,000 input cost + \$3,000 processing cost) based on the proportion of the total final sales value represented by each product:

Big:  $\$5,000 \times (\$7,200 \div \$8,000) = \$4,500$

Mini:  $\$5,000 \times (\$ 800 \div \$8,000) = \$ 500$

The per-unit cost of producing Big using the sales value at split-off method is therefore \$5.63 (\$4,500 allocated joint cost  $\div$  800 gallons).

- Answer (B) is **incorrect**. The amount of \$5.00 results from dividing total joint costs by total output; in other words, a physical-volume method was used rather than the sales value method.
- Answer (C) is **incorrect**. The amount of \$4.50 results from dividing by 1,000 gallons of total output.
- Answer (D) is **incorrect**. The amount of \$3.38 results from allocating only the processing costs rather than the total joint costs.

[25] Gleim #: 3.3.77 -- Source: CMA 0408 2-123

Tempo Company produces three products from a joint process. The three products are sold after further processing as there is no market for any of the products at the split-off point. Joint costs per batch are \$315,000. Other product information is shown below.

	<u>Product A</u>	<u>Product B</u>	<u>Product C</u>
Units produced per batch	20,000	30,000	50,000
Further processing and marketing cost per unit	\$ .70	\$3.00	\$1.72
Final sales value per unit	5.00	6.00	7.00

If Tempo uses the net realizable value method of allocating joint costs, how much of the joint costs will be allocated to each unit of Product C?

- A. \$2.10
- B. \$2.65
- C. \$3.15
- D. \$3.78

- Answer (A) is **incorrect**. The amount of \$2.10 results from allocating the \$315,000 equally among all three products.
- Answer (B) is **incorrect**. The amount of \$2.65 results from failing to use the net realizable value method.
- Answer (C) is **incorrect**. The amount of \$3.15 results from dividing total joint costs by total output; in other words, a physical-volume method was used rather than the net realizable value method.

- Answer (D) is **correct**. First, the final sales prices are estimated:

Product A: 20,000 units @ \$5/unit = \$100,000  
 Product B: 30,000 units @ \$6/unit = \$180,000  
 Product C: 50,000 units @ \$7/unit = \$350,000

From these amounts, separable costs are deducted:

Product A: \$100,000 – (20,000 × \$0.70) = \$ 86,000  
 Product B: \$180,000 – (30,000 × \$3.00) = \$ 90,000  
 Product C: \$350,000 – (50,000 × \$1.72) = \$264,000

This yields a total final sales value for the entire production run of \$440,000. Multiply the total joint costs to be allocated by the proportion of the final expected sales of each product:

Product A:	$\$315,000 \times (\$ 86,000 \div \$440,000) =$	\$ 61,568
Product B:	$\$315,000 \times (\$ 90,000 \div \$440,000) =$	\$ 64,432
Product C:	$\$315,000 \times (\$264,000 \div \$440,000) =$	<u>\$189,000</u>
Joint costs -- check total		<u><u>\$315,000</u></u>

The per-unit amount allocated to Product C is therefore \$3.78 (\$189,000 ÷ 50,000).

**[26] Gleim #: 3.3.78 -- Source: CMA 0408 2-124**

Fitzpatrick Corporation uses a joint manufacturing process in the production of two products, Gummo and Xylo. Each batch in the joint manufacturing process yields 5,000 pounds of an intermediate material, Valdene, at a cost of \$20,000. Each batch of Gummo uses 60% of the Valdene and incurs \$10,000 of separate costs. The resulting 3,000 pounds of Gummo sells for \$10 per pound. The remaining Valdene is used in the production of Xylo, which incurs \$12,000 of separable costs per batch. Each batch of Xylo yields 2,000 pounds and sells for \$12 per pound. Fitzpatrick uses the net realizable value method to allocate the joint material costs. The company is debating whether to process Xylo further into a new product, Zinten, which would incur an additional \$4,000 in costs and sell for \$15 per pound. If Zinten is produced, income would increase by

- A. \$2,000
- B. \$5,760
- C. \$14,000
- D. \$26,000

- Answer (A) is **correct**. If Xylo is processed further, the incremental sales revenue will be \$6,000 [2,000 pounds  $\times$  (\$15 – \$12)]. After subtracting the incremental costs, operating income will increase by \$2,000 (\$6,000 – \$4,000).
- Answer (B) is **incorrect**. The amount of \$5,760 results from allocating the \$4,000 rather than assigning it all to Zinten.
- Answer (C) is **incorrect**. The amount of \$14,000 results from adding the additional costs of \$4,000 rather than subtracting them and failing to answer the question about incremental income.
- Answer (D) is **incorrect**. The amount of \$26,000 is the sales revenue of Zinten, less the additional costs.

[1] Gleim #: 3.4.79 -- Source: CMA 1290 3-4

Units of production is an appropriate overhead allocation base when

- A. Several well-differentiated products are manufactured.
  - B. Direct labor costs are low.
  - C. Direct material costs are large relative to direct labor costs incurred.
  - D. Only one product is manufactured.
- Answer (A) is **incorrect**. The number of units of production may have no logical relationship to overhead when several different products are made.
  - Answer (B) is **incorrect**. A low level of direct labor costs means that fixed overhead is substantial, and an appropriate cost driver should be used to make the allocation.
  - Answer (C) is **incorrect**. The allocation should be made on the basis of the appropriate cost drivers without regard to the relationship between direct materials and labor costs.
  - Answer (D) is **correct**. Allocating overhead on the basis of the number of units produced is usually not appropriate. Costs should be allocated on the basis of some plausible relationship between the cost object and the incurrence of the cost, preferably cause and effect. The fixed portion of overhead costs is incurred regardless of the level of production. When multiple products are involved, the number of units of production may bear no relationship to the incurrence of the allocated cost. If overhead is correlated with machine hours but different products require different quantities of that input, the result may be an illogical allocation. However, if a firm manufactures only one product, this allocation method may be acceptable because all costs are to be charged to the single product.

[2] Gleim #: 3.4.80 -- Source: CMA 1296 3-19

Generally, individual departmental rates rather than a plantwide rate for applying manufacturing overhead are used if

- A. A company wants to adopt a standard cost system.
  - B. A company's manufacturing operations are all highly automated.
  - C. Manufacturing overhead is the largest cost component of its product cost.
  - D. The manufactured products differ in the resources consumed from the individual departments in the plant.
- Answer (A) is **incorrect**. A standard cost system can be based on individual or multiple application rates.

- Answer (B) is **incorrect**. Whether production is machine intensive affects the nature but not necessarily the number of cost drivers.
- Answer (C) is **incorrect**. A single plant-wide application rate is acceptable, even with high overhead, if all overhead is highly correlated with a single application base.
- Answer (D) is **correct**. Overhead is usually assigned to products based on a predetermined rate or rates. The activity base for overhead allocation should have a high degree of correlation with the incurrence of overhead. Given only one cost driver, one overhead application rate is sufficient. If products differ in the resources consumed in individual departments, multiple rates are preferable.

**[3] Gleim #: 3.4.81 -- Source: CMA 696 3-21**

The appropriate method for the disposition of underapplied or overapplied overhead of a manufacturer

- A. Is to cost of goods sold only.
  - B. Is to finished goods inventory only.
  - C. Is apportioned to cost of goods sold and finished goods inventory.
  - D. Depends on the significance of the amount.
- Answer (A) is **incorrect**. A material amount should be allocated among cost of goods sold, work-in-process, and finished goods.
  - Answer (B) is **incorrect**. A material amount should be allocated among cost of goods sold, work-in-process, and finished goods.
  - Answer (C) is **incorrect**. A material amount should be allocated among cost of goods sold, work-in-process, and finished goods.
  - Answer (D) is **correct**. Overapplied or underapplied overhead should be disposed of at the end of an accounting period by transferring the balance either to cost of goods sold (if the amount is not material) or to cost of goods sold, finished goods inventory, and work-in-process inventory. Theoretically, the allocation is preferred, but, because the amount is usually immaterial, the entire balance is often transferred directly to cost of goods sold. Thus, the entry depends upon the significance of the amount.

**[Fact Pattern #1]**

Nash Glassworks Company has budgeted fixed manufacturing overhead of \$100,000 per month.

The company uses absorption costing for both external and internal financial reporting purposes. Budgeted overhead rates for cost allocations for the month of April using alternative unit output denominator levels are shown in the next column.

<u>Capacity Levels</u>	<u>Budgeted Denominator Level (units of output)</u>	<u>Budgeted Overhead Cost Rate</u>
Theoretical	1,500,000	\$.0667
Practical	1,250,000	.0800
Normal	775,000	.1290
Master-budget	800,000	.1250

Actual output for the month of April was 800,000 units of glassware.

**[5] Gleim #: 3.4.83 -- Source: CMA 696 3-1**

(Refers to Fact Pattern #1)

When Nash Glassworks Company allocates fixed costs, management will select a capacity level to use as the denominator volume. All of the following are appropriate as the capacity level that approximates actual volume levels **except**

- A. Normal capacity.
- B. Expected annual activity.
- C. Theoretical capacity.
- D. Master-budget capacity.

- Answer (A) is **incorrect**. Normal capacity is the long-term average level of activity that will approximate demand over a period that includes seasonal, cyclical, and trend variations.
- Answer (B) is **incorrect**. Expected annual activity is an approximation of actual volume levels for a specific year.
- Answer (C) is **correct**. Theoretical (ideal) capacity is the maximum capacity given continuous operations with no holidays, downtime, etc. It assumes perfect efficiency at all times. Consequently, it can never be attained and is not a reasonable estimate of actual volume.
- Answer (D) is **incorrect**. Master-budget capacity is the expected level of activity used for budgeting for a given year.

**[6] Gleim #: 3.4.84 -- Source: CMA 0205 2-27**

In determining next year's overhead application rates, a company desires to focus on manufacturing capacity rather than output demand for its products. To derive a realistic application rate, the denominator activity level should be based on

- A. Practical capacity.
- B. Maximum capacity.
- C. Normal capacity.
- D. Master-budget (expected annual) capacity.

- Answer (A) is **correct**. Practical capacity is based on realistic, attainable levels of production and input efficiency and is the most appropriate denominator level to use in selecting an overhead application rate.
- Answer (B) is **incorrect**. Using maximum capacity assumes no downtime, an unrealistic assumption in any case.
- Answer (C) is **incorrect**. Normal capacity may be lower than the equipment is capable of with proper maintenance and attention to efficiency.
- Answer (D) is **incorrect**. Master-budget (expected) capacity cannot be determined until the application base is selected.

**[14] Gleim #: 3.4.92 -- Source: CMA 692 3-6**

Departmental overhead rates are usually preferred to plant-wide overhead rates when

- A. The activities of each of the various departments in the plant are not homogeneous.
- B. The costs of many service departments are being allocated to each of the various departments.
- C. All products passing through the various departments require the same manufacturing effort in each department.
- D. Most of the overhead costs are fixed.

- Answer (A) is **correct**. The activity base for overhead allocation should have a high correlation with the incurrence of overhead. Thus, the activities of various departments are usually more appropriate as activity bases than plant-wide activities, particularly when products and production activities are not homogeneous.
- Answer (B) is **incorrect**. The number of departments is not as important as the relationship between the costs and activity base.
- Answer (C) is **incorrect**. Products require similar manufacturing effort, they are relatively homogeneous, and a plant-wide rate might be adequate.

- Answer (D) is **incorrect**. The degree of variability in costs is not as important as the relationship between activity bases and costs, and the degree to which manufacturing activities are similar for all products.

**[15] Gleim #: 3.4.93 -- Source: CMA 0408 2-098**

Normal costing systems are said to offer a user several distinct benefits when compared with actual costing systems. Which one of the following is **not** a benefit associated with normal costing systems?

- A. More timely costing of jobs and products.
  - B. A smoothing of product costs throughout the period.
  - C. Improved accuracy of job and product costing.
  - D. A more economical way of attaching overhead to a job or product.
- Answer (A) is **incorrect**. More timely costing of jobs and products is one of the benefits of normal costing.
  - Answer (B) is **incorrect**. A smoothing of product costs throughout the period is one of the benefits of normal costing.
  - Answer (C) is **correct**. Normal costing can provide more timely information about job and product costs, and it can helpfully smooth product costs throughout a period, but it cannot in and of itself improve the accuracy of costing.
  - Answer (D) is **incorrect**. Providing a more economical way of attaching overhead to a job or product is one of the benefits of normal costing.

**[16] Gleim #: 3.4.94 -- Source: CMA 0408 2-145**

Henry Manufacturing, which uses direct labor hours to apply overhead to its product line, undertook an extensive renovation and modernization program 2 years ago.

Manufacturing processes were reengineered, considerable automated equipment was acquired, and 60% of the company's nonunion factory workers were terminated. Which of the following statements would apply to the situation at Henry?

- I. The company's factory overhead rate has likely increased.
- II. The use of direct labor hours seems to be appropriate.
- III. Henry will lack the ability to properly determine labor variances.
- IV. Henry has likely reduced its ability to quickly cut costs in order to respond to economic downturns.

- A. I, II, III, and IV.
- B. I and IV only.
- C. II and IV only.
- D. I and III only.

- Answer (A) is **incorrect**. The use of direct labor hours is an inappropriate driver for overhead when a process has been highly automated.
- Answer (B) is **correct**. Henry's overhead rate will almost certainly increase because of all the new equipment that must be depreciated. Also, this heavy investment in new machinery will make it more difficult to quickly cut costs during economic downturns.
- Answer (C) is **incorrect**. The heavy investment in new machinery will make it more difficult to quickly cut costs during economic downturns.
- Answer (D) is **incorrect**. Process reengineering, a high degree of automation, and a reduction in the workforce do not complicate or preclude the calculation of variances.

**[17] Gleim #: 3.4.95 -- Source: CMA 0408 2-148**

The most important criterion in accurate cost allocations is

- A. Using a simple allocation method.
- B. Allocating fixed and variable costs by using the same allocation base.
- C. Using homogeneous cost pools.
- D. Using multiple drivers for each cost pool.

- Answer (A) is **incorrect**. The simplicity of an allocation method is usually inversely proportional to its accuracy in assigning costs.

- Answer (B) is **incorrect**. Using the same allocation base for both fixed and variable costs is almost always a guarantee of inaccurate costing.
- Answer (C) is **correct**. All the cost objects gathered in a cost pool should be similar enough that a single allocation base can be selected that will appropriately allocate all of them.
- Answer (D) is **incorrect**. In a well-designed costing system, a cost pool will have fewer rather than more drivers.

[2] Gleim #: 3.5.97 -- Source: CMA Sample Q3-5

Pane Company uses a job costing system and applies overhead to products on the basis of direct labor cost. Job No. 75, the only job in process on January 1, had the following costs assigned as of that date: direct materials, \$40,000; direct labor, \$80,000; and factory overhead, \$120,000. The following selected costs were incurred during the year:

Traceable to jobs:

Direct materials	\$178,000
Direct labor	<u>345,000</u>
Total	<u><u>\$523,000</u></u>

Not traceable to jobs:

Factory materials and supplies	\$ 46,000
Indirect labor	235,000
Plant maintenance	73,000
Depreciation on factory equipment	29,000
Other factory costs	<u>76,000</u>
Total	<u><u>\$459,000</u></u>

Pane's profit plan for the year included budgeted direct labor of \$320,000 and overhead of \$448,000. Assuming no work-in-process on December 31, Pane's overhead for the year was

- A. \$11,000 overapplied.
- B. \$24,000 overapplied.
- C. \$11,000 underapplied.
- D. \$24,000 underapplied.

- Answer (A) is **incorrect**. The amount of \$11,000 equals the difference between budgeted and actual overhead.
- Answer (B) is **correct**. Pane applies overhead to products on the basis of direct labor cost. The rate is 1.4 (\$448,000 budgeted OH ÷ \$320,000 budgeted DL cost). Thus, \$483,000 (\$345,000 actual DL cost × 1.4) of overhead was applied, of which \$24,000 (\$483,000 – \$459,000 actual OH) was overapplied.
- Answer (C) is **incorrect**. The amount of \$11,000 equals the difference between budgeted and actual overhead.
- Answer (D) is **incorrect**. The overhead was overapplied.

**[Fact Pattern #1]**

Nash Glassworks Company has budgeted fixed manufacturing overhead of \$100,000 per month.

The company uses absorption costing for both external and internal financial reporting purposes. Budgeted overhead rates for cost allocations for the month of April using alternative unit output denominator levels are shown in the next column.

<u>Capacity Levels</u>	<u>Budgeted Denominator Level (units of output)</u>	<u>Budgeted Overhead Cost Rate</u>
Theoretical	1,500,000	\$.0667
Practical	1,250,000	.0800
Normal	775,000	.1290
Master-budget	800,000	.1250

Actual output for the month of April was 800,000 units of glassware.

**[8] Gleim #: 3.5.103 -- Source: CMA 696 3-2**

(Refers to Fact Pattern #1)

The choice of a production volume level as a denominator in the computation of fixed overhead rates can significantly affect reported net income. Which one of the following statements is true for Nash Glassworks Company if its beginning inventory is zero, production exceeded sales, and variances are adjustments to cost of goods sold? The choice of

- A. Practical capacity as the denominator level will result in a lower net income amount than if master-budget capacity is chosen.
- B. Normal capacity as the denominator level will result in a lower net income amount than if any other capacity volume is chosen.
- C. Master-budget capacity as the denominator level will result in a lower net income amount than if theoretical capacity is chosen.
- D. Practical capacity as the denominator level will result in a higher net income amount than if normal capacity is chosen.

- Answer (A) is **correct**. The choice of practical rather than master budget capacity as the denominator level will result in a lower absorption costing net income. Practical capacity is the maximum level at which output is produced efficiently, with an allowance for unavoidable interruptions, for example, for holidays and scheduled maintenance. Because this level will be higher than master-budget (expected) capacity, its use will usually result in the underapplication of fixed overhead. For example, given costs of \$100,000 and master-budget capacity of 800,000 units, \$.125 per unit is the application rate. If practical capacity is 1,250,000 units, the application rate is \$.08 per unit. If actual production is 800,000 units, fixed overhead will not be over- or underapplied given the use of master-budget capacity. However, there will be \$36,000 ( $450,000 \text{ units} \times \$.08$ ) of underapplied fixed overhead if practical capacity is the denominator level. Consequently, given that the beginning inventory is zero and that production exceeded sales, less fixed overhead will be inventoried at the lower practical capacity rate than at the master-budget rate. Thus, master-budget net income will be greater.
- Answer (B) is **incorrect**. A normal capacity rate results in a larger ending inventory and a greater net income than a theoretical or practical capacity rate.
- Answer (C) is **incorrect**. The master-budget rate exceeds the theoretical capacity rate. It results in a greater ending inventory and a greater net income.
- Answer (D) is **incorrect**. A practical capacity rate results in a lower ending inventory and a lower net income than a normal capacity rate.

**[9] Gleim #: 3.5.104 -- Source: CMA 0205 2-21**

A review of the year-end accounting records of Elk Industries discloses the following information:

Raw materials	\$ 80,000
Work-in-process	128,000
Finished goods	272,000
Cost of goods sold	1,120,000

The company's underapplied overhead equals \$133,000. On the basis of this information, Elk's cost of goods sold is most appropriately reported as

- A. \$987,000
- B. \$1,213,100
- C. \$1,218,000
- D. \$1,253,000

- Answer (A) is **incorrect**. The amount of \$987,000 results from improperly subtracting the entire amount of underapplied overhead from the balance of cost of goods sold instead of allocating it across three inventory accounts.
- Answer (B) is **incorrect**. The amount of \$1,213,100 improperly includes raw materials in the allocation base for underapplied overhead.
- Answer (C) is **correct**. Given the amounts involved, \$133,000 is material; thus, over- or underapplied overhead should be allocated to all work-in-process, finished goods, and cost of goods sold. The proportion of the total of these three accounts represented by cost of goods sold is 73.68% [ $\$1,120,000 \div (\$128,000 + \$272,000 + \$1,120,000)$ ]. The amount of underapplied overhead assigned to cost of goods sold is thus \$98,000 ( $\$133,000 \times 73.68\%$ ), making the total reported amount of cost of goods sold \$1,218,000 ( $\$1,120,000 + \$98,000$ ).
- Answer (D) is **incorrect**. The amount of \$1,253,000 results from improperly allocating the entire amount of underapplied overhead to cost of goods sold.

**[10] Gleim #: 3.5.105 -- Source: CMA 0205 2-28**

Wagner Corporation applies factory overhead based upon machine hours. At the beginning of the year, Wagner budgeted factory overhead at \$250,000 and estimated that 100,000 machine hours would be used to make 50,000 units of product. During the year, the company produced 48,000 units using 97,000 machine hours. Actual overhead for the year was \$252,000. Under a standard cost system, the amount of factory overhead applied during the year was

- A. \$240,000
- B. \$242,500
- C. \$250,000
- D. \$252,000

- Answer (A) is **correct**. Wagner's application rate for overhead is \$2.50 per machine hour ( $\$250,000 \text{ budgeted total} \div 100,000 \text{ estimated machine hours}$ ), and each unit of output is estimated to require 2 machine hours ( $100,000 \text{ estimated machine hours} \div 50,000 \text{ units budgeted output}$ ). Under a standard cost system, the amount of overhead applied during the year was therefore \$240,000 ( $48,000 \text{ units actual output} \times \$2.50 \text{ per machine hour application rate} \times 2 \text{ machine hours standard per unit}$ ).
- Answer (B) is **incorrect**. The amount of \$242,500 results from improperly multiplying by 48,500 units of product (half the number of machine hours).
- Answer (C) is **incorrect**. The amount of \$250,000 results from improperly multiplying by the 50,000 budgeted units of product instead of by the 48,000 actual units.
- Answer (D) is **incorrect**. The amount of \$252,000 was the actual overhead incurred.

[Fact Pattern #2]

Madtack Company's beginning and ending inventories for the month of November are

	<u>November 1</u>	<u>November 30</u>
Direct materials	\$ 67,000	\$ 62,000
Work-in-process	145,000	171,000
Finished goods	85,000	78,000

Production data for the month of November follows:

Direct labor	\$200,000
Actual factory overhead	132,000
Direct materials purchased	163,000
Transportation in	4,000
Purchase returns and allowances	2,000

Madtack uses one overhead control account and charges overhead to production at 70% of direct labor cost. The company does not formally recognize over- or underapplied overhead until year end.

[11] Gleim #: 3.5.106 -- Source: CMA 1295 3-23

(Refers to Fact Pattern #2)

Madtack Company's net charge to overhead control for the month of November is

- A. \$8,000 debit, overapplied.
  - B. \$8,000 debit, underapplied.
  - C. \$8,000 credit, overapplied.
  - D. \$8,000 credit, underapplied.
- Answer (A) is **incorrect**. An overapplication of overhead is represented by a credit in the overhead control account.
  - Answer (B) is **incorrect**. The overhead was overapplied for the month.
  - Answer (C) is **correct**. The overhead control account would have been debited for \$132,000 of actual overhead. Credits would have totaled \$140,000 representing 70% of direct labor costs of \$200,000. Hence, the \$140,000 credit exceeds the \$132,000 debit. Overhead was overapplied by \$8,000.
  - Answer (D) is **incorrect**. The overhead was overapplied for the month.

[13] Gleim #: 3.5.108 -- Source: CMA 0408 2-099

From the following budgeted data, calculate the budgeted indirect cost rate that would be used in a normal costing system.

Total direct labor hours	250,000
Total indirect labor hours	50,000
Direct costs	\$10,000,000
Total indirect labor related costs	5,000,000
Total indirect nonlabor related costs	7,000,000

- A. \$20
- B. \$28
- C. \$40
- D. \$48

- Answer (A) is **incorrect**. The amount of \$20 results from improperly using only indirect labor costs in the numerator.
- Answer (B) is **incorrect**. The amount of \$28 results from improperly using only indirect nonlabor costs in the numerator.
- Answer (C) is **incorrect**. The amount of \$40 results from improperly using the total of direct and indirect labor hours as the allocation base.
- Answer (D) is **correct**. Total indirect costs are \$12,000,000 (\$5,000,000 + \$7,000,000). The appropriate allocation base is direct labor hours, since this more closely matches activity level than does indirect labor or the combination of the two. The budgeted indirect cost rate is thus \$48 per direct labor hour (\$12,000,000 ÷ 250,000).

[14] Gleim #: 3.5.109 -- Source: CMA 0408 2-149

Baldwin Printing Company uses a job order costing system and applies overhead based on machine hours. A total of 150,000 machine hours have been budgeted for the year. During the year, an order for 1,000 units was completed and incurred the following:

Direct material costs	\$1,000
Direct labor costs	1,500
Actual overhead	1,980
Machine hours	450

The accountant calculated the inventory cost of this order to be \$4.30 per unit. The annual budgeted overhead in dollars was

- A. \$577,500
- B. \$600,000
- C. \$645,000
- D. \$660,000

- Answer (A) is **incorrect**. The amount of \$577,500 results from treating the .45 units per hour ratio as a cost, deducting it from the total unit cost, then improperly multiplying this total unit cost by the budgeted total machine hours.
- Answer (B) is **correct**. The results from the production run of 1,000 units allow Baldwin to calculate its per-unit costs for materials ( $\$1,000 \div 1,000 \text{ units} = \$1.00$ ) and labor ( $\$1,500 \div 1,000 \text{ units} = \$1.50$ ). Overhead can then be derived as follows:

Total cost per unit	\$4.30
Less: direct materials	(1.00)
Less: direct labor	<u>(1.50)</u>
Overhead per unit	<u><u>\$1.80</u></u>

The number of machine hours required to manufacture a single unit is .45 (450 hours  $\div$  1,000 units). Therefore, \$1.80 represents 45% of the cost of a machine hour ( $\$1.80 \div .45 = \$4.00$ ). Since 150,000 hours were budgeted, total budgeted overhead for the year was \$600,000 (150,000 hours  $\times$  \$4.00 per hour).

- Answer (C) is **incorrect**. The amount of \$645,000 results from simply multiplying total unit cost by the budgeted total machine hours.
- Answer (D) is **incorrect**. The amount of \$660,000 results from allocating overhead based on actual rather than budgeted usage.

**[15] Gleim #: 3.5.110 -- Source: CMA 0408 2-150**

John Sheng, cost accountant at Starlet Co., is developing departmental factory overhead application rates for the company's tooling and fabricating departments. The budgeted overhead for each department and the data for one job are shown below.

	Department:	
	Tooling	Fabricating
Supplies	\$ 850	\$ 200
Supervisor's salaries	1,500	2,000
Indirect labor	1,200	4,880
Depreciation	1,000	5,500
Repairs	4,075	3,540
Total budgeted overhead	<u>\$8,625</u>	<u>\$16,120</u>
Total direct labor hours	460	620
Direct labor hours on Job #231	12	3

Using the departmental overhead application rates, total overhead applied to Job #231 in the Tooling and Fabricating Departments will be

- A. \$225
- B. \$303
- C. \$537
- D. \$671

- Answer (A) is **incorrect**. The amount of \$225 is the allocation for just the Tooling Department.
- Answer (B) is **correct**. Starlet's departmental overhead allocations are determined by the proportion of the total driver expended by each department on this job, as follows:

Tooling:	$\$8,625 \times (12 \div 460)$	=	\$225
Fabricating:	$\$16,120 \times (3 \div 620)$	=	<u>78</u>
Total			<u>\$303</u>

- Answer (C) is **incorrect**. The amount of \$537 results from improperly using 12 hours to allocate the cost of both departments.
- Answer (D) is **incorrect**. The amount of \$671 results from improperly using the combined hours for the two departments to allocate the departmental costs.

**[16] Gleim #: 3.5.111 -- Source: CMA 0408 2-151**

Cynthia Rogers, the cost accountant for Sanford Manufacturing, is preparing a management report that must include an allocation of overhead. Budgeted overhead for each department and the data for one job are shown below.

	Department	
	Tooling	Fabricating
Supplies	\$ 690	\$ 80
Supervisor's salaries	1,400	1,800
Indirect labor	1,000	4,000
Depreciation	1,200	5,200
Repairs	4,400	3,000
Total budgeted overhead	<u>\$8,690</u>	<u>\$14,080</u>
Total direct labor hours	440	640
Direct labor hours on Job #231	10	2

Using the departmental overhead application rates and allocating overhead on the basis of direct labor hours, overhead applied to Job #231 in the Tooling Department would be

- A. \$44.00
- B. \$197.50
- C. \$241.50
- D. \$501.00

- Answer (A) is **incorrect**. The amount of \$44.00 is the allocation for the Fabricating Department.
- Answer (B) is **correct**. Sanford's departmental overhead allocations are determined by the proportion of the total driver expended by each department on this job. Tooling's allocation is \$197.50 [ $\$8,690 \times (10 \div 440)$ ].
- Answer (C) is **incorrect**. The amount of \$241.50 is the total for Tooling and Fabricating combined.
- Answer (D) is **incorrect**. The amount of \$501.00 results from improperly using the combined hours for the two departments to allocate the departmental costs.

[17] Gleim #: 3.5.112 -- Source: CMA 0408 2-152

Patterson Corporation expects to incur \$70,000 of factory overhead and \$60,000 of general and administrative costs next year. Direct labor costs at \$5 per hour are expected to total \$50,000. If factory overhead is to be applied per direct labor hour, how much overhead will be applied to a job incurring 20 hours of direct labor?

- A. \$28
- B. \$120
- C. \$140
- D. \$260

- Answer (A) is **incorrect**. The amount of \$28 results from improperly dividing the true overhead cost by the \$5 per hour direct labor cost.
- Answer (B) is **incorrect**. The amount of \$120 results from improperly including direct labor costs in the allocation.
- Answer (C) is **correct**. Direct labor hours budgeted for next year are 10,000 (\$50,000 total ÷ \$5 per hour). Factory overhead is applied at the rate of \$7 per direct labor hour (\$70,000 ÷ 10,000 hours). A job incurring 20 hours of direct labor will thus be charged with \$140 of overhead (\$7 per direct labor hour × 20 hours).
- Answer (D) is **incorrect**. The amount of \$260 results from including G&A expenses in factory overhead.

[18] Gleim #: 3.5.113 -- Source: CMA 0408 2-058

Using the following budget data for Valley Corporation, which produces only one product, calculate the company's predetermined factory overhead application rate for variable overhead.

Units to be produced	11,000
Units to be sold	10,000
Indirect materials, varying with production	\$ 1,000
Indirect labor, varying with production	10,000
Factory supervisor's salary, incurred regardless of production	20,000
Depreciation on factory building and equipment	30,000
Utilities to operate factory machines	12,000
Security lighting for factory	2,000
Selling, general, and administrative expenses	5,000

- A. \$2.09
- B. \$2.30
- C. \$4.73
- D. \$5.20

- Answer (A) is **correct**. Variable overhead consists of those inputs to the production process that (1) vary with the level of production and (2) cannot be practicably traced to end products. In Valley's case, these include indirect materials (\$1,000), indirect labor (\$10,000), and utilities (\$12,000), for a total of \$23,000. Dividing this amount by the number of units scheduled for production yields a variable overhead application rate of \$2.09 ( $\$23,000 \div 11,000$ ).
- Answer (B) is **incorrect**. The amount of \$2.30 results from dividing total variable overhead by the number of units to be sold rather than the number to be produced.
- Answer (C) is **incorrect**. The amount of \$4.73 results from improperly excluding indirect materials and improperly including the factory supervisor's salary.
- Answer (D) is **incorrect**. The amount of \$5.20 results from improperly excluding indirect materials and improperly including the factory supervisor's salary, then dividing by the number of units to be sold rather than the number to be produced.

**[1] Gleim #: 3.6.114 -- Source: CMA 1292 3-2**

In allocating factory service department costs to producing departments, which one of the following items would most likely be used as an activity base?

- A. Units of product sold.
- B. Salary of service department employees.
- C. Units of electric power consumed.
- D. Direct materials usage.

- Answer (A) is **incorrect**. Making allocations on the basis of units sold may not meet the cause-and-effect criterion.
- Answer (B) is **incorrect**. The salary of service department employees is the cost allocated, not a basis of allocation.
- Answer (C) is **correct**. Service department costs are considered part of factory overhead and should be allocated to the production departments that use the services. A basis reflecting cause and effect should be used to allocate service department costs. For example, the number of kilowatt hours used by each producing department is probably the best allocation base for electricity costs.
- Answer (D) is **incorrect**. Making allocations on the basis of materials usage may not meet the cause-and-effect criterion.

**[2] Gleim #: 3.6.115 -- Source: CMA 689 4-28**

The two most appropriate factors for budgeting manufacturing overhead expenses would be

- A. Machine hours and production volume.
- B. Management judgment and contribution margin.
- C. Management judgment and production volume.
- D. Management judgment and sales dollars.

- Answer (A) is **incorrect**. Machine hours may not be the appropriate activity base. Moreover, some overhead is fixed regardless of the activity base.
- Answer (B) is **incorrect**. The contribution margin can be calculated only after variable costs and sales prices are determined. Some overhead is variable.

- Answer (C) is **correct**. The most important factor in budgeting manufacturing overhead is production volume. Many overhead items have variable costs, and those that are fixed with a relevant range of output may increase if production exceeds that range. The other essential consideration is management's judgment with respect to the nature and amount of costs to be incurred and expectations for production volume. Because overhead is applied based on predetermined rates, accurate judgment is important.
- Answer (D) is **incorrect**. Sales volume (or dollars) is less significant because overhead is based on production volume.

**[3] Gleim #: 3.6.116 -- Source: CMA 1295 3-16**

When allocating service department costs to production departments, the method that does **not** consider different cost behavior patterns is the

- A. Step method.
- B. Reciprocal method.
- C. Direct method.
- D. Single-rate method.

- Answer (A) is **incorrect**. The step method can be used on a single- or dual-rate basis.
- Answer (B) is **incorrect**. The reciprocal method can be used on a single- or dual-rate basis.
- Answer (C) is **incorrect**. The direct method can be used on a single- or dual-rate basis.
- Answer (D) is **correct**. The single-rate method combines fixed and variable costs. However, dual rates are preferable because they allow variable costs to be allocated on a different basis from fixed costs.

**[4] Gleim #: 3.6.117 -- Source: CMA 1290 3-3**

There are several methods for allocating service department costs to the production departments. The method that recognizes service provided by one service department to another but does **not** recognize reciprocal interdepartmental service is the

- A. Direct method.
- B. Variable method.
- C. Reciprocal method.
- D. Step-down method.

- Answer (A) is **incorrect**. The direct method does not make allocations to other service departments.

- Answer (B) is **incorrect**. The term variable method is nonsensical.
- Answer (C) is **incorrect**. The reciprocal method recognizes reciprocal interdepartmental service.
- Answer (D) is **correct**. The three major methods of allocating service department costs, in order of increasing sophistication, are the direct method, the step-down method, and the reciprocal (or simultaneous-equations) method. The direct method is the simplest. It involves allocating all service department costs to production departments without recognizing any service provided by one service department to another. The step-down method is a sequential process that allocates service costs among service as well as production departments. However, once a department's costs have been allocated, no additional allocations are made back to that department. The reciprocal method uses simultaneous equations to recognize mutual services. The latter method is the most complex.

**[6] Gleim #: 3.6.119 -- Source: CMA 1290 3-2**

Allocation of service department costs to the production departments is necessary to

- A. Control costs.
- B. Coordinate production activity.
- C. Determine overhead rates.
- D. Maximize efficiency.

- Answer (A) is **incorrect**. Costs can be controlled by the service departments without allocation. However, allocation encourages cost control by the production departments. If the costs are allocated, managers have an incentive not to use services indiscriminately.
- Answer (B) is **incorrect**. Allocation does not affect the coordination of production activity.
- Answer (C) is **correct**. Service department costs are indirect costs allocated to production departments to better determine overhead rates when the measurement of full (absorption) costs is desired. Overhead should be charged to production on some equitable basis to provide information useful for such purposes as allocation of resources, pricing, measurement of profits, and cost reimbursement.
- Answer (D) is **incorrect**. Allocation of costs has no effect on the efficiency of the provision of services when the department that receives the allocation has no control over the costs being controlled.

**[10] Gleim #: 3.6.123 -- Source: CMA 0408 2-153**

When allocating costs from one department to another, a dual-rate cost-allocation method may be used. The dual-rate cost-allocation method is most useful when

- A. Two or more cost pools are to be allocated.
  - B. Two or more departments' costs are to be allocated.
  - C. Two or more products are produced.
  - D. Costs are separated into variable-cost and fixed-cost subpools.
- Answer (A) is **incorrect**. The dual-rate method is used with exactly two cost pools, one for fixed costs and one for variable costs.
  - Answer (B) is **incorrect**. Use of the dual-rate depends on cost behavior, not the number of departments.
  - Answer (C) is **incorrect**. Use of the dual-rate depends on cost behavior, not the number of products.
  - Answer (D) is **correct**. The dual-rate method of allocating costs from one department to another involves classifying the costs to be allocated into two pools, one variable and one fixed.

**[11] Gleim #: 3.6.124 -- Source: CMA 0408 2-154**

The management of ROX Company wishes to encourage all other departments to use the legal department, as circumstances warrant. To accomplish this, legal department costs should be

- A. Allocated to users on the basis of the actual cost of hours used.
  - B. Allocated to users on the basis of the budgeted cost of actual hours used.
  - C. Allocated to users on the basis of standard cost for the type of service provided.
  - D. Absorbed as a corporate expense.
- Answer (A) is **incorrect**. Any allocation that differentiates among the users will cause the users to examine the cost of the service and might thereby discourage use.
  - Answer (B) is **incorrect**. Any allocation that differentiates among the users will cause the users to examine the cost of the service and might thereby discourage use.
  - Answer (C) is **incorrect**. Any allocation that differentiates among the users will cause the users to examine the cost of the service and might thereby discourage use.
  - Answer (D) is **correct**. The most effective way to encourage more use of a service is to keep the user from having to bear the cost of the service.

[12] Gleim #: 3.6.125 -- Source: CMA 0408 2-155

Jones Tax Company has three divisions – Compliance, Tax Planning, and Financial Consulting. Based on the divisional data presented below, which one of the allocation bases for common company expenses would likely have the **least** negative behavioral impact on the Financial Consulting Division manager?

	<u>Compliance</u>	<u>Tax Planning</u>	<u>Financial Consulting</u>
Revenues	\$4,500,000	\$6,000,000	\$4,500,000
Variable expenses	1,500,000	3,750,000	2,250,000
No. of employees	68	76	56

- A. Revenues.
- B. Contribution margin.
- C. Equal sharing.
- D. Number of employees.

- Answer (A) is **incorrect**. Using revenues would cause the Financial Consulting Division to bear as much of the burden as the Compliance Division.
- Answer (B) is **incorrect**. Contribution margin, while advantageous to the Financial Consulting Division, is not as advantageous as using the number of employees.
- Answer (C) is **incorrect**. Equal sharing would cause the same burden to be laid on the Financial Consulting Division as on the other divisions.
- Answer (D) is **correct**. The Financial Consulting Division has the fewest employees. Using that as the basis for allocation would therefore be the most advantageous.

**[13] Gleim #: 3.6.126 -- Source: CMA 0408 2-157**

Boston Furniture Company manufactures several steel products. It has three production departments: Fabricating, Assembly, and Finishing. The service departments include Maintenance, Material Handling, and Designing. Currently, the company does not allocate service department costs to the production departments. John Baker, who has recently joined the company as the new cost accountant, believes that service department rates should be developed and charged to the production departments for services requested. If the company adopts this new policy, the production department managers would be **least** likely to

- A. Request an excessive amount of service.
- B. Replace outdated and inefficient systems.
- C. Refrain from using necessary services.
- D. Be encouraged to control costs.

- Answer (A) is **correct**. When a user is forced to bear a realistic cost for a service, the user is less likely to use an excessive amount of that service.
- Answer (B) is **incorrect**. Having to bear maintenance costs would be an incentive to replace outdated and inefficient systems.
- Answer (C) is **incorrect**. If a service is necessary, having to bear a realistic cost will not be a barrier.
- Answer (D) is **incorrect**. When a user is forced to bear a cost for a service, the user has an incentive to control costs.

**[14] Gleim #: 3.6.127 -- Source: CMA 0408 2-158**

Cotton Company has two service departments and three operating departments. In allocating service department costs to the operating departments, which of the following three methods (direct, step-down, reciprocal) will result in the same amount of service department costs being allocated to each operating department, regardless of the order in which the service department costs are allocated?

- A. Direct and reciprocal methods only.
- B. Step-down and reciprocal methods only.
- C. Direct and step-down methods only.
- D. Direct method only.

- Answer (A) is **correct**. With the direct and reciprocal methods, the order of allocation is irrelevant. However, under the step-down method, some service department cost is allocated to other service departments before allocation to the operating departments. These first allocations change the proportions of the total constituted by each department.
- Answer (B) is **incorrect**. Under the step-down method, the amounts allocated are affected by the order of allocation.
- Answer (C) is **incorrect**. Under the step-down method, the amounts allocated are affected by the order of allocation.
- Answer (D) is **incorrect**. Order of allocation also does not apply under the reciprocal method.

---

**[Fact Pattern #1]**

Wilcox Industrial has two support departments, the Information Systems Department and the Personnel Department, and two manufacturing departments, the Machining Department and the Assembly Department. The support departments service each other as well as the two production departments. Company studies have shown that the Personnel Department provides support to a greater number of departments than the Information Systems Department.

---

**[15] Gleim #: 3.6.128 -- Source: CMA 0408 2-159**

(Refers to Fact Pattern #1)

If Wilcox uses the reciprocal method of department allocation, which one of the following departmental allocations would occur? The costs of the

- A. Assembly Department are allocated to the Information Systems Department and the Personnel Department.
  - B. Information Systems Department are allocated to the Machining Department and the costs of the Machining Department are allocated to the Assembly Department.
  - C. Personnel Department are allocated solely to the Information Systems Department.
  - D. Information Systems Department are allocated to the Personnel Department, Machining Department, and Assembly Department.
- Answer (A) is **incorrect**. The costs of production departments are not allocated.
  - Answer (B) is **incorrect**. The costs of production departments are not allocated.

- Answer (C) is **incorrect**. Under the reciprocal method, the costs of support departments are allocated to both production departments and other support departments.
- Answer (D) is **correct**. The reciprocal method is the most complex and the most theoretically sound of the three service department allocation methods. The reciprocal method recognizes services rendered by all service departments to each other as well as to the production departments.

**[16] Gleim #: 3.6.129 -- Source: CMA 0408 2-160**

(Refers to Fact Pattern #1)

If Wilcox uses the step-down method of departmental allocation, which one of the following cost allocations would **not** occur? Some of the costs of the

- A. Personnel Department would be allocated to the Information Systems Department.
- B. Information Systems Department would be allocated to the Personnel Department.
- C. Personnel Department would be allocated to the Assembly Department.
- D. Personnel Department would be allocated to the Assembly Department and the Machining Department.

- Answer (A) is **incorrect**. Personnel would be allocated to Information Systems.
- Answer (B) is **correct**. The step or step-down method allocates some of the costs of services rendered by service departments to each other. The step method derives its name from the procedure involved: The service departments are allocated in order, from the one that provides the most service to other service departments down to the one that provides the least. Since Personnel provides more services than Information Systems, Personnel will be allocated to Information Systems, but not the other way around.
- Answer (C) is **incorrect**. Personnel would be allocated to Assembly.
- Answer (D) is **incorrect**. Personnel would be allocated to both Assembly and Machining.

**[17] Gleim #: 3.6.130 -- Source: CMA 0408 2-164**

(Refers to Fact Pattern #1)

If Wilcox uses the direct method of departmental allocation, which one of the following cost allocations would occur? Some of the costs of the

- A. Personnel Department would be allocated to the Information Systems Department.
- B. Machining Department would be allocated to the Information Systems Department.
- C. Information Systems Department would be allocated to the Assembly Department.
- D. Assembly Department would be allocated to the Machining Department.

- Answer (A) is **incorrect**. The services rendered by service departments to each other are simply allocated to production departments under the direct method.
- Answer (B) is **incorrect**. The costs of production departments are not allocated to service departments under any of the allocation methods.
- Answer (C) is **correct**. The direct method of service department allocation is the simplest. Service department costs are allocated directly to the producing departments without regard for services rendered by service departments to each other. Service department costs are allocated to production departments based on an allocation base appropriate to each service department's function.
- Answer (D) is **incorrect**. The costs of production departments are not allocated to each other under the direct method.

**[18] Gleim #: 3.6.131 -- Source: CMA 0408 2-161**

Render, Inc., has four support departments (maintenance, power, human resources, and legal) and three operating departments. The support departments provide services to the operating departments as well as to the other support departments. The method of allocating the costs of the support departments that best recognizes the mutual services rendered by support departments to other support departments is the

- A. Direct allocation method.
- B. Dual-rate allocation method.
- C. Step-down allocation method.
- D. Reciprocal allocation method.

- Answer (A) is **incorrect**. The direct method of service department allocation, the simplest of the three methods, consists of allocating service department costs directly to the producing departments without regard for services rendered by service departments to each other.
- Answer (B) is **incorrect**. Dual-rate allocation is a term more properly associated with overhead assignment.
- Answer (C) is **incorrect**. The step or step-down method, while more theoretically sound than the direct method, is less sound than the reciprocal method.
- Answer (D) is **correct**. The reciprocal method is the most complex and the most theoretically sound of the three service department allocation methods. The reciprocal method recognizes services rendered by all service departments to each other as well as to the production departments.

**[Fact Pattern #1]**

The managers of Rochester Manufacturing are discussing ways to allocate the cost of service departments, such as Quality Control and Maintenance, to the production departments. To aid them in this discussion, the controller has provided the following information:

	<u>Quality Control</u>	<u>Maintenance</u>	<u>Machining</u>	<u>Assembly</u>	<u>Total</u>
Budgeted overhead costs					
before allocation	\$350,000	\$200,000	\$400,000	\$300,000	\$1,250,000
Budgeted machine hours	--	--	50,000	--	50,000
Budgeted direct labor hours	--	--	--	25,000	25,000
Budgeted hours of service:					
Quality Control	--	7,000	21,000	7,000	35,000
Maintenance	10,000	--	18,000	12,000	40,000

**[2] Gleim #: 3.7.133 -- Source: CMA 691 3-16**

(Refers to Fact Pattern #1)

If Rochester uses the direct method of allocating service department costs, the total service costs allocated to the assembly department would be

- A. \$80,000
- B. \$87,500
- C. \$120,000
- D. \$167,500

- Answer (A) is **incorrect**. The total of the service department costs allocated to the Assembly Department is \$167,500
- Answer (B) is **incorrect**. The total of the service department costs allocated to the Assembly Department is \$167,500
- Answer (C) is **incorrect**. The total of the service department costs allocated to the Assembly Department is \$167,500

- Answer (D) is **correct**. Under the direct method, service department costs are allocated directly to the production departments, with no allocation to other service departments. The total budgeted hours of service by the Quality Control Department to the two production departments is 28,000 (21,000 + 7,000). Given that the Assembly Department is expected to use 25% ( $7,000 \div 28,000$ ) of the total hours budgeted for the production departments, it will absorb 25% of total quality control costs ( $\$350,000 \times 25\% = \$87,500$ ). The total budgeted hours of service by the Maintenance Department to the production departments is 30,000 (18,000 + 12,000). The Assembly Department is expected to use 40% ( $12,000 \div 30,000$ ) of the total maintenance hours budgeted for the production departments. Thus, the Assembly Department will be allocated 40% of the \$200,000 of maintenance costs, or \$80,000. The total service department costs allocated to the Assembly Department is \$167,500 ( $\$87,500 + \$80,000$ ).

**[3] Gleim #: 3.7.134 -- Source: CMA 691 3-17**

(Refers to Fact Pattern #1)

Using the direct method, the total amount of overhead allocated to each machine hour at Rochester would be

- A. \$2.40
- B. \$5.25
- C. \$8.00
- D. \$15.65

- Answer (A) is **incorrect**. The overhead cost per machine hour is \$15.65.
- Answer (B) is **incorrect**. The overhead cost per machine hour is \$15.65.
- Answer (C) is **incorrect**. The overhead cost per machine hour is \$15.65.
- Answer (D) is **correct**. Machining uses 75% ( $21,000 \div 28,000$ ) of the total quality control hours and 60% ( $18,000 \div 30,000$ ) of the total maintenance hours budgeted for the production departments. Under the direct method, it will therefore be allocated \$262,500 ( $\$350,000 \times 75\%$ ) of quality control costs and \$120,000 ( $\$200,000 \times 60\%$ ) of maintenance costs. In addition, Machining is expected to incur another \$400,000 of overhead costs. Thus, the total estimated Machining overhead is \$782,500 ( $\$262,500 + \$120,000 + \$400,000$ ), and the overhead cost per machine hour is \$15.65 ( $\$782,500 \div 50,000$  hours).

**[4] Gleim #: 3.7.135 -- Source: CMA 691 3-19**

(Refers to Fact Pattern #1)

If Rochester uses the step-down method of allocating service costs beginning with quality control, the maintenance costs allocated to the assembly department would be

- A. \$70,000
- B. \$108,000
- C. \$162,000
- D. \$200,000

- Answer (A) is **incorrect**. The Assembly Department will be allocated maintenance costs of \$108,000.
- Answer (B) is **correct**. The step-down method allocates service costs to both service and production departments but does not involve reciprocal allocations among service departments. Accordingly, Quality Control will receive no allocation of maintenance costs. The first step is to allocate quality control costs to the Maintenance Department. Maintenance is expected to use 20% ( $7,000 \div 35,000$ ) of the available quality control hours and will be allocated \$70,000 ( $\$350,000 \times 20\%$ ) of quality control costs. Thus, total allocable maintenance costs equal \$270,000 ( $\$70,000 + \$200,000$ ). The Assembly Department is estimated to use 40% ( $12,000 \div 30,000$ ) of the available maintenance hours. Consequently, it will be allocated maintenance costs of \$108,000 ( $\$270,000 \times 40\%$ ).
- Answer (C) is **incorrect**. The Assembly Department will be allocated maintenance costs of \$108,000.
- Answer (D) is **incorrect**. The Assembly Department will be allocated maintenance costs of \$108,000.

**[5] Gleim #: 3.7.136 -- Source: CMA 691 3-20**

(Refers to Fact Pattern #1)

If Rochester uses the reciprocal method of allocating service costs, the total amount of quality control costs (rounded to the nearest dollar) to be allocated to the other departments would be

- A. \$284,211
- B. \$336,842
- C. \$350,000
- D. \$421,053

- Answer (A) is **incorrect**. The total quality control costs to be allocated equal \$421,053.

- Answer (B) is **incorrect**. The total quality control costs to be allocated equal \$421,053.
- Answer (C) is **incorrect**. The total quality control costs to be allocated equal \$421,053.
- Answer (D) is **correct**. The reciprocal method involves mutual allocations of service costs among service departments. For this purpose, a system of simultaneous equations is necessary. The total costs for the Quality Control Department consist of \$350,000 plus 25% (10,000 hours ÷ 40,000 hours) of maintenance costs. The total costs for the Maintenance Department equal \$200,000 plus 20% (7,000 hours ÷ 35,000 hours) of quality control costs. These relationships can be expressed by the following equations:

$$Q = \$350,000 + .25M$$

$$M = \$200,000 + .2Q$$

To solve for Q, the second equation can be substituted into the first as follows:

$$Q = \$350,000 + .25(\$200,000 + .2Q)$$

$$Q = \$350,000 + \$50,000 + .05Q$$

$$.95Q = \$400,000$$

$$Q = \$421,053$$

**[6] Gleim #: 3.7.137 -- Source: CMA 691 3-18**

(Refers to Fact Pattern #1)

If Rochester decides not to allocate service costs to the production departments, the overhead allocated to each direct labor hour in the Assembly Department would be

- A. \$3.20
- B. \$3.50
- C. \$12.00
- D. \$16.00

- Answer (A) is **incorrect**. The overhead cost applied per direct labor hour will be \$12.
- Answer (B) is **incorrect**. The overhead cost applied per direct labor hour will be \$12.
- Answer (C) is **correct**. With no allocation of service department costs, the only overhead applicable to the Assembly Department is the \$300,000 budgeted for that department. Hence, the overhead cost applied per direct labor hour will be \$12 (\$300,000 budgeted overhead ÷ 25,000 hours).
- Answer (D) is **incorrect**. The overhead cost applied per direct labor hour will be \$12.

---

**[Fact Pattern #2]**

Longstreet Company's Photocopying Department provides photocopy services for both Departments A and B and has prepared its total budget using the following information for next year:

Fixed costs	\$100,000
Available capacity	4,000,000 pages
Budgeted usage	
Department A	1,200,000 pages
Department B	2,400,000 pages
Variable cost	\$0.03 per page

---

**[7] Gleim #: 3.7.138 -- Source: CMA 697 3-6**

(Refers to Fact Pattern #2)

Assume that Longstreet uses the single-rate method of cost allocation and the allocation base is budgeted usage. How much photocopying cost will be allocated to Department B in the budget year?

- A. \$72,000
- B. \$122,000
- C. \$132,000
- D. \$138,667

- Answer (A) is **incorrect**. The amount of \$72,000 is the variable cost allocation.
- Answer (B) is **incorrect**. The amount of \$122,000 assumes that fixed costs are allocated equally between A and B.
- Answer (C) is **incorrect**. The amount of \$132,000 assumes fixed costs are allocated at a per-page rate based on available capacity ( $\$100,000 \div 4,000,000 \text{ pages} = \$0.025 \text{ per page}$ ), not on budgeted usage ( $\$100,000 \div 3,600,000 \text{ pages} = \$0.0278 \text{ per page}$ ).
- Answer (D) is **correct**. Department B is budgeted to use 66 2/3% of total production ( $2,400,000 \div 3,600,000$ ), so it should be allocated fixed costs of \$66,667 ( $\$100,000 \times 66 \frac{2}{3}\%$ ). The variable cost allocation is \$72,000 ( $2,400,000 \text{ pages} \times \$0.03 \text{ per page}$ ), and the total allocated is therefore \$138,667 ( $\$66,667 + \$72,000$ ).

[8] Gleim #: 3.7.139 -- Source: CMA 697 3-7

(Refers to Fact Pattern #2)

Assume that Longstreet uses the dual-rate cost allocation method, and the allocation basis is budgeted usage for fixed costs and actual usage for variable costs. How much cost would be allocated to Department A during the year if actual usage for Department A is 1,400,000 pages and actual usage for Department B is 2,100,000 pages?

- A. \$42,000
- B. \$72,000
- C. \$75,333
- D. \$82,000

- Answer (A) is **incorrect**. The amount of \$42,000 equals the variable costs allocated to Department A.
- Answer (B) is **incorrect**. The amount of \$72,000 is the allocation to Department B using a single rate.
- Answer (C) is **correct**. Based on budgeted usage, Department A should be allocated 33 1/3%  $[1,200,000 \text{ pages} \div (1,200,000 \text{ pages} + 2,400,000 \text{ pages})]$  of fixed costs, or \$33,333  $(\$100,000 \times 33 \frac{1}{3}\%)$ . The variable costs are allocated at \$.03 per unit for 1,400,000 pages, or \$42,000. The sum of the fixed and variable elements is \$75,333.
- Answer (D) is **incorrect**. The amount of \$82,000 assumes fixed costs are allocated at a per-page rate based on actual usage  $(\$100,000 \div 3,500,000 \text{ pages} = \$.0286 \text{ per page})$ .

---

**[Fact Pattern #3]**

M&P Tool has three service departments that support the production area. Outlined below is the estimated overhead by department for the upcoming year:

<u>Service Departments</u>	<u>Estimated Overhead</u>	<u>Number of Employees</u>
Receiving	\$25,000	2
Repair	35,000	2
Tool	10,000	1
<u>Production Departments</u>		
Assembly		25
Bolting		12

The Repair Department supports the greatest number of departments, followed by the Tool Department. Overhead cost is allocated to departments based upon the number of employees.

---

**[9] Gleim #: 3.7.140 -- Source: CMA 697 3-8**

(Refers to Fact Pattern #3)

If M&P uses the direct method of allocation, how much of the Repair Department's overhead will be allocated to the Tool Department?

- A. \$0
- B. \$875
- C. \$7,000
- D. \$11,667

- Answer (A) is **correct**. The direct method allocates service department costs directly to the producing departments without recognition of services provided among the service departments. Hence, no service cost is allocated to the Tool Department because it is a service department.
- Answer (B) is **incorrect**. The direct method does not recognize any allocation between or among service departments; only production departments receive cost allocations.
- Answer (C) is **incorrect**. The direct method does not recognize any allocation between or among service departments; only production departments receive cost allocations.
- Answer (D) is **incorrect**. The direct method does not recognize any allocation between or among service departments; only production departments receive cost allocations.

[10] Gleim #: 3.7.141 -- Source: CMA 697 3-9

(Refers to Fact Pattern #3)

If M&P uses the step-down method of allocation, the allocation from the Repair Department to the Tool Department would be

- A. \$0
- B. \$875
- C. \$7,000
- D. \$11,667

- Answer (A) is **incorrect**. Under the step-down method, other service departments share in the allocation of costs.
- Answer (B) is **correct**. Under the step-down method, service costs are allocated to all departments. However, no reciprocal allocations among service departments are performed. The process usually begins with the department that provides the greatest percentage of its services to other service departments. Thus, the Repair Department is the logical starting point. Given that service costs are allocated to each department (service or production) on the basis of its proportion of employees (excluding employees in the allocating department), the allocation of the Repair Department's overhead to the Tool Department is \$875  $\{[1 \text{ employee} \div (1 + 2 + 25 + 12)] \times \$35,000\}$ .
- Answer (C) is **incorrect**. This amount is far greater than could be allocated to a service department with one employee.
- Answer (D) is **incorrect**. This amount is far greater than could be allocated to a service department with one employee.

**[Fact Pattern #4]**

Logo, Inc., has two service departments (the Systems Department and the Facilities Department) that provide support to the company's three production departments (Machining Department, Assembly Department, and Finishing Department). The overhead costs of the Systems Department are allocated to other departments on the basis of computer usage hours. The overhead costs of the Facilities Department are allocated based on square feet occupied (in thousands). Other information pertaining to Logo is as follows:

<u>Department</u>	<u>Overhead</u>	<u>Computer Usage Hours</u>	<u>Square Feet Occupied</u>
Systems	\$200,000	300	1,000
Facilities	100,000	900	600
Machining	400,000	3,600	2,000
Assembly	550,000	1,800	3,000
Finishing	620,000	<u>2,700</u>	<u>5,000</u>
Total		<u><u>9,300</u></u>	<u><u>11,600</u></u>

**[13] Gleim #: 3.7.144 -- Source: CMA 0408 2-162**

(Refers to Fact Pattern #4)

Logo employs the direct method of allocating service department costs. The overhead of the Systems Department would be allocated by dividing the overhead amount by

- A. 1,200 hours.
- B. 8,100 hours.
- C. 9,000 hours.
- D. 9,300 hours.

- Answer (A) is **incorrect**. The number of computer hours used by the service departments is 1,200.
- Answer (B) is **correct**. The direct method of service department allocation is the simplest. Service department costs are allocated directly to the producing departments without regard for services rendered by service departments to each other. Service department costs are allocated to production departments based on an allocation base appropriate to each service department's function. The appropriate allocation base for the Systems Department is computer usage hours. Thus, the denominator for allocating Systems will be the total computer hours used by the production departments ( $3,600 + 1,800 + 2,700 = 8,100$ ).
- Answer (C) is **incorrect**. The number of 9,000 improperly includes the Facilities Department, which would receive no allocation from Systems under the direct method.

- Answer (D) is **incorrect**. The number of 9,300 improperly includes both service departments and production departments.

**[14] Gleim #: 3.7.145 -- Source: CMA 0408 2-165**

(Refers to Fact Pattern #4)

Logo employs the step-down method of allocating service department costs and begins with the Systems Department. Which one of the following correctly denotes the amount of the Systems Department's overhead that would be allocated to the Facilities Department and the Facilities Department's overhead charges that would be allocated to the Machining Department?

	<u>Systems to Facilities</u>	<u>Facilities to Machining</u>
A.	\$0	\$20,000
B.	\$19,355	\$20,578
C.	\$20,000	\$20,000
D.	\$20,000	\$24,000

- Answer (A) is **incorrect**. Under the step-down method, some of the service department costs are allocated to the other service departments.
- Answer (B) is **incorrect**. Allocating \$19,355 to Facilities results from improperly including the Systems Department's hours in the allocation base.
- Answer (C) is **incorrect**. The amount of \$20,000 of Facilities allocated to Machining results from failing to allocate Systems to Facilities first.

- Answer (D) is **correct**. The first step in applying the step-down method is to determine the percentage of the total driver for the first service department that is to be assigned to the other departments:

<u>Allocate Systems:</u>	<u>Computer Hours</u>	<u>% of Total</u>	<u>Amount to Be Allocated</u>	<u>Departmental Allocations</u>
To Facilities	900	10.0%	\$200,000	\$ 20,000
To Machining	3,600	40.0%	200,000	80,000
To Assembly	1,800	20.0%	200,000	40,000
To Finishing	2,700	30.0%	200,000	60,000
Totals	<u>9,000</u>	<u>100.0%</u>		<u>\$200,000</u>

The second step is to allocate the costs of the first service department (\$000 omitted):

	<u>Service Depts.</u>		<u>Production Departments</u>			
	<u>Systems</u>	<u>Facilities</u>	<u>Machining</u>	<u>Assembly</u>	<u>Finishing</u>	<u>Total</u>
Totals before allocation	\$200	\$100	\$400	\$550	\$620	\$1,870
Allocate Sys.	<u>(200)</u>	<u>20</u>	<u>80</u>	<u>40</u>	<u>60</u>	<u>0</u>
Totals after first allocation	<u>\$ 0</u>	<u>\$120</u>	<u>\$480</u>	<u>\$590</u>	<u>\$680</u>	<u>\$1,870</u>

The third step is to determine the percentage of the total driver for the second allocated service department that is to be assigned to each of the remaining departments:

<u>Allocate Facilities:</u>	<u>Square Footage</u>	<u>% of Total</u>	<u>Amount to Be Allocated</u>	<u>Departmental Allocations</u>
To Machining	2,000	20.0%	\$120,000	24,000
To Assembly	3,000	30.0%	120,000	36,000
To Finishing	5,000	50.0%	120,000	60,000
Totals	<u>10,000</u>	<u>100.0%</u>		<u>\$120,000</u>

The final step is to allocate the costs of the second service department:

	<u>Service Dept.</u>	<u>Production Departments</u>			
	<u>Facilities</u>	<u>Machining</u>	<u>Assembly</u>	<u>Finishing</u>	<u>Total</u>
Totals after first allocation	\$120,000	\$480,000	\$590,000	\$680,000	\$1,870,000
Allocate Facil.	<u>(120,000)</u>	<u>24,000</u>	<u>36,000</u>	<u>60,000</u>	<u>0</u>
Totals after 2nd allocation	<u>\$ 0</u>	<u>\$504,000</u>	<u>\$626,000</u>	<u>\$740,000</u>	<u>\$1,870,000</u>

**[Fact Pattern #5]**

Adam Corporation manufactures computer tables and has the following budgeted indirect manufacturing cost information for next year:

	<u>Support Departments</u>		<u>Operating Departments</u>		
	<u>Maintenance</u>	<u>Systems</u>	<u>Machining</u>	<u>Fabrication</u>	<u>Total</u>
Budgeted overhead	\$360,000	\$95,000	\$200,000	\$300,000	\$955,000
Support work finished:					
From Maintenance		10%	50%	40%	100%
From Systems	5%		45%	50%	100%

**[15] Gleim #: 3.7.146 -- Source: CMA 0408 2-163**

(Refers to Fact Pattern #5)

If Adam uses the step-down method, beginning with the Maintenance Department, to allocate support department costs to production departments, the total overhead (rounded to the nearest dollar) for the Machining Department to allocate to its products would be

- A. \$415,526
- B. \$422,750
- C. \$442,053
- D. \$445,000

- Answer (A) is **incorrect**. The amount of \$415,526 results from mixing up the allocation rates to all departments from each service department.
- Answer (B) is **incorrect**. The amount of \$422,750 results from intermixing the allocation rates between the two service departments.

- Answer (C) is **correct**. The first step in applying the step-down method is to determine the percentage of the total driver for the first service department that is to be assigned to the other departments:

<u>Allocate</u>		<u>% of</u>	<u>Amount to be</u>	<u>Departmental</u>
<u>Maintenance:</u>	<u>Proportion</u>	<u>Total</u>	<u>Allocated</u>	<u>Allocations</u>
To Systems	10	10.0%	\$360,000	\$ 36,000
To Machining	50	50.0%	360,000	180,000
To Fabrication	40	40.0%	360,000	144,000
Totals		<u>100.0%</u>		<u>\$360,000</u>

The second step is to allocate the costs of the first service department:

	<u>Service Departments</u>		<u>Production Departments</u>		
	<u>Maint.</u>	<u>Systems</u>	<u>Machining</u>	<u>Fabrication</u>	<u>Total</u>
Tot. bef. allocation	\$360,000	\$ 95,000	\$200,000	\$300,000	\$955,000
Allocate Maint.	<u>(360,000)</u>	<u>36,000</u>	<u>180,000</u>	<u>144,000</u>	<u>0</u>
Totals after first allocation	<u>\$ 0</u>	<u>\$131,000</u>	<u>\$380,000</u>	<u>\$444,000</u>	<u>\$955,000</u>

The third step is to determine the percentage of the total driver for the second allocated service department that is to be assigned to each of the remaining departments:

<u>Allocate</u>		<u>% of</u>	<u>Amount to Be</u>	<u>Departmental</u>
<u>Systems:</u>	<u>Proportion</u>	<u>Total</u>	<u>Allocated</u>	<u>Allocations</u>
To Machining	45	47.4%	\$131,000	\$ 62,053
To Fabrication	50	52.6%	131,000	68,947
Totals		<u>100.0%</u>		<u>\$131,000</u>

The final step is to allocate the costs of the second service department:

	<u>Service</u>	<u>Production Departments</u>		
	<u>Department</u>	<u>Machining</u>	<u>Fabrication</u>	<u>Total</u>
Totals after first allocation	\$131,000	\$380,000	\$444,000	\$955,000
Allocate Systems	<u>(131,000)</u>	<u>62,053</u>	<u>68,947</u>	<u>0</u>
Totals after second allocation	<u>\$ 0</u>	<u>\$442,053</u>	<u>\$512,947</u>	<u>\$955,000</u>

- Answer (D) is **incorrect**. The amount of \$445,000 results from improperly allocating half the cost of Systems to each production department or by using the direct method of allocation.

**[16] Gleim #: 3.7.147 -- Source: CMA 0408 2-166**

(Refers to Fact Pattern #5)

If Adam uses the direct method to allocate support department costs to production departments, the total overhead (rounded to the nearest dollar) for the Machining Department to allocate to its products would be

- A. \$418,000
- B. \$422,750
- C. \$442,053
- D. \$445,000

- Answer (A) is **incorrect**. The amount of \$418,000 results from multiplying the given percentages (50% of machining and 40% of systems) times the service department costs instead of using proportions, such as 50/90 and 45/95.
- Answer (B) is **incorrect**. The amount of \$422,750 results from using the step-down method but intermixing the starting rates.
- Answer (C) is **incorrect**. The amount of \$442,053 results from applying the step-down method beginning with the maintenance department.

- Answer (D) is **correct**. The first step in applying the direct method is to determine the percentage of the total drivers for the two service departments that are to be assigned to the production departments:

<u>Allocate</u> <u>Maintenance:</u>	<u>Proportion</u>	<u>% of</u> <u>Total</u>	<u>Amount to be</u> <u>Allocated</u>	<u>Departmental</u> <u>Allocations</u>
To Machining	50	55.6%	\$360,000	\$200,000
To Fabrication	40	44.4%	360,000	160,000
Totals		<u>100.0%</u>		<u>\$360,000</u>

<u>Allocate</u> <u>Systems:</u>	<u>Proportion</u>	<u>% of</u> <u>Total</u>	<u>Amount to be</u> <u>Allocated</u>	<u>Departmental</u> <u>Allocations</u>
To Machining	45	47.4%	\$95,000	\$45,000
To Fabrication	50	52.6%	95,000	50,000
Totals		<u>100.0%</u>		<u>\$95,000</u>

The second step is to allocate the costs of the service departments:

	<u>Service Departments</u>		<u>Production Departments</u>		
	<u>Maint.</u>	<u>Systems</u>	<u>Machining</u>	<u>Fabrication</u>	<u>Total</u>
Totals before allocation	\$360,000	\$95,000	\$200,000	\$300,000	\$955,000
Allocate Maintenance	(360,000)	--	200,000	160,000	0
Allocate Systems	--	(95,000)	45,000	50,000	0
Totals after allocation	<u>\$ 0</u>	<u>\$ 0</u>	<u>\$445,000</u>	<u>\$510,000</u>	<u>\$955,000</u>

[1] Gleim #: 4.1.1 -- Source: CMA 1294 4-6

Companies that adopt just-in-time purchasing systems often experience

- A. A reduction in the number of suppliers.
  - B. Fewer deliveries from suppliers.
  - C. A greater need for inspection of goods as the goods arrive.
  - D. Less need for linkage with a vendor's computerized order entry system.
- Answer (A) is **correct**. The objective of JIT is to reduce carrying costs by eliminating inventories and increasing the deliveries made by suppliers. Ideally, shipments of raw materials are received just in time to be incorporated into the manufacturing process. The focus of quality control under JIT is the prevention of quality problems. Quality control is shifted to the supplier. JIT companies typically do not inspect incoming goods; the assumption is that receipts are of perfect quality. Suppliers are limited to those who guarantee perfect quality and prompt delivery.
  - Answer (B) is **incorrect**. More deliveries are needed. Each shipment is smaller.
  - Answer (C) is **incorrect**. In a JIT system, materials are delivered directly to the production line ready for insertion in the finished product.
  - Answer (D) is **incorrect**. The need for communication with the vendor is greater. Orders and deliveries must be made on short notice, sometimes several times a day.

[16] Gleim #: 4.1.16 -- Source: CMA 0205 3-3

Just-in-time production is also called

- A. Kaizen.
  - B. Lean manufacturing.
  - C. Activity-based management.
  - D. Backflush costing.
- Answer (A) is **incorrect**. Kaizen is a Japanese word meaning continuous pursuit of improvement in every aspect of organizational operations.

- Answer (B) is **correct**. To implement a just-in-time (JIT) approach to inventory management and to eliminate waste of materials, labor, factory space, and machine usage, the factory is reorganized to permit what is often called lean production. Plant layout in a JIT-lean production environment is not arranged by functional department or process but by manufacturing cells (work cells). Central support departments are reduced or eliminated, space is saved, fewer and smaller factories may be required, and materials and tools are brought close to the point of use.
- Answer (C) is **incorrect**. Activity-based management is the linkage of product costing and continuous improvement of processes. It redirects and improves the use of resources to increase the value created for customers and other stakeholders.
- Answer (D) is **incorrect**. Backflush costing is utilized with just-in-time production as a planning and control system. Backflush costing is less costly to operate than most traditional costing systems.

[17] Gleim #: 4.1.17 -- Source: CMA 0205 3-4

Which of the following is **not** a correct comparison of a just-in-time system with a traditional system?

<u>Traditional</u>	<u>Just-in-Time</u>
A. Longer lead times	Shorter lead times
B. Inventory is an asset	Inventory is a liability
C. Some scrap tolerated	Zero defects desired
D. Lot size based on immediate need	Lot size based on formulas

- Answer (A) is **incorrect**. The difference in lead times is a correct comparison between the two systems.
- Answer (B) is **incorrect**. Minimization of inventory is a goal of the just-in-time system since many inventory-related activities are viewed as nonvalue-added.
- Answer (C) is **incorrect**. The focus of quality control under a just-in-time system shifts from the discovery of defective parts to the prevention of quality problems. Zero defects are the ultimate goal.
- Answer (D) is **correct**. Lot sizes based on immediate need are typical of just-in-time systems, while lot sizes based on formulas are characteristic of traditional inventory management systems.

[7] Gleim #: 4.2.24 -- Source: CMA 0205 3-5

Starr Company uses material requirements planning (MRP) and manufactures a product with the following product structure tree.

(Refer to Figure FIGURE03\_02\_02\_Q2.)

Starr has just received an order for 100 units of X, the finished product. The company has 20 units of X, 100 units of B, and 50 units of E in inventory. How many units of E must Starr purchase in order to fill the order?

- A. 1,000
- B. 950
- C. 800
- D. 550

- Answer (A) is **incorrect**. Failing to consider the units already in inventory results in 1,000.
- Answer (B) is **incorrect**. Failing to consider the 20 units of X and the 100 units of B results in 950.
- Answer (C) is **incorrect**. Failing to consider the 100 units of B and the 50 units of E already in inventory results in 800.
- Answer (D) is **correct**. Starr already has 20 units of the finished product in inventory so 80 will need to be manufactured to fill this order. The amount of Subunit B that must be purchased is  $[(80 \times 5) - 100 \text{ on hand}] = 300$ . The amount of Subunit E that must be purchased is therefore  $[(300 \times 2) - 50 \text{ on hand}] = 550$ .

[1] Gleim #: 4.3.25 -- Source: CMA 1294 4-2

United Industries manufactures three products at its highly automated factory. The products are very popular, with demand far exceeding the company's ability to supply the marketplace. To maximize profit, management should focus on each product's

- A. Gross margin.
- B. Segment margin.
- C. Contribution margin ratio.
- D. Contribution margin per machine hour.

- Answer (A) is **incorrect**. Focusing on high gross margin products does not maximize profits if those products require an excessive amount of resources.
- Answer (B) is **incorrect**. The company can sell as much of each product as it can produce. Thus, sales are limited by production constraints, e.g., machine hours. The company should therefore seek to maximize its return per unit of the constraint.
- Answer (C) is **incorrect**. The contribution margin ratio is only important as it translates to dollars. A high margin on a low sales volume will not be profitable.
- Answer (D) is **correct**. When demand far exceeds a company's ability to supply the marketplace, management will want to maximize its profits per unit of scarce resource. If the scarce resource is raw materials, the products that provide the greatest contribution margin per unit of raw materials are the products to emphasize. If machine hours are the constraint, profits are maximized by emphasizing the contribution margin per machine hour.

[2] Gleim #: 4.3.26 -- Source: CMA 0205 3-6

Antler, Inc., produces a single product that sells for \$150 per unit. The product is processed through the Cutting and Finishing Departments. Additional data for these departments are as follows:

	Cutting	Finishing
Annual capacity (36,000 direct labor hours available in each department)	180,000 units	135,000 units
Current production rate (annualized)	108,000 units	108,000 units
Fixed manufacturing overhead	\$1,296,000	\$1,944,000
Fixed selling and administrative expense	864,000	1,296,000
Direct materials cost per unit	45	15

The current production rate is the budgeted rate for the entire year. Direct labor employees earn \$20 per hour, and the company has a “no layoff” period in effect. What is the amount of the throughput contribution per unit as computed using the theory of constraints?

- A. \$90.00
- B. \$76.67
- C. \$46.67
- D. \$26.67

- Answer (A) is **correct**. Throughput costing, sometimes called supervariable costing, recognizes only direct materials costs as being truly variable and thus relevant to the calculation of throughput margin (throughput contribution). All other manufacturing costs are ignored because they are considered fixed in the short run. For Antler’s single product, the throughput margin is therefore \$90 (\$150 selling price – \$45 direct materials in Cutting – \$15 direct materials in Finishing).
- Answer (B) is **incorrect**. Labor, overhead, and selling and administrative costs are not considered in the calculation of throughput contribution.
- Answer (C) is **incorrect**. Labor, overhead, and selling and administrative costs are not considered in the calculation of throughput contribution.
- Answer (D) is **incorrect**. Labor, overhead, and selling and administrative costs are not considered in the calculation of throughput contribution.

[3] Gleim #: 4.3.27 -- Source: CMA 0205 3-7

Three of the basic measurements used by the theory of constraints (TOC) are

- A. Gross margin (or gross profit), return on assets, and total sales.
- B. Number of constraints (or subordinates), number of nonconstraints, and operating leverage.
- C. Throughput (or throughput contribution), inventory (or investments), and operational expense.
- D. Fixed manufacturing overhead per unit, fixed general overhead per unit, and unit gross margin (or gross profit).

- Answer (A) is **incorrect**. Gross margin, return on assets, and total sales are used in analyzing a firm's profitability; they are not measurements used in TOC analysis.
- Answer (B) is **incorrect**. Although the number of constraints/nonconstraints is important under the TOC, these numbers are not basic measurements used in TOC analysis. Operating leverage concerns contribution margin, which is not a basic measurement under TOC.
- Answer (C) is **correct**. Theory of constraints (TOC) analysis describes three basic measurements: throughput contribution (sales – direct materials), investments (raw materials; work-in-process; finished goods; R&D costs; and property, plant, and equipment), and operating costs (all costs except direct materials).
- Answer (D) is **incorrect**. These measurements are used under absorption (full) costing, not in TOC analysis.

**[3] Gleim #: 4.4.52 -- Source: CIA, adapted**

Capacity expansion is also referred to as

- A. Market penetration.
- B. Market development.
- C. Product development.
- D. Diversification.

- Answer (A) is **correct**. Market penetration is growth of existing products or development of existing markets. It occurs in mature firms within an industry.
- Answer (B) is **incorrect**. Market development seeks new markets for current products.
- Answer (C) is **incorrect**. Product development is launching new products in existing markets.
- Answer (D) is **incorrect**. Diversification is launching new products for new markets.

**[8] Gleim #: 4.5.60 -- Source: Publisher**

Which of the following is **not** an appropriate time measure for use in process analysis?

- A. Product development time.
- B. Breakeven time.
- C. Customer-response time.
- D. Process value time.

- Answer (A) is **incorrect**. Product development time is a crucial factor in the competitive equation
- Answer (B) is **incorrect**. Breakeven time is a financial measure of product development, and thus is an appropriate time measure for process analysis.
- Answer (C) is **incorrect**. Customer-response time is one of the common time measures for process analysis.
- Answer (D) is **correct**. The three common time measures for process analysis are product development time, breakeven time, and customer-response time. Process value time is not a meaningful term in this context.

**[5] Gleim #: 4.6.65 -- Source: CMA 1295 3-12**

The four categories of costs associated with product quality costs are

- A. External failure, internal failure, prevention, and carrying.
- B. External failure, internal failure, prevention, and appraisal.
- C. External failure, internal failure, training, and appraisal.
- D. Warranty, product liability, training, and appraisal.

- Answer (A) is **incorrect**. Carrying cost is not one of the elements of quality costs.
- Answer (B) is **correct**. IMA's *Management Accounting Glossary* lists four categories of quality costs: prevention, appraisal, internal failure, and external failure (lost opportunity). Costs of prevention include attempts to avoid defective output, including employee training, review of equipment design, preventive maintenance, and evaluation of suppliers. Appraisal costs include quality control programs, inspection, and testing. Internal failure costs are incurred when detection of defective products occurs before shipment, including scrap, rework, tooling changes, and downtime. External failure costs are incurred after the product has been shipped, including the costs associated with warranties, product liability, and customer ill will.
- Answer (C) is **incorrect**. Training costs are not a category of quality costs.
- Answer (D) is **incorrect**. Warranty, product liability, and training are not cost categories identified by IMA's *Management Accounting Glossary*.

**[6] Gleim #: 4.6.66 -- Source: CMA 1296 3-22**

The cost of scrap, rework, and tooling changes in a product quality cost system is categorized as a(n)

- A. Training cost.
- B. External failure cost.
- C. Internal failure cost.
- D. Prevention cost.

- Answer (A) is **incorrect**. Training costs are prevention costs.
- Answer (B) is **incorrect**. The costs of external failure, such as warranty expense, product liability, and customer ill will, arise when problems are discovered after products have been shipped.
- Answer (C) is **correct**. According to IMA's *Management Accounting Glossary*, internal failure costs are incurred when detection of defective products occurs before shipment. Examples of internal failure costs are scrap, rework, tooling changes, and downtime.

- Answer (D) is **incorrect**. Prevention costs are incurred to avoid defective output. Examples include preventive maintenance, employee training, review of equipment design, and evaluation of suppliers.

**[7] Gleim #: 4.6.67 -- Source: CMA 1295 3-14**

The cost of statistical quality control in a product quality cost system is categorized as a(n)

- A. Internal failure cost.
- B. Training cost.
- C. External failure cost.
- D. Appraisal cost.

- Answer (A) is **incorrect**. Internal failure costs arise after poor quality has been found; statistical quality control is designed to detect quality problems.
- Answer (B) is **incorrect**. Statistical quality control is not a training cost.
- Answer (C) is **incorrect**. External failure costs are incurred after the product has been shipped, including the costs associated with warranties, product liability, and customer ill will.
- Answer (D) is **correct**. The following are the four categories of quality costs: prevention, appraisal, internal failure, and external failure (lost opportunity). Appraisal costs include quality control programs, inspection, and testing. However, some authorities regard statistical quality and process control as preventive activities because they not only detect faulty work but also allow for adjustment of processes to avoid future defects.

**[8] Gleim #: 4.6.68 -- Source: CMA 697 3-28**

Listed below are selected line items from the Cost of Quality Report for Watson Products for last month.

<u>Category</u>	<u>Amount</u>
Rework	\$ 725
Equipment maintenance	1,154
Product testing	786
Product repair	695

What is Watson's total prevention and appraisal cost for last month?

- A. \$786
- B. \$1,154
- C. \$1,940
- D. \$2,665

- Answer (A) is **incorrect**. The appraisal cost is \$786.
- Answer (B) is **incorrect**. The prevention cost is \$1,154.
- Answer (C) is **correct**. The costs of prevention and appraisal are conformance costs that serve as financial measures of internal performance. Prevention costs are incurred to prevent defective output. These costs include preventive maintenance, employee training, review of equipment design, and evaluation of suppliers. Appraisal costs are incurred to detect nonconforming output. They embrace such activities as statistical quality control programs, inspection, and testing. The equipment maintenance cost of \$1,154 is a prevention cost. The product testing cost of \$786 is an appraisal cost. Their sum is \$1,940.
- Answer (D) is **incorrect**. The amount of \$2,665 includes rework, an internal failure cost.

**[12] Gleim #: 4.6.72 -- Source: CMA 0408 2-025**

All of the following are examples of benchmarking standards **except**

- A. The performance of the unit during the previous year.
  - B. The best performance of the unit in comparable past periods.
  - C. A comparison with a similar unit within the same company.
  - D. The best performance of a competitor with a similar operation.
- Answer (A) is **correct**. Benchmarking involves setting standards high. Arbitrarily using the unit's prior period performance runs counter to the goal of benchmarking.

- Answer (B) is **incorrect**. Using the unit's best historical performance is an example of benchmarking.
- Answer (C) is **incorrect**. Making a comparison with a similar unit within the same company is an example of benchmarking.
- Answer (D) is **incorrect**. Considering the best performance of a competitor with a similar operation is an example of benchmarking.

**[13] Gleim #: 4.6.73 -- Source: CMA 0408 2-277**

A quality cost report prepared by Dominion, Inc., reveals the following information.

Prevention costs	10%
Appraisal costs	15%
Internal failure costs	20%
External failure costs	<u>55%</u>
Total quality costs	<u>100%</u>

Which one of the following should Dominion emphasize in order to most effectively improve its overall cost of quality performance?

- A. Quality training.
- B. Inspections.
- C. Rework.
- D. Customer support.

- Answer (A) is **correct**. The largest portion of Dominion's total cost of quality is external failure. Quality training, which will result in higher quality awareness on the part of all employees, is the appropriate corrective action. Quality training is a prevention cost, and an increase in prevention should reduce all other cost categories.
- Answer (B) is **incorrect**. Increased inspections will simply raise appraisal costs.
- Answer (C) is **incorrect**. Rework is a non-value-adding activity; increasing it should be avoided.
- Answer (D) is **incorrect**. Increased customer support does not solve the problem of poor quality.

# **PART 1**

# **Financial Planning, Performance and Control**

## **Section C - Performance Management (25% - Levels A, B, and C)**

Section B, Performance Management, is 25% of the exam, another large part. Section B covers Operational Control (management-by-exception approach) in U.7 and Management Control (management-by-objectives approach) in U.8. Factors to be analyzed for control and performance evaluation include revenues, costs, profits, and investment in assets. Variance analysis based on flexible budgets and standard costs is heavily tested, as is responsibility accounting for revenue, cost, contribution, and profit centers. The balanced scorecard is included in this coverage, as are quality considerations.

## Introduction

### PERFORMANCE EVALUATION AND CONTROL

**Performance evaluation** is the process by which managers at all levels gain information about the performance of tasks within the firm and judge that performance against pre established criteria as set out in budgets, plans, and goals. Performance evaluation is applied for each of the three management functions: operations, marketing, and finance.

#### **Operational Control (management-by-exception approach) versus Management Control (management-by-objectives approach)**

**Operational control** means the evaluation of operating level employees by mid-level managers.

Operational control,

- which focuses on detailed short-term performance measures,
- has a management-by-exception approach; that is, it identifies units or individuals whose performance does not comply with expectations so that the problem can be promptly corrected.

#### **Operational Control Issues:**

Standard Costing and Variance Measures (unit 10)

- Analyze performance against operational goals
- Direct Materials Variances
- Direct Labor Variances
- Overhead Variances
- Sales Variances
- Mix and Yield Variances

**CMA EXAM:** For variances you need to be able to both calculate the variances and interpret the information that you get through variance analysis. This will require the memorization of the variance formulas, but also an understanding of what each formula is calculating.

Mathematically, the majority of the questions will come from variance analysis and performance measurement parts of this section. A number of variances are covered, and you need to know not only how to calculate them, but also what they mean and who can affect them. While the variance topic may seem large and overwhelming at first, when it is broken down into its Individual elements it will become easier.

**Management control** refers to the evaluation by upper-level managers of the performance of mid-level managers. Management control focuses on higher- level managers and long-term, strategic issues.

#### **Management control Issues:**

Responsibility Accounting and Performance Measures (unit 11)

- Responsibility Centers
- Contribution and Segment Reporting
- Common Costs
- Transfer Pricing
- Performance measures & Financial Measures(ROI, RI and EVA)
- The Balanced Scorecard

**CMA EXAM:** The performance measurement portions focus on a few performance measures, specifically Return on Investment (ROI) and Residual Income (RI). For these measurements you need to know what they are, how they are calculated and how they are used. You also need to be able to identify the weaknesses that are inherent in each one. Responsibility accounting is the breaking down of costs into those costs that can be controlled by the manager and those that cannot be controlled by the manager. There are a number of different cost classifications and allocation methods within this section that you need to be aware of.

Transfer pricing is a topic that you need to know from both a theoretical standpoint and a numerical one as well. The questions may require you to understand the issues that company faces in establishing the transfer price as well as being able to calculate an acceptable transfer price under certain situations.

The final topic covered in this Section is performance feedback, and more specifically the balanced scorecard, you need to know conceptually what the balanced scorecard is and how it works as well as be familiar with its application.

## STUDY UNIT TEN

# COST AND VARIANCE MEASURES

### Introduction

In Chapter 9, you saw how budgets assist managers in their function as planners. We now turn to how budgets - specifically flexible budgets - are used to evaluate feedback on variances, aiding managers in their control function. Feedback enables managers to compare actual results-that is, what is happening-with planned performance-what should have been happening according to plans. Flexible budgets and variances help managers gain insights into *why* the actual results differ from the planned performance. That "why" is what this chapter is about. Controlling operations assists managers in attaining the budgeted goals they set out to accomplish. Assessing operating results provides feedback to managers and helps them gain insights into the causes that led to the operating results. By learning from the past, managers can control the future.

### The Use of standards

- To set performance expectations,
- evaluate and control operations,
- motivate employees, and encourage efforts toward their goals.
- allows a manager to identify the cost to manufacture and sell a product or provide a service,
- to find causes and attributes of cost overruns or efficient operations, and
- to manage by exception.

### THE USE OF VARIANCES

Each variance we compute is the difference between an amount based on an actual result and the corresponding budgeted amount-that is, the actual amount of something and the amount it was supposed to be according to the budget. The budgeted amount is a point of reference from which comparisons may be made.

- **Variance analysis enables management by exception:** Variance analysis enables management by exception, the practice of giving attention primarily to significant deviations from expectations (whether favorable or unfavorable) and areas not operating as expected (such as a shortfall in sales of a product) and giving less attention to areas operating as expected. Attending to operations not performing within expected limits is likely to yield the best ratio of the benefits of investigation to costs.
  - Benefits of management by exception reporting include reduction in reports production costs, information overload, and unfocused management actions.
- **Variance analysis assigns responsibility:** The purpose of identifying and assigning responsibility for variances is to determine who is likely to have information that will enable management to find solutions. The constructive approach is to promote learning and continuous improvement in manufacturing operations, not to assign blame.
- **Variances will guide managers to seek explanations** and to take early corrective action, ensuring that future operations will be as planned.
- **Sometimes variances suggest a change in strategy.** Excessive defect rates for a new product may suggest a flawed product design. Executives may then want to reevaluate their product strategies.
- **Variances may signify that standards need to be reevaluated.** Management is signaled that corrective action may be needed.

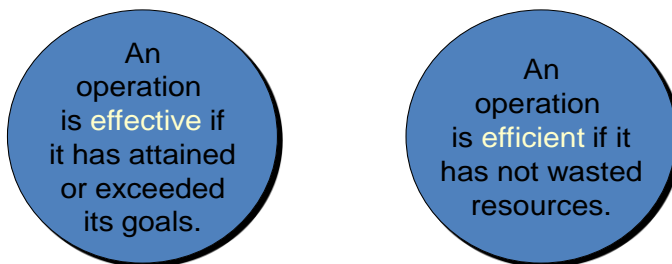

- Variances assist managers in their planning and control decisions.
- Variances used in performance evaluation (discussed in more detail later).

This chapter explores the uses of budgets and standard costing systems in operations. We will start our discussion with comparing actual results with master *static* budget followed by introducing flexible budget.

## EVALUATING OPERATING RESULTS: STATIC BUDGETS AND FLEXIBLE BUDGETS

Two aspects of operations are generally of interest to management in assessing operations: effectiveness in attaining goals and efficiency in carrying out operations.

### Effectiveness and Efficiency

An operation may be **effective but inefficient**, and it may be **efficient but ineffective**.

The master budget, or static budget, discussed in Chapter 2, is based on the level of output planned at the start of the budget period. It's static in the sense that the budget is developed for a single planned output level. When variances are computed from a static budget at the end of the period, adjustments are not made to the budgeted amounts for the actual output level in the budget period.

*A master budget delineates the desired operating results for the period and is a common starting point in assessing the effectiveness of operations.*

### Assessing Effectiveness

**Master budgets** are prepared for a single activity level.

Comparing actual results with the master budget reveals operating income variances.

## Assessing Effectiveness

An important short-term goal for a company is to earn the budgeted operating income for the period. *A company's effectiveness is often measured by comparing the actual amount of operating income earned to the amount in the master budget.*

### Accounting System at Webb

Webb manufactures and sells a designer jacket that requires tailoring and many hand operations. Sales are made to distributors who sell to independent clothing stores and retail chains. Webb's only costs are manufacturing costs; it incurs no costs in other value chain functions such as marketing and distribution. We assume that all units manufactured in April 2011 are sold in April 2011. There are no beginning inventories or ending inventories. Webb has three variable-cost categories. The budgeted variable cost per jacket for each category is

#### Variable Cost

##### Cost Category per Jacket

Direct materials costs	\$60
Direct manufacturing labor costs	16
Variable manufacturing overhead costs	<u>12</u>
Total variable costs	<u>\$88</u>

The *number of units manufactured* is the cost driver for direct materials, direct manufacturing labor, and variable manufacturing overhead. The relevant range for the cost driver is from 0 to 12,000 jackets.

The budgeted fixed manufacturing costs are

for production between 0 and 12,000 jackets. \$276,000

The budgeted selling price is \$120 per jacket.

The static budget for April 2011 is based on selling 12,000 jackets.

Actual sales for April 2011 were 10,000 jackets.

Exhibit 7-1, column 3, presents the static budget for Webb Company for April 2011

In this book, **"level"** followed by a number denotes the amount of detail shown by a variance analysis. Level 0 reports the least detail Level 1 offers more information, and so on. We will use the example of Webb Company to illustrate static budgets and flexible budgets and their related variances.

### Favorable variance vs. unfavorable variance

A favorable variance-denoted F in this book - has the effect of increasing operating income relative to the budgeted amount. For revenue items, F means actual revenues exceed budgeted revenues. For cost items, F means actual costs are less than budgeted costs.

An unfavorable variance-denoted U in this book-has the effect of decreasing operating income relative to the budgeted amount.

The significance of variances depends not only on their amount but also on their direction, frequency, and trend. Moreover,

## STATIC-BUDGET VARIANCES

A static-budget variance is the difference between an actual result and the corresponding budgeted amount in the static budget. Exhibit 7-1 shows the Level 0 and Level 1 variance analyses for April 2011. Level 0 gives the least detailed comparison of the actual and budgeted operating income.

The unfavorable variance of \$93,100 in Exhibit 7-1 for Level 0 is simply the result of subtracting the static-budget operating income of the \$108,000 from the actual operating income of \$14,900:

Static- budget			
variance for	=	Actual	Static- budget
operating income		result	- amount
		= \$14,900	- \$108,000
		= \$93,100, or \$93,100 U	

The difference between the actual operating income and the master *static* budget operating income is the operating income variance--a measure of the effectiveness of the period.

Webb Company was not effective in attaining its goal for the period; its operation fell 86 percent short of its budgeted operating income.

### EXHIBIT 7-1 Static-Budget-Based Variance Analysis for Webb Company for April 2011a

#### LEVEL 0 ANALYSIS

Actual operating income	\$14,000
Budgeted operating income	<u>108,000</u>
Static-budget variance for operating income	<u>\$93,100U</u>

Level 1 analysis in Exhibit 7-1 provides managers with more detailed information on the static-budget variance for operating income of \$93,100 U. The additional information added in Level 1 indicates how each of the line items of operating income \_ revenues, individual variable costs, and fixed costs - add up to the static-budget variance of \$93,100. The budgeted contribution margin percentage of 26.7% decreases to 24.0% for the actual results.

Level 1 Analysis			
	Actual Results (1)	Static-Budget Variances (2) = (1) - (3)	Static Budget (3)
Units sold	<u>10,000</u>	<u>2,000 U</u>	<u>12,000</u>
Revenues	<u>\$ 1,250,000</u>	<u>\$190,000 U</u>	<u>\$1,440,000</u>
Variable costs			
Direct materials	621,600	98,400 F	720,000
Direct manufacturing labor	198,000	6,000 U	192,000
Variable manufacturing overhead	<u>130,500</u>	<u>13,500 F</u>	<u>144,000</u>
Total variable costs	<u>950,100</u>	<u>105,900 F</u>	<u>1,056,000</u>
Contribution margin	<u>299,900</u>	<u>84,100 U</u>	<u>384,000</u>
Fixed costs	<u>285,000</u>	<u>9,000 U</u>	<u>276,000</u>
Operating income	<u>\$ 14,900</u>	<u>\$ 93,100 U</u>	<u>\$ 108,000</u>

a F,= favorable effect on operating income; U = unfavorable effect on operating income.

b Contribution margin percentage =  $\frac{\$299,900}{\$1,250,000} = 24.0\%$

c Contribution margin percentage =  $\frac{\$384,000}{\$1,440,000} = 26.7\%$

In addition to the operating income variance, Exhibit 7-1 reports the difference between the master budget and the actual operating result for each reported item such as units sold, sales, and others. One notable item is the variance that actual sales deviated from the master budget by 2000 units or \$ 190,000-a decrease from the budgeted amount of 16.7percent in units and 13.2 percent in sales dollars.

Exhibit 7-1 also reports that the variable expense incurred in April is \$950,100 less than the budgeted amount-a favorable variance. This comparison probably would lead us to conclude that the primary reason for Webb failure to be effective in earning its budgeted net income is the shortfall in sales. The shortfall is so large that even with a good control of expenses, as evidenced by the substantial favorable variance in variable expenses, the firm still suffers a substantial decrease in operating income and, as a result, failed to be effective in earning the budgeted \$108,000 in operating income .

## Flexible Budget

### The Flexible Budget

The relevant question is . . .

“How much of the favorable cost variance is due to lower activity, and how much is due to good cost control?”

To answer the question, we must **flex** the budget to the actual activity.

A **flexible budget** will help me evaluate efficiency.

## The Flexible Budget

***A flexible budget is a budget that adjusts revenues and expenses for changes in output achieved.***

In this chapter we emphasize flexible budgets. A flexible budget calculates budgeted revenues and budgeted costs based on *the actual output level in the budget period*. A *flexible budget* is calculated at the end of the period when the actual output is known; a *static budget* is *developed at the start of the budget period based on the planned output level* for the period. As we show, a flexible budget enables managers to compute variances that provide more information than the information from variances in a static budget.

## STEPS IN DEVELOPING A FLEXIBLE BUDGET

The flexible budget is prepared at the end of the period (April 2011) after the actual output level of 10,000 jackets is known. The flexible budget is the budget that Webb would have prepared at the start of the budget period had it correctly forecast the actual output level of 10,000 jackets. In preparing the flexible budget:

1. The budgeted selling price is the same \$120 per jacket used in preparing the static budget.
2. The budgeted variable costs are the same \$88 per jacket used in the static budget.
3. The budgeted fixed costs are the same static budget amount of \$276,000 (because the 10,000 jackets produced falls within the relevant range of 0 to 12,000 jackets for which fixed costs are \$276,000).

The *only* difference between the static budget and the flexible budget is that the static budget is prepared for the planned output of 12,000 jackets, whereas the flexible budget is based on the actual output of 10,000 jackets: The static budget is being "flexed" or adapted from 12,000 jackets to 10,000 jackets. In preparing the flexible budget for 10,000 jackets, all costs are assumed to be either variable or fixed with respect to the number of jackets produced.

Webb develops its flexible budget in three steps.

**Step 1: Identify the Actual Quantity of Output.** In April 2011, Webb produced and sold 10,000 jackets.

**Step 2: Calculate the Flexible Budget for Revenues Based on Budgeted Selling Price and Actual Quantity of Output.**

$$\begin{aligned}\text{Flexible-budget revenues} &= \$120 \text{ per jacket} \times 10,000 \text{ jackets} \\ &= \$1,200,000\end{aligned}$$

**Step 3: Calculate the Flexible Budget for Costs Based on Budgeted Variable Cost per Output Unit, Actual Quantity of Output, and Budgeted Fixed Costs.**

Flexible-budget variable costs	
Direct materials, \$60 per jacket x 10,000 jackets	\$ 600,000
Direct manufacturing labor, \$16 per jacket x 10,000 jackets	160,000
Variable manufacturing overhead, \$12 per jacket x 10,000 jackets	<u>120,000</u>
Total flexible-budget variable costs	880,000
Flexible-budget fixed costs	<u>276,000</u>
Flexible-budget total costs	<u><u>\$1,156,000</u></u>

**Question:** If the flexible budget (FB) is based on *actual output*, which isn't known until the end of the period, how can it be a *budget*?

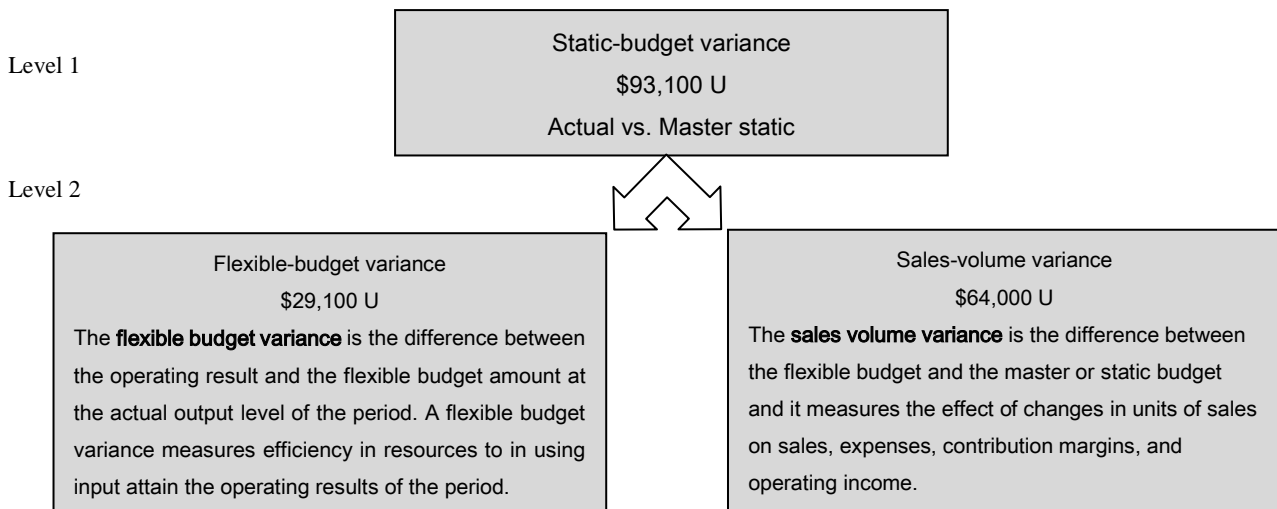

**Answer:** The FB shows the costs that should have been incurred (the budgeted costs) to achieve the actual output level. The FB is the budget we would have made at the beginning of the period if we had perfectly predicted the actual output level.

These three steps enable Webb to prepare a flexible budget as shown in Exhibit 7-2, column 3. Webb uses the flexible budget to move to a Level 2 variance analysis that further subdivides the \$93,100 unfavorable static-budget variance for operating income.

## Assessing Efficiency: FLEXIBLE-BUDGET VARIANCES AND SALES-VOLUME VARIANCES

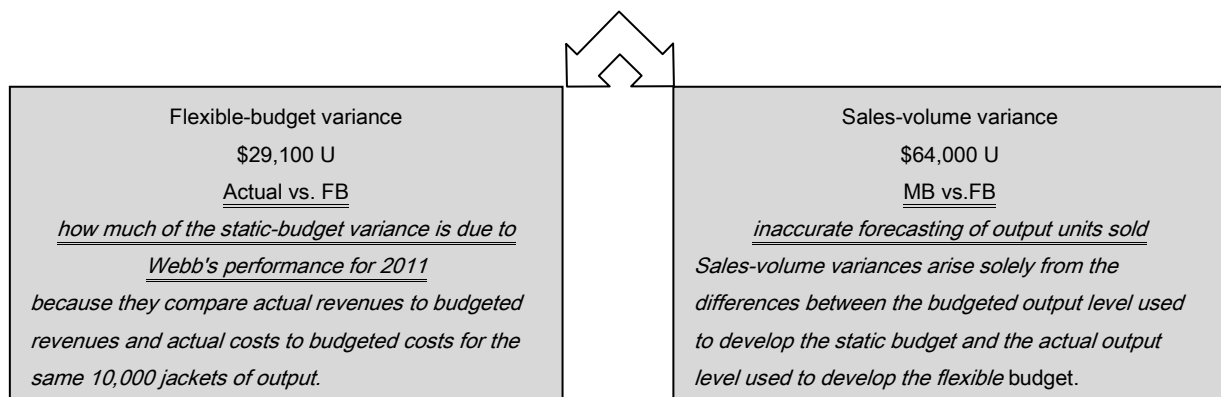

With the help of a flexible budget, we can separate the difference between the operating result and the master budget into two variances: the flexible budget variance and the sales volume variance.

Exhibit7-2 shows the Level 2 flexible-budget-based variance analysis for Webb. The Level 2 variances subdivide the Level 1 \$93,100 unfavorable static-budget variance for operating income into two parts: a flexible-budget variance of \$29,100 U and a sales-volume variance of \$64,000 U.

What useful information comes from subdividing the static-budget variance into its two components?

Remember, Webb actually produced and sold 10,000 jackets, although the static budget had anticipated an output of 12,000 jackets. *Managers would like to know how much of the static-budget variance is due to*

Creating a flexible budget makes it possible for managers to learn these two amounts.

## Sales-Volume Variances

Keep in mind the flexible-budget amounts in column 3 of Exhibit 7-2 and the static budget amounts in column 5 are both computed using budgeted selling prices, budgeted variable cost per jacket, and budgeted fixed costs. The only distinction is that the flexible budget amount is calculated using the actual output level, whereas the static-budget amount is calculated using the budgeted output level. The difference between these two amounts is called the sales-volume variance because it represents the difference caused solely by the difference in the 10,000 actual quantity (or volume) of jackets sold and the 12,000 quantity of jackets expected to be sold in the static budget.

Sales-volume variance for operating income	=	Flexible- budget amount	—	Static- budget amount
=	\$44,000	-	\$108,000	
=	-\$64,000, or \$64,000 U			

In our Webb example, this sales-volume variance for operating income arises solely because of inaccurate forecasting of output units sold: Webb sold only 10,000 jackets, 2,000 fewer than the budgeted 12,000 jackets. Note particularly, budgeted selling price and budgeted variable cost per unit are held constant in computing sales-volume variances. Hence:

Sales volume variance for operating income		= Budgeted CM per unit X (Actual Units sold - static-budget units sold)				
						
Sales volume variance for operating income	=	Budgeted selling price cost per unit	-	Budgeted variable cost per unit	x	Actual units sold - Static-budget units sold
	=	(\$120 per jacket - \$88 per jacket)		x		(10,000 jackets - 12,000 jackets)
	=	\$32 per jacket		x		(-2,000 jackets)
	=	-\$64,000, or \$64,000 U				

Note that the operating income sales volume variance is the same as the contribution margin sales volume variance. This happens because fixed expenses in the master budget and the flexible budget usually do not change. Thus, an alternative way to compute the operating income sales volume variance is to multiply the difference in units of sales actually sold and in the master (static) budget by the master budget contribution margin per unit.

## Sales volume variance Interpretation

Significant sales volume variances can have serious implications for strategic management. A significant unfavorable sales volume variance can indicate that the market is smaller than the level planned when the firm set its strategy and the goal for the period. The firm might need to modify or abandon its strategy.

An insignificant sale volume variance can indicate that the firm's strategy and operating plans are on track to attain its goals. A significant favorable sales volume variance can indicate that the firm needs to pursue a more aggressive strategy or operating goal.

Webb's unfavorable sales-volume variance could be due to one or more of the following:

1. The overall demand for jackets is not growing at the rates that were anticipated.
2. Competitors are taking away market share from Webb.
3. Webb did not adapt quickly to changes in customer preferences and tastes.
4. Quality problems developed that led to customer dissatisfaction with Webb's jackets.
5. Budgeted sales targets were set without careful analysis of market conditions.

How Webb responds to the unfavorable sales-volume variance will be influenced by what is presumed to be the cause of the variance. For example, if Webb believes the variance was caused by market-related reasons (reasons 1 or 2), the sales manager would be in the best position to explain what happened and to suggest corrective actions, such as sales promotions, that may be needed. If however, the unfavorable variance was caused by quality problems, the manufacturing manager would be in the best position to analyze the causes and to suggest strategies for improvement, such as changes in the manufacturing process or investments in new machines

#### Exhibit 7-2

Level 2 Flexible-Budget-Based Variance Analysis for Webb Company for April 2011<sup>a</sup>

Level 2 Analysis					
	Actual Results (1)	Flexible-Budget Variances (2) = (1) – (3)	Flexible Budget (3)	Sales-Volume Variances (4) = (3) – (5)	Static Budget (5)
Units sold	10,000	0	10,000	2,000 U	12,000
Revenues	\$1,250,000	\$50,000 F	\$1,200,000	\$240,000 U	\$1,440,000
Variable costs					
Direct materials	621,600	21,600 U	600,000	120,000 F	720,000
Direct manufacturing labor	198,000	38,000 U	160,000	32,000 F	192,000
Variable manufacturing overhead	130,500	10,500 U	120,000	24,000 F	144,000
Total variable costs	950,100	70,100 U	880,000	176,000 F	1,056,000
Contribution margin	299,900	20,100 U	320,000	64,000 U	384,000
Fixed manufacturing costs	285,000	9,000 U	276,000	0	276,000
Operating income	\$ 14,900	\$29,100 U	\$ 44,000	\$ 64,000 U	\$ 108,000
Level 2		\$29,100 U		\$ 64,000 U	
		Flexible-budget variance		Sales-volume variance	
Level 1			\$93,100 U		
		Static-budget variance			

<sup>a</sup>F = favorable effect on operating income; U = unfavorable effect on operating income.

## Flexible-Budget Variances (Operating Income Flexible Budget Variance)

Operating income flexible budget variances measure efficiencies in operations that are primarily internal to the firm.

Factors contributing to operating income flexible budget variances include

- deviations in selling prices,
- variable costs, and
- Fixed costs.

Management is likely to have controls or influences on these factors. Substantial or continuous unfavorable operating income flexible budget variances can diminish the feasibility of the strategy and jeopardize its continuation.

The first three columns of Exhibit 7-2 compare actual results with flexible-budget amounts. Flexible-budget variances are in column 2 for each line item in the income statement:

$$\text{Flexible- budget Variance} = \text{Actual results} - \text{Flexible- budget amount}$$

The operating income line in Exhibit 7-2 shows the flexible-budget variance is \$29,100 U (\$14,900 - \$44,000). The \$29,100 U arises because actual selling price, variable cost per unit, and fixed costs differ from their budgeted amounts. The actual and budgeted amounts for the selling price and variable cost per unit are

	Actual Amount	Budgeted Amount
Selling price	\$125.00 (\$1,250,000 ÷ 10,000 jackets)	\$120.00 (\$1,200,000 ÷ 10,000 jackets)
Variable cost per jacket	\$ 95.01 (\$ 950,100 ÷ 10,000 jackets)	\$ 88.00 (\$ 880,000 ÷ 10,000 jackets)

## Selling Price variance

The flexible-budget variance for revenues is called the selling-price variance because it arises solely from differences between the actual selling price and the budgeted selling price:

$$\text{Selling-price variance} = \text{Actual selling price} - \text{Budgeted selling price} \times \text{Actual units sold}$$

$$\begin{aligned} &= (\$125 \text{ per jacket} - \$120 \text{ per jacket}) \times 10,000 \text{ jackets} \\ &= \$50,000, \text{ or } \$50,000 \text{ F} \end{aligned}$$

## Variable cost variance

The flexible-budget variance for variable costs is unfavorable for the actual output of 10,000 jackets. It's unfavorable because either

- (a) Webb used more quantities of inputs (such as direct manufacturing labor-hours) relative to the budgeted quantities of inputs, or
- (b) Webb incurred higher prices per unit for the inputs (such as the wage rate per direct manufacturing labor-hour) relative to the budgeted prices per unit for the inputs, or
- (c) both (a) and (b).

Higher input quantities relative to the budget and/or higher input prices relative to the budget could be the result of Webb deciding to produce a superior product to what was planned in the budget, or the result of inefficiencies in Webb's manufacturing and purchasing, or both. *You should always think of variance analysis as providing suggestions for further investigation rather than as establishing conclusive evidence of good or bad performance.*

## Need for Further Analysis of the Variable Expense Flexible Budget Variance

Different factors may drive each of these variances. An aggregated total amount, such as the total variable expense flexible budget variance can mask poor performance in one or more of the cost components or operating divisions, especially when there are offsetting materials, labor and manufacturing overhead

## Fixed cost variance

The actual fixed costs of \$285,000 are \$9,000 more than the budgeted amount of \$276,000. This higher fixed cost decreases operating income, making this flexible-budget variance unfavorable.

## PRICE VARIANCES AND EFFICIENCY VARIANCES FOR DIRECT-COST INPUTS (DM&DL)

We now illustrate how the Level 2 flexible-budget variance for direct-cost inputs can be further subdivided into two more detailed variances, which are Level 3 variances:

1. A price variance that reflects the difference between an actual input price and a budgeted input price
2. An efficiency variance that reflects the difference between an actual input quantity and a budgeted input quantity

Managers generally have more control over efficiency variances than price variances. That's because the quantity of inputs used is primarily affected by factors *inside* the company, whereas price changes are primarily due to market forces *outside* the company.

The information available from these Level 3 variances helps managers better understand past performance and better plan for future performance.

## Obtaining Budgeted Input Price and Budgeted Input Quantities

To calculate price and efficiency variances, Webb needs to obtain budgeted input prices and budgeted input quantities. Webb's three main sources of information are

1. Actual input data from past periods.
2. Data from other companies that have similar processes.
3. Standards developed by Webb

### 1. Actual input data from past periods.

Most companies have past data on actual input prices and actual input quantities. These past prices and quantities could be used as the budgeted prices and quantities in a flexible budget. Past data are typically available at low cost. Nevertheless, there are limitations to using this source of data: (i) past data can include inefficiencies, and (ii) past data do not incorporate any expected changes for the budget period.

### 2. Data from other companies that have similar processes.

The main limitation of using this source is that input price and input quantity data from other companies may not be available.

**3. Standards developed by Webb.** A standard is a carefully determined price, cost, or quantity. A standard is usually expressed on a per unit basis. Consider how Webb determines its standards. Using engineering studies, Webb conducts a detailed breakdown of the steps required to make a jacket.

Each step is assigned a *standard* time based on work performed by a skilled operator using equipment operating in an efficient manner.

There are two advantages of using standard times:

- (i) they aim to exclude past inefficiencies, and
- (ii) they aim to take into account changes expected to occur in the budget period.

An example of (ii) is the decision for leasing of new sewing machines that operate at a faster speed and enable output to be produced with lower defect rates.

### Standards for DM & DL

The standard manufacturing labor cost for each jacket is computed by multiplying the standard time allowed to produce a jacket by the standard wage rate that Webb expects to pay its operators. Similarly, Webb determines the standard quantity of square yards of cloth required by a skilled operator to make each jacket, the standard price per square yard of cloth, and (by multiplying them together) the standard direct material cost of a jacket.

The term "standard" refers to many different things. Always clarify its meaning and how it is being used.

- **A standard input** is a carefully determined quantity of input - such as square yards of cloth or direct manufacturing labor-hours - required for one unit of output, such as a jacket.
- **A standard price** is a carefully determined price that a company expects to pay for a unit of input. In the Webb example, the standard wage rate is an example of a standard price of a direct manufacturing labor-hour.
- **A standard cost** is a carefully determined cost of a unit of output - for example the standard direct manufacturing labor cost of a jacket at Webb.

Standard cost per <b>output</b> unit for each variable direct-cost input	=	Standard input allowed for one output unit	X	Standard price per unit input unit
--	---	--	---	------------------------------------

Standard cost per <b>jacket</b> for each variable direct-cost input	=	Standard input allowed for one output unit	x	Standard price per input unit
---	---	--	---	-------------------------------

**Standard direct material cost per jacket:** 2 square yards of cloth input allowed per output unit (jacket) manufactured, at \$30 standard price per square yard

Standard direct material cost per jacket =	2 square yards x	\$30 per square yard =	\$60
--	------------------	------------------------	------

**Standard direct manufacturing labor cost per jacket:** 0.8 manufacturing labor-hour of input allowed per output unit manufactured, at \$20 standard price per hour.

Standard direct manufacturing labor cost per jacket =	0.8 hour	x	\$20 per hour =	\$16
---	----------	---	-----------------	------

## "Budget" vs. "Standard"

How are the words "budget" and "standard" related? Budget is the broader term. As the description above indicates, budgeted input prices, budgeted input quantities, and budgeted costs need not be based on standards. However, when standards are used to obtain budgeted input quantities and budgeted input prices, the terms "standard" and "budget" mean the same thing and are used interchangeably. In its standard costing system, Webb uses standards that are attainable through efficient operations but allow for normal disruptions.

## Data for Calculating Webb's Price Variances and Efficiency Variances

Consider Webb's two direct-cost categories. The actual cost for each of these categories for the 10,000 jackets manufactured and sold in April 2011 is

### Direct material purchased and used

1. Square yards of cloth input purchased and used	22,200
2. Actual price incurred per square yard	\$28
3. Direct material costs (22,200 x \$28) [Exhibit 7-2, column 1]	\$621,600

### Direct manufacturing labor

1. Direct manufacturing labor-hours	9,000
2. Actual price incurred per direct manufacturing labor-hour	\$22
3. Direct manufacturing labor costs (9,000 x \$22) [Exhibit 7-2, column 1]	\$198,000

### Price variance vs. Efficiency variance

- A **price variance** is the difference between the actual price and the budgeted price multiplied by the actual quantity of input, such as direct material purchased or used.
  - A price variance is sometimes called an **input-price variance or rate variance**, especially when referring to a price variance for direct labor.
- An **efficiency variance** is the difference between the actual quantity of input used - such as square yards of cloth of direct materials - and the budgeted quantity of input that should have been used to produce the actual output, multiplied by the budgeted price.
  - An efficiency variance is sometimes called a **usage variance**.

**Exhibit 7-3**

Columnar Presentation of Variance Analysis: Direct Costs for Webb Company for April 2011<sup>a</sup>

Level 3 Analysis			
	Actual Costs Incurred (Actual Input Quantity × Actual Price) (1)	Actual Input Quantity × Budgeted Price (2)	Flexible Budget (Budgeted Input Quantity Allowed for Actual Output × Budgeted Price) (3)
Direct Materials	(22,200 sq. yds. × \$28/sq. yd.) \$621,600	(22,200 sq. yds. × \$30/sq. yd.) \$666,000	(10,000 units × 2 sq. yds./unit × \$30/sq. yd.) \$600,000
Level 3		\$44,400 F Price variance	\$66,000 U Efficiency variance
Level 2			\$21,600 U Flexible-budget variance
Direct Manufacturing Labor	9,000 hours × \$22/hr. \$198,000	9,000 hours × \$20/hr. \$180,000	10,000 units × 0.8 hr./unit × \$20/hr. \$160,000
Level 3		\$18,000 U Price variance	\$20,000 U Efficiency variance
Level 2			\$38,000 U Flexible-budget variance

<sup>a</sup>F = favorable effect on operating income; U = unfavorable effect on operating income.

Exhibit 7-3 shows how the price variance and the efficiency variance subdivide the flexible budget variance.

Consider the panel for direct materials.

- The direct material **flexible-budget variance** of \$21,600 U is the difference between the actual costs incurred (actual input quantity x actual price) shown in column 1 and the flexible budget (budgeted input quantity allowed for actual output x budgeted price) shown in column 3.
  - Column 2 (actual input quantity x budgeted price) is inserted between column 1 and column 3. The difference between columns 1 and 2 is the **price variance of \$44,400 F** because the same actual input quantity is multiplied by the *actual price* in column 1 and the *budgeted price* in column 2.
  - The difference between columns 2 and 3 is the efficiency variance of \$66,000 U because the same budgeted price is multiplied by the *actual input quantity* in column 2 and the *budgeted input quantity allowed for actual output* in column 3. See how the direct material price variance, \$44,400 F, plus the direct material **efficiency variance, \$66,000 U**, equals the direct material flexible-budget variance, \$21,600 U.

We next discuss the price variances and the efficiency variances in greater detail.

## Price Variances

The formula for computing the price variance is

Price variance	=	(Actual price of input – Budgeted (Std) price of input)	X	Actual quantity of input
DM Price variance	=	( AP – SP )	x	AQ
DL Price variance	=	( AR – SR )	x	AH

AP: Actual Price, AR : Actual Rate, SP: Std. Price, SR: Std Rate, AQ: Actual Quantity, AH: Actual Hours.

$$\text{Price variance} = \left( \frac{\text{Actual price of input} - \text{Budgeted price of input}}{\text{of input}} \right) \times \text{Actual quantity of input}$$

Price variances for Webb's two direct-cost categories are as follows:

Direct-Cost Category	$\left( \frac{\text{Actual price of input} - \text{Budgeted price of input}}{\text{of input}} \right) \times$	Actual quantity of input	= Price Variance
Direct materials	$(\$28 \text{ per sq. yard} - \$30 \text{ per sq. yard}) \times$	22,200 square yards	= \$44,400 F
Direct manufacturing labor	$(\$22 \text{ per hour} - \$20 \text{ per hour}) \times$	9,000 hours	= \$18,000 U

### Interpreting the Direct material price variance

Possible causes of a favorable direct materials price variance are:

For example, Webb's favorable direct material price variance could be due to one or more of the following:

- An unexpected price change for the materials, changes in freight costs, variation in grades of the purchased items, rush orders, or other causes.
- Webb's purchasing manager negotiated the direct material price more skillfully than was planned for in the budget.
- The purchasing manager changed to a lower-price supplier.
- Webb's purchasing manager bought in larger quantities than the quantities budgeted, thereby obtaining quantity discounts.
- Direct material prices decreased unexpectedly due to, say, industry oversupply.
- Budgeted purchase prices for direct material were set without careful analysis of market conditions.
- The purchasing manager received unfavorable terms on factors other than price (such as lower quality material).

### Responsibility of the variance

Generally speaking, the **purchasing department** is often the office most likely to provide an explanation or the responsibility for materials price variances, as the purchasing manager has control over the price paid for goods.

However, someone other than the purchasing manager could be responsible for a material price variance.

Production may be scheduled in such a way, for example, that the purchasing manager must request express delivery. In these cases the **production manager** should be held responsible for the resulting price variance.

### Company's response

How Webb responds to a material price variance will be vitally affected by what is presumed to be the cause of the variance. Assume Webb's managers attribute the favorable variance to the purchasing manager ordering in larger quantities than budgeted, thereby receiving quantity discounts. Webb could examine if purchasing in these larger quantities resulted in higher storage costs. If the increase in storage and inventory holding costs exceeds the quantity discounts, purchasing in larger quantities is not beneficial. For this reason some companies have reduced their materials storage to prevent their purchasing managers from ordering in larger quantities.

## Interpreting the Direct labor Rate Variance

Possible causes of an unfavorable direct labor price variance are:

- Different rate for example a increase in labor rates, The firm's inability to pay the same hourly wage as specified in the standard cost sheet.
- Different labor skills, the firm's inability to use the same skill-level workers as specified in the standard cost sheet.
- The standard being set without detailed analysis of labor compensation.

## Responsibility of the variance

The **personnel department** usually is responsible for direct labor rate variances. **Production supervisors**, however, could be responsible for the variance if it chooses to use employees with a different skill level than that specified in the standard cost sheet.

## Efficiency Variance

For any actual level of output, the *efficiency variance* is the difference between the input that was actually used and the input that should have been used to produce the actual output, holding input price constant at the budgeted price:

Efficiency Variance =	Actual quantity of input used	-	Budgeted quantity of input allowed for actual output	X	Budgeted (std) price of input
DM Quantity (Efficiency) Variance		= (AQ -	SQ)	X	SP
DL Efficiency Variance		= (AH -	SH)	X	SR

The idea here is that a company is inefficient if it uses a larger quantity of input than the budgeted quantity for the actual output units produced; the company is efficient if it uses fewer inputs than budgeted for the actual output units produced.

$$\text{Efficiency Variance} = \left( \frac{\text{Actual quantity of input used} - \text{Budgeted quantity of input allowed for actual output}}{\text{input used}} \right) \times \text{Budgeted price of input}$$

The efficiency variances for each of Webb's direct-cost categories are

Direct-Cost Category	$\left( \frac{\text{Actual quantity of input used} - \text{Budgeted quantity of input allowed for actual output}}{\text{input used}} \right)$	$\times$	Budgeted price of input	=	Efficiency Variance
Direct materials	[22,200 sq. yds. - (10,000 units $\times$ 2 sq. yds./unit)] = (22,200 sq. yds. - 20,000 sq. yds.)	$\times$	\$30 per sq. yard		
		$\times$	\$30 per sq. yard	=	\$66,000 U
Direct manufacturing labor	[9,000 hours - (10,000 units $\times$ 0.8 hour/unit)] = (9,000 hours - 8,000 hours)	$\times$	\$20 per hour		
		$\times$	\$20 per hour	=	20,000 U

**Note: distinguish inputs from output**

The flexible budget for inputs is based on the budgeted quantity of inputs allowed for actual output level (BOIA). To understand BQIA in the Webb example, distinguish inputs (square yards of cloth, direct manufacturing labor-hours) from output (jackets). BQIA is computed by multiplying the actual quantity of output produced times how much of each input should have been used per output unit.

## General conclusion

The two manufacturing efficiency variances - direct material efficiency variance and direct manufacturing labor efficiency variance - are unfavorable because more input was used than was budgeted, resulting in a decrease in operating income.

## Interpreting the Direct Materials Usage (quantity) Variance

- Using faulty machines or other production factors,
- Using Inferior material quality or substitutions of the material for other materials
- Inadequate training or inexperienced employees,
- Poor supervision

## Responsibility of the variance

Generally speaking, it is the responsibility of the **production department** to see that material usage is kept in line with standards. There may be times, however, when the **purchasing department** is responsible for an unfavorable material usage (quantity) variance by buying inferior material.

## Interpreting the Direct labor Efficiency Variance

- Employees or supervisors are new on the job or inadequately trained, Webb's personnel manager hired underskilled workers. or Supervision is inadequate.
- Undermotivated workers
- Employee skill levels are different from those specified in the standard cost Sheet.
- Scheduling is poor, Webb's production scheduler inefficiently scheduled work, resulting in more manufacturing labor time than budgeted being used per jacket. Or Batch sizes are different from the standard size.
- Using faulty equipment, causing breakdowns and work interruptions
- Materials are different from those specified.
- Machines or equipment are not in proper working condition, Webb's Maintenance Department did not properly maintain machines, resulting in more manufacturing labor time than budgeted being used per jacket.
- Insufficient demand for the company's product accompanied with fixed labor contracts, with the intent of the company to keep every worker busy.
- Budgeted time standards were set too tight without careful analysis of the operating conditions and the employees' skills.

## Company's response

Suppose Webb's managers determine that the unfavorable variance is due to poor machine maintenance. Webb may then have a team consisting of plant engineers and machine operators develop a future maintenance schedule so that there will be fewer breakdowns adversely affecting labor time and product quality.

## Responsibility of the variance

A direct labor efficiency variance usually is the responsibility of the **production department**. There may be times, however, when the **purchasing department** is responsible for an unfavorable direct labor Efficiency Variance by buying inferior material.

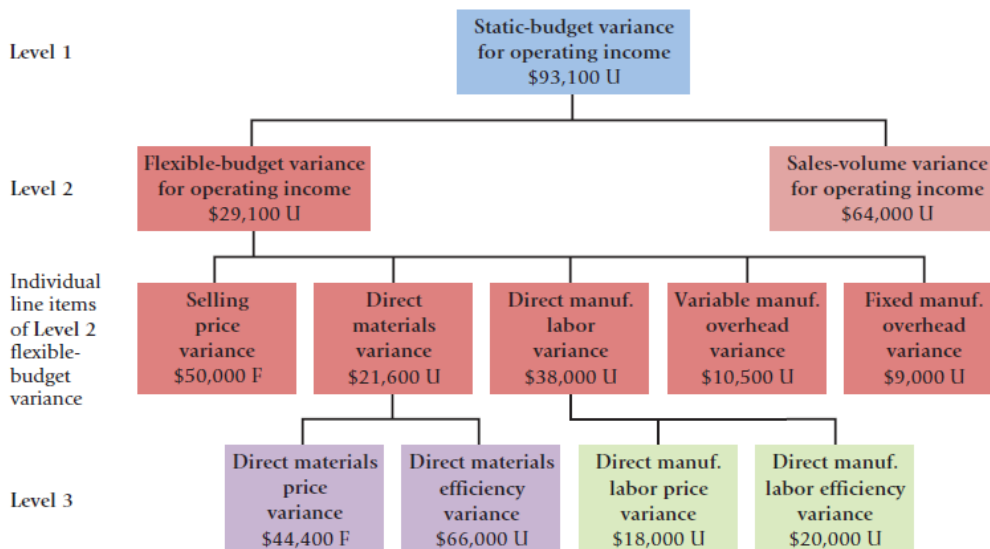

## Summary of Variances

Exhibit 7-4 is a summary of the Level 2, and 3 variances. Note how the variances in Level 3 aggregate to the variances in Level 2 and how the variances in Level 2 aggregate to the variances in Level 1.

The variances show why actual operating income is \$14,900 when the static budget operating income is \$108,000. Recall, a favorable variance has the effect of increasing operating income relative to the static budget, and an unfavorable variance has the effect of decreasing operating income relative to the static budget.

**Exhibit 7-4**

Summary of Level 1, 2, and 3 Variance Analyses

## MANAGEMENT USES OF VARIANCES

### Performance Measurement Using Variances

Variance analysis is often used for performance evaluation. Two attributes of performance are commonly evaluated:

- Effectiveness: the degree to which a predetermined objective or target is met.
- Efficiency: the relative amount of inputs used to achieve a given output level. The fewer the inputs used for a given level of output or the greater the output for a given level of input, the greater the efficiency.

Be careful to understand the causes of a variance before using it for performance evaluation.

Suppose a Webb purchasing manager has just negotiated a deal that results in a favorable price variance for direct material. The deal could have achieved a favorable variance for any or all of three reasons:

1. The purchasing manager bargained effectively with suppliers.
2. The purchasing manager secured a discount for buying in bulk with fewer purchase orders. Alas, buying larger quantities than necessary for the short run resulted in excessive inventory.
3. The purchasing manager accepted a bid from the lowest-priced supplier after only minimal effort to check that the supplier monitored the quality of the material before shipping it.

If the purchasing manager's performance is evaluated solely on price variances, then the evaluation will be positive. Reason 1 would support this favorable conclusion - the purchasing manager bargained effectively. Reasons 2 and 3 have short-run gains, buying in bulk or making less effort to check the supplier's quality-monitoring procedures. However, these short-run gains could be offset by higher inventory storage costs or higher inspection costs and defect rates on Webb's production line, leading to unfavorable direct manufacturing labor and direct materials efficiency variances.

Companies are increasingly evaluating performance based on the effect a manager's action has had on the total costs of the company as a whole. In the purchasing manager example, Webb may ultimately lose more money because of reasons 2 and 3 than it gains from the favorable price variance. *Do not automatically interpret a favorable variance as "good news."*

A benefit of variance analysis is that it highlights individual aspects of performance. However, if any single performance measure (for example, a labor efficiency variance or a consumer rating report) receives excessive emphasis, managers will tend to make decisions that make that particular performance measure look good. These actions may conflict with the company's overall goals, inhibiting them from being achieved. This faulty perspective on performance usually arises when top management designs a performance evaluation and reward system that does not emphasize total company objectives.

### Multiple Causes of Variances and Organization Learning

Variances often affect one another. For example, an unfavorable direct material efficiency variance may be related to a favorable direct material price variance due to a purchasing manager buying lower-priced, lower-quality materials. *Do not interpret variances in isolation of each other.* The causes of variances in one part of the value chain can be the result of decisions made in another part of the value chain of the company or even in another company. Consider an unfavorable direct material efficiency variance on Webb's production line.

**Possible operational causes of this variance across the value chain of the company are**

1. Poor design of products or processes,
2. Poor work on the production line,
3. Underskilled labor force,
4. Inappropriate assignment of labor or machines to specific jobs, and
5. Congestion due to scheduling a large number of rush orders from Webb's sales representatives.
6. Webb's suppliers do not manufacture cloth materials of uniformly high quality. Item6 describes an even broader perspective on the cause of the unfavorable direct material efficiency variance by considering actions taken in the supply chain of companies.

*The focus of variance analysis is to understand why variances arise and how to use that understanding to learn and to improve performance.* For instance, to reduce the unfavorable direct material efficiency variance, a company may seek improvements in product design, in the quality of supplied materials, and in the commitment of the manufacturing labor force to do the job right the first time, among other improvements. Sometimes an unfavorable direct material efficiency variance may signal a need to change product strategy, perhaps because the product cannot be made at a low enough cost. Variance analysis should not be a tool to "play the blame game" (that is, seeking a person to blame for every unfavorable variance). Rather, it should help the company learn about what happened and how to perform better.

A delicate balance needs to be struck between the two uses of variances we have discussed: performance evaluation and organization learning.

Variance analysis is helpful for performance evaluation, but an overemphasis on performance evaluation and meeting individual variance targets can undermine learning and continuous improvement. Why? Because achieving the standard becomes an end in and of itself. As a result, managers will seek targets that are easy to attain rather than targets that are challenging and that require creativity and resourcefulness. For example, if performance evaluation is overemphasized, Webb's manufacturing manager will prefer a standard that allows workers ample time to manufacture a jacket; he will have little incentive to improve processes and methods to reduce manufacturing time and cost.

An overemphasis on performance evaluation may also cause managers to take actions to achieve the budget and avoid an unfavorable variance, even if such actions could hurt the company in the long run. For example, the manufacturing manager may push workers to produce jackets within the time allowed, even if this action could lead to poorer quality jackets being produced. Such negative impacts are less likely to occur if variance analysis is seen as a way of promoting organization learning. Managers will then be more willing to experiment with ways to reduce manufacturing costs and will also be less likely to compromise quality to avoid unfavorable variances.

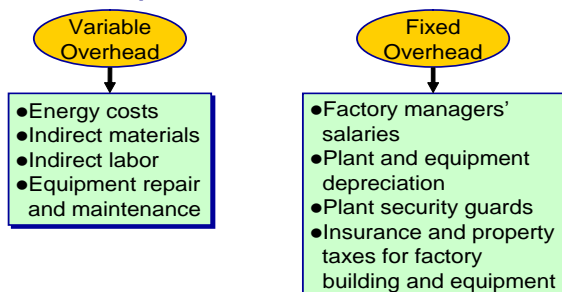

## OVERHEAD VARIANCES

Overhead costs are a big part of the costs of many companies. Chemical, paper, and steel companies incur large costs to construct and maintain their physical plant and equipment: These costs are part of their overhead costs.

This chapter shows how flexible budgets and variance analysis can help managers plan and control the overhead costs of their companies. In this chapter, we focus on the indirect-cost categories of variable manufacturing overhead and fixed manufacturing overhead. And we explain why managers should be careful when interpreting variances based on overhead cost concepts developed primarily for financial reporting purposes.

**Explain in what ways the planning of variable overhead costs and fixed overhead costs are similar and in what ways they differ.**

### Standard Costs for Factory Overhead

### Planning of Variable & Fixed Overhead Costs

Effective planning of variable overhead costs involves undertaking only those variable overhead activities that add value for customers using the product or service.

The key challenge with planning fixed overhead is choosing the appropriate level of capacity or investment that will benefit the company over an extended time period.

## Comprehensive example

Nina Garcia is the newly appointed president of Laser Products. She is examining the May 2012 results for the Aerospace Products Division. This division manufactures wing parts for satellites. Garcia's current concern is with manufacturing overhead costs at the Aerospace Products Division. Both variable and fixed overhead costs are allocated to the wing parts on the basis of laser-cutting-hours. The following budget information is available:

Budgeted variable overhead rate	\$200 per hour
Budgeted fixed overhead rate	\$240 per hour
Budgeted laser-cutting time per wing part	1.5 hours
Budgeted production and sales for May 2012	5,000 wing parts
Budgeted fixed overhead costs for May 2012	\$1,800,000

### Actual results for May 2012 are as follows:

Wing parts produced and sold	4,800 units
Laser-cutting-hours used	8,400 hours
Variable overhead costs	\$1,478,400
Fixed overhead costs	\$1,832,200

### Required

1. Compute the spending variance and the efficiency variance for variable overhead.
2. Compute the spending variance and the production-volume variance for fixed overhead.
3. Give two explanations for each of the variances calculated in requirements 1 and 2.

## Standard Overhead Costs: Planning versus Control

For variable factory overhead the underlying model for cost-control and product-costing purposes is the same, as illustrated in Exhibit 8-7. Laser Products Company uses machine hours as the activity variable for applying overhead costs. Other allocation bases, such as number of direct labor hours, could have been used by the company.

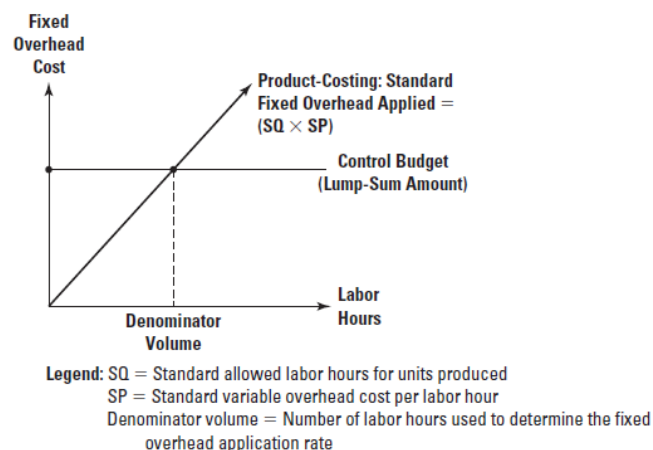

As you can see, the standard variable overhead rate per unit is \$300 (1.5 standard laser-cutting-hours/unit X \$200 standard variable overhead cost per laser-cutting-hour). It is this amount that is charged to production for the period (product-costing purpose) and that is used in the flexible budget (cost-control purpose). In short, the graph below show variable overhead cost is similar in form to what we could have prepared either direct materials cost or direct labor cost. This makes sense because all three are variable costs.

## Variable Manufacturing Overhead: Product-Costing versus Control Purposes

The situation for fixed costs, however, is different, as reflected in the graph presented below. For cost-control purposes, we see that budgeted (lump-sum) fixed overhead costs are used—see the horizontal line in Exhibit 15.3. At the end of the period, this budgeted amount is compared to the actual fixed overhead cost incurred. The resulting difference is called a *spending variance*. For product-costing purposes, however, we must “unitize” fixed overhead costs. As indicated in Exhibit 15.3, for product-costing purposes we treat fixed overhead costs as if they were variable costs. In our Company case, the standard fixed overhead rate per unit produced is \$360 (i.e., 1.5 standard direct laser hours per unit X \$240 standard fixed overhead cost per hour).

**EXHIBIT 15.3**  
Fixed Manufacturing Overhead Costs: Product Costing versus Control

We assume that Laser Products Company uses a standard cost system. Thus, at the end of each period the accountant for the company prepares an analysis of the total standard cost variance for both variable and fixed overhead costs. In each case, the goal will be to explain the difference between the actual cost incurred and the cost charged to production (units produced) for the period.

For product-costing purposes, the total overhead variance for the period (also called the total under/overapplied overhead) is equal to the difference between actual overhead cost incurred and the standard overhead cost applied to production.

$$\text{Total overhead variance} = \text{Total actual overhead} - \text{Total applied overhead}$$

$$= (\text{Total variable overhead} + \text{Total fixed overhead}) - (\text{Total overhead application rate} \times \text{Standard hours allowed for this period's production})$$

$$= (\$1,478,400 + \$1,832,200) - (\{200+240\} \text{ per hour} \times 4800 \times 1.5 \text{ hours per unit})$$

$$= (\$3,310,600) - (\$3,168,000)$$

$$= \$142,600 \text{ U (underapplied overhead)}$$

As explained below, the total overhead variance for the period can be subdivided into a set of variable overhead cost variances and a set of fixed overhead cost variances.

## Applied Overhead Costs: Normal Cost System versus Standard Cost System (Exhibit 11A-2)

Normal Cost System		Standard Cost System	
Manufacturing Overhead		Manufacturing Overhead	
Actual overhead costs incurred.	Applied overhead costs: Actual hours $\times$ Pre-determined overhead rate.	Actual overhead costs incurred.	Applied overhead costs: Standard hours allowed for actual output $\times$ Pre-determined overhead rate.
Underapplied or overapplied overhead		Underapplied or overapplied overhead	

To understand fixed overhead variances, we first have to understand how overhead is applied to work in process in a standard cost system. Recall that in the job-order costing chapter we applied overhead to work in process on the basis of the actual level of activity. This procedure was correct because at the time we were dealing with a normal cost system. However, we are now dealing with a standard cost system. In such a system, overhead is applied to work in process on the basis of the standard hours allowed for the actual output of the period rather than on the basis of the actual number of hours worked. Exhibit 11A-2 illustrates this point. In a standard cost system, every unit of a particular product is charged with the same amount of overhead cost, regardless of how much time the unit actually requires for processing.

## Variable manufacturing Overhead Cost Analysis

The total variable overhead variance is the difference between actual variable overhead cost incurred and the standard variable overhead cost applied to production; also called over- or underapplied variable overhead for the period.

=actual variable overhead costs incurred (\$1,478,400) - the standard variable overhead costs charged to production during May 2012 [\$1,440,000= (4800 units X 1.5 standard laser hours per unit)X \$200 standard variable overhead cost per laser hour].

= \$38,400 U underapplied variable overhead for the period

**(Total variable overhead variance)= Over/under allocated VOH=VOH FB Variance**

Variable overhead = Actual costs - Flexible-budget  
flexible- budget variance incurred amount

**FB VOH variance = Spending variance + Efficiency Variance**

## Cost Control: Breakdown of the Total Variable Overhead Variance

We see from Exhibit 8-7 panel A that the total variable overhead variance for a period (\$38,400U in our example) can be broken down into a **variable overhead spending variance** and a **variable overhead efficiency variance**, as follows:

### Variable overhead spending variance

**Variable overhead spending variance** is the difference between actual variable overhead cost incurred and the flexible budget for variable overhead based on *inputs* for the period (e.g., actual laser cutting hours worked)

Spending variance= \$201,600 F

Variable overhead spending variance =

*Actual* variable overhead - *Budgeted* variable overhead based on inputs (e.g., actual laser hours worked)  
=(AQ x AP)-(AQ x SP)  
=AQ X (AP-SP)

= (8,400 hrs.X176/hr.) - (8,400 hrs. X \$200/hr.)  
=\$1,478,400- \$1,680,000 or = 8400 actual hours X (\$176-\$200)  
= \$201,600 F

### Possible reasons

- One possible reason for this variance is that actual prices of individual items included in variable overhead (such a cutting fluids, supplies and utilities) are lower than budgeted prices.
- A second possible reason is that the percentage increase in the actual quantity usage of individual items in the variable overhead cost pool is less than the percentage increase in machine-hours compared to the flexible budget.

#### Variable OH Spending Variance

Variable	Actual variable		Budgeted variable		Actual quantity of
Overhead =	overhead	-	overhead cost per	x	variable overhead
Spending			unit of cost-allocation base		cost-allocation base
variance					used for actual output

Variable overhead = (AH X AR) – (AH X SR)  
spending variance

Or, in factored form:

**AH (AR-SR)**

**Variable overhead efficiency variance**

**Variable overhead efficiency variance** is the difference between the flexible budget for variable overhead based on *inputs* (e.g., actual laser cutting hours worked) and the flexible budget for variable overhead based on *outputs* (i.e., standard allowed laser hours for units produced).

Variable overhead efficiency variance=

Budgeted variable overhead based on inputs - Standard variable overhead *applied* to production

$$= (AQ \times SP) - (SQ \times SP)$$

$$= SP \times (AQ - SQ)$$

As the amount of standard overhead cost applied to production (product-costing purpose) and the flexible budget based on output (cost-control purpose) for variable overhead are always equal. Thus, the second term on the right-hand side of the above equation could have been expressed as "budgeted variable overhead based on outputs."

$$= (8,400 \text{ hrs.} \times \$200/\text{hr.}) - (1.5 \text{ hrs./unit} \times 4,800 \text{ units} \times \$200/\text{hr.})$$

$$= (8,400 \text{ hrs.} \times \$200/\text{hr.}) - (7,200 \text{ hrs.} \times \$200/\text{hr.})$$

$$= \$1,680,000 - \$1,440,000$$

$$\text{Efficiency variance} = \$240,000 \text{ U}$$

**Possible reasons**

One possible reason for this variance is inadequate maintenance of laser machines, causing them to take more laser time per wing part. A second possible reason is use of undermotivated, inexperienced, or underskilled workers with the laser-cutting machines, resulting in more laser-time per wing part. Efficiency variance is a function of the selected activity measure. It does not reflect overhead control.

**Variable OH efficiency variance**

Variable	Actual quantity of	Budgeted quantity of		Budgeted variable
Overhead	variable overhead	variable overhead		overhead cost per unit
=	cost-allocation base -	cost-allocation base	X	of cost-allocation base
efficiency	used for actual	allowed for		
variance	output	actual output		

Or, in factored form:

$$SR(AH - SH)$$

$$\text{Variable overhead efficiency variance} = (AH \times SR) - (SH \times SR)$$

**Exhibit 8-7**Columnar Presentation of Integrated Variance Analysis: Laser Products for May 2012<sup>a</sup>**PANEL A: Variable (Manufacturing) Overhead**

Actual Costs Incurred: Actual Input Quantity × Actual Rate (1)	Actual Input Quantity × Budgeted Rate (2)	Flexible Budget: Budgeted Input Quantity Allowed for Actual Output × Budgeted Rate (3)	Allocated: Budgeted Input Quantity Allowed for Actual Output × Budgeted Rate (4)
(8,400 hrs. × \$176/hr.) \$1,478,400	(8,400 hrs. × \$200/hr.) \$1,680,000	(1.5 hrs./unit × 4,800 units × \$200/hr.) (7,200 hrs. × \$200/hr.) \$1,440,000	(1.5 hrs./unit × 4,800 units × \$200/hr.) (7,200 hrs. × \$200/hr.) \$1,440,000
	\$201,600 F	\$240,000 U	
	Spending variance	Efficiency variance	Never a variance
	\$38,400 U		
	Flexible-budget variance		Never a variance
		\$38,400 U	
		Underallocated variable overhead (Total variable overhead variance)	

**Fixed Overhead Cost Analysis**

The **total fixed overhead variance** is the difference between the actual fixed overhead cost incurred and the fixed overhead cost applied to production based on a standard fixed overhead application rate; also called *over or underapplied fixed overhead* for the period.

(Total fixed overhead variance)= Over/under allocated FOH=

**Fixed OH FB variance ( Spending FOH variance) + Production Volume Variance**

For product-costing purposes, the total variance is \$104,200 U, which is the difference between actual fixed overhead costs incurred (\$1,832,200 ) and the standard fixed overhead costs charged to production during May (1.5 hrs./unit X 4,800 units X \$240/hr.) (7,200 hrs. X \$240/hr.) \$1,728,000

Note, too, that this total variance, from a product-costing standpoint, could be called *total over- or underapplied fixed overhead cost* for the period. When the actual fixed overhead costs are greater than the fixed overhead costs assigned to production, as they were for the month of May, we call the \$104,200 U figure *under applied* fixed overhead.

**The Production-Volume (Denominator /Output-Level) Variance**

**Fixed overhead productionvolume variance** is the difference between budgeted fixed overhead for the period and the standard fixed overhead applied to production (using the fixed overhead allocation rate).

As noted earlier in unit 3, for federal income tax and GAAP purposes, companies must report inventories on a full (absorption) cost basis. This means that each unit produced must absorb a share of fixed factory overhead costs in addition to variable manufacturing costs. In turn, this requires that fixed overhead costs be “unitized” for product-costing purposes.

**Volume Variance**

Volume = variance	Fixed component of the predetermined overhead rate	X	(Denominator _ Standard hours) hours                  allowed
Production volume = Variance	Budgeted fixed Overhead	-	Fixed overhead allocated using budgeted input allowed for actual output units produced

The following four-step process can be used for this purpose.

**Step 1: Determine budgeted total fixed factory overhead** Fixed manufacturing overhead costs, by definition, do not vary in the short run in response to changes in output or activity. As such, these costs are often referred to as *capacity-related* manufacturing support costs. Thus, once an organization has determined its capacity for an upcoming period (e.g., one year), it constructs a budget for capacity-related costs. In the case of our Company, assume that the capacity-related manufacturing costs are estimated at \$1800,000 per month.

**Step 2: Choose an appropriate activity measure for applying fixed factory overhead i.e. ,laser cutting hours in our example.**

**Step 3: Choose a denominator activity level** In order to unitize fixed overhead costs for product-costing purposes, we must choose some level of output (activity) over which the budgeted fixed costs for the period can be spread. Our Company uses 7500 laser hours per month (i.e., 5000 units X 1.5 laser hours per unit) for this purpose. The general term used to describe the level of output (activity) used to establish the standard **fixed overhead application rate** is **denominator activity level** or **denominator volume**. Several alternatives exist for defining the denominator activity level: two “supply-based” alternatives, and two “demand-based” alternatives as stated in U.3 .

**Step 4: Calculate the predetermined fixed overhead application rate**

= \$1,800,000 ÷ 5000units X 1.5(laser hours)

= \$1,800,000 ÷ 7500 laser cutting hours

In summary, for product-costing purposes a company must choose an activity level over which it spreads budgeted fixed manufacturing costs for a given period. If the company actually operates at the level assumed when the application rate was determined, it will have assigned to production an amount exactly equal to the budgeted fixed overhead for the period. If, on the other hand, the company operates at any level of activity other than the denominator activity level, then it will have applied to production an amount greater or lesser than budgeted fixed overhead. It is this over- or underapplied budgeted fixed overhead that we call the **production-volume variance** for the period.

For May, this variance for our Company is \$72,000 U as follows:

Production-volume variance=

Budgeted fixed factory overhead cost Standard- fixed overhead cost assigned to production

= \$1,800,000 - (1.5 hrs./unit \_ 4,800 units \_ \$240/hr.)

= \$1,800,000 - (7,200 hrs. \_ \$240/hr.)

= \$1,800,000 - \$1,728,000

= \$72,000 U

Or

= SP X (Denominator activity hours – SQ)

= \$240/hour X {7500-(4800\*1.5 hours/unit)}

= \$240/hour X (7500-7200)

= \$72,000 U

### Possible reasons

- Actual production of wing parts is 4,800 units, compared with the 5,000 units budgeted. One possible reason for this variance is demand factors, such as a decline in an aerospace program that led to a decline in the demand for aircraft parts.
- A second possible reason is supply factors, such as a production stoppage
- Interpretation of this variance is difficult due to the nature of the costs involved and how they are budgeted
- Fixed costs are by definition somewhat inflexible. While market conditions may cause production to flex up or down, the associated fixed costs remain the same
- Fixed costs may be set years in advance, and may be difficult to change quickly
- The inability to operate at the activity budgeted for the period.
- Management decisions, Unexpected changes in market demand, Unforeseen problems in manufacturing operations

### Production (Denominator) Volume Variance

This variance is an artifact of unitizing fixed overhead costs for product-costing purposes. This variance has no meaning for cost-control purposes. However, if practical capacity is used to establish the fixed overhead application rate, then the production-volume variance can be viewed as a rough measure of capacity utilization. This is because the variance reflects differences between available capacity and actual capacity usage. In short, the reporting of production volume variances over time provides decision makers with information that can be used to manage *spending* on capacity-related resources. For example, consistently reported underapplied fixed overhead (i.e., unfavorable production-volume variances) may signal the need to reduce spending on capacity-related costs or motivate action to better utilize the capacity that does exist. You will note that if the fixed overhead allocation rate were based on expected (budgeted) output, then the cost of unused capacity would be hidden, that is, charged to the units actually produced during the period. To the extent that selling prices are based on indicated costs and budgeted output is less than practical capacity, the use of budgeted output could lead to successively increasing charges (and, therefore, selling prices) over time, a situation referred to as the **death-spiral effect**. In this case, fixed overhead costs get allocated over successively lower outputs.

When practical capacity is used to calculate the fixed overhead application rate, the cost of unused capacity becomes visible to management through the amount and direction of the production-volume variance. To avoid misinterpretations, yet communicate information regarding capacity usage, some companies prefer to report the fixed overhead production volume variance in physical terms only.

Finally, we note the importance of not placing too much emphasis on individual variances because of the interrelatedness of these performance indicators. For example, a production department in a manufacturing facility can generate a favorable production-volume variance by overproducing for the period, that is, producing more units than needed to meet sales and target ending inventory requirements. Such practice, of course, runs counter to the JIT philosophy.

In this case, a financial performance indicator (production-volume variance) might be accompanied by one or more nonfinancial performance indicators (e.g., inventory turnover or spoilage/obsolescence rates).

### **Fixed Overhead Spending (Budget) Variance**

Spending (Budget) Variance is the difference between budgeted and actual fixed factory overhead costs for a period. For our Company, the fixed overhead spending (budget) variance for May was \$32,200 U, as follows:

$$\begin{aligned}\text{Fixed overhead spending variance} &= \text{Actual fixed overhead} - \text{Budgeted fixed overhead} \\ &= \$1,832,200 - \$1,800,000 \\ &= \$32,200 \text{ U}\end{aligned}$$

#### **Fixed OH FB variance= Spending FOH variance**

Fixed overhead	=	Actual costs	Flexible-budget
flexible-budget variance		incurred	- amount

Budget	Actual fixed	-	Budgeted fixed
Variance=	overhead cost		overhead cost

Also equal,

Fixed overhead	=	Actual costs - Flexible-budget
spending variance		incurred amount

### **Possible reasons**

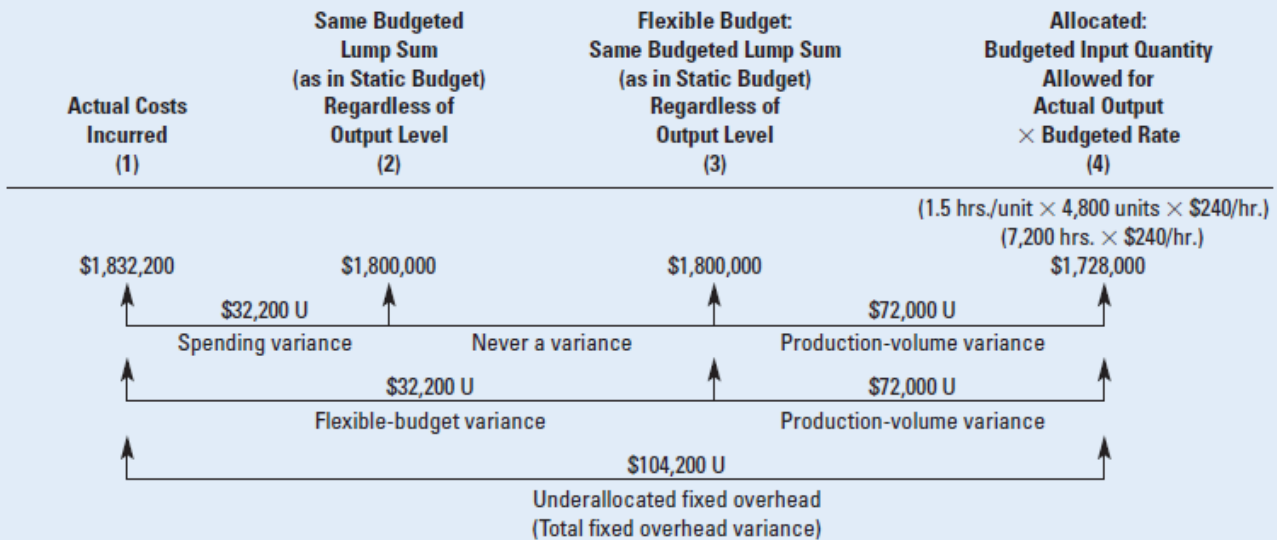

One possible reason for this variance is that the actual prices of individual items in the fixed-cost pool unexpectedly increased from the prices budgeted (such as an unexpected increase in machine leasing costs). A second possible reason is misclassification of items as fixed that are in fact variable.

- Paying more or less than expected for overhead items For example, a budget that inadvertently neglected scheduled raises for factory managers, changes in property taxes on factory buildings and equipment, or purchases of new equipment create unfavorable spending variances.
- Ineffective budget procedures
- Inadequate control of costs(EX: Events such as emergency repairs, impromptu replacement of equipment, or the addition of production supervisors for an unscheduled second shift all would result in unfavorable fixed overhead spending variances for the period).
- Misclassification of cost items

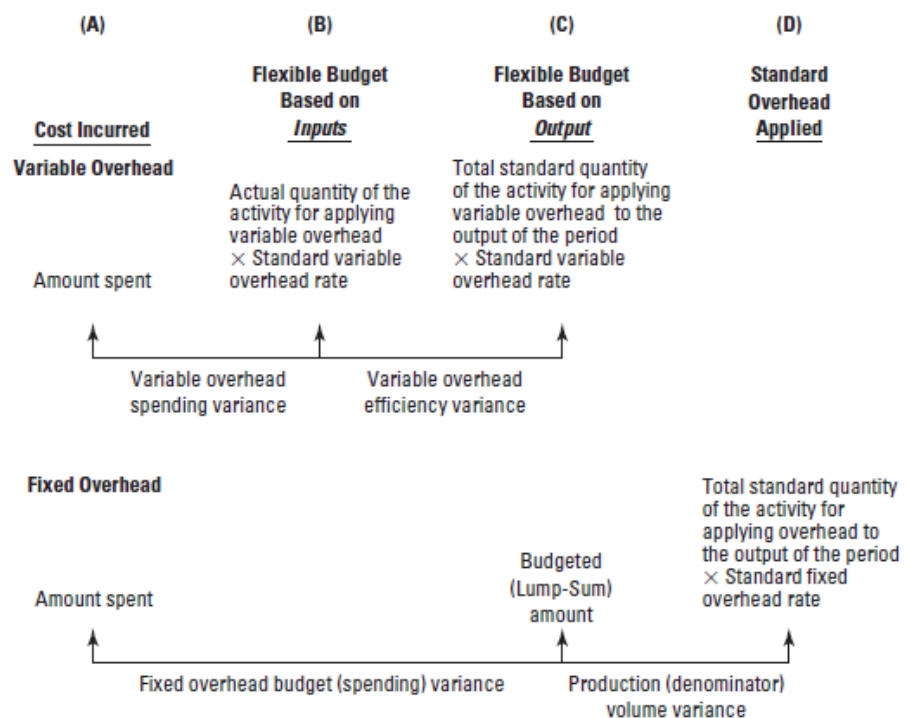

**PANEL B: Fixed (Manufacturing) Overhead**

**EXHIBIT 15.6**

**General Model: Four-Way Analysis of Total Overhead Variance**

Before leaving this discussion, it is important to point out some alternative terminology for the variances to which we referred in the preceding sections. When standard costs are incorporated formally into the accounting records (that is, when a standard cost system is used), we have already indicated that the total overhead variance for the period can also be referred to as *total over- or underapplied overhead*. Also, note that the production volume variance is also referred to as the *capacity variance*, the *idle-capacity variance*, the *denominator-level variance*, the *output-level overhead variance*, or simply, the *denominator variance*. The spending variance for variable overhead is sometimes referred to as a *price variance* or a *budget variance*. The total flexible-budget variance for overhead (and by extension the total flexible-budget variance for fixed overhead and the total flexible-budget variance for variable overhead) is sometimes referred to as a *controllable variance*. This latter term is more descriptive of the use of standard costs and related variances for cost-control purposes. For this reason, the production-volume variance is sometimes referred to as the *noncontrollable overhead variance*. The important point is that, unfortunately, this is an area where the terminology is not standard. Therefore, you need to keep the above-listed alternatives in mind in any given situation.

## Operational Performance Measurement: Further Analysis of Productivity and Sales

### PARTIAL AND TOTAL FACTOR PRODUCTIVITY

Productivity is the ratio of output to input. Improvements in productivity enable firms to do more with fewer resources. A productivity measure is often compared to the performance of a prior period, another firm, the industry standard, or a benchmark in assessing a firm's productivity.

- **Fabro, Inc. produced 1,500 units of Product RX-6 last week. The inputs to the production process for Product RX-6 were as follows:**

- 450 pounds of Direct Material A at a cost of \$1.50 per pound
- 300 pounds of Direct Material Z at a cost of \$2.75 per pound
- 300 labor hours at a cost of \$15.00 per hour

What is the total factor productivity for Product RX-6?

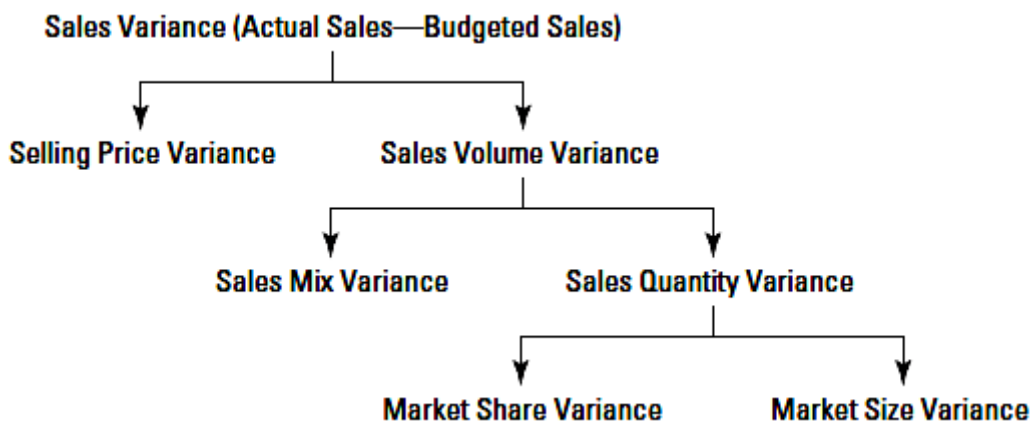

- Total factor productivity equals units of output divided by the cost of all inputs.
- Hence, the total factor productivity equals 0.25 units per dollar input  $\{1,500 \text{ units} \div [(450 \text{ pounds of A} \times \$1.50) + (300 \text{ pounds of Z} \times \$2.75) + (300 \text{ hours} \times \$15)]\}$ .

What is the partial productivity for DM for Product RX-6?

- A **partial productivity** measure is the **ratio of output quantity to input quantity** for a single factor of production.
- **The partial productivity for the DM**, Hence, the **partial** productivity equals 1.00 unit per dollar input  $\{1,500 \text{ units} \div [(450 \text{ pounds of A} \times \$1.50) + (300 \text{ pounds of Z} \times \$2.75)]\}$ .

### Sales Variances

To effectively evaluate sales performance, management must be fully informed of the effects of changes in selling prices, sales volumes, sale mixes, market sizes, and market shares on the firm's sales.

To effectively evaluate sales performance, management must be fully informed of the effects of changes in selling prices, sales volumes, sale mixes, market sizes, and market shares on the firm's sales.

The sales volume variance reflects the difference in contribution margin or operating income between a flexible budget and the master budget. The sales volume variance for a single product firm can be determined by multiplying the budgeted contribution margin per unit of the product times the difference in units between the number of units sold and the budgeted units to be sold. The sales volume variance of firms with multiple products can be separated into sales mix and sales quantity variances. The sales mix variance is the product of three components:

1. The difference between the actual sales mix (defined as the ratio of the units of the product to the total units of all products) and the budgeted sales mix
2. The total number of units of all products sold during the period
3. The product's budgeted contribution margin

A product's sales quantity variance has three elements: (1) the difference between the firm's total actual units sold and budgeted sales units, (2) the product's budgeted sales mix, and (3) the budgeted contribution margin. The product of these three elements is the product's sales quantity variance.

A sales quantity variance assesses the effect of the difference between the units sold and budgeted sales on total contribution margin and operating income.

A sales quantity variance can be separated further into market size and market share variances. A market size variance assesses the effect of changes in the industry's total market size on the firm's total contribution margin and operating income.

A market size variance is the product of three factors: (1) the difference between the actual and the budgeted total market size (in number of units), (2) the firm's budgeted market share, and (3) the weighted-average budgeted contribution margin per unit. The market size variance is favorable if the actual total market size is larger than the market size expected when the master budget was prepared.

A market share variance measures the effect of changes in the firm's market share on its operating income. A market share variance is the product of three elements: (1) the actual total number of units in the market (actual market size), (2) the difference between the firm's actual and budgeted market share, and (3) the weighted average budgeted contribution margin per unit.

Sales performance can be analyzed from either of two benchmarks: the master budget or the prior period. The period-to-period analysis also uses the flexible budget, and the same variances are calculated, with similar interpretations.

The Payne Company manufactures two types of vinyl flooring. Budgeted and actual operating data for 2012 are as follows:

	Static Budget			Actual Results		
	Commercial	Residential	Total	Commercial	Residential	Total
Unit sales in rolls	20,000	60,000	80,000	25,200	58,800	84,000
Contribution margin	\$10,000,000	\$24,000,000	\$34,000,000	\$11,970,000	\$24,696,000	\$36,666,000

In late 2011, a marketing research firm estimated industry volume for commercial and residential vinyl flooring for 2012 at 800,000 rolls. Actual industry volume for 2012 was 700,000 rolls.

1. Compute the sales-mix variance and the sales-quantity variance by type of vinyl flooring and in total. (Compute all variances in terms of contribution margins.)
2. Compute the market-share variance and the market-size variance .
3. What insights do the variances calculated in requirements 1 and 2 provide about Payne Company's performance in 2012?

### Solution

1. Actual sales-mix percentage:

Commercial =  $25,200 \div 84,000 = 0.30$ , or 30%

Residential =  $58,800 \div 84,000 = 0.70$ , or 70%

- Budgeted sales-mix percentage:

Commercial =  $20,000 \div 80,000 = 0.25$ , or 25%

Residential =  $60,000 \div 80,000 = 0.75$ , or 75%

- Budgeted contribution margin per unit:

Commercial =  $\$10,000,000 \div 20,000 \text{ units} = \$500 \text{ per unit}$

Residential =  $\$24,000,000 \div 60,000 \text{ units} = \$400 \text{ per unit}$

	Actual Units of All Products Sold	×	$\left( \begin{array}{c} \text{Actual} \\ \text{Sales-Mix} \\ \text{Percentage} \end{array} - \begin{array}{c} \text{Budgeted} \\ \text{Sales-Mix} \\ \text{Percentage} \end{array} \right)$	×	Budgeted Contribution Margin per Unit	=	Sales-Mix Variance
Commercial	84,000 units	×	(0.30 – 0.25)	×	\$500 per unit	=	\$2,100,000 F
Residential	84,000 units	×	(0.70 – 0.75)	×	\$400 per unit	=	1,680,000 U
Total sales-mix variance							<u>\$ 420,000 F</u>

	$\left( \begin{array}{c} \text{Actual Units} \\ \text{of All} \\ \text{Products Sold} \end{array} - \begin{array}{c} \text{Budgeted} \\ \text{Units of All} \\ \text{Products Sold} \end{array} \right)$	×	Budgeted Sales-Mix Percentage	×	Budgeted Contribution Margin per Unit	=	Sales- Quantity Variance
Commercial	(84,000 units – 80,000 units)	×	0.25	×	\$500 per unit	=	\$ 500,000 F
Residential	(84,000 units – 80,000 units)	×	0.75	×	\$400 per unit	=	1,200,000 F
Total sales-quantity variance							<u>\$1,700,000 F</u>

2. Actual market share =  $84,000 \div 700,000 = 0.12$ , or 12%

Budgeted market share =  $80,000 \div 800,000$  units = 0.10, or 10%

Budgeted contribution margin

per composite unit =  $\$34,000,000 \div 80,000$  units = \$425 per unit  
of budgeted mix

Budgeted contribution margin per composite unit of budgeted mix can also be calculated as follows:

Commercial:  $\$500 \text{ per unit} \times 0.25 = \$125$

Residential:  $\$400 \text{ per unit} \times 0.75 = \underline{300}$

Budgeted contribution margin per composite unit = \$425

$$\text{Market-share variance} = \begin{array}{c} \text{Actual} \\ \text{market size} \\ \text{in units} \end{array} \times \left( \begin{array}{c} \text{Actual} \\ \text{market} \\ \text{share} \end{array} - \begin{array}{c} \text{Budgeted} \\ \text{market} \\ \text{share} \end{array} \right) \times \begin{array}{c} \text{Budgeted} \\ \text{contribution margin} \\ \text{per composite unit} \\ \text{for budgeted mix} \end{array}$$

$$= 700,000 \text{ units} \times (0.12 - 0.10) \times \$425 \text{ per unit}$$

$$= \$5,950,000 \text{ F}$$

$$\text{Market-size variance} = \left( \begin{array}{c} \text{Actual} \\ \text{market size} \\ \text{in units} \end{array} - \begin{array}{c} \text{Budgeted} \\ \text{market size} \\ \text{in units} \end{array} \right) \times \begin{array}{c} \text{Budgeted} \\ \text{market} \\ \text{share} \end{array} \times \begin{array}{c} \text{Budgeted} \\ \text{contribution margin} \\ \text{per composite unit} \\ \text{for budgeted mix} \end{array}$$

$$= (700,000 \text{ units} - 800,000 \text{ units}) \times 0.10 \times \$425 \text{ per unit}$$

$$= \$4,250,000 \text{ U}$$

Note that the algebraic sum of the market-share variance and the market-size variance is equal to the sales-quantity variance: \$5,950,000 F + \$4,250,000 U = \$1,700,000 F.

3. Both the total sales-mix variance and the total sales-quantity variance are favorable. The favorable sales-mix variance occurred because the actual mix comprised more of the higher-margin commercial vinyl flooring. The favorable total sales-quantity variance occurred because the actual total quantity of rolls sold exceeded the budgeted amount.

The company's large favorable market-share variance is due to a 12% actual market share compared with a 10% budgeted market share. The market-size variance is unfavorable because the actual market size was 100,000 rolls less than the budgeted market size. Payne's performance in 2012 appears to be very good. Although overall market size declined, the company sold more units than budgeted and gained market share.

### Mix and Yield Variances for Substitutable Inputs

The framework for calculating the sales-mix variance and the sales-quantity variance can also be used to analyze production-input variances in cases in which managers have some leeway in combining and substituting inputs.

For example, Del Monte can combine material inputs (such as pineapples, cherries, and grapes) in varying proportions for its cans of fruit cocktail. Within limits, these individual fruits are *substitutable inputs* in making the fruit cocktail.

We illustrate how the efficiency variance can be subdivided into variances that highlight the financial impact of input mix and input yield when inputs are substitutable. Consider Delpino Corporation, which makes tomato ketchup. Our example focuses on direct material inputs and substitution among three of these inputs. The same approach can also be used to examine substitutable direct manufacturing labor inputs.

To produce ketchup of a specified consistency, color, and taste, Delpino mixes three types of tomatoes grown in different regions: Latin American tomatoes (Latoms), California tomatoes (Caltoms), and Florida tomatoes (Flotoms). Delpino's production standards require 1.60 tons of tomatoes to produce 1 ton of ketchup; 50% of the tomatoes are budgeted to be Latoms, 30% Caltoms, and 20% Flotoms. The direct material inputs budgeted to produce 1 ton of ketchup are as follows:

0.80 (50% of 1.6) ton of Latoms at \$70 per ton	\$ 56.00
0.48 (30% of 1.6) ton of Caltoms at \$80 per ton	38.40
0.32 (20% of 1.6) ton of Flotoms at \$90 per ton	28.80
Total budgeted cost of 1.6 tons of tomatoes	<u>\$123.20</u>

Budgeted average cost per ton of tomatoes is  $\$123.20 \div 1.60 \text{ tons} = \$77 \text{ per ton}$ .

Because Delpino uses fresh tomatoes to make ketchup, no inventories of tomatoes are kept.

Purchases are made as needed, so all price variances relate to tomatoes purchased and used.

Actual results for June 2012 show that a total of 6,500 tons of tomatoes were used to produce 4,000 tons of ketchup:

3,250 tons of Latoms at actual cost of \$70 per ton	\$227,500
2,275 tons of Caltoms at actual cost of \$82 per ton	186,550
975 tons of Flotoms at actual cost of \$96 per ton	93,600
6,500 tons of tomatoes	<u>507,650</u>
Budgeted cost of 4,000 tons of ketchup at \$123.20 per ton	<u>492,800</u>
Flexible-budget variance for direct materials	<u>\$ 14,850 U</u>

Given the standard ratio of 1.60 tons of tomatoes to 1 ton of ketchup, 6,400 tons of tomatoes should be used to produce 4,000 tons of ketchup. At standard mix, quantities of each type of tomato required are as follows:

**Latoms:**  $0.50 \times 6,400 = 3,200$  tons

**Caltoms:**  $0.30 \times 6,400 = 1,920$  tons

**Flotoms:**  $0.20 \times 6,400 = 1,280$  tons

### Direct Materials Price and Efficiency Variances

Exhibit 14-12 presents in columnar format the analysis of the flexible-budget variance for direct materials discussed

in Chapter 7. The materials price and efficiency variances are calculated separately for each input material and then

added together. The variance analysis prompts Delpino to investigate the unfavorable price and efficiency variances.

Why did it pay more for tomatoes and use greater quantities than it had budgeted? Were actual market prices of tomatoes

higher, in general, or could the purchasing department have negotiated lower prices? Did the inefficiencies result

from inferior tomatoes or from problems in processing?

#### Exhibit 14-12

Direct Materials Price and Efficiency Variances for the Delpino Corporation June 2012

	Actual Costs Incurred: Actual Input Quantity × Actual Price (1)	Actual Input Quantity × Budgeted Price (2)	Flexible Budget: Budgeted Input Quantity Allowed for Actual Output × Budgeted Price (3)
Latoms:	$3,250 \times \$70 = \$227,500$	$3,250 \times \$70 = \$227,500$	$3,200 \times \$70 = \$224,000$
Caltoms:	$2,275 \times \$82 = 186,550$	$2,275 \times \$80 = 182,000$	$1,920 \times \$80 = 153,600$
Flotoms:	$975 \times \$96 = 93,600$	$975 \times \$90 = 87,750$	$1,280 \times \$90 = 115,200$
	<u>\$507,650</u>	<u>\$497,250</u>	<u>\$492,800</u>
Level 3		\$10,400 U	\$4,450 U
		Price variance	Efficiency variance
Level 2		\$14,850 U	
		Flexible-budget variance	

F = favorable effect on operating income; U = unfavorable effect on operating income.

### Direct Materials Mix and Direct Materials Yield Variances

Managers sometimes have discretion to substitute one material for another. The manager of Delpino's ketchup plant has some leeway in combining Latoms, Caltoms, and Flotoms without affecting the ketchup's quality. We will assume that to maintain quality, mix percentages of each type of tomato can only vary up to 5% from standard mix. For example, the percentage of Caltoms in the mix can vary between 25% and 35% (30%  $\pm$  5%). When inputs are substitutable, direct materials efficiency improvement relative to budgeted costs can come from two sources: (1) using a cheaper mix to produce a given quantity of output, measured by the direct materials mix variance, and (2) using less input to achieve a given quantity of output, measured by the direct materials yield variance.

Holding actual total quantity of all direct materials inputs used constant, the total **direct materials mix variance** is the difference between (1) budgeted cost for actual mix of actual total quantity of direct materials used and (2) budgeted cost of budgeted mix of actual total quantity of direct materials used. Holding budgeted input mix constant, the **direct materials yield variance** is the difference between (1) budgeted cost of direct materials based on actual total quantity of direct materials used and (2) flexible-budget cost of direct materials based on budgeted total quantity of direct materials allowed for actual output produced. Exhibit 14-13 presents the direct materials mix and yield variances for the Delpino Corporation.

### Direct Materials Mix Variance

The total direct materials mix variance is the sum of the direct materials mix variances for each input:

$$\text{Direct materials mix variance for each input} = \text{Actual total quantity of all direct materials inputs used} \times \left( \frac{\text{Actual direct materials input mix percentage} - \text{Budgeted direct materials input mix percentage}}{\text{Budgeted price of direct materials input}} \right)$$

The direct materials mix variances are as follows:

$$\begin{aligned} \text{Latoms: } & 6,500 \text{ tons} \times (0.50 - 0.50) \times \$70 \text{ per ton} = 6,500 \times 0.00 \times \$70 = \$ 0 \\ \text{Caltoms: } & 6,500 \text{ tons} \times (0.35 - 0.30) \times \$80 \text{ per ton} = 6,500 \times 0.05 \times \$80 = 26,000 \text{ U} \\ \text{Flotoms: } & 6,500 \text{ tons} \times (0.15 - 0.20) \times \$90 \text{ per ton} = 6,500 \times -0.05 \times \$90 = 29,250 \text{ F} \\ \text{Total direct materials mix variance} & \underline{\underline{\$ 3,250 \text{ F}}} \end{aligned}$$

The total direct materials mix variance is favorable because relative to the budgeted mix, Delpino substitutes 5% of the cheaper Caltoms for 5% of the more-expensive Flotoms.

#### Exhibit 14-13

Total Direct Materials Yield and Mix Variances for the Delpino Corporation for June 2012

	Actual Total Quantity of All Inputs Used × Actual Input Mix × Budgeted Price (1)	Actual Total Quantity of All Inputs Used × Budgeted Input Mix × Budgeted Price (2)	Flexible Budget: Budgeted Total Quantity of All Inputs Allowed for Actual Output × Budgeted Input Mix × Budgeted Price (3)
Latoms:	$6,500 \times 0.50 \times \$70 = \$227,500$	$6,500 \times 0.50 \times \$70 = \$227,500$	$6,400 \times 0.50 \times \$70 = \$224,500$
Caltoms:	$6,500 \times 0.35 \times \$80 = 182,000$	$6,500 \times 0.30 \times \$80 = 156,000$	$6,400 \times 0.30 \times \$80 = 153,600$
Flotoms:	$6,500 \times 0.15 \times \$90 = 87,750$	$6,500 \times 0.20 \times \$90 = 117,000$	$6,400 \times 0.20 \times \$90 = 115,200$
	<u>\$497,250</u>	<u>\$500,500</u>	<u>\$492,800</u>
Level 4		\$3,250 F	\$7,700 U
		Mix variance	Yield variance
Level 3			\$4,450 U
			Efficiency variance

F = favorable effect on operating income; U = unfavorable effect on operating income.

**Direct Materials Yield Variance**

The direct materials yield variance is the sum of the direct materials yield variances for each input:

$$\text{Direct materials yield variance for each input} = \left( \begin{array}{c} \text{Actual total} \\ \text{quantity of} \\ \text{all direct} \\ \text{materials} \\ \text{inputs used} \end{array} - \begin{array}{c} \text{Budgeted total} \\ \text{quantity of all} \\ \text{direct materials} \\ \text{inputs allowed} \\ \text{for actual output} \end{array} \right) \times \begin{array}{c} \text{Budgeted} \\ \text{direct materials} \\ \text{input mix} \\ \text{percentage} \end{array} \times \begin{array}{c} \text{Budgeted} \\ \text{price of} \\ \text{direct materials} \\ \text{input} \end{array}$$

The direct materials yield variances are as follows:

**Latoms:**  $(6,500 - 6,400) \text{ tons} \times 0.50 \times \$70 \text{ per ton} = 100 \times 0.50 \times \$70 = \$3,500 \text{ U}$

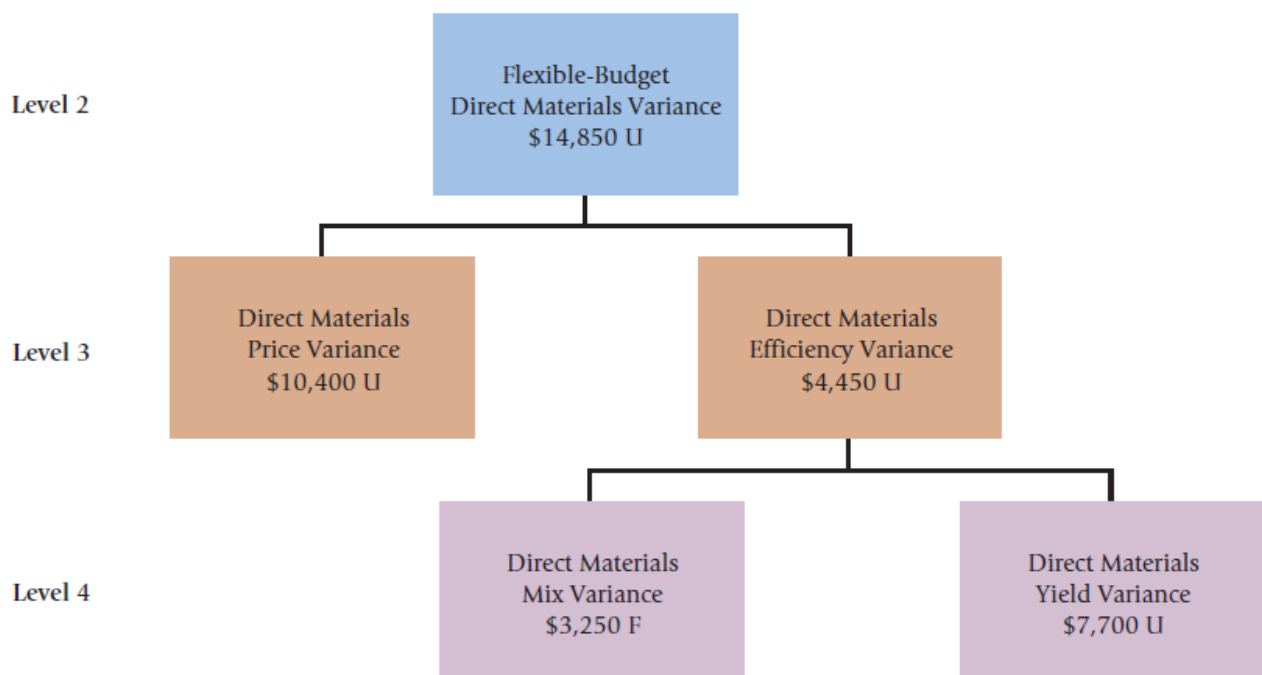

**Caltoms:**  $(6,500 - 6,400) \text{ tons} \times 0.30 \times \$80 \text{ per ton} = 100 \times 0.30 \times \$80 = 2,400 \text{ U}$

**Flotoms:**  $(6,500 - 6,400) \text{ tons} \times 0.20 \times \$90 \text{ per ton} = 100 \times 0.20 \times \$90 = 1,800 \text{ U}$

**Total direct materials yield variance** \$7,700 U

The total direct materials yield variance is unfavorable because Delpino used 6,500 tons of tomatoes rather than the 6,400 tons that it should have used to produce 4,000 tons of ketchup. Holding the budgeted mix and budgeted prices of tomatoes constant, the budgeted cost per ton of tomatoes in the budgeted mix is \$77 per ton. The unfavorable yield variance represents the budgeted cost of using 100 more tons of tomatoes,  $(6,500 - 6,400) \text{ tons} \times \$77 \text{ per ton} = \$7,700 \text{ U}$ . Delpino would want to investigate reasons for this unfavorable yield variance. For example, did the substitution of the cheaper Caltoms for Flotoms that resulted in the favorable mix variance also cause the unfavorable yield variance?

The direct materials variances computed in Exhibits 14-12 and 14-13 can be summarized as follows:

# Glossary

(based on ICMA suggested reading list)

**accounting (book) rate of return** Equals the ratio of some measure of accounting profit to some measure of investment in the project

**Activity variance** The difference between a revenue or cost item in the static planning budget and the same item in the flexible budget. An activity variance is due solely to the difference between the level of activity assumed in the planning budget and the actual level of activity used in the flexible budget

**arm's-length standard** A transfer price set to reflect the price that unrelated parties acting independently would have set

**asset turnover** The amount of sales dollars achieved per dollar of investment; measures the manager's ability to increase sales from a given level of investment

**Autonomy.** The degree of freedom to make decisions.

**Balanced scorecard.** A framework for implementing strategy that translates an organization's mission and strategy into a set of performance measures.

**balanced scorecard (BSC)** An accounting report that includes the firm's critical success factors in four areas: (1) financial performance, (2) customer satisfaction, (3) internal processes, and (4) learning and growth

**Balanced scorecard** An integrated set of performance measures that are derived from and support the organization's strategy.

**budgeted capacity utilization** The planned (forecasted) output for the coming period, usually a year

**Budgeted indirect-cost rate.** Budgeted annual indirect costs in a cost pool divided by the budgeted annual quantity of the cost allocation base.

**Budgeted performance.** Expected performance or a point of reference to compare actual results.

**business analysis** Evaluates the firm's overall performance by using the balanced scorecard, financial ratio analysis and economic value added

**Committed fixed costs** Investments in facilities, equipment, and basic organizational structure that can't be significantly reduced even for short periods of time without making fundamental changes.

**Common cost.** Cost of operating a facility, activity, or like cost object that is shared by two or more users.

**Common cost** A cost that is incurred to support a number of cost objects but that cannot be traced to them individually. For example, the wage cost of the pilot of a 747 airliner is a common cost of all of the passengers on the aircraft. Without the pilot, there would be no flight and no passengers. But no part of the pilot's wage is caused by any one passenger taking the flight.

**Common fixed cost** A fixed cost that supports more than one business segment, but is not traceable in whole or in part to any one of the business segments.

**Control.** Taking actions that implement the planning decisions, deciding how to evaluate performance, and providing feedback and learning that will help future decision making. (10)

**control** The set of procedures, tools, and systems that organizations use to reach their goals

**Control** The process of instituting procedures and then obtaining feedback to ensure that all parts of the organization are functioning effectively and moving toward overall company goals.

**Control** Those steps taken by management to increase the likelihood that all parts of the organization are working together to achieve the goals set down at the planning stage.

**Controlling** Actions taken to help ensure that the plan is being followed and is appropriately modified as circumstances change.

**Controllability.** Degree of influence that a specific manager has over costs, revenues, or related items for which he or she is responsible.

**Controllable cost.** Any cost that is primarily subject to the influence of a given responsibility center manager for a given period.

**controllable cost** A cost that a manager or employee has discretion in choosing to incur or can significantly influence the amount of within a given, usually short, period of time

**controllable fixed costs** Fixed costs that the profit center manager can influence in approximately a year or less

**controllable margin** A margin determined by subtracting short-term controllable fixed costs from the contribution margin

**Controller.** The financial executive primarily responsible for management accounting and financial accounting. Also called *chief accounting officer*.

**Controller** The member of the top management team who is responsible for providing relevant and timely data to managers and for preparing financial statements for external users. The controller reports to the CFO.

**Corporate governance** The system by which a company is directed and controlled. If properly implemented it should provide incentives for top management to pursue objectives that are in the interests of the company and it should effectively monitor performance.

**Cost-application base.** Cost-allocation base when the cost object is a job, product, or customer.

**Cost center.** Responsibility center where the manager is accountable for costs only.

**cost center** A firm's production or support unit that provides the best quality product or service at the lowest cost

**Cost center** A business segment whose manager has control over cost but has no control over revenue or investments in operating assets.

**Cost of capital** The average rate of return a company must pay to its long-term creditors and shareholders for the use of their funds.

**critical success factors (CSFs)** Measures of those aspects of the firm's performance that are essential to its competitive advantage and therefore to its success

**currently attainable standard** A level of performance that workers with proper training and experience can attain most of the time without extraordinary effort

**Customer-profitability analysis.** The reporting and analysis of revenues earned from customers and the costs incurred to earn those revenues.

**customer profitability analysis** Identifies customer service activities, cost drivers, and the profitability of individual customers or groups of customers

**death-spiral effect** Continual raising of selling prices in an attempt to recover fixed costs, in spite of successive decreases in demand; generally described as one of the dangers of cost-plus pricing

**decentralized** A firm that has chosen to delegate a significant amount of responsibility to SBU managers.

**Decentralized organization** An organization in which decision-making authority is not confined to a few top executives but rather is spread throughout the organization.

**Decentralization.** The freedom for managers at lower levels of the organization to make decisions.

**Decentralization** The delegation of decision-making authority throughout an organization by providing managers with the authority to make decisions relating to their area of responsibility.

**Degree of operating leverage** A measure, at a given level of sales, of how a percentage change in sales will affect profits. The degree of operating leverage is computed by dividing contribution margin by net operating income.

**denominator activity level** The output (activity) level used to establish the predetermined fixed overhead application rate; generally defined as *practical capacity*; also called the denominator volume

**denominator volume** The output (activity) level used to calculate the predetermined fixed overhead application rate; generally defined as *practical capacity*; also called the denominator activity level

**Denominator level.** The denominator in the budgeted fixed overhead rate computation.

**Denominator-level variance.** See *production-volume variance*.

**desired rate of return** The minimum rate of return the investing firm requires for an investment

**Directing and motivating** Mobilizing people to carry out plans and run routine operations.

**direct labor efficiency variance** The difference between the actual hours worked and the standard hours allowed for the units manufactured, multiplied by the standard wage rate

**direct labor rate variance** The difference between the actual and standard hourly wage rate multiplied by the actual direct hours worked during the period

**direct materials flexible-budget variance** For each material, the difference between total direct materials cost incurred and the flexible-budget amount for the units manufactured during the period

**direct materials price variance** For each direct material, the difference between the actual and standard unit price of the material multiplied by the actual quantity used

**Direct materials mix variance.** The difference between (1) budgeted cost for actual mix of the actual total quantity of direct materials used and (2) budgeted cost of budgeted mix of the actual total quantity of direct materials used.

**Direct materials yield variance.** The difference between (1) budgeted cost of direct materials based on the actual total quantity of direct materials used and (2) flexible-budget cost of direct materials based on the budgeted total quantity of direct materials allowed for the actual output produced.

**direct materials usage variance** For each material, the difference between the actual units used during the period and the number of standard units that should have been used for the output of the period, multiplied by the standard cost per unit of the direct material

**Discretionary costs.** Arise from periodic (usually annual) decisions regarding the maximum amount to be incurred and have no measurable cause-and-effect relationship between output and resources used.

**Discretionary fixed costs** Those fixed costs that arise from annual decisions by management to spend on certain fixed cost items, such as advertising and research.

**dual allocation** A cost allocation method that separates fixed and variable costs and traces variable service department costs to the user departments; fixed costs are allocated based on either equal shares among departments or a predetermined budgeted proportion

**Dual pricing.** Approach to transfer pricing using two separate transfer-pricing methods to price each transfer from one subunit to another.

**dual pricing** involves the use of multiple prices for an internal transfer or cost allocation, one based on variable cost and one based on fixed cost

**Dual-rate method.** Allocation method that classifies costs in each cost pool into two pools (a variable-cost pool and a fixed cost pool) with each pool using a different cost-allocation base.

**Dysfunctional decision making.** See *suboptimal decision making*.

**Economic value added (EVA®).** After-tax operating income minus the (after-tax) weighted-average cost of capital multiplied by total assets minus current liabilities.

**economic value added (EVA ®)** A measure of financial performance designed to approximate an entity's economic profit; calculated most often as net operating profit after-taxes (adjusted for accounting "distortions") less an imputed charge based on the level of invested capital

**Effectiveness.** The degree to which a predetermined objective or target is met.

**effective operation** The attainment of the goal set for the operation

**Efficiency.** The relative amount of inputs used to achieve a given output level.

**Efficiency variance.** The difference between actual input quantity used and budgeted input quantity allowed for actual output, multiplied by budgeted price. Also called *usage variance*.

**Effort.** Exertion toward achieving a goal.

**employment contract** An agreement between the manager and top management, designed to provide incentives for the manager to act autonomously to achieve top management's objectives

**enterprise risk management** A framework and process that firms use to manage the risks that could negatively or positively affect the company's competitiveness and success

**Enterprise risk management** A process used by a company to help identify the risks that it faces and to develop responses to those risks that enable the company to be reasonably assured of meeting its goals.

**Favorable variance.** Variance that has the effect of increasing operating income relative to the budgeted amount. Denoted F.

**factory overhead applied** The amount of overhead assigned to a cost object using a predetermined factory overhead rate

**Feedback** Accounting and other reports that help managers monitor performance and focus on problems and/or opportunities that might otherwise go unnoticed.

**financial control** The comparison between actual and budgeted financial results

**fixed overhead application rate** A term used for product costing purposes; the rate at which fixed overhead is charged to production per unit of activity (or output)

**fixed overhead production volume variance** The difference between budgeted fixed overhead and the standard fixed overhead applied to production (using the fixed overhead allocation rate); also called the production volume variance

**fixed overhead spending (budget) variance** The difference between budgeted and actual fixed factory overhead costs for a period

**Fixed overhead flexible-budget variance.** The difference between actual fixed overhead costs and fixed overhead costs in the flexible budget.

**Fixed overhead spending variance.** Same as the fixed overhead flexible-budget variance. The difference between actual fixed overhead costs and fixed overhead costs in the flexible budget.

**fixed performance contract** An incentive compensation plan whereby compensation is a function of actual performance compared to a fixed (budgeted) target

**Flexible budget.** Budget developed using budgeted revenues and budgeted costs based on the actual output in the budget period.

**flexible budget** A budget that adjusts revenues and costs to the actual output level achieved

**Flexible budget** A report showing estimates of what revenues and costs should have been, given the actual level of activity for the period.

**flexible-budget (FB) variance** The difference between actual and flexible-budget amounts on the income statement

**Flexible-budget variance.** The difference between an actual result and the corresponding flexible-budget amount based on the actual output level in the budget period.

**goal congruence** The consistency between the goals of the firm and the goals of its employees. It is achieved when the manager acts independently in such a way as to simultaneously achieve top management's objectives

**Goal congruence.** Exists when individuals and groups work toward achieving the organization's goals. Managers working in their own best interest take actions that align with the overall goals of top management.

**hurdle rate** The minimum acceptable rate of return on an investment for capital-budgeting purposes, also referred to as the *required rate of return*

**ideal standard** A standard that reflects perfect implementation and maximum efficiency in every aspect of the operation

**Ideal standards** Standards that assume peak efficiency at all times.

**Incongruent decision making.** See *suboptimal decision making*.

**Incremental cost-allocation method.** Method that ranks the individual users of a cost object in the order of users most responsible for the common cost and then uses this ranking to allocate cost among those users.

**Input-price variance.** See *price variance*.

**Intermediate product.** Product transferred from one subunit to another subunit of an organization. This product may either be further worked on by the receiving subunit or sold to an external customer.

**internal accounting controls** A set of policies and procedures that restrict and guide activities in the processing of financial data with the objective of preventing or detecting errors and fraudulent acts

**Investment.** Resources or assets used to generate income.

**Investment center.** Responsibility center where the manager is accountable for investments revenues, and costs.

**investment center** A business unit that includes in its financial performance metric the level assets (capital) employed by the unit as well as profit generated by that unit

**Investment center** A business segment whose manager has control over cost, revenue, and investments in operating assets.

**Labor efficiency variance** The difference between the actual hours taken to complete a task and the standard hours allowed for the actual output, multiplied by the standard hourly labor rate.

**Labor rate variance** The difference between the actual hourly labor rate and the standard rate, multiplied by the number of hours worked during the period.

**Line management.** Managers (for example, in production, marketing, or distribution) who are directly responsible for attaining the goals of the organization.

**management accounting and control system** An organization's core performance-measurement system

**Management by exception.** Practice of focusing management attention on areas not operating as expected and giving less attention to areas operating as expected.

**Management by exception** A management system in which standards are set for various activities, with actual results compared to these standards. Significant deviations from standards are flagged as exceptions.

**Management control system.** Means of gathering and using information to aid and coordinate the planning and control decisions throughout an organization and to guide the behavior of its managers and employees.

**management control** The evaluation of mid-level managers by upper-level managers

**Manufacturing overhead allocated.** Amount of manufacturing overhead costs allocated to individual jobs, products, or services based on the budgeted rate multiplied by the actual quantity used of the cost-allocation base. Also called *manufacturing overhead applied*.

**Manufacturing overhead applied.** See *manufacturing overhead allocated*.

**Manufacturing overhead budget** A detailed plan showing the production costs, other than direct materials and direct labor, that will be incurred over a specified time period.

**Market-share variance.** The difference in budgeted contribution margin for actual market size in units caused solely by actual market share being different from budgeted market share.

**Market-size variance.** The difference in budgeted contribution margin at the budgeted market share caused solely by actual market size in units being different from budgeted market size in units.

**market-price method** A transfer price set as the current price of the product in the external market

**market share variance** A comparison of the firm's actual market share to its budgeted market share and measurement of the effect of changes in the firm's market share on its total contribution margin and operating income

**market size variance** A measure of the effect of changes in the total market size on the firm's total contribution margin and operating income

**master (static) budget variance** The difference between actual operating income and the master budget operating income for a period; also called the **operating-income variance**

**Master-budget capacity utilization.** The expected level of capacity utilization for the current budget period (typically one year).

**Materials price variance** The difference between the actual unit price paid for an item and the standard price, multiplied by the quantity purchased.

**materials usage ratio** The ratio of the quantity used to the quantity purchased

**Materials quantity variance** The difference between the actual quantity of materials used in production and the standard quantity allowed for the actual output, multiplied by the standard price per unit of materials.

**Motivation.** The desire to attain a selected goal (the goal congruence aspect) combined with the resulting pursuit of that goal (the effort aspect).

**negotiated-price method** The determination of a transfer price through a negotiation process and sometimes arbitration between units

**noncontrollable fixed costs** Costs that are not controllable within a year's time, usually including facilities-related costs such as depreciation, taxes, and insurance

**normal capacity** The expected average demand per year over an intermediate term, for example, the upcoming three to five years

**Normal capacity utilization.** The level of capacity utilization that satisfies average customer demand over a period (say, two to three years) that includes seasonal, cyclical, and trend factors.

**Normal costing.** A costing system that traces direct costs to a cost object by using the actual direct-cost rates times the actual quantities of the direct-cost inputs and that allocates indirect costs based on the budgeted indirect-cost rates times the actual quantities of the cost-allocation bases.

**Normal cost system** A costing system in which overhead costs are applied to a job by multiplying a predetermined overhead rate by the actual amount of the allocation base incurred by the job.

**Operating assets** Cash, accounts receivable, inventory, plant and equipment, and all other assets held for operating purposes.

**operating-income variance** The difference between the actual operating income of the period and the master budget operating income projected for the period; also referred to as the **master**

**(static) budget variance** for the period

**operational control** The monitoring of short-term operating performance; takes place when mid-level managers monitor the activities of operating-level managers and employees

**operational productivity** The ratio of output to the number of units of an input factor

**Operating income.** Total revenues from operations minus cost of goods sold and operating costs (excluding interest expense and income taxes).

**Operating-income volume variance.** The difference between static-budget operating income and the operating income based on budgeted profit per unit and actual units of output.

**Operating leverage** A measure of how sensitive net operating income is to a given percentage change in dollar sales.

**operating leverage** The ratio of the contribution margin to operating profit at a given level of output. Also called the degree of operating leverage (DOL).

**Opportunity cost.** The contribution to operating income that is forgone or rejected by not using a limited resource in its next-best alternative use.

**opportunity cost** The benefit lost when choosing one option precludes receiving the benefits from an alternative option

**Opportunity cost** The potential benefit that is given up when one alternative is selected over another.

**Out-of-pocket costs** Actual cash outlays for salaries, advertising, repairs, and similar costs.

**Overabsorbed indirect costs.** See *overallocated indirect costs*.

**overapplied overhead** The amount of factory overhead applied that exceeds the actual factory overhead cost

**overhead** All the indirect costs commonly combined into a single cost pool

**overhead application or allocation** A process of allocating overhead costs to cost objects

**overtime premium** The excess wage rate over the standard hourly wage rate

**Overallocated indirect costs.** Allocated amount of indirect costs in an accounting period is greater than the actual (incurred) amount in that period. Also called *overapplied indirect costs* and *overabsorbed indirect costs*.

**Overapplied indirect costs.** See *overallocated indirect costs*.

**Overapplied overhead** A credit balance in the Manufacturing Overhead account that occurs when the amount of overhead cost applied to Work in Process exceeds the amount of overhead cost actually incurred during a period. (p. 109)

**Overhead application** The process of charging manufacturing overhead cost to job cost sheets and to the Work in Process account.

**Partial productivity.** Measures the quantity of output produced divided by the quantity of an individual input used.

**partial productivity** A productivity measure that focuses only on the relationship between one of the inputs and the output attained

**participative standards** Active participation throughout the standard-setting process by employees affected by the standards

**performance evaluation** The process by which managers at all levels gain information about the performance of tasks within the firm and judge that performance against pre-established criteria as set out in budgets, plans, and goals

**performance measurement** A measurement that identifies items that indicate the work performed and the results achieved by an activity, process, or organizational unit

**Performance report** A detailed report comparing budgeted data to actual data.

**Planning and control cycle** The flow of management activities through planning, directing and motivating, and controlling, and then back to planning again.

**Practical capacity.** The level of capacity that reduces theoretical capacity by unavoidable operating interruptions such as scheduled maintenance time, shutdowns for holidays, and so on.

**practical capacity** Theoretical capacity reduced by normal output losses due to personal time, normal maintenance, and so on; the measure of capacity used to estimate cost-driver rates under ABC and TDABC systems

**Practical standards** Standards that allow for normal machine downtime and other work interruptions and that can be attained through reasonable, though highly efficient, efforts by the average worker.

**predetermined factory overhead rate** An estimated rate used to apply factory overhead cost to a cost object

**Predetermined overhead rate** A rate used to charge manufacturing overhead cost to jobs that is established in advance for each period. It is computed by dividing the estimated total manufacturing overhead cost for the period by the estimated total amount of the allocation base for the period.

**principal-agent model** A conceptual model that contains the key elements that contracts must have to achieve the desired objectives

**Price variance.** The difference between actual price and budgeted price multiplied by actual quantity of input. Also called *input-price variance* or *rate variance*.

**Price variance** A variance that is computed by taking the difference between the actual price and the standard price and multiplying the result by the actual quantity of the input.

**production volume variance** Represents the over- or underapplied budgeted fixed overhead for the period, that is, the difference between the fixed overhead costs applied to production and the (lump-sum) budgeted fixed overhead for the period; also called fixed overhead production volume variance

**Production-denominator level.** The denominator in the budgeted manufacturing fixed overhead rate computation.

**Production-volume variance.** The difference between budgeted fixed overhead and fixed overhead allocated on the basis of actual output produced. Also called *denominator level variance*.

**productivity** The ratio of output to input

**Productivity.** Measures the relationship between actual inputs used (both quantities and costs) and actual outputs produced; the lower the inputs for a given quantity of outputs or the higher the outputs for a given quantity of inputs, the higher the productivity.

**Productivity component.** Change in costs attributable to a change in the quantity of inputs used in the current period relative to the quantity of inputs that would have been used in the prior period to produce the quantity of current period output.

**Profit center.** Responsibility center where the manager is accountable for revenues and costs.

**profit center** A business unit whose manager is responsible for revenues and expenses, but not the level of invested capital, in the unit

**Profit t center** A business segment whose manager has control over cost and revenue but has no control over investments in operating assets.

**Proration.** The spreading of underallocated manufacturing overhead or overallocated manufacturing overhead among ending work in process, finished goods, and cost of goods sold.

**Quantity variance** A variance that is computed by taking the difference between the actual quantity of the input used and the amount of the input that should have been used for the actual level of output and multiplying the result by the standard price of the input.

**Rate variance.** See *price variance*.

**Required rate of return (RRR).** The minimum acceptable annual rate of return on an investment. Also called the *discount rate*, *hurdle rate*, *cost of capital*, or *opportunity cost of capital*.

**Residual income (RI).** Accounting measure of income minus a dollar amount for required return on an accounting measure of investment.

**Residual income** The net operating income that an investment center earns above the minimum required return on its operating assets.

**residual income (RI)** A dollar amount equal to the income of a business unit less a charge for the level of investment in the division

**Responsibility accounting.** System that measures the plans, budgets, actions, and actual results of each responsibility center.

**Responsibility accounting** A system of accountability in which managers are held responsible for those items of revenue and cost—and only those items—over which they can exert significant control. The managers are held responsible for differences between budgeted and actual results.

**Responsibility center.** Part, segment, or subunit of an organization whose manager is accountable for a specified set of activities.

**Responsibility center** Any business segment whose manager has control over costs, revenues, or investments in operating assets.

**resale-price method** A transfer-pricing method based on determining an appropriate markup based on gross profits of unrelated firms selling similar products

**resource** An economic element applied or used to perform activities

**resource-capacity planning** Procedures used to ensure adequate but not excessive supply of capacity-related resources

**resource consumption cost driver** An activity or characteristic that consumes resources

**Return on investment (ROI).** An accounting measure of income divided by an accounting measure of investment. See also *accrual accounting rate of return method*.

**Return on investment (ROI)** Net operating income divided by average operating assets. It also equals margin multiplied by turnover.

**return on investment (ROI)** Some measure of profit divided by some measure of investment in a business unit

**return on sales (ROS)** A firm's profit per sales dollar; measures the manager's ability to control expenses and increase revenues to improve profitability

**Revenue center.** Responsibility center where the manager is accountable for revenues only.

**revenue center** A business unit with responsibility for sales, defined either by product line or by geographical area and focuses on the selling function

**revenue drivers** The factors that affect sales volume, such as price changes, promotions, discounts, customer service, changes in product features, delivery dates, and other value added factors

**Revenue driver.** A variable, such as volume, that causally affects revenues.

**Revenues.** Inflows of assets (usually cash or accounts receivable) received for products or services provided to customers.

**Revenue variance** The difference between how much the revenue should have been, given the actual level of activity, and the actual revenue for the period. A favorable (unfavorable) revenue variance occurs because the revenue is higher (lower) than expected, given the actual level of activity for the period.

**sales mix** The proportion of units (or dollars) of each product or service to the total of all products or services

**Sales mix.** Quantities of various products or services that constitute total unit sales.

**Sales mix** The relative proportions in which a company's products are sold. Sales mix is computed by expressing the sales of each product as a percentage of total sales.

**sales mix variance** The product of the difference between the actual and budgeted sales mix multiplied by the actual total number of units of all products sold, and by the budgeted contribution margin per unit of the product

**Sales-mix variance.** The difference between (1) budgeted contribution margin for the actual sales mix, and (2) budgeted contribution margin for the budgeted sales mix.

**Sales-quantity variance.** The difference between (1) budgeted contribution margin based on actual units sold of all products at the budgeted mix and (2) contribution margin in the static budget (which is based on the budgeted units of all products to be sold at the budgeted mix).

**sales quantity variance** The product of three elements: (1) the difference between the budgeted and actual total sales quantity, (2) the budgeted sales mix of the product, and (3) the budgeted contribution margin per unit of the product. It measures the effect of the change in the number of units sold from the number of units budgeted to be sold

**sales volume variance** The difference between the flexible budget amount for that item and the amount for that item reflected in the master budget for the period for each income statement item

**Sales-volume variance.** The difference between a flexible-budget amount and the corresponding static-budget amount.

**Sarbanes-Oxley Act of 2002** Legislation enacted to protect the interests of stockholders who invest in publicly traded companies by improving the reliability and accuracy of the disclosures provided to them.

**Segment** Any part or activity of an organization about which managers seek cost, revenue, or profit data.

**Segment margin** A segment's contribution margin less its traceable fixed costs. It represents the margin available after a segment has covered all of its own traceable costs.

**Selling-price variance.** The difference between the actual selling price and the budgeted selling price multiplied by the actual units sold.

**selling price variance** The difference between the total actual sales revenue and the total flexible-budget sales revenue for the units sold during a period

**Semivariable cost.** See *mixed cost*.

**Single-rate method.** Allocation method that allocates costs in each cost pool to cost objects using the same rate per unit of a single allocation base.

**Spending variance.** The difference between how much a cost should have been, given the actual level of activity, and the actual amount of the cost. A favorable (unfavorable) spending variance occurs because the cost is lower (higher) than expected, given the actual level of activity for the period.

**Stand-alone cost-allocation method.** Method that uses information pertaining to each user of a cost object as a separate entity to determine the cost-allocation weights.

**Stand-alone revenue-allocation method.** Method that uses product-specific information on the products in the bundle as weights for allocating the bundled revenues to the individual products.

**Standard.** A carefully determined price, cost, or quantity that is used as a benchmark for judging performance. It is usually expressed on a per unit basis.

**Standard cost.** A carefully determined cost of a unit of output.

**standard cost** The cost a firm should incur for an operation

**Standard cost card** A detailed listing of the standard amounts of inputs and their costs that are required to produce a unit of a specific product.

**standard cost sheet** A listing of the standard price and quantity of each manufacturing cost element for the production of one unit of a product

**standard cost system** One in which standard, not actual, costs flow through the formal accounting records

**Standard costing.** Costing system that traces direct costs to output produced by multiplying the standard prices or rates by the standard quantities of inputs allowed for actual outputs produced and allocates overhead costs on the basis of the standard overhead-cost rates times the standard quantities of the allocation bases allowed for the actual outputs produced.

**Standard cost per unit** The standard quantity allowed of an input per unit of a specific product, multiplied by the standard price of the input.

**Standard hours allowed** The time that should have been taken to complete the period's output. It is computed by multiplying the actual number of units produced by the standard hours per unit.

**Standard hours per unit** The amount of direct labor time that should be required to complete a single unit of product, including allowances for breaks, machine downtime, cleanup, rejects, and other normal inefficiencies.

**Standard price per unit** The price that should be paid for an input. The price should be net of discounts and should include any shipping costs.

**Standard quantity allowed** The amount of an input that should have been used to complete the period's actual output. It is computed by multiplying the actual number of units produced by the standard quantity per unit.

**Standard quantity per unit** The amount of an input that should be required to complete a single unit of product, including allowances for normal waste, spoilage, rejects, and other normal inefficiencies.

**Standard rate per hour** The labor rate that should be incurred per hour of labor time, including employment taxes and fringe benefits.

**Standard input.** A carefully determined quantity of input required for one unit of output.

**Standard price.** A carefully determined price that a company expects to pay for a unit of input.

**static budget variance** (See **master budget variance**)

**statistical control charts** Charts that set control limits using a statistical procedure

**Static budget.** Budget based on the level of output planned at the start of the budget period.

**Static-budget variance.** Difference between an actual result and the corresponding budgeted amount in the static budget.

**strategic business unit (SBU)** A well-defined set of controllable operating activities over which an SBU manager is responsible

**strategic control system** The processes and procedures organizations use to monitor progress toward strategic goals of the organization

**strategic performance measurement** An accounting system used by top management for the evaluation of SBU managers

**Suboptimal decision making.** Decisions in which the benefit to one subunit is more than offset by the costs or loss of benefits to the organization as a whole. Also called *incongruent decision making* or *dysfunctional decision making*.

**Super-variable costing.** See *throughput costing*.

**Target rate of return on investment.** The target annual operating income that an organization aims to achieve divided by invested capital.

**Theoretical capacity.** The level of capacity based on producing at full efficiency all the time.

**theoretical capacity** A measure of capacity (output or activity) that assumes 100 percent efficiency; maximum possible output (or activity)

**Total factor productivity (TFP).** The ratio of the quantity of output produced to the costs of all inputs used, based on current period prices.

**total fixed overhead variance** The difference between actual fixed overhead costs for the period and the standard fixed overhead costs charged to production for the period; this variance can be broken down into a fixed overhead spending variance and a fixed overhead production volume variance

**total flexible-budget (FB) variance** The difference between the flexible-budget operating income and the actual operating income for the period

**total flexible-budget variance for overhead** The difference between the actual overhead for a period and the flexible budget for overhead based on *output*

**total productivity** A measure including all input resources in computing the ratio of the output attained and the input used to attain the output

**total variable cost flexible-budget (FB) variance** The difference between variable costs incurred and the total variable costs in the flexible budget for the period

**total variable overhead variance** The difference between actual variable overhead cost incurred and the standard variable overhead cost applied to production; also called “over- or underapplied variable overhead” for the period

**Total-overhead variance.** The sum of the flexible-budget variance and the production-volume variance.

**Traceable fixed cost** A fixed cost that is incurred because of the existence of a particular business segment and that would be eliminated if the segment were eliminated.

**Transfer price.** Price one subunit (department or division) charges for a product or service supplied to another subunit of the same organization.

**transfer pricing** The determination of an exchange price for a product or service when different business units within a firm exchange it

**Underabsorbed indirect costs.** See *underallocated indirect costs*.

**Underallocated indirect costs.** Allocated amount of indirect costs in an accounting period is less than the actual (incurred) amount in that period. Also called *underapplied indirect costs* or *underabsorbed indirect costs*. (118)

**Underapplied indirect costs.** See *underallocated indirect costs*. (118)

**underapplied overhead** The amount that actual factory overhead exceeds the factory overhead applied

**Underapplied overhead** A debit balance in the Manufacturing Overhead account that occurs when the amount of overhead cost actually incurred exceeds the amount of overhead cost applied to Work in Process during a period.

**Unfavorable variance.** Variance that has the effect of decreasing operating income relative to the budgeted amount. Denoted U.

**Unused capacity.** The amount of productive capacity available over and above the productive capacity employed to meet consumer demand in the current period.

**Usage variance.** See *efficiency variance*.

**Variable overhead efficiency variance** The difference between the actual level of activity (direct labor-hours, machine-hours, or some other base) and the standard activity allowed, multiplied by the variable part of the predetermined overhead rate.

**Variable overhead efficiency variance.** The difference between the actual quantity of variable overhead cost-allocation base used and budgeted quantity of variable overhead cost-allocation base that should have been used to produce actual output, multiplied by budgeted variable overhead cost per unit of cost allocation base.

**Variable overhead flexible-budget variance.** The difference between actual variable overhead costs incurred and flexible budget variable overhead amounts.

**Variable overhead spending variance.** The difference between actual variable overhead cost per unit and budgeted variable overhead cost per unit of the cost-allocation base, multiplied by actual quantity of variable overhead cost-allocation base used for actual output.

**Variable overhead rate variance** The difference between the actual variable overhead cost incurred during a period and the standard cost that should have been incurred based on the actual activity of the period.

**Variance.** The difference between actual result and expected performance.

**variable expense flexible-budget variance** The difference between the actual variable expenses incurred and the total standard variable expenses in the flexible budget for the units sold during the period

**variable overhead efficiency variance** The difference between the flexible budget for variable overhead based on *inputs* (e.g., actual labor hours worked) and the flexible budget for variable overhead based on *outputs* (i.e., standard allowed labor hours for units produced)

**variable overhead spending variance** The difference between actual variable overhead cost incurred and the flexible budget for variable overhead based on *inputs* for the period (e.g., actual labor hours worked)

**variances** The differences between budgeted and actual amounts, for either financial or nonfinancial measures

**weighted-average cost of capital (WACC)** An average of the (after-tax) cost of debt and equity capital for a firm; in general, the WACC is the appropriate discount rate to use for future cash flows associated with “average risk” projects

# Self Assessment Quiz

**COST ACCUMULATION SYSTEMS**

Cost accumulation systems are used to assign costs to products. The system used is driven by the cost object involved. If the cost object is a custom order, **job** costing is used. If the cost object is a mass-produced homogeneous product (e.g. .steel), **process** costing is used.

**PASS KEY**

Although the most commonly tested cost accumulation systems are job-order costing and process costing, there are many variations of cost accumulation systems that may appear en your examination:

- .Operations costing uses components of both job-order costing and process costing.
- .Backflush costing accounts for certain costs at the end of the process in circumstances where there is little need for in-process inventory valuation.

Life-cycle costing seeks to monitor costs throughout the product's life cycle and expand on the traditional costing systems that focus only on the manufacturing phase of a product's life.

52. A specialty instrument manufacturer is in the process of establishing a cost system. The company produces machines for customers that are unique and distinctive. These machines are produced when purchase requests are received from customers. Although some common parts and sub-assemblies are to be held in inventory, no finished goods inventory is maintained since each purchase request is for a customized specialty instrument. The type of cost accumulation system that would be **best** suited for this type of environment would be

- a. backflush costing.
- b. batch-level costing.
- c. job order costing.
- d. process costing.

52. c

**JOB-ORDER COSTING (cost accumulation system)**

Job-order costing (or job costing) is the method of product costing that identifies the job (or individual units or batches) as the cost objective and is used when there are relatively few units produced and when each unit is unique or easily identifiable.

**Cost Objective Is the Job (or unit)**

Under job-order costing, cost is allocated to a specific job as it moves through the manufacturing process. Record keeping for job-costing emphasizes the job as the cost objective.

**Cost Measurement: Actual, Normal, or Standard Costing?**

Costs in either a job or process costing system can be measured in their actual, normal, or standard amount.

Costing System	Types of Cost Used For		
	Direct Materials	Direct Labor	Factory Overhead
Actual costing	Actual cost	Actual cost	Actual cost
Normal costing	Actual cost	Actual cost	Estimated overhead cost (using predetermined rate(s))
Standard costing	Standard cost	Standard cost	Standard cost

**Exhibit 4-5**

**Actual Costing and  
Normal Costing  
Methods**

	Actual Costing	Normal Costing
<b>Direct Costs</b>	$\text{Actual direct-cost rates} \times \text{actual quantities of direct-cost inputs}$	$\text{Actual direct-cost rates} \times \text{actual quantities of direct-cost inputs}$
<b>Indirect Costs</b>	$\text{Actual indirect-cost rates} \times \text{actual quantities of cost-allocation bases}$	$\text{Budgeted indirect-cost rates} \times \text{actual quantities of cost-allocation bases}$

Using actual costing, the company could not know the cost or the profitability of each job when it is completed during the period, but only at the end of the period, and then the company would know the profitability of all the jobs combined. Most companies, like TFI, need to know for management planning and control purposes the cost and profitability of each job as it is completed, so they use normal costing rather than actual costing.(Blocher)

**Example (Robinson Company):**

Assume the following costs related to job 298

- Direct materials : \$4,606 (actual cost)
- Direct manufacturing labor : \$1,579 (actual cost).
- Direct manufacturing labor hours for job 298 = 88 H (*Robinson, however, chooses direct manufacturing labor-hours as the sole allocation base*)
- Robinson records 27,000 actual direct manufacturing labor-hours.
- Actual manufacturing overhead costs = \$1,215,000
- Robinson Budgeted annual indirect costs = \$1,120,000
- Total direct Budgeted manufacturing labor-hours = 28,000

**Required:**

Calculate the total manufacturing costs of job 298 using actual and normal method.

At the beginning of the period:

$$\boxed{\text{Estimated total manufacturing overhead cost}} \div \boxed{\text{Estimated total amount of the allocation base}} = \boxed{\text{Predetermined overhead rate}}$$

During the period:

$$\boxed{\text{Predetermined overhead rate}} \times \boxed{\text{Actual total amount of the allocation base incurred during the period}} = \boxed{\text{Total manufacturing overhead applied}}$$

At the end of the period:

$$\boxed{\text{Actual total manufacturing overhead cost}} - \boxed{\text{Total manufacturing overhead applied}} = \boxed{\text{Underapplied (overapplied) overhead}}$$

23. Huntley Company has two departments, Machining and Assembly, at its Milwaukee plant. This year's budget for the plant contained the following information.

	Machining	Assembly
Manufacturing overhead	\$4,000,000	\$2,000,000
Direct labor hours	100,000	200,000
Machine hours	40,000	40,000

Assume the Milwaukee plant uses machine hours as the overhead base in machining and direct labor in Assembly. If Job 2420 uses 20 direct labor hours in each department, 10 machine hours in Machining and 5 machine hours in Assembly, how much overhead would be assigned to the job?

- a. \$1,100.
- b. \$1,200.
- c. \$2,100.
- d. \$2,200.

23. b

#### Budgeted Indirect Costs and End-of-Accounting- Year Adjustments

If Factory Overhead is . . .	<u>Alternative 1</u> Allocation	<u>Alternative 2</u> Close to Cost of Goods Sold
<b>UNDERAPPLIED</b> (Applied OH is less than actual OH)	<b>INCREASE</b> Work in Process Finished Goods Cost of Goods Sold	<b>INCREASE</b> Cost of Goods Sold
<b>OVERAPPLIED</b> (Applied OH is greater than actual OH)	<b>DECREASE</b> Work in Process Finished Goods Cost of Goods Sold	<b>DECREASE</b> Cost of Goods Sold

52. Which one of the following is a variance that could appear if a company uses a normal costing system?

- a. Direct material price variance.
- b. Direct labor efficiency variance.
- c. Variable overhead spending variance.
- d. Variable overhead efficiency variance.

52. c

52. Lemmon Corporation's results for the past year are shown below.

Cost of goods available for sale	\$136,000
Ending balance, raw material inventory	6,000
Ending balance, work-in-process inventory	14,000
Ending balance, finished goods inventory	13,000
Manufacturing overhead applied	50,000
Actual manufacturing overhead	55,000

If Lemmon prorates any overapplied or underapplied overhead at the end of the year, cost of goods sold after proration would total

- a. \$140,150.
- b. \$127,100.
- c. \$126,950.
- d. \$118,900.

52. b

61. Information regarding Parrett Company's year-end account balances is shown below.

	Account Balance (Before Proration)	Allocated Overhead in Each Balance
Direct material inventory	\$ 100,000	\$ 0
Work-in-process inventory	25,000	10,000
Finished goods inventory	225,000	100,000
Cost of goods sold	2,250,000	890,000

If Parrett's overhead was overapplied by \$90,000 and the company uses the most accurate method of prorating overapplied or underapplied overhead, the balance in the cost of goods sold account after proration would be

- a. \$2,169,000.
- b. \$2,169,900.
- c. \$2,172,115.
- d. \$2,330,100.

61. b

### Accounting for Normal/Abnormal spoilage under job-order costing

Normal spoilage should be part of the normal cost of manufacturing goods and should be charged to good units produced. Abnormal spoilage, not a part of normal operations, should be expensed as a period cost when detected.

Under job-order costing, unit manufacturing cost is unaffected by abnormal spoilage. Abnormal spoilage should be written-off to a special account that is separately reported in the income statement. The cost associated with abnormal spoilage is expensed in the period in which it is incurred.

186. CSO: 1C2a LOS: 1C2c

Darden Manufacturing, a calendar-year corporation, had \$17,000 of spoilage during April that production management characterized as abnormal. The spoilage was incurred on Job No. 532, that was sold three months later for \$459,000. Which of the following correctly describes the impact of the spoilage on Darden's unit manufacturing cost for Job No. 532 and on the year's operating income?

Unit Manufacturing	Cost Operating Income
a. Increase.	No effect.
b. Increase.	Decrease.
c. No effect.	Decrease.
d. No effect.	Not enough information to judge.

186. Correct answer c

### Standard Cost System

Recall that in the job-order costing we applied overhead to work in process on the basis of the **actual level of activity**. This procedure was correct because at the time we were dealing with a **normal cost system**. However, we are now dealing with a standard cost system. In such a system, overhead is applied to work in process on the basis of:

*the standard hours allowed for the actual output of the period rather than on the basis of the actual number of hours worked.*

*In a standard cost system, every unit of a particular product is charged with the same amount of overhead cost, regardless of how much time the unit actually requires for processing.*

[10] Gleim #: 3.5.105 -- Source: CMA 0205 2-28

Wagner Corporation applies factory overhead based upon machine hours. At the beginning of the year, Wagner budgeted factory overhead at \$250,000 and estimated that 100,000 machine hours would be used to make 50,000 units of product. During the year, the company produced 48,000 units using 97,000 machine hours. Actual overhead for the year was \$252,000. Under a standard cost system, the amount of factory overhead applied during the year was

- A. \$240,000
- B. \$242,500
- C. \$250,000
- D. \$252,000

Answer (A) is correct. Wagner's application rate for overhead is \$2.50 per machine hour (\$250,000 budgeted total ÷ 100,000 estimated machine hours), and each unit of output is estimated to require 2 machine hours (100,000 estimated machine hours ÷ 50,000 units budgeted output). Under a standard cost system, the amount of overhead applied during the year was therefore \$240,000 (48,000 units actual output × \$2.50 per machine hour application rate × 2 machine hours standard per unit).

48. Consider the cost of goods sold calculation shown below.

Beginning inventory	\$ 100,000
Plus cost of goods manufactured	2,500,000
Less ending inventory	(125,000)
Plus variable overhead efficiency variance	10,000
Cost of goods sold	\$2,485,000

This is an example of which cost measurement technique?

- a. Normal costing.
- b. Standard costing.
- c. Either actual costing or normal costing.
- d. Either normal costing or standard costing.

48. d

3. Jay Company uses a standard cost system. During the past year, the variances from standard were significant. Jay is considering whether to allocate the variances among the appropriate inventory accounts and cost of goods sold, or to allocate all of the variances directly to cost of goods sold. Under which one of the following situations would reported net income be largest?

- a. All of the variances are favorable and are written off directly to cost of goods sold.
- b. All of the variances are unfavorable and are written off directly to cost of goods sold.
- c. All of the variances are favorable and are allocated among cost of goods sold and ending inventory accounts.
- d. All of the variances are unfavorable and are allocated among cost of goods sold and ending inventory accounts.

3. a

59. If Moore Corporation used a normal cost system, applying overhead based on the number of units produced, the variance that could arise that would not be present under an actual cost system is the

- a. direct material efficiency variance.
- b. direct labor efficiency variance.
- c. variable overhead efficiency variance.
- d. fixed overhead production volume variance.

59. d

## II. ACTUAL/NORMAL/STANDARD COSTS

Once a cost accumulation system (e.g. job order costing, process costing, etc.) has been chosen, the decision of which cost measurement method to use must be made. Cost measurement methods for product costing can use actual costing, normal costing, or standard costing, and they often focus on the allocation of overhead costs. The measurement method used will impact the decisions made by a firm for its operations and strategic planning, so the decision as to which method to use will depend on many factors. These factors may include the nature of industry and/or of product or service, the strategy of the firm, and whether or not the system is cost-beneficial.

### A. STRATEGIC VALUE OF COST INFORMATION

It is critically important for management to have the ability to obtain timely and accurate costing information so that the decisions may have a positive effect on the operations of the firm. Further, there is often a trade-off between accuracy and timeliness of information. While accurate information is generally preferred it may arrive too late to have been instrumental in making appropriate business decisions for the firm. Often, a process that provides reliable information in a fast and efficient manner is more valuable than accurate but late information. The strategic value of cost information (as it relates to products and services pricing strategy, allocation of costs to products, etc.) is enhanced by decisions to use proper overall costing systems.

### B. ACTUAL COSTING

Actual costing uses actual costs incurred for all product costs including the indirect (overhead) costs.

#### 1. Calculations

##### a. Direct Costs

Actual price x Actual quantity = Actual direct costs

##### b. Indirect (Overhead) Costs

Actual price x Actual quantity = Actual indirect costs

#### 2. Rarely Used by Firms

The actual costing system is used rarely by firms. Reasons for this include:

##### a. Lack of Timeliness of Information :

Actual costs are not always easy to determine. In fact, certain overhead costs are not even determined until significantly far along in the production process, when it is too late for the information to have made an impact on strategic planning decisions.

##### b. Large Fluctuations in Costs from Period to Period

Because actual costs are considered, significant fluctuations in total product cost can exist especially due to fluctuations in overhead. This fluctuation may lead to serious problems with pricing (and other product decisions) and performance evaluations.

### C. NORMAL COSTING

Normal costing uses actual costs for direct material and direct labor but uses normal costs for overhead by applying a predetermined overhead allocation rate based on an applicable cost driver. The allocation rate is calculated by dividing the total budgeted overhead amount by the budgeted volume. Then, the actual quantity of the cost allocation base (cost driver) is multiplied by the budgeted application rate.

### **1. Calculations**

#### **a. Direct Costs**

Actual price x Actual quantity = Actual direct costs

#### **b. Indirect (Overhead Costs)**

Standard (predetermined) rate x Actual quantity = Normal Indirect costs

### **2. Solves Some Problems with Actual Costing**

Normal costing is a system that attempts to solve some of the problems associated with actual costing.

#### **a. Timeliness of Information**

Typically, the actual costs for direct materials and direct labor are readily available, but (as mentioned above) the actual costs for overhead can take some time to gather. The use of predetermined overhead allocation rates for the overhead component in normal costing allows for information that is available in a timely manner to be useful in making important business decisions.

#### **b. Less Fluctuations in Costs from Period to Period**

As significant fluctuations can particularly exist in actual overhead incurred, the use of a predetermined overhead rate will smooth the effect of overhead costs over a period on the total costs of a product.

This will avoid some of the problems in pricing and performance evaluations that exist with actual costing.

### **D. STANDARD COSTING**

Standard costs are costs the firm had targeted to incur in a production process. They are the costs the firm expects it should incur during the process. The firm sets standard costs it hopes to attain using various techniques (covered in other chapters). In a standard costing system, standard costs are used for all manufacturing costs (i.e., raw materials, direct labor, and manufacturing overhead). For overhead, the standard application rate is multiplied by the standard quantity of the allocation base (not the actual quantity of the allocation base, as with normal costing).

### **1. Calculations**

#### **a. Direct Costs**

Standard price x Standard quantity = Standard direct costs

#### **b. Indirect (Overhead) Costs**

Standard (predetermined) rate x Standard quantity = Standard Indirect costs

### **2. Advantages of Standard Costing Systems**

#### **a. Cost control**

#### **b. Data for performance evaluations (via variance analysis from actual to standard)**

#### **c. Ability to learn from standards and improve various processes**

### **3. Determination of Tracking Method to Use**

When a standard cost measurement system is used, the firm must also decide which type of cost tracing system it will use, Sequential (as in traditional costing systems that track the flow of costs through traditional accounts) or back-flush (as in constant flow manufacturing).

## Inventory Costing Variable and Absorption Costing

### Absorption Costing (GAAP/TAX)

Inventoriable (*product*) costs:

- Direct material
- Direct manufacturing labor
- Variable Manufacturing overhead (indirect)
- Fixed Manufacturing overhead (indirect)

Period costs (*recorded as expenses when incurred*):

All nonmanufacturing costs in the value chain  
(*whether variable or fixed/direct or indirect*):

- Selling & Marketing (whether variable or fixed/direct or indirect).
- General & Administration cost
- Design, research and development.

### Variable/direct Costing (NOT GAAP)

Inventoriable (*product*) costs:

- Direct material
- Direct manufacturing labor
- Variable Manufacturing overhead (indirect)

Period costs (*recorded as expenses when incurred*):

All nonmanufacturing costs in the value chain  
(*whether variable or fixed/direct or indirect*):

- Selling & Marketing (whether variable or fixed/direct or indirect).
- General & Administration cost
- Design, research and development.

+

- Fixed Manufacturing overhead (indirect)

*Note: Selling, general, and administrative expenses are period costs under both methods.*

These two methods **differ only** in how they account for fixed manufacturing costs.

### Balance sheet (one condition):

Because fixed manufacturing overhead is included in inventory, finished goods inventory will be **higher** under absorption costing than when using variable costing where fixed manufacturing is expensed.

### Income statement:

How do changes in unit inventory levels affect operating income?

	Absorption Costing	Variable Costing
Production = sales	Equal	Equal
Production > sales	Higher	Lower
Production < sales	Lower	Higher

When comparing absorption costing with variable costing, the difference in operating income can be explained by the difference between the ending inventory in units and the beginning inventory in units, multiplied by the fixed manufacturing cost per unit.

Variable Costing (Internal) income figures that vary closely with sales and external income figures that are influenced by both units sold and productive output.

### Absorption Costing (GAAP/TAX)

#### (1) Absorption Costing-Benefits

- Absorption costing is GAAP (released to shareholders).
- The Internal Revenue Service requires the use of the absorption method for financial reporting.

#### (2) Absorption Costing-Limitations

- The level of inventory affects net income because fixed costs are a component of product cost.
- The net income reported under the absorption method is less reliable (especially for use in performance evaluations) than under the variable method because the cost of the product includes fixed costs and, therefore, the level of inventory affects net income.

Accountants who support absorption costing for external reporting maintain that inventories should carry a fixed-manufacturing-cost component. Why? Because both variable manufacturing costs and **fixed manufacturing costs are necessary to produce goods.**

### Variable (Direct) Costing (contribution approach)

#### (1) Variable Costing-Benefits

- Variable and fixed costs are separated and can be easily traced to and controlled by management.
- The net income reported under the contribution income statement is more reliable (especially for use in performance evaluations) than under the absorption method because the cost of the product does not include fixed costs and, therefore, the level of inventory does not affect net income.
- Variable costing isolates the contribution margins in financial statements to aid in decision making (the contribution margin is defined as sales price less all variable costs, including variable sales and administrative costs, and breakeven analysis CVP) is often based on contribution margins).

#### (2) Variable Costing-Limitations

- Variable costing is not GAAP.
- The Internal Revenue Service does not allow the use of the variable cost method for financial reporting.

Accountants who favor variable costing for external reporting maintain that the **fixed portion of manufacturing costs is more closely related to the capacity** to produce than to the actual production of specific units.

- **Indirect production costs** include items such as rent, utilities, maintenance, repair expenses, indirect materials, and indirect labor.
- For other indirect cost categories (including depreciation, insurance, taxes, officers' salaries, factory administrative expenses, and strike-related costs), the portion of the cost that is "incident to and necessary for production or manufacturing operations or processes" is inventoriable for tax purposes if (and only if) it is treated as inventoriable for the purposes of financial reporting. Accordingly, costs must often be allocated between those portions related to manufacturing activities and those not related to manufacturing.

### Throughput costing, which also is called super-variable costing (so far it has not been widely adopted)

Is an extreme form of variable costing in which only direct material costs are included as inventoriable costs.

All other costs are costs of the period in which they are incurred. In particular, variable direct manufacturing labor costs and variable manufacturing overhead costs are regarded as period costs and are deducted as expenses of the period.

### Throughput Margin

**Throughput margin equals revenues minus all direct material cost of goods sold**

Revenues - Direct material cost of goods sold = Throughput margin

**A Comparison of Alternative Inventory-Costing Methods**

Variable costing and absorption costing (as well as throughput costing) may be combined with actual, normal, or standard costing. Exhibit 9-6 compares product costing under six alternative inventory-costing systems.

<u>Variable Costing</u>	<u>Absorption Costing</u>
Actual costing	Actual costing
Standard costing	Standard costing
Normal costing	Normal costing

**Exhibit 9-6**

Comparison of Alternative Inventory-Costing Systems

		Actual Costing	Normal Costing	Standard Costing	
Absorption Costing	Variable Costing	Variable Direct Manufacturing Cost	Actual prices $\times$ Actual quantity of inputs used	Standard prices $\times$ Standard quantity of inputs allowed for actual output achieved	
		Variable Manufacturing Overhead Costs	Actual variable overhead rates $\times$ Actual quantity of cost-allocation bases used	Budgeted variable overhead rates $\times$ Actual quantity of cost-allocation bases used	Standard variable overhead rates $\times$ Standard quantity of cost-allocation bases allowed for actual output achieved
		Fixed Direct Manufacturing Costs	Actual prices $\times$ Actual quantity of inputs used	Actual prices $\times$ Actual quantity of inputs used	Standard prices $\times$ Standard quantity of inputs allowed for actual output achieved
		Fixed Manufacturing Overhead Costs	Actual fixed overhead rates $\times$ Actual quantity of cost-allocation bases used	Budgeted fixed overhead rates $\times$ Actual quantity of cost-allocation bases used	Standard fixed overhead rates $\times$ Standard quantity of cost-allocation bases allowed for actual output achieved

**Denominator-Level Capacity Concepts and Fixed-Cost Capacity Analysis**

We start by analyzing a key question in absorption costing: Given a level of spending on fixed manufacturing costs, what capacity level should be used to compute the fixed manufacturing cost per unit produced?

Capacity levels can be measured in terms of capacity supplied

- Theoretical capacity or
- Practical capacity.

Capacity can also be measured in terms of output demanded

- Normal capacity utilization or
- Master-budget capacity utilization.

The choice of the capacity level used to allocate budgeted fixed manufacturing costs to products can greatly affect the operating income reported under normal costing or standard costing and the product-cost information available to managers.

49. Last year a company had sales of 75,000 units and production of 100,000 units. Other information for the year is shown below.

Direct manufacturing labor	\$187,500
Variable manufacturing overhead	100,000
Direct materials	150,000
Variable selling expenses	100,000
Fixed administrative expenses	100,000
Fixed manufacturing overhead	200,000

Assuming no beginning inventory, what is the total value of ending finished goods inventory under absorption costing?

- a. \$159,375.
- b. \$184,375.
- c. \$209,375.
- d. \$279,175.

49. a

50. Using absorption costing, Langdon Company's income for October was \$250,000. Langdon began the month with 10,000 units in finished goods inventory that contained \$30,000 of fixed manufacturing overhead costs. During October, the company produced 330,000 units and sold 325,000 units. The fixed manufacturing overhead for October totaled \$990,000. If Langdon Company used variable costing, its income for October would be

- a. \$265,000.
- b. \$250,000.
- c. \$235,000.
- d. \$234,308.

50. c

16. Last year, a company had sales of 75,000 units and production of 100,000 units. Other information for the year is shown below.

Direct manufacturing labor	\$187,500
Variable manufacturing overhead	\$100,000
Direct materials	\$ 150,000
Variable selling expenses	\$100,000
Fixed administrative expenses	\$100,000
Fixed manufacturing overhead	\$ 200,000

Assuming no beginning inventory, what is the cost of goods sold under variable costing?

- a. \$553,125.
- b. \$478,125.
- c. \$403,125.
- d. \$328,125.

16. d

17. Almax Corporation produces and sells smart phones. The following information relates to Almax's operations for the last year.

Variable cost per unit	\$5.20
Total fixed manufacturing overhead cost	\$260,000
Total fixed selling and administrative cost	\$180,000
Units produced and sold	400,000

Using absorption costing, what was Almax's cost per unit last year?

- a. \$4.55.
- b. \$5.00.
- c. \$5.85.
- d. \$6.30.

17. c

7. The primary difference between absorption and variable costing is that variable costing treats

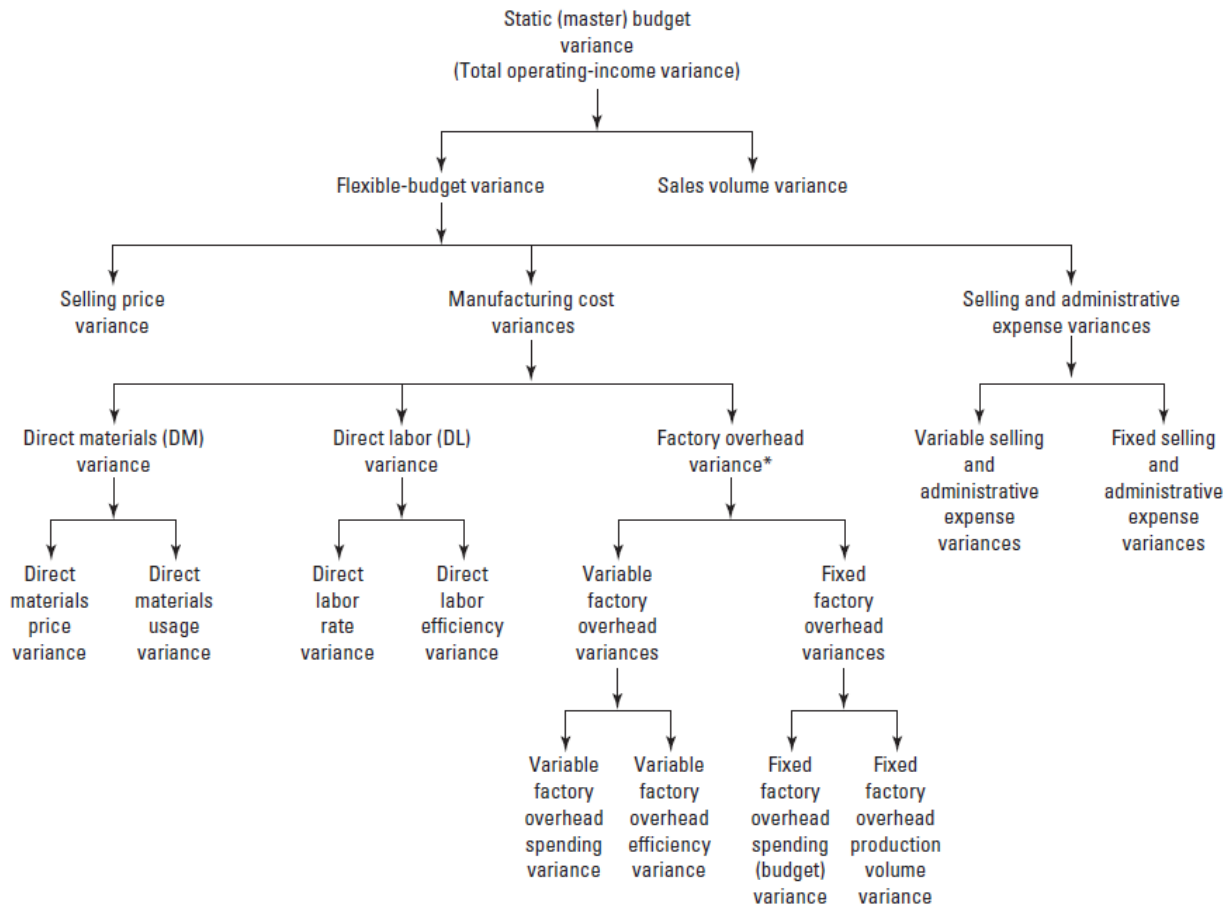

- a. only direct materials and direct labor as product cost.
- b. direct materials, direct labor, the variable portion of manufacturing overhead, and an allocated portion of fixed manufacturing overhead as product costs.
- c. only direct materials, direct labor, the variable portion of manufacturing overhead, and the variable portion of selling and administrative expenses as product cost.
- d. only direct materials, direct labor, and the variable portion of manufacturing overhead as product costs.

7. d

10. Isaac Toy Company management would like to determine profitability of its Alpha Doll product line. To eliminate the possibility of profit distortion due to changes in production, the managers should primarily review

- a. variable (direct) costing income statements.
- b. absorption costing income statements.
- c. multi-step income statements.
- d. cash flow statements.

10. a

**Operating-Income Variances (Single-Product Example)****Sales Volume Variance**

$$\text{Sales volume variance in terms of operating income} = \left( \text{Actual units sold} - \text{Units budgeted to be sold} \right) \times \text{Master budget contribution margin per unit}$$

27. Robinson Corporation's most recent performance report indicated:

	<u>Actual Results</u>	<u>Flexible Budget</u>	<u>Static Budget</u>
Revenues	\$5,000,000	\$4,600,000	\$5,200,000
Variable costs	2,600,000	2,300,000	2,600,000
Fixed costs	2,300,000	2,000,000	2,000,000
Operating income	\$ 100,000	\$ 300,000	\$ 600,000

Robinson's sales-volume variance for operating income is

- \$200,000U.
- \$300,000U.
- \$400,000F.
- \$500,000U.

27. b

**The sales volume variance may be a result of one or more of the following:**

1. The market for the product has changed. The total demand for the product grew (declined) at a rate higher than expected.
2. The firm lost market share to competitors.
3. The firm failed to set a proper goal for the period.
4. The firm set an inappropriate selling price for the product.
5. The marketing and promotion programs were not effective.

Each of these causes may be a result of one or more contributing factors. For example, a firm might have lost market share because of quality problems that led to customers' dissatisfaction, shifts in customer preferences and tastes, ineffective advertising, reduction in the number of sales calls or salespeople, or products not available due to production problems, among others. The proper response to a sales volume variance depends on the cause of the variance.

*For a multiproduct firm (not considered in this chapter), the sales volume variance can be decomposed into a pure volume variance and a sales-mix variance.*

**Flexible-Budget (FB) Variances**

$$\text{Total flexible-budget variance} = (\text{Actual}) \text{ operating income earned} - \text{Flexible-budget operating income}$$

**Breakdown of the Total Flexible-Budget Variance**

**Factors that contribute to the total flexible-budget variance include deviations in:**

- **selling prices,**
- **variable costs, and**
- **fixed costs from their standard or budgeted amounts.**

**Selling Price Variance**

$$\begin{aligned} \text{Selling price variance} &= \frac{\text{Actual sales revenue}}{\text{Flexible budget sales revenue}} \\ &= \left( \text{Units sold} \times \text{Actual selling price per unit} \right) - \left( \text{Units sold} \times \text{Budgeted selling price per unit} \right) \\ &= \left( \text{Actual selling price per unit} - \text{Budgeted selling price per unit} \right) \times \text{Units sold} \\ &= \text{Selling price variance} \end{aligned}$$

39. For the first week of the month the Flour Shop Bakery budgeted to sell 100 cakes at \$35 each. They actually sold 105 cakes at \$40 each. The selling-price variance is

- a. \$525 favorable.
- b. \$525 unfavorable.
- c. \$700 favorable.
- d. \$700 unfavorable.

39. a

**Variable Cost Flexible-Budget Variances**

$$\text{Total variable cost flexible-budget variance} = \text{Total variable cost incurred} - \text{Total flexible budget variable cost}$$

The total variable cost flexible-budget variance is the sum of flexible-budget variances of all variable costs and expenses, including flexible-budget variances for:

- direct materials,
- direct labor,
- variable overhead, and
- variable selling and administrative expenses.

**Direct Materials Flexible-Budget Variance**

The direct materials flexible-budget variance for each material is the difference between the **actual direct** materials cost and the total standard direct materials cost *for this period's output*.

1. Materials Price variance

$$\text{Materials price variance} = (AQ \times AP) - (AQ \times SP)$$

$$\text{Materials price variance} = AQ(AP - SP)$$

102. CSO: 1B1e LOS: 1B1k

Frisco Company recently purchased 108,000 units of raw material for \$583,200. Three units of raw materials are budgeted for use in each finished good manufactured, with the raw material standard set at \$16.50 for each completed product. Frisco manufactured 32,700 finished units during the period just ended and used 99,200 units of raw material. If management is concerned about the timely reporting of variances in an effort to improve cost control and bottom-line performance, the materials **purchase price variance** should be reported as

- \$6,050 unfavorable.
- \$9,920 favorable.
- \$10,800 unfavorable.
- \$10,800 favorable.

102. Correct answer d. Frisco's purchase price variance is \$10,800 F calculated as follows.

Price per unit purchased:  $\$583,200 \div 108,000 = \$5.40$

Standard price per unit:  $\$16.50 \div 3 = \$5.50$

Purchase price variance  $(\$5.50 - \$5.40) \times 108,000 = \$10,800 \text{ F}$

*A favorable direct materials price variance could lead to high manufacturing costs if the low-cost materials are of poor quality. Downstream costs such as scrap, rework, schedule disruptions, or field-service costs could exceed the price savings from lower materials prices.*

*A direct materials price variance (PV) can result from failure to take purchase discounts, unexpected price change of materials, changes in freight costs, variation in grades of materials, or other causes.*

2. Materials Quantity variance (Usage/Efficiency Variance)

$$\text{Materials quantity variance} = (AQ \times SP) - (SQ \times SP)$$

Actual quantity      Standard price      Standard quantity allowed for actual output

Again, the formula can be factored as follows:

$$\text{Materials quantity variance} = SP(AQ - SQ)$$

*A direct materials usage variance can result from the efforts of production personnel, substitutions of materials or production factors, variation in the quality of direct materials, inadequate training or inexperienced employees, poor supervision, or other factors.*

30. TwoCo established a standard direct material cost of \$20 per finished unit for its main product. The standard is calculated using direct materials of 4 pounds and a standard rate of \$5 per pound. For the month of March, TwoCo expected to produce 32,000 units. During the month, TwoCo purchased and used 130,000 pounds of material and produced 31,000 finished units. The actual price paid per pound was \$5.40. What was the material quantity variance for the month of March?

- a. \$10,000 unfavorable.
- b. \$20,000 unfavorable.
- c. \$30,000 unfavorable.
- d. \$32,400 favorable.

30. c

5. Bettis Company began business on January 1 of the current year. The firm's standard cost system allows for 4 yards of fabric at \$1.55 per yard for each finished unit of product. During the year, Bettis produced 20,000 units of finished product and sold 18,000 units. Although there was no work-in-process inventory at the end of the year, there were 2,100 yards of fabric included in the ending raw materials inventory. If the materials quantity variance was \$1,240 unfavorable, how many yards of fabric did Bettis buy during the year?

- a. 72,800 yards.
- b. 74,900 yards.
- c. 80,800 yards.
- d. 82,900 yards.

5. d

**Direct Labor Flexible-Budget Variance**

Direct labor flexible-budget variance is a result of the total direct labor cost of a period being different from the total standard direct labor cost for the output of the period.

**1.Direct Labor Rate Variance**

$$\text{Direct labor rate variance} = \left( \frac{\text{Actual hourly wage rate paid}}{\text{Standard hourly wage rate}} - 1 \right) \times \frac{\text{Total direct labor hours worked}}{\text{Standard hours}} \times \text{Standard rate}$$

$$RV = (AP - SP) \times AQ$$

*This could result from not using workers with the skill level specified in the standard cost sheet for the work performed or from using an out-of-date standard. The personnel department usually is responsible for direct labor rate variances. Production, however, could be responsible for the variance if it chooses to use employees with a different skill level than that specified in the standard cost sheet.*

33. Sleep-Fine Company is a mattress manufacturer. The company has a standard direct labor rate of \$25 per hour, 75 direct labor employees, and 50 indirect labor employees. Last week the direct labor payroll was \$90,000 for 3,000 hours worked. The company manufactured 1,000 mattresses. The standard cost sheet allows for 2.5 hours of labor per mattress. The direct labor rate variance was

- a. \$15,000 unfavorable.
- b. \$27,500 unfavorable.
- c. \$15,000 favorable.
- d. \$27,500 favorable.

33. a

**2.Direct Labor Efficiency Variance**

$$\text{Direct labor efficiency variance} = \left( \frac{\text{Total direct labor hours worked}}{\text{Total standard direct labor hours for the output of the period}} - 1 \right) \times \frac{\text{Standard direct labor hours}}{\text{Standard rate}}$$

$$EV = (AQ - SQ) \times SP$$

105. CSO: 1B1e LOS: 1B11

Lee Manufacturing uses a standard cost system with overhead applied based on direct labor hours. The manufacturing budget for the production of 5,000 units for the month of May included the following information.

Direct labor (10,000 hours at \$15 per hour) \$150,000

Variable overhead 30,000

Fixed overhead 80,000

During May, 6,000 units were produced and the direct labor efficiency variance was \$1,500 unfavorable. Based on this information, the actual number of direct labor hours used in May was

- a. 9,900 hours.
- b. 10,100 hours.
- c. 11,900 hours.

d. 12,100 hours.

105. Correct answer d. The actual direct labor hours used by Lee Manufacturing is 12,100 calculated as follows.

$$\begin{array}{lcl} \text{Efficiency variance: (Actual quantity – Standard quantity) x Standard price} & & \\ \text{Standard quantity} & = & 6,000 \text{ units} \times 2 \text{ hours per unit} \\ & = & 12,000 \text{ hours} \\ \text{Actual hours:} & (X - 12,000) \times \$15 = & \$1,500 \\ & X - 12,000 = & 100 \\ & X = & \underline{12,100} \end{array}$$

This variance usually is the responsibility of the production department. Besides the employees' efficiency or inefficiency in carrying out their tasks, however, several other factors—including these—can lead to a direct-labor efficiency variance:

1. Employees or supervisors are new on the job or are inadequately trained.
2. Employees' skill levels are different from those specified in the standard cost sheet.
3. Batch sizes are different from the standard size.
4. Materials are different from those specified.
5. Machines or equipment are not in proper working condition.
6. Supervision is inadequate.
7. Scheduling is poor.

**Variance Analysis for Manufacturing Overhead Costs (We assume that the Company uses a standard cost system).**

$$\begin{aligned} \text{Total overhead variance} &= \text{Total actual overhead} - \text{Total applied overhead} \\ &= (\text{Total variable overhead} + \text{Total fixed overhead}) - (\text{Total overhead application rate} \times \\ &\quad \text{Standard hours allowed for this period's production}) \end{aligned}$$

Nina Garcia is the newly appointed president of Laser Products. She is examining the May 2012 results for the Aerospace Products Division. This division manufactures wing parts for satellites. Garcia's current concern is with manufacturing overhead costs at the Aerospace Products Division. Both variable and fixed overhead costs are allocated to the wing parts on the basis of laser-cutting-hours. The following budget information is available:

**Problem for Self-Study**

Budgeted variable overhead rate	\$200 per hour
Budgeted fixed overhead rate	\$240 per hour
Budgeted laser-cutting time per wing part	1.5 hours
Budgeted production and sales for May 2012	5,000 wing parts
Budgeted fixed overhead costs for May 2012	\$1,800,000

**Actual results for May 2012 are as follows:**

Wing parts produced and sold	4,800 units
Laser-cutting-hours used	8,400 hours
Variable overhead costs	\$1,478,400
Fixed overhead costs	\$1,832,200

**Developing Budgeted Overhead Rates**

**1. Select the Cost-Allocation Bases to Use in:**

**Allocating Variable Overhead Costs to Output Produced.** Assume operating managers select machine-hours as the cost-allocation base. Based on an engineering study, assume we estimate it will take 1.5 of a machine-hour per actual output unit. For its budgeted output of 5,000 wings, we budget 7,500 (1.5 x 5,000) machine-hours.

**1. Select the Cost-Allocation Bases to Use in:**

**Allocating Fixed Overhead Costs to Output Produced.** Assume operating managers select machine-hours as the cost-allocation base, the number of machine-hours is the denominator in the budgeted fixed overhead rate computation and is called the denominator level or, in manufacturing settings, the production-denominator level. We expect to operate at capacity 7,500 machine-hours.

**2. Identify the Variable Overhead Costs Associated with Each Cost-Allocation Base.**

Our company groups all of its variable overhead costs, including costs of energy, machine maintenance, engineering support, indirect materials, and indirect manufacturing labor in a single cost pool. Our total budgeted variable overhead costs are \$1,500,000.

**2. Identify the Fixed Overhead Costs Associated with Each Cost-Allocation Base.**

Costs in this pool include depreciation on plant and equipment, plant and equipment leasing costs, and the plant manager's salary. Fixed overhead budget is \$1,800,000.

**3. Compute the Rate per Unit of Each Cost-Allocation Base Used to Allocate Variable Overhead Costs to Output Produced.** Dividing the amount in Step 3 (\$1,500,000) by the amount in Step 1 (7,500 machine-hours), we estimate a rate of \$200 per standard machine-hour for allocating its variable overhead costs.

$$\begin{array}{ccccc} \text{Budgeted variable} & & \text{Budgeted input} & & \text{Budgeted variable} \\ \text{overhead cost rate} & = & \text{allowed per} & \times & \text{overhead cost rate} \\ \text{per output unit} & & \text{output unit} & & \text{per input unit} \end{array}$$

$$\begin{aligned} &= 1.5 \text{ hour per wing} \times \$200 \text{ per hour} \\ &= \$300 \text{ per wing part} \end{aligned}$$

**3. Compute the Rate per Unit of Each Cost-Allocation Base Used to Allocate Fixed Overhead Costs to Output Produced.**

Dividing the \$1,800,000 from Step 2 by the 7,500 machine-hours from Step 1, we estimate a fixed overhead cost rate of \$240 per machine-hour:

$$\begin{array}{ccc} \text{Budgeted fixed} & & \text{Budgeted total costs} \\ \text{overhead cost per} & = & \text{in fixed overhead cost pool} \\ \text{unit of cost-allocation} & & \text{Budgeted total quantity of} \\ \text{base} & & \text{cost-allocation base} \end{array}$$

We can now calculate the budgeted fixed overhead cost per output unit as follows:

$$\begin{array}{ccccc} \text{Budgeted fixed} & & \text{Budgeted quantity of} & & \text{Budgeted fixed} \\ \text{overhead cost per} & = & \text{cost-allocation} & \times & \text{overhead cost} \\ \text{output unit} & & \text{base allowed per} & & \text{per unit of} \\ & & \text{output unit} & & \text{cost-allocation base} \end{array}$$

$$\begin{aligned} &= 1.5 \text{ of a machine-hour per wing} \times \$240 \text{ per machine-hour} \\ &= \$360 \text{ per wing part} \end{aligned}$$

**1. Compute the Total overhead variance:**

$$\begin{aligned}\text{Total overhead variance} &= \text{Total actual overhead} - \text{Total applied overhead} \\ &= (\text{Total variable overhead} + \text{Total fixed overhead}) - (\text{Total overhead application rate} \times \\ &\quad \text{Standard hours allowed for this period's production})\end{aligned}$$

- **Total actual overhead** = Actual Variable overhead costs + Actual Fixed overhead costs

Total actual overhead =

- **Total applied overhead** = Applied Variable overhead costs + Applied Fixed overhead costs

Total applied overhead =

**Applied Variable overhead costs =**

Budgeted Input Quantity Allowed for Actual Output	<b>X</b>	Variable Budgeted Rate
Standard hours allowed for this period's production	<b>X</b>	Variable application rate

**Applied Fixed overhead costs =**

Budgeted Input Quantity Allowed for Actual Output	<b>X</b>	Fixed Budgeted Rate
Standard hours allowed for this period's production	<b>X</b>	Fixed application rate

*Note, too, that this total variance, from a product-costing standpoint, could be called total over/underapplied overhead cost for the period.*

**Cost Control: Breakdown of the Total Variable Overhead Variance**

The total variable overhead variance for a period (\$.....in our example) can be broken down into:

- a variable overhead spending variance and
- a variable overhead efficiency variance, as follows:

**Variable overhead spending variance**

$$\begin{aligned}\text{Variable overhead spending variance} &= \text{Actual variable overhead} - \text{Budgeted variable overhead} \\ &\quad \text{based on inputs (e.g., actual labor hours worked)} \\ &= (AQ \times AP) - (AQ \times SP) \\ &= AQ \times (AP - SP)\end{aligned}$$

$$\text{Variable overhead spending variance} = \left( \begin{array}{cc} \text{Actual variable} & \text{Budgeted variable} \\ \text{overhead cost per unit} & \text{overhead cost per unit} \\ \text{of cost-allocation base} & \text{of cost-allocation base} \end{array} \right) \times \begin{array}{l} \text{Actual quantity of} \\ \text{variable overhead} \\ \text{cost-allocation base} \\ \text{used for actual output} \end{array}$$

**Variable overhead efficiency variance**

$$\begin{aligned}\text{Variable overhead efficiency variance} &= \text{Budgeted variable overhead based on inputs} - \text{Standard variable overhead applied to production} \\ &= (AQ \times SP) - (SQ \times SP) \\ &= SP \times (AQ - SQ)\end{aligned}$$

$$\text{Variable overhead efficiency variance} = \left( \begin{array}{c} \text{Actual quantity of} \\ \text{variable overhead} \\ \text{cost-allocation base} \\ \text{used for actual} \\ \text{output} \end{array} - \begin{array}{c} \text{Budgeted quantity of} \\ \text{variable overhead} \\ \text{cost-allocation base} \\ \text{allowed for} \\ \text{actual output} \end{array} \right) \times \begin{array}{c} \text{Budgeted variable} \\ \text{overhead cost per unit} \\ \text{of cost-allocation base} \end{array}$$

**Total fixed overhead variance**

The total fixed overhead variance is the difference between the actual fixed overhead cost incurred and the fixed overhead cost applied to production based on a standard fixed overhead application rate; also called over or underapplied fixed overhead for the period.

The total fixed overhead variance for a period (\$.....in our example) can be broken down into:

- o The Production-Volume (Denominator) Variance and
- o Fixed Overhead Spending (Budget) Variance, as follows:

$$\text{Total fixed overhead variance} = \text{Spending variance} + \text{Production-volume variance}$$

**The Production-Volume (Denominator) Variance (noncontrollable overhead variance)**

As noted earlier for GAAP purposes, companies must report inventories on a full (**absorption**) cost basis. This means that each unit produced must absorb a share of fixed factory overhead costs in addition to variable manufacturing costs. In turn, this requires that fixed overhead costs be “unitized” for product-costing purposes. This variance is an artifact of **unitizing** fixed overhead costs for product-costing purposes. PVV reflects differences between available capacity and actual capacity usage. In short, the reporting of production volume variances over time provides decision makers with information that can be used to manage spending on capacity-related resources.

$$\text{Production volume variance} = \text{Budgeted fixed overhead} - \text{Fixed overhead allocated for actual output units produced}$$

$$\text{Production-volume variance} = \text{Budgeted fixed factory overhead cost} - \text{Standard fixed overhead cost assigned to production}$$

$$= SP \times (\text{Denominator activity hours} - SQ)$$

In summary, for product-costing purposes a company must choose an activity level over which it spreads budgeted fixed manufacturing costs for a given period. If the company actually operates at the level assumed when the application rate was determined, it will have assigned to production an amount exactly equal to the budgeted fixed overhead for the period.

If, on the other hand, the company operates at any level of activity other than the denominator activity level, then it will have applied to production an amount greater or lesser than budgeted fixed overhead. It is this over-or underapplied budgeted fixed overhead that we call the **production-volume variance** for the period.

### **Fixed Overhead Spending (Budget) Variance**

is the difference between budgeted and actual fixed factory overhead costs for a period.

*Unfavorable fixed overhead spending variances can also result from excessive spending due to improper or inadequate cost controls. Events such as emergency repairs, impromptu replacement of equipment, or the addition of production supervisors for an unscheduled second shift all would result in unfavorable fixed overhead spending variances for the period.*

Fixed overhead spending variance = Actual fixed overhead – Budgeted fixed overhead

**Choose a denominator activity level**

Choose a denominator activity level In order to unitize fixed overhead costs for product-costing purposes, we must choose some level of output (activity) over which the budgeted fixed costs for the period can be spread.

The general term used to describe the level of output (activity) used to establish the standard fixed overhead application rate is denominator activity level or denominator volume. Several alternatives exist for defining the denominator activity level:

two “supply-based” alternatives:

- **theoretical capacity** (the maximum level of activity or output based on available capacity)
- **practical capacity** (theoretical capacity reduced by normal employee breaks, machine downtime for maintenance, and other “expected” loss of output).

and two “demand-based” alternatives:

- **budgeted (master) capacity** utilization (the expected level of activity or output for the upcoming period, usually a year), or
- **normal capacity** (the average level of demand for the company’s product projected over an intermediate-level number of years into the future, say, three to five years).

**Theoretical capacity > Practical capacity > Budgeted (master) & normal capacity**

The larger the denominator in the overhead application rate, the smaller the rate and the lower the cost assigned to the product.

Theoretical capacity, which is the absolute capacity during continuous operations, ignoring holidays, maintenance time, etc., provides the largest denominator in the ratio.

Nash Glassworks Company has budgeted fixed manufacturing overhead of \$100,000 per month. The company uses absorption costing for both external and internal financial reporting purposes. Budgeted overhead rates for cost allocations for the month of April using alternative unit output denominator levels are shown in the next column.

<u>Capacity Levels</u>	<u>Budgeted Denominator Level (units of output)</u>	<u>Budgeted Overhead Cost Rate</u>
Theoretical	1,500,000	\$.0667
Practical	1,250,000	.0800
Normal	775,000	.1290
Master-budget	800,000	.1250

Actual output for the month of April was 800,000 units of glassware.

[353] Gleim #: 3.5.103 -- Source: CMA 696 3-2

The choice of a production volume level as a denominator in the computation of fixed overhead rates can significantly affect reported net income. Which one of the following statements is true for Nash Glassworks Company if its beginning inventory is zero, production exceeded sales, and variances are adjustments to cost of goods sold? The choice of

- A. Practical capacity as the denominator level will result in a lower net income amount than if master-budget capacity is chosen.
- B. Normal capacity as the denominator level will result in a lower net income amount than if any other capacity volume is chosen.
- C. Master-budget capacity as the denominator level will result in a lower net income amount than if theoretical capacity is chosen.
- D. Practical capacity as the denominator level will result in a higher net income amount than if normal capacity is chosen.

Answer (A) is correct. The choice of practical rather than master budget capacity as the denominator level will result in a lower absorption costing net income. Practical capacity is the maximum level at which output is produced efficiently, with an allowance for unavoidable interruptions, for example, for holidays and scheduled maintenance. Because this level will be higher than master-budget (expected) capacity, its use will usually result in the underapplication of fixed overhead. For example, given costs of \$100,000 and master-budget capacity of 800,000 units, \$.125 per unit is the application rate. If practical capacity is 1,250,000 units, the application rate is \$.08 per unit. If actual production is 800,000 units, fixed overhead will not be over- or underapplied given the use of master-budget capacity. However, there will be \$36,000 (450,000 units  $\times$  \$.08) of underapplied fixed overhead if practical capacity is the denominator level. Consequently, given that the beginning inventory is zero and that production exceeded sales, less fixed overhead will be inventoried at the lower practical capacity rate than at the master-budget rate. Thus, master-budget net income will be greater.

Which activity level should be chosen when determining the fixed overhead application rate?

*The answer is partly subjective.*

This is due largely to the fact that the resulting **product-cost information** can be used for different purposes, ranging from **product-pricing decisions**, to **performance-evaluation purposes**, to **tax and external reporting requirements in accounting**.

*Generally Accepted Accounting Principles (GAAP) require that allocation of fixed production overhead to products be based on the **normal** capacity of the production facilities.*

**Note that different definitions of the denominator volume will result in:**

- different fixed overhead application rates,
- different amounts of fixed overhead costs charged to production, and therefore
- different amounts for the production-volume variance.

Depending on how variances are disposed of at the end of the year, the financial statements can be affected by the choice of denominator activity level.

Our position is that for internal reporting purposes **practical capacity** be used as the denominator level for setting the fixed overhead allocation rate.

- Practical capacity is consistent with current Federal income tax requirements.
- Practical capacity volume provides more uniform data over time, which facilitates decision making on the part of management.
- Practical capacity in the denominator is logically consistent with the numerator in the fixed overhead rate calculation. That is, the numerator represents the costs of the capacity supplied and the denominator represents, in practical terms, the amount of capacity supplied.
- Practical capacity means that current customers and current production will not be burdened with the cost of unused capacity, which would be the case if budgeted output were used and budgeted output is less than practical capacity.
- The cost of unused capacity becomes visible to management through the amount and direction of the production-volume variance.

### Variable Overhead Spending Variance

26. Huffman Corporation's budget indicated that it should produce 50,000 units of finished goods, while incurring 20,000 hours of direct labor and \$150,000 of variable manufacturing overhead. Huffman actually produced 52,000 finished goods units using 22,000 hours of direct labor and incurring \$160,000 of variable manufacturing overhead. If Huffman uses a standard cost system and applies variable manufacturing overhead based upon direct labor hours, its **variable overhead spending** variance was

- a. \$4,000 unfavorable.
- b. \$5,000 favorable.
- c. \$9,000 unfavorable.
- d. \$10,000 unfavorable.

26. b

45. International Corporation uses a standard costing system and allocates variable overhead costs based on direct labor hours. The annual budget projected 1,000 finished units, 10,000 hours of direct labor and \$100,000 of variable overhead costs. At the end of the year 750 units were completed using 8,000 hours of direct labor and \$75,000 in variable overhead. What is the variable overhead spending variance?

- a. \$0.
- b. \$5,000 favorable.
- c. \$5,000 unfavorable.
- d. \$25,000 favorable.

45. b

42. Sugar Plums Inc. manufactures dresses for children. The variable overhead costs are allocated on the basis of budgeted direct labor hours. According to the December budget, each dress takes four direct labor hours to produce. Budgeted variable manufacturing overhead cost per labor hour is \$12 and the budgeted number of dresses to be made is 1,040. Actual variable manufacturing costs in December were \$52,164 for 1,080 dresses produced. Actual direct labor hours were 4,536 hours. The variable overhead spending variance is

- a. \$2,592 favorable.
- b. \$2,592 unfavorable.
- c. \$2,268 favorable.
- d. \$2,268 unfavorable.

42. c

### Production Volume Variance

28. Last year Elegis Skin Care Inc. budgeted \$600,000 of fixed overhead for its plant that manufactures moisturizing cream. The \$600,000 was based on a denominator activity level of 40,000 machine hours. There is 0.1 standard machine hours for each bottle of moisturizing cream. 350,000 bottles of moisturizing cream were produced, and 360,000 bottles were sold last year. What was the production volume variance?

- a. \$60,000 unfavorable.
- b. \$75,000 unfavorable.
- c. \$60,000 favorable.
- d. \$75,000 favorable.

28. b

31. A company using a standard cost system established a standard fixed cost per finished unit of \$4.00, and forecasted production and sales of 300,000 units. For the year, the company experienced an unfavorable production volume variance of \$14,000. Which one of the following would be the cause of this variance?

- a. The number of units produced was more than 300,000.
- b. The number of units produced was less than 300,000.
- c. The number of units sold was more than 300,000.
- d. The number of units sold was less than 300,000.

31. b

**[1] Gleim #: 7.1.1 -- Source: CMA 1296 3-23**

The purpose of identifying manufacturing variances and assigning their responsibility to a person/department should be to

- A. Use the knowledge about the variances to promote learning and continuous improvement in the manufacturing operations.
  - B. Trace the variances to finished goods so that the inventory can be properly valued at year-end.
  - C. Determine the proper cost of the products produced so that selling prices can be adjusted accordingly.
  - D. Pinpoint fault for operating problems in the organization.
- Answer (A) is **correct**. The purpose of identifying and assigning responsibility for variances is to determine who is likely to have information that will enable management to find solutions. The constructive approach is to promote learning and continuous improvement in manufacturing operations, not to assign blame. However, information about variances may be useful in evaluating managers' performance.
  - Answer (B) is **incorrect**. Depending on a cost-benefit determination, variances either are adjustments of cost of goods sold or are allocated among the inventory accounts and cost of goods sold. Moreover, the accounting issues are distinct from supervisory considerations.
  - Answer (C) is **incorrect**. Selling prices are based on much more than the cost of production; for instance, competitive pressure is also a consideration.
  - Answer (D) is **incorrect**. By itself, pinpointing fault is not an appropriate objective. Continuous improvement is the ultimate objective.

**[2] Gleim #: 7.1.2 -- Source: CMA 683 4-5**

A difference between standard costs used for cost control and the budgeted costs of the same manufacturing effort can exist because

- A. Standard costs represent what costs should be, whereas budgeted costs are expected actual costs.
- B. Budgeted costs are historical costs, whereas standard costs are based on engineering studies.
- C. Budgeted costs include some slack, whereas standard costs do not.
- D. Standard costs include some slack, whereas budgeted costs do not.

- Answer (A) is **correct**. In the long run, these costs should be the same. In the short run, however, they may differ because standard costs represent what costs should be, whereas budgeted costs are expected actual costs. Budgeted costs may vary widely from standard costs in certain months, but, for an annual budget period, the amounts should be similar.
- Answer (B) is **incorrect**. Standard costs are not necessarily determined by engineering studies.
- Answer (C) is **incorrect**. Standard costs are usually based on currently attainable standards applicable when a process is under control. They are set without regard to variances or slack.
- Answer (D) is **incorrect**. Budgeted costs include expected deviations from the standards.

**[3] Gleim #: 7.1.3 -- Source: Publisher**

In a responsibility accounting system, a feedback report that focuses on the difference between budgeted amounts and actual amounts is an example of

- A. Management by exception.
  - B. Assessing blame.
  - C. Granting rewards to successful managers.
  - D. Ignoring other variables for which the budgeted goals were met.
- Answer (A) is **correct**. A responsibility accounting system should have certain controls that provide for feedback reports indicating deviations from expectations. Management may then focus on those deviations (exceptions) for either reinforcement or correction.
  - Answer (B) is **incorrect**. The responsibility accounting system should not be used exclusively to assess blame.
  - Answer (C) is **incorrect**. The responsibility accounting system should not be used exclusively to give rewards.
  - Answer (D) is **incorrect**. Feedback reports concentrate on deviations, but not to the total exclusion of other budgeted variables.

[6] Gleim #: 7.1.6 -- Source: CMA 0408 2-230

Use of a standard cost system can include all of the following advantages **except** that it

- A. Assists in performance evaluation.
  - B. Emphasizes qualitative characteristics.
  - C. Permits development of flexible budgeting.
  - D. Allows employees to better understand what is expected of them.
- Answer (A) is **incorrect**. Standard costing assists in performance evaluation.
  - Answer (B) is **correct**. A standard cost system is fully focused on quantitative factors, not qualitative characteristics.
  - Answer (C) is **incorrect**. Standard cost permits the development of flexible budgeting.
  - Answer (D) is **incorrect**. Standard costing allows employees to better understand what is expected of them.

[1] Gleim #: 7.2.7 -- Source: CMA 1295 3-6

The difference between the actual amounts and the flexible budget amounts for the actual output achieved is the

- A. Production volume variance.
- B. Flexible budget variance.
- C. Sales volume variance.
- D. Standard cost variance.

- Answer (A) is **incorrect**. The production volume variance equals under- or overapplied fixed overhead.
- Answer (B) is **correct**. A flexible budget is prepared at the end of the budget period when the actual results are available. A flexible budget reflects the revenues that should have been earned and costs that should have been incurred given the achieved levels of production and sales. The difference between the flexible budget and actual figures is known as the flexible budget variance.
- Answer (C) is **incorrect**. The sales volume variance is the difference between the flexible budget amount and the static budget amount.
- Answer (D) is **incorrect**. A standard cost variance is not necessarily based on a flexible budget.

[2] Gleim #: 7.2.8 -- Source: CMA 1293 3-25

A manufacturing firm planned to manufacture and sell 100,000 units of product during the year at a variable cost per unit of \$4.00 and a fixed cost per unit of \$2.00. The firm fell short of its goal and only manufactured 80,000 units at a total incurred cost of \$515,000. The firm's manufacturing cost variance was

- A. \$85,000 favorable.
- B. \$35,000 unfavorable.
- C. \$5,000 favorable.
- D. \$5,000 unfavorable.

- Answer (A) is **incorrect**. The amount of \$85,000 favorable is based on a production level of 100,000 units.
- Answer (B) is **incorrect**. The variance is favorable.

- Answer (C) is **correct**. The company planned to produce 100,000 units at \$6 each (\$4 variable + \$2 fixed cost), or a total of \$600,000, consisting of \$400,000 of variable costs and \$200,000 of fixed costs. Total production was only 80,000 units at a total cost of \$515,000. The flexible budget for a production level of 80,000 units includes variable costs of \$320,000 (80,000 units × \$4). Fixed costs would remain at \$200,000. Thus, the total flexible budget costs are \$520,000. Given that actual costs were only \$515,000, the variance is \$5,000 favorable.
- Answer (D) is **incorrect**. The variance is favorable.

**[3] Gleim #: 7.2.9 -- Source: CMA 1295 3-24**

Based on past experience, a company has developed the following budget formula for estimating its shipping expenses. The company's shipments average 12 lbs. per shipment:

Shipping costs = \$16,000 + (\$0.50 × lbs. shipped)

The planned activity and actual activity regarding orders and shipments for the current month are given in the following schedule:

	Plan	Actual
Sales orders	800	780
Shipments	800	820
Units shipped	8,000	9,000
Sales	\$120,000	\$144,000
Total pounds shipped	9,600	12,300

The actual shipping costs for the month amounted to \$21,000. The appropriate monthly flexible budget allowance for shipping costs for the purpose of performance evaluation would be

- A. \$20,680
- B. \$20,920
- C. \$20,800
- D. \$22,150

- Answer (A) is **incorrect**. The amount of \$20,680 is based on the actual number of sales orders, rather than on pounds shipped.
- Answer (B) is **incorrect**. The amount of \$20,920 is based on the number of shipments, not the number of pounds shipped.
- Answer (C) is **incorrect**. The amount of \$20,800 is based on planned pounds shipped of 9,600, not actual pounds shipped of 12,300.

- Answer (D) is **correct**. The flexible budget formula is

Shipping costs = \$16,000 + (\$.50 × lbs. shipped)

Therefore, to determine the flexible budget amount, multiply the actual pounds shipped (12,300) times the standard cost (\$.50) to arrive at a total expected variable cost of \$6,150. Adding the variable cost to \$16,000 of fixed cost produces a budget total of \$22,150.

**[7] Gleim #: 7.2.13 -- Source: CMA 0408 2-222**

An advantage of using a flexible budget compared to a static budget is that, in a flexible budget,

- A. Shortfalls in planned production are clearly presented.
- B. Standards can easily be changed to adjust to changing circumstances.
- C. Fixed cost variances are more clearly presented.
- D. Budgeted costs for a given output level can be compared with actual costs for the same level of output.

- Answer (A) is **incorrect**. Shortfalls in planned production should be clearly presented by any budget system.
- Answer (B) is **incorrect**. Easily changed standards defeat the purpose of having standards.
- Answer (C) is **incorrect**. Fixed cost variances are no more clearly presented under a flexible budgeting system than they are under any other.
- Answer (D) is **correct**. The actual level of production for a period is rarely identical to the level that was projected when the period was being planned. Flexible budgets use standard costs to report what costs “should” have been incurred given the actual level of production achieved.

**[8] Gleim #: 7.2.14 -- Source: CMA 0408 2-223**

A major disadvantage of a static budget is that

- A. It is more difficult to develop than a flexible budget.
  - B. It is made for only one level of activity.
  - C. Variances tend to be smaller than when flexible budgeting is used.
  - D. Variances are more difficult to compute than when flexible budgeting is used.
- Answer (A) is **incorrect**. A static budget is easier to prepare than a flexible budget.

- Answer (B) is **correct**. Static budgets are prepared based on the best estimates for output to be produced and costs to be incurred before the period begins. If there are any variations in conditions actually experienced, the static budget is unhelpful for diagnosing specific problem areas since it only reflects one level of activity.
- Answer (C) is **incorrect**. The size of the variances encountered is not a function of the budgeting system used.
- Answer (D) is **incorrect**. Variances are no harder to compute under static budgeting than under flexible budgeting.

**[9] Gleim #: 7.2.15 -- Source: CMA 0408 2-224**

Arkin Co.'s controller has prepared a flexible budget for the year just ended, adjusting the original static budget for the unexpected large increase in the volume of sales. Arkin's costs are mostly variable. The controller is pleased to note that both actual revenues and actual costs approximated amounts shown on the flexible budget. If actual revenues and actual costs are compared with amounts shown on the original (static) budget, what variances would arise?

- A. Both revenue variances and cost variances would be favorable.
  - B. Revenue variances would be favorable and cost variances would be unfavorable.
  - C. Revenue variances would be unfavorable and cost variances would be favorable.
  - D. Both revenue variances and cost variances would be unfavorable.
- Answer (A) is **incorrect**. Only one of the variances would be favorable.
  - Answer (B) is **correct**. Since Arkin's actual sales volume exceeded expectations, revenue variances will be favorable. By the same token, the higher level of output resulted in the company incurring more production costs than expected.
  - Answer (C) is **incorrect**. Revenue variances would be favorable and cost variances would be unfavorable.
  - Answer (D) is **incorrect**. Only one of the variances would be unfavorable.

**[10] Gleim #: 7.2.16 -- Source: CMA 0408 2-225**

Which one of the following statements is correct concerning a flexible budget cost formula? Variable costs are stated

- A. Per unit and fixed costs are stated in total.
- B. In total and fixed costs are stated per unit.
- C. In total and fixed costs are stated in total.
- D. Per unit and fixed costs are stated per unit.

- Answer (A) is **correct**. Variable costs by their nature are directly related to the level of activity. Thus, a flexible budget formula must use per-unit variable costs to be useful. At the same time, all fixed costs must be covered regardless of the level of output. They are most meaningful when stated in total.
- Answer (B) is **incorrect**. A flexible budget formula would use variable costs per unit.
- Answer (C) is **incorrect**. A flexible budget formula would use variable costs per unit.
- Answer (D) is **incorrect**. A flexible budget formula would use fixed costs in total.

**[11] Gleim #: 7.2.17 -- Source: CMA 0408 2-226**

The monthly sales volume of Shugart Corporation varies from 7,000 units to 9,800 units over the course of a year. Management is currently studying anticipated selling expenses along with the related cash resources that will be needed. Which of the following types of budgets (1) should be used by Shugart in planning and (2) will provide Shugart the best feedback in performance reports for comparing planned expenditures with actual amounts?

	<u>Planning</u>	<u>Performance Reporting</u>
A.	Static	Static
B.	Static	Flexible
C.	Flexible	Static
D.	Flexible	Flexible

- Answer (A) is **incorrect**. Flexible budgets should be used for both planning and performance reporting.
- Answer (B) is **incorrect**. A flexible budget should also be used for planning.
- Answer (C) is **incorrect**. A flexible budget should also be used for performance reporting.

- Answer (D) is **correct**. A flexible budget is always more useful than a static budget. A static budget is only helpful when exactly the combination of circumstances on which it is based are actually experienced. Using a flexible budget in the planning stages will allow Shugart to project the results of multiple combinations of factors, and using one in measuring performance will allow the company to most accurately identify areas of success and failure.

**[12] Gleim #: 7.2.18 -- Source: CMA 0408 2-229**

The benefits of management by exception reporting include all of the following **except** a reduction in

- A. Reports/production costs.
- B. Information overload.
- C. Reliance on advance planning.
- D. Unfocused management actions.

- Answer (A) is **incorrect**. Management by exception will tend to produce fewer reports.
- Answer (B) is **incorrect**. Management by exception may tend to decrease information overload since managers will have fewer reports to study.
- Answer (C) is **correct**. Management by exception, the practice of giving attention primarily to significant deviations from expectations, is dependent upon careful formulation of standards and sound projection of output and cost levels. Advance planning will be just as important as ever. There will be no less reliance than in the past.
- Answer (D) is **incorrect**. Management actions will be more focused since they will be able to target only a few areas for analysis instead of everything.

**[13] Gleim #: 7.2.19 -- Source: CMA 0408 2-231**

Teeny Toddlers is a 4-year old manufacturer of colorful, plastic toddler riding toys. To maintain competitive prices, control of costs is critical. Management has considered moving production overseas, but so far they are committed to remaining in the U.S. Management has decided to permit their employees to participate in setting up a new standard cost system. Management likely expects the new standard cost system, along with the employee input, to provide all of the following benefits **except** that

- A. Unfavorable variances are more likely to occur.
- B. Employees who participate in setting standards may be more efficient.
- C. Standard costs will help management in uncovering potential cost problems.
- D. Standard costing permits management by exception, which should save some time.

- Answer (A) is **correct**. A well-designed standard cost system should produce fewer unfavorable variances.
- Answer (B) is **incorrect**. Employees who participate in setting standards may be more efficient.
- Answer (C) is **incorrect**. Standard costs will help management in uncovering potential cost problems.
- Answer (D) is **incorrect**. Standard costing permits management by exception, which should save some time.

**[14] Gleim #: 7.2.20 -- Source: CMA 0408 2-232**

Which one of the following will allow a better use of standard costs and variance analysis to help improve managerial decision-making?

- A. Set standards with the help of line personnel directly involved in the process.
  - B. Do not differentiate between variable and fixed overhead in calculating overhead variances.
  - C. Use standard costs only for inventory valuation.
  - D. Use the prior year's average actual cost as the current year's standard.
- 
- Answer (A) is **correct**. Standard costs should be set with input from the personnel who are most familiar with input usage.
  - Answer (B) is **incorrect**. A failure to distinguish between variable and fixed cost variances will inevitably lead to poor decision-making.
  - Answer (C) is **incorrect**. Standard costs should be used for all inputs to the production process and should be used for control purposes as well as inventory valuation.
  - Answer (D) is **incorrect**. Simply using an average amount based on previous experience defeats the purpose of standard costing, which should be based on best estimates and established as scientifically as is economical.

[1] Gleim #: 7.3.21 -- Source: CMA 694 3-21

Under a standard cost system, the materials efficiency variances are the responsibility of

- A. Production and industrial engineering.
- B. Purchasing and industrial engineering.
- C. Purchasing and sales.
- D. Sales and industrial engineering.

- Answer (A) is **correct**. The materials efficiency variance is the difference between actual and standard quantities used in production, times the standard price. An unfavorable materials efficiency variance is usually caused by wastage, shrinkage, or theft. Thus, it may be the responsibility of the production department because excess usage would occur while the materials are in that department. In addition, industrial engineering may play a role because it is responsible for design of the production process.
- Answer (B) is **incorrect**. Purchasing rarely can control the materials efficiency variance.
- Answer (C) is **incorrect**. Sales has no effect on the materials efficiency variance.
- Answer (D) is **incorrect**. Sales has no effect on the materials efficiency variance.

---

[Fact Pattern #1]

Blaster, Inc., a manufacturer of portable radios, purchases the components from subcontractors to use to assemble into a complete radio. Each radio requires three units each of Part XBEZ52, which has a standard cost of \$1.45 per unit. During May, Blaster experienced the following with respect to Part XBEZ52.

	<u>Units</u>
Purchases (\$18,000)	12,000
Consumed in manufacturing	10,000
Radios manufactured	3,000

---

[2] Gleim #: 7.3.22 -- Source: CMA 695 3-23

(Refers to Fact Pattern #1)

During May, Blaster incurred a purchase price variance of

- A. \$450 unfavorable.
- B. \$450 favorable.
- C. \$500 favorable.
- D. \$600 unfavorable.

- Answer (A) is **incorrect**. The standard quantity needed for the actual output times the \$.05 unfavorable price variance per part equals \$450 unfavorable.
- Answer (B) is **incorrect**. The variance is unfavorable, and \$450 is the amount of the variance that relates only to the standard input for the actual output.
- Answer (C) is **incorrect**. The variance is unfavorable. Furthermore, the variance is based on the quantity purchased, not the quantity consumed. [Note: The materials price variance is sometimes isolated at the time of transfer to production.]
- Answer (D) is **correct**. Blaster's purchase price variance is calculated as follows:

$$\begin{aligned}\text{Purchase price variance} &= \text{AQ} \times (\text{SP} - \text{AP}) \\ &= 12,000 \text{ parts} \times (\$1.45 - \$1.50) \\ &= 12,000 \times -\$0.05 \\ &= \$600 \text{ unfavorable}\end{aligned}$$

[3] Gleim #: 7.3.23 -- Source: CMA 695 3-24

(Refers to Fact Pattern #1)

During May, Blaster incurred a materials efficiency variance of

- A. \$1,450 unfavorable.
- B. \$1,450 favorable.
- C. \$4,350 unfavorable.
- D. \$4,350 favorable.

- Answer (A) is **correct**. Standard usage was three parts per radio at \$1.45 each. For a production level of 3,000 units, the total materials needed equaled 9,000 parts, but materials actually used totaled 10,000 parts. Thus, the variance is \$1,450 unfavorable  $\{ \text{SP} \times (\text{AQ} - \text{SQ}) = [\$1.45 \text{ standard cost per part} \times (10,000 \text{ actually used} - 9,000 \text{ standard usage})] \}$ .

- Answer (B) is **incorrect**. The variance is unfavorable. The actual quantity used exceeded the standard input allowed.
- Answer (C) is **incorrect**. Assuming that 12,000 parts were consumed results in \$4,350 unfavorable.
- Answer (D) is **incorrect**. Assuming that 12,000 parts were consumed and that the variance is favorable results in \$4,350 favorable.

**[4] Gleim #: 7.3.24 -- Source: CMA Sample Q3-11**

Garland Company uses a standard cost system. The standard for each finished unit of product allows for 3 pounds of plastic at \$0.72 per pound. During December, Garland bought 4,500 pounds of plastic at \$0.75 per pound, and used 4,100 pounds in the production of 1,300 finished units of product. What is the materials purchase price variance for the month of December?

- A. \$117 unfavorable.
- B. \$123 unfavorable.
- C. \$135 unfavorable.
- D. \$150 unfavorable.

- Answer (A) is **incorrect**. The variance of \$117 unfavorable is based on the standard input for 1,300 units.
- Answer (B) is **incorrect**. The variance of \$123 unfavorable is based on the actual quantity used.
- Answer (C) is **correct**. The materials purchase price variance equals the quantity purchased multiplied by the difference between the standard price and the actual price, or \$135 unfavorable [4,500 lbs.  $\times$  (\$0.75 – \$0.72)].
- Answer (D) is **incorrect**. The variance of \$150 unfavorable is based on the assumption that 5,000 lbs. were purchased.

---

**[Fact Pattern #2]**

ChemKing uses a standard costing system in the manufacture of its single product. The 35,000 units of direct materials in inventory were purchased for \$105,000, and two units of direct materials are required to produce one unit of final product. In November, the company produced 12,000 units of product. The standard allowed for materials was \$60,000, and the unfavorable quantity variance was \$2,500.

---

**[5] Gleim #: 7.3.25 -- Source: CMA 1293 3-22**

(Refers to Fact Pattern #2)

ChemKing's standard price for one unit of direct materials is

- A. \$2.00
- B. \$2.50
- C. \$3.00
- D. \$5.00

- Answer (A) is **incorrect**. The unit standard cost is \$2.50.
- Answer (B) is **correct**. Given that the company produced 12,000 units with a total standard cost for direct materials of \$60,000, the standard cost must be \$5.00 ( $\$60,000 \div 12,000$  units) per unit of finished product. Because each unit of finished product requires two units of direct materials, the standard unit cost for direct materials must be \$2.50.
- Answer (C) is **incorrect**. The actual cost per unit of direct materials is \$3.
- Answer (D) is **incorrect**. The total standard cost of direct materials for each unit of finished product is \$5.

**[6] Gleim #: 7.3.26 -- Source: CMA 1293 3-23**

(Refers to Fact Pattern #2)

ChemKing's units of direct materials used to produce November output totaled

- A. 12,000 units.
- B. 12,500 units.
- C. 23,000 units.
- D. 25,000 units.

- Answer (A) is **incorrect**. The number of units of finished product is 12,000.
- Answer (B) is **incorrect**. Assuming that each unit of finished product includes only one unit of direct materials results in 12,500 units.
- Answer (C) is **incorrect**. Assuming a favorable quantity variance results in 23,000 units.

- Answer (D) is **correct**. The company produced 12,000 units of output, each of which required two units of direct materials. Thus, the standard input allowed for direct materials was 24,000 units at a standard cost of \$2.50 each [ $\$60,000 \div (12,000 \text{ units of output} \times 2 \text{ units of direct materials})$ ]. An unfavorable quantity variance signifies that the actual quantity used was greater than the standard input allowed. The direct materials quantity variance equals the standard price per unit times the difference between actual and standard quantities. Consequently, because 1,000 ( $\$2,500 \text{ U} \div \$2.50$ ) additional units were used, the actual total quantity must have been 25,000 units (24,000 standard + 1,000).

**[7] Gleim #: 7.3.27 -- Source: CMA 1293 3-24**

(Refers to Fact Pattern #2)

ChemKing's direct materials price variance for the units used in November was

- A. \$2,500 unfavorable.
- B. \$11,000 unfavorable.
- C. \$12,500 unfavorable.
- D. \$3,500 unfavorable.

- Answer (A) is **incorrect**. The direct materials quantity variance is \$2,500 unfavorable.
- Answer (B) is **incorrect**. The price variance is \$12,500, or \$.50 per unit.
- Answer (C) is **correct**. The standard price was \$2.50 [ $\$60,000 \div (12,000 \text{ units of output} \times 2 \text{ units of direct materials})$ ]. An unfavorable quantity variance of \$2,500 means that 1,000 ( $\$2,500 \text{ U} \div \$2.50$ ) additional units were used, resulting in an actual total quantity of 25,000 units [ $(12,000 \text{ units of output} \times 2 \text{ units of direct materials}) + 1,000$ ]. Actual price was \$3.00 ( $\$105,000 \text{ total cost} \div 35,000 \text{ units purchased}$ ). Consequently, the direct materials price variance is \$12,500 unfavorable  $\{AQ \times (AP - SP) = [25,000 \text{ units} \times (\$3.00 - \$2.50)]\}$ .
- Answer (D) is **incorrect**. The price variance is \$12,500, or \$.50 per unit.

**[8] Gleim #: 7.3.28 -- Source: CMA 694 3-23**

A favorable materials price variance coupled with an unfavorable materials usage variance most likely results from

- A. Machine efficiency problems.
- B. Product mix production changes.
- C. The purchase and use of higher-than-standard quality materials.
- D. The purchase of lower than standard quality materials.

- Answer (A) is **incorrect**. Machine efficiency problems do not explain the price variance.
- Answer (B) is **incorrect**. A change in product mix does not explain the price variance.
- Answer (C) is **incorrect**. Materials of higher-than-standard quality are more likely to cause an unfavorable price variance and a favorable quantity variance.
- Answer (D) is **correct**. A favorable materials price variance is the result of paying less than the standard price for materials. An unfavorable materials usage variance is the result of using an excessive quantity of materials. If a purchasing manager were to buy substandard materials to achieve a favorable price variance, an unfavorable quantity variance could result from using an excessive amount of poor quality materials.

**[9] Gleim #: 7.3.29 -- Source: CMA 1294 3-24**

Tower Company planned to produce 3,000 units of its single product, Titactium, during November. The standard specifications for one unit of Titactium include 6 pounds of materials at \$.30 per pound. Actual production in November was 3,100 units of Titactium. The accountant computed a favorable direct materials purchase price variance of \$380 and an unfavorable direct materials quantity variance of \$120. Based on these variances, one could conclude that

- A. More materials were purchased than were used.
  - B. More materials were used than were purchased.
  - C. The actual cost of materials was less than the standard cost.
  - D. The actual usage of materials was less than the standard allowed.
- 
- Answer (A) is **incorrect**. No variance relates quantity purchased to quantity used.
  - Answer (B) is **incorrect**. No variance relates quantity purchased to quantity used.
  - Answer (C) is **correct**. The direct materials purchase price variance may be isolated at the time of purchase or at the time of transfer to production. It equals the actual quantity of materials purchased or transferred times the difference between the standard and actual unit prices. Hence, a favorable direct materials purchase price variance means that materials were purchased at a price less than the standard price.
  - Answer (D) is **incorrect**. The unfavorable quantity variance indicates that more materials were used than allowed by the standards. The direct materials quantity variance equals the standard unit price times the difference between the standard quantity allowed for the actual output and the actual quantity used.

**[10] Gleim #: 7.3.30 -- Source: CMA 1296 3-21**

David Rogers, purchasing manager at Fairway Manufacturing Corporation, was able to acquire a large quantity of direct materials from a new supplier at a discounted price. Marion Conner, inventory supervisor, is concerned because the warehouse has become crowded and some things had to be rearranged. Brian Jones, vice president of production, is concerned about the quality of the discounted materials. However, the Engineering Department tested the new materials and indicated that they are of acceptable quality. At the end of the month, Fairway experienced a favorable direct materials usage variance, a favorable direct labor usage variance, and a favorable direct materials price variance. The usage variances were solely the result of a higher yield from the new material. The favorable direct materials price variance is considered the responsibility of the

- A. Purchasing manager.
- B. Inventory supervisor.
- C. Vice president of production.
- D. Engineering manager.

- Answer (A) is **correct**. A direct materials price variance is the actual quantity used times the difference between the standard and actual prices. It is normally considered the responsibility of the purchasing manager because no one else has an opportunity to influence the price. In this case, the purchasing manager obtained the discount that led to the favorable price variance.
- Answer (B) is **incorrect**. An inventory supervisor has no influence over the price paid for materials.
- Answer (C) is **incorrect**. The vice president receives the materials without knowing the price.
- Answer (D) is **incorrect**. The engineering manager is concerned only with the quality of the materials.

**[11] Gleim #: 7.3.31 -- Source: CMA 695 3-25**

Price variances and efficiency variances can be key to the performance measurement within a company. In evaluating the performance within a company, a materials efficiency variance can be caused by all of the following **except** the

- A. Performance of the workers using the material.
- B. Actions of the purchasing department.
- C. Design of the product.
- D. Sales volume of the product.

- Answer (A) is **incorrect**. Worker performance is a possible cause of a materials efficiency variance.
- Answer (B) is **incorrect**. Purchasing department actions are possible causes of a materials efficiency variance.
- Answer (C) is **incorrect**. Product design is a possible cause of a materials efficiency variance.
- Answer (D) is **correct**. An unfavorable materials quantity or usage (efficiency) variance can be caused by a number of factors, including waste, shrinkage, theft, poor performance by production workers, nonskilled workers, or the purchase of below-standard-quality materials by the purchasing department. Changes in product design can also affect the quantity of materials used. Sales volume of the product should not be a contributing factor to a materials efficiency variance.

**[12] Gleim #: 7.3.32 -- Source: CMA 1287 4-30**

Todco planned to produce 3,000 units of its single product, Teragram, during November. The standard specifications for one unit of Teragram include six pounds of materials at \$.30 per pound. Actual production in November was 3,100 units of Teragram. The accountant computed a favorable materials purchase price variance of \$380 and an unfavorable materials quantity variance of \$120. Based on these variances, one could conclude that

- A. More materials were purchased than were used.
  - B. More materials were used than were purchased.
  - C. The actual cost of materials was less than the standard cost.
  - D. The actual usage of materials was less than the standard allowed.
- 
- Answer (A) is **incorrect**. The quantity of materials purchased cannot be determined from the information given.
  - Answer (B) is **incorrect**. The quantity of materials purchased cannot be determined from the information given.
  - Answer (C) is **correct**. A favorable price variance indicates that the materials were purchased at a price less than standard. The unfavorable quantity variance indicates that the quantity of materials used for actual production exceeded the standard quantity for the good units produced.
  - Answer (D) is **incorrect**. The actual usage was greater than standard.

**[13] Gleim #: 7.3.33 -- Source: CMA 1295 3-25**

Which one of the following variances is most controllable by the production control supervisor?

- A. Materials price variance.
- B. Materials usage variance.
- C. Variable overhead spending variance.
- D. Fixed overhead budget variance.

- Answer (A) is **incorrect**. The materials price variance can be greatly influenced by the purchasing manager.
- Answer (B) is **correct**. The production control supervisor has the most control over the materials usage variance. The materials usage variance measures the excess amount of materials used over the amount specified in the standards. The materials usage (or materials quantity) variance, when unfavorable, is often attributable to waste, shrinkage, or theft in the production areas. The excess usage occurs under the supervision of the production department.
- Answer (C) is **incorrect**. The variable overhead spending variance is both a quantity and a price variance. Prices paid are not controllable by the production control supervisor.
- Answer (D) is **incorrect**. Fixed overhead variances can be controlled by the manufacturing departments, but only to a lesser extent than materials usage. The controllability is split between manufacturing and management.

---

**[Fact Pattern #3]**

The controller for Durham Skates is reviewing the production cost report for July. An analysis of direct materials costs reflects an unfavorable flexible budget variance of \$25. The plant manager believes this is excellent performance on a flexible budget for 5,000 units of direct materials. However, the production supervisor is not pleased with this result because she claims to have saved \$1,200 in materials cost on actual production using 4,900 units of direct materials. The standard materials cost is \$12 per unit. Actual materials used for the month amounted to \$60,025.

---

[14] Gleim #: 7.3.34 -- Source: CMA 697 3-22

(Refers to Fact Pattern #3)

Durham's actual average cost per unit for materials was

- A. \$12.00
- B. \$12.01
- C. \$12.24
- D. \$12.25

- Answer (A) is **incorrect**. The standard cost is \$12.
- Answer (B) is **incorrect**. The amount of \$12.01 is based on the budgeted usage.
- Answer (C) is **incorrect**. The \$60,000 standard cost for 5,000 units divided by 4,900 units equals \$12.24.
- Answer (D) is **correct**. Dividing the actual cost of \$60,025 by the 4,900 units used results in an average cost of \$12.25 per unit.

[15] Gleim #: 7.3.35 -- Source: CMA 697 3-23

(Refers to Fact Pattern #3)

If Durham's direct materials variance is investigated further, it will reflect a price variance of

- A. Zero.
- B. \$1,200 favorable.
- C. \$1,225 unfavorable.
- D. \$2,500 favorable.

- Answer (A) is **incorrect**. A price variance exists. The actual price paid was greater than the standard allowed.
- Answer (B) is **incorrect**. The variance is unfavorable.
- Answer (C) is **correct**. The price variance equals the actual quantity times the difference between the actual price and the standard price. The actual price is \$12.25, and the standard price is \$12 (given). Thus, the price variance is \$1,225 unfavorable  $\{AQ \times (AP - SP) = [4,900 \text{ units} \times (\$12.25 \text{ actual} - \$12.00 \text{ standard})]\}$ .
- Answer (D) is **incorrect**. The variance is unfavorable.

**[16] Gleim #: 7.3.36 -- Source: CMA 1295 3-11**

In a standard cost system, the investigation of an unfavorable materials usage variance should begin with the

- A. Production manager only.
- B. Plant controller only.
- C. Purchasing manager only.
- D. Production manager or the purchasing manager.

- Answer (A) is **incorrect**. Both the purchasing manager and the production manager could be at fault.
- Answer (B) is **incorrect**. The plant controller is at too high a level for an investigation of a materials usage variance.
- Answer (C) is **incorrect**. Both the purchasing manager and the production manager could be at fault.
- Answer (D) is **correct**. An unfavorable materials quantity variance is usually caused by waste, shrinkage, or theft. Alternatively, an unfavorable variance could be attributable to the purchasing department's not buying the proper quality of materials in an attempt to achieve a favorable material price variance. Thus, either the production manager or the purchasing manager could be responsible for a material usage variance.

**[17] Gleim #: 7.3.37 -- Source: CMA 694 3-20**

Under a standard cost system, the materials price variances are usually the responsibility of the

- A. Production manager.
- B. Cost accounting manager.
- C. Sales manager.
- D. Purchasing manager.

- Answer (A) is **incorrect**. The production manager has no control over the price paid for materials.
- Answer (B) is **incorrect**. The cost accounting manager has no control over the price paid for materials.
- Answer (C) is **incorrect**. The sales manager has no control over the price paid for materials.

- Answer (D) is **correct**. The materials price variance is the difference between the standard price and the actual price paid for materials. This variance is usually the responsibility of the purchasing department. Thus, the purchasing manager has an incentive to obtain the best price possible.

**[25] Gleim #: 7.3.45 -- Source: CMA 0408 2-216**

A company has a raw material price variance that is unfavorable. An analysis of this variance indicates that the company's only available supplier of one of its raw materials unexpectedly raised the price of the material. The action management should take regarding this situation should be to

- A. Negatively evaluate the performance of the purchasing manager.
  - B. Negatively evaluate the performance of the production manager.
  - C. Change the raw material price standard.
  - D. Ask the production manager to lower the material usage standard to compensate for higher material costs.
- Answer (A) is **incorrect**. An action by the supplier is beyond the control of the purchasing manager.
  - Answer (B) is **incorrect**. An action by the supplier is beyond the control of the production manager.
  - Answer (C) is **correct**. Since there is only one source for the raw material, the standard cost should be changed to reflect the firm's true situation.
  - Answer (D) is **incorrect**. A change in price does not affect how efficiently a material can be used.

**[26] Gleim #: 7.3.46 -- Source: CMA 0408 2-234**

Frisco Company recently purchased 108,000 units of raw material for \$583,200. Three units of raw materials are budgeted for use in each finished good manufactured, with the raw material standard set at \$16.50 for each completed product. Frisco manufactured 32,700 finished units during the period just ended and used 99,200 units of raw material. If management is concerned about the timely reporting of variances in an effort to improve cost control and bottom-line performance, the materials purchase price variance should be reported as

- A. \$6,050 unfavorable.
- B. \$9,920 favorable.
- C. \$10,800 unfavorable.
- D. \$10,800 favorable.

- Answer (A) is **incorrect**. The materials quantity variance is \$6,050 unfavorable; it results from using the difference between the quantity actually consumed and the “expected” quantity.
- Answer (B) is **incorrect**. The materials price variance is \$9,920 favorable; it results from using the quantity actually consumed instead of the quantity purchased.
- Answer (C) is **incorrect**. Reversing the order of the subtraction of standard and actual price results in \$10,800 unfavorable.
- Answer (D) is **correct**. The general formula for the purchase price variance is quantity purchased times (standard price minus actual price). The standard price equals the materials charge per finished unit divided by the number of inputs per finished unit ( $\$16.50 \div 3 = \$5.50$ ), and the actual price equals the total amount paid for materials purchased (not just used) divided by the number purchased ( $\$583,200 \div 108,000 = \$5.40$ ). Frisco’s purchase price variance is therefore calculated as follows:  $[108,000 \times (\$5.50 - \$5.40)] = \$10,800 \text{ F}$ .

**[27] Gleim #: 7.3.47 -- Source: CMA 0408 2-235**

Christopher Akers is the chief executive officer of SBL, Inc., a masonry contractor. The financial statements have just arrived showing a \$3,000 loss on the new stadium job that was budgeted to show a \$6,000 profit. Actual and budget information relating to the materials for the job are as follows.

	<u>Actual</u>	<u>Budget</u>
Bricks -- number of bundles	3,000	2,850
Bricks -- cost per bundle	\$7.90	\$8.00

Which one of the following is a **correct** statement regarding the stadium job for SBL?

- A. The price variance was favorable by \$285.
  - B. The price variance was favorable by \$300.
  - C. The efficiency variance was unfavorable by \$1,185.
  - D. The flexible budget variance was unfavorable by \$900.
- Answer (A) is **incorrect**. The budgeted units of input times the difference between the standard and actual price, an undefined variance, results in \$285 favorable.
  - Answer (B) is **correct**. The direct materials price variance is defined as the actual quantity used in production times the standard price minus the actual price. In SBL's case, this calculation is  $[3,000 \text{ units} \times (\$8.00 - \$7.90)] = \$300$  favorable.
  - Answer (C) is **incorrect**. The efficiency variance cannot be determined without knowing the actual level of output and the standard units of input per unit of output.
  - Answer (D) is **incorrect**. The flexible budget variance cannot be determined without knowing the actual level of output and the standard units of input per unit of output.

[28] Gleim #: 7.3.48 -- Source: CMA 0408 2-236

A company isolates its raw material price variance in order to provide the earliest possible information to the manager responsible for the variance. The budgeted amount of material usage for the year was computed as follows:

$$150,000 \text{ units of finished goods} \times 3 \text{ lbs./unit} \times \$2.00/\text{lb.} = \$900,000$$

Actual results for the year were the following.

Finished goods produced	160,000 units
Raw materials purchased	500,000 pounds
Raw materials used	490,000 pounds
Cost per pound	\$2.02

The raw material price variance for the year was

- A. \$9,600 unfavorable.
- B. \$9,800 unfavorable.
- C. \$10,000 unfavorable.
- D. \$20,000 unfavorable.

- Answer (A) is **incorrect**. The expected quantity (the actual units produced times the standard inputs per unit of output) times the standard price minus the actual price, an undefined variance, equals \$9,600 unfavorable.
- Answer (B) is **incorrect**. Using the quantity consumed instead of the quantity purchased results in \$9,800 unfavorable.
- Answer (C) is **correct**. The direct materials price variance, when it is isolated early, is calculated as the quantity purchased times the standard price minus the actual price (this firm has decided that waiting until the quantity actually used is known delays the usefulness of the calculation). The calculation is therefore  $[500,000 \times (\$2.00 - \$2.02)] = \$10,000$  unfavorable.
- Answer (D) is **incorrect**. The quantity (efficiency) variance is \$20,000 unfavorable.

**[29] Gleim #: 7.3.49 -- Source: CMA 0408 2-238**

At the beginning of the year, Douglas Company prepared the following monthly budget for direct materials.

Units produced and sold	10,000	15,000
Direct material	\$15,000	\$22,500

At the end of the month, the company's records showed that 12,000 units were produced and sold and \$20,000 was spent for direct materials. Each unit of output requires one unit of direct material. The flexible budget variance for direct materials is

- A. \$2,000 favorable.
- B. \$2,000 unfavorable.
- C. \$5,000 favorable.
- D. \$5,000 unfavorable.

- Answer (A) is **incorrect**. Reversing the order of subtraction results in \$2,000 favorable.
- Answer (B) is **correct**. The standard per-unit cost of direct materials can be found by dividing the total cost at either budgeted level of production by the units at that level ( $\$15,000 \div 10,000 = \$1.50$  per unit or  $\$22,500 \div 15,000 = \$1.50$  per unit). Since 12,000 units were actually consumed, the flexible budget for direct materials, that is, the amount that should have been spent given the achieved level of production, was \$18,000 ( $12,000 \times \$1.50$ ). The difference between the flexible budget and the actual amount spent on direct materials is the flexible budget variance ( $\$18,000 - \$20,000 = \$2,000$  U).
- Answer (C) is **incorrect**. Improperly treating the production range in units as a dollar variance results in \$5,000 favorable.
- Answer (D) is **incorrect**. Improperly treating the production range in units as a dollar variance results in \$5,000 unfavorable.

**[30] Gleim #: 7.3.50 -- Source: CMA 0408 2-241**

Richter Company has an unfavorable materials efficiency (usage) variance for a particular month. Which one of the following is **least** likely to be the cause of this variance?

- A. Inadequate training of the direct labor employees.
- B. Poor performance of the shipping employees.
- C. Poor design of the production process or product.
- D. Poor quality of the raw materials.

- Answer (A) is **incorrect**. Inadequate training of workers can result in excessive waste of materials.
- Answer (B) is **correct**. Shipping employees send out finished products to customers. They are not involved in the production process.
- Answer (C) is **incorrect**. Poor design of the production process or product can result in high levels of wasted inputs.
- Answer (D) is **incorrect**. The inevitable waste associated with poor quality materials can result in a higher-than-expected usage level.

**[31] Gleim #: 7.3.51 -- Source: CMA 0408 2-251**

Fortune Corporation's Marketing Department recently accepted a rush order for a nonstock item from a valued customer. The Marketing Department filed the necessary paperwork with the Production Department, which complained greatly about the lack of time to do the job the right way. Nevertheless, the Production Department accepted the manufacturing commitment and filed the required paperwork with the Purchasing Department for the needed raw materials. A purchasing clerk temporarily misplaced the paperwork. By the time the paperwork was found, it was too late to order from the company's regular supplier. A new supplier was located, and that vendor quoted a very attractive price. The materials arrived and were rushed into production, bypassing the normal inspection processes (as directed by the Production Department supervisor) to make up for lost time. Unfortunately, the goods were of low quality and created considerable difficulty for Fortune's assembly-line personnel. Which of the following best indicates the responsibility for the materials usage variance in this situation?

- A. Purchasing.
- B. Purchasing and Marketing.
- C. Marketing and Production.
- D. Purchasing, Marketing, and Production.

- Answer (A) is **incorrect**. The Purchasing Department is not the only one responsible for the bad outcome.
- Answer (B) is **incorrect**. The Production Department also bears some responsibility for this situation.
- Answer (C) is **incorrect**. The Purchasing Department also bears some responsibility for this situation.

- Answer (D) is **correct**. All three departments bear responsibility for this fiasco. The Marketing Department should never have accepted a rush order for an item not carried in regular stock without first determining whether the Production Department would be able to fill the order on time and at an acceptable level of quality. The Purchasing Department did not give a rush order the appropriate level of attention; the paperwork should never have been in a position to be misplaced. The Production Supervisor should not have given in to pressure from the Marketing Department to bypass the normal inspection process; this simply led to more delays and lower quality.

**[32] Gleim #: 7.3.52 -- Source: CMA 0408 2-253**

Johnson, Inc., has established per-unit standards for material and labor for its production department based on 900 units of normal production capacity as shown below.

3 lbs. of direct materials @ \$4 per lb.	\$12
1 direct labor hour @ \$15 per hr.	<u>15</u>
Standard cost per unit	<u><u>\$27</u></u>

During the year, 1,000 units were produced. The accounting department has charged the production department supervisor with the following unfavorable variances.

Materials Quantity Variance	
Actual usage	3,300 lbs.
Standard usage	<u>3,000 lbs.</u>
Unfavorable	<u><u>300 lbs.</u></u>

Material Price Variance	
Actual cost	\$4,200
Standard cost	<u>4,000</u>
Unfavorable	<u><u>\$ 200</u></u>

Bob Sterling, the production supervisor, has received a memorandum from his boss stating that he did not meet the established standards for material prices and quantity, and corrective action should be taken. Sterling is very unhappy about the situation and is preparing to reply to the memorandum explaining the reasons for his dissatisfaction. All of the following are valid reasons for Sterling's dissatisfaction **except** that the

- A. Material price variance is the responsibility of the purchasing department.
  - B. Cause of the unfavorable material usage variance was the acquisition of substandard material.
  - C. Standards have not been adjusted to the engineering changes.
  - D. Variance calculations fail to properly reflect that actual production exceeded normal production capacity.
- Answer (A) is **incorrect**. This is a valid argument; the production supervisor has no control over the price for raw materials negotiated by Purchasing.
  - Answer (B) is **incorrect**. This is a valid argument; the production supervisor has no control over the quality of raw materials procured by Purchasing.

- Answer (C) is **incorrect**. This is a valid argument; the production supervisor cannot be held responsible if the standards have not been adjusted for engineering changes in the process.
- Answer (D) is **correct**. The production supervisor displays a misunderstanding of the variance process by raising this issue. Variance calculations are specifically designed to isolate the effects of actual production varying from normal production. Also, the materials variances should not be affected by the higher production.

**[33] Gleim #: 7.3.53 -- Source: CMA 0408 2-255**

During the month of May, Tyler Company experienced a significant unfavorable material efficiency variance in the production of its single product at one of Tyler's plants. Which one of the following reasons would be **least** likely to explain why the unfavorable variance arose?

- A. Inferior materials were purchased.
  - B. Actual production was lower than planned production.
  - C. Workers used were less skilled than expected.
  - D. Replacement production equipment had just been installed.
- Answer (A) is **incorrect**. Inferior raw materials can be a cause of an unfavorable materials efficiency variance.
  - Answer (B) is **correct**. An unfavorable material efficiency variance means that excess materials were used during production. This might be due to buying inferior quality materials or using workers who were not as skilled in working with the materials. Also, new equipment might damage materials during early production runs.
  - Answer (C) is **incorrect**. Less-skilled workers can tend to be wasteful of raw materials, leading to an unfavorable efficiency variance.
  - Answer (D) is **incorrect**. The use of unfamiliar equipment can result in an unfavorable materials efficiency variance.

[1] Gleim #: 7.4.54 -- Source: CMA 1296 3-24

The inventory control supervisor at Wilson Manufacturing Corporation reported that a large quantity of a part purchased for a special order that was never completed remains in stock. The order was not completed because the customer defaulted on the order. The part is not used in any of Wilson's regular products. After consulting with Wilson's engineers, the vice president of production approved the substitution of the purchased part for a regular part in a new product. Wilson's engineers indicated that the purchased part could be substituted providing it was modified. The units manufactured using the substituted part required additional direct labor hours resulting in an unfavorable direct labor efficiency variance in the Production Department. The unfavorable direct labor efficiency variance resulting from the substitution of the purchased part in inventory is best assigned to the

- A. Sales manager.
- B. Inventory supervisor.
- C. Production manager.
- D. Vice president of production.

- Answer (A) is **incorrect**. The sales manager did not make the substitution decision.
- Answer (B) is **incorrect**. The inventory supervisor did not make the substitution decision.
- Answer (C) is **incorrect**. The production manager did not make the substitution decision.
- Answer (D) is **correct**. An unfavorable direct labor efficiency variance is normally charged to the production manager, the person with the most control over the amount and kinds of direct labor used. However, that individual is not responsible. (S)he was told to use the nonconforming part that required extra labor time. Thus, the variance should be charged to the vice president of production, the individual who most influenced the incurrence of the cost.

[2] Gleim #: 7.4.55 -- Source: CMA 694 3-22

Under a standard cost system, direct labor price variances are usually **not** attributable to

- A. Union contracts approved before the budgeting cycle.
- B. Labor rate predictions.
- C. The use of a single average standard rate.
- D. The assignment of different skill levels of workers than planned.

- Answer (A) is **correct**. The direct labor price (rate) variance is the actual hours worked times the difference between the standard rate and the actual rate paid. This difference may be attributable to (1) a change in labor rates since the establishment of the standards, (2) using a single average standard rate despite different rates earned among different employees, (3) assigning higher-paid workers to jobs estimated to require lower-paid workers (or vice versa), or (4) paying hourly rates, but basing standards on piecework rates (or vice versa). The difference should not be caused by a union contract approved before the budgeting cycle because such rates would have been incorporated into the standards.
- Answer (B) is **incorrect**. Predictions about labor rates may have been inaccurate.
- Answer (C) is **incorrect**. Using a single average standard rate may lead to variances if some workers are paid more than others and the proportions of hours worked differ from estimates.
- Answer (D) is **incorrect**. Assigning higher paid (and higher skilled) workers to jobs not requiring such skills leads to an unfavorable variance.

---

**[Fact Pattern #1]**

Zazoo, Inc. specializes in reviewing and editing technical magazine articles. Zazoo sets the following standards for evaluating the performance of the professional staff:

Annual budgeted fixed costs for normal capacity level of 10,000 articles reviewed and edited	\$600,000
Standard professional hours per 10 articles	200 hours
Flexible budget of standard labor costs to process 10,000 articles	\$10,000,000

The following data apply to the 9,500 articles that were actually reviewed and edited during the current year.

Total hours used by professional staff	192,000 hours
Flexible costs	\$9,120,000
Total cost	\$9,738,000

---

**[3] Gleim #: 7.4.56 -- Source: CMA 692 3-17**

(Refers to Fact Pattern #1)

Zazoo's labor efficiency variance for the year is

- A. \$100,000 unfavorable.
- B. \$238,000 unfavorable.
- C. \$380,000 favorable.
- D. \$500,000 favorable.

- Answer (A) is **correct**. The labor efficiency variance is the standard cost per hour times the difference between standard and actual hour. The standard labor rate is \$50 per hour, and the standard time allowed for 9,500 articles is 190,000 hours ( $9,500 \times 20$ ). Actual hours worked totaled 192,000. Thus, an unfavorable variance of 2,000 hours occurred. The unfavorable labor efficiency variance is therefore \$100,000 ( $2,000 \text{ hours} \times \$50$ ).
- Answer (B) is **incorrect**. The difference between the standard labor cost (\$9,500,000) and total actual (fixed + variable) cost (\$9,738,000) is \$238,000.
- Answer (C) is **incorrect**. The variance is unfavorable.
- Answer (D) is **incorrect**. The efficiency variance is based on standard hours for actual production levels--in this case, 190,000 hours.

**[Fact Pattern #2]**

Jackson Industries employs a standard cost system in which direct materials inventory is carried at standard cost. Jackson has established the following standards for the prime costs of one unit of product.

	Standard Quantity	Standard Price	Standard Cost
Direct materials	5 pounds	\$ 3.60/pound	\$18.00
Direct labor	1.25 hours	\$12.00/hour	15.00
			<u>\$33.00</u>

During May, Jackson purchased 125,000 pounds of direct materials at a total cost of \$475,000. The total factory wages for May were \$364,000, 90% of which were for direct labor. Jackson manufactured 22,000 units of product during May using 108,000 pounds of direct materials and 28,000 direct labor hours.

**[4] Gleim #: 7.4.57 -- Source: CMA 692 3-19**

(Refers to Fact Pattern #2)

Jackson's direct materials usage (quantity) variance for May is

- A. \$7,200 unfavorable.
- B. \$7,600 favorable.
- C. \$5,850 unfavorable.
- D. \$7,200 favorable.

- Answer (A) is **incorrect**. The variance is favorable.
- Answer (B) is **incorrect**. The variance is calculated by multiplying the quantity difference times the standard unit cost of \$3.60, not the actual unit cost.
- Answer (C) is **incorrect**. The variance is favorable. Actual usage was less than the standard.
- Answer (D) is **correct**. This variance equals the standard unit cost times the difference between the actual quantity used and the standard quantity for good production. Consequently, the variance is \$7,200 favorable  $\{[(5 \text{ pounds} \times 22,000 \text{ units}) - 108,000 \text{ pounds used}] \times \$3.60\}$ .

**[5] Gleim #: 7.4.58 -- Source: CMA 692 3-20**

(Refers to Fact Pattern #2)

Jackson's direct labor price (rate) variance for May is

- A. \$8,400 favorable.
- B. \$7,200 unfavorable.
- C. \$8,400 unfavorable.
- D. \$6,000 unfavorable.

- Answer (A) is **correct**. The direct labor rate variance equals the actual quantity of hours worked times the difference between the standard and actual labor rates. Total direct labor cost was \$327,600 ( $\$364,000 \times 90\%$ ), and the actual unit direct labor cost was \$11.70 ( $\$327,600 \div 28,000 \text{ hours}$ ). Thus, the variance is \$8,400 favorable  $[28,000 \text{ hours} \times (\$12.00 - \$11.70)]$ .
- Answer (B) is **incorrect**. The variance is favorable. The actual labor rate was less than the standard rate.
- Answer (C) is **incorrect**. The variance is favorable. The actual labor rate was less than the standard rate.

- Answer (D) is **incorrect**. The labor efficiency variance is \$6,000, not the labor rate variance.

**[6] Gleim #: 7.4.59 -- Source: CMA 692 3-21**

(Refers to Fact Pattern #2)

Jackson's direct labor usage (efficiency) variance for May is

- A. \$5,850 favorable.
- B. \$6,000 unfavorable.
- C. \$5,850 unfavorable.
- D. \$6,000 favorable.

- Answer (A) is **incorrect**. The variance is unfavorable. More hours were worked than allowed by the standards.
- Answer (B) is **correct**. The direct labor efficiency variance equals the standard unit cost times the difference between actual hours and standard hours. Accordingly, the variance is \$6,000 unfavorable  $\{[28,000 \text{ hours} - (1.25 \text{ hours} \times 22,000 \text{ units})] \times \$12\}$ .
- Answer (C) is **incorrect**. The labor efficiency variance is calculated using the standard labor rate, not the actual labor rate.
- Answer (D) is **incorrect**. The variance is unfavorable.

**[7] Gleim #: 7.4.60 -- Source: CMA 693 3-15**

The static budget for the month of May was for 9,000 units with direct materials at \$15 per unit. Direct labor was budgeted at 45 minutes per unit for a total of \$81,000. Actual output for the month was 8,500 units with \$127,500 in direct materials and \$77,775 in direct labor expense. The direct labor standard of 45 minutes was maintained throughout the month. Variance analysis of the performance for the month of May shows a(n)

- A. Favorable direct materials usage variance of \$7,500.
  - B. Favorable direct labor efficiency variance of \$1,275.
  - C. Unfavorable direct labor efficiency variance of \$1,275.
  - D. Unfavorable direct labor price variance of \$1,275.
- Answer (A) is **incorrect**. The amount of \$7,500 equals the difference between the static budget output (9,000 units) and the flexible budget output (8,500 units), multiplied by the budgeted unit cost of direct materials (\$15). This amount is not a direct materials usage variance  $[(\text{actual quantity of input} - \text{standard quantity of input}) \times \text{standard price of input}]$ .

- Answer (B) is **incorrect**. No direct labor efficiency variance occurred. Budgeted hours were identical to actual hours for 8,500 units.
- Answer (C) is **incorrect**. No direct labor efficiency variance occurred. Budgeted hours were identical to actual hours for 8,500 units.
- Answer (D) is **correct**. Because direct labor for 9,000 units was budgeted at \$81,000, the unit direct labor cost is \$9. Thus, the direct labor budget for 8,500 units is \$76,500, and the total direct labor variance is \$1,275 (\$77,775 – \$76,500). Because the actual cost is greater than the budgeted amounts, the \$1,275 variance is unfavorable. Given that the actual time per unit (45 minutes) was the same as that budgeted, no direct labor efficiency variance was incurred. Hence, the entire \$1,275 unfavorable variance must be attributable to the direct labor rate (or price) variance.

**[8] Gleim #: 7.4.61 -- Source: CMA 1294 3-25**

An unfavorable direct labor efficiency variance could be caused by a(n)

- A. Unfavorable variable overhead spending variance.
  - B. Unfavorable direct materials usage variance.
  - C. Unfavorable fixed overhead volume variance.
  - D. Favorable variable overhead spending variance.
- Answer (A) is **incorrect**. The variable overhead spending variance may be affected by, but does not affect, a direct labor efficiency variance. It equals the difference between actual variable overhead, which includes indirect but not direct labor, and the variable overhead applied based on the standard rate and the actual activity level, which may or may not be measured in direct labor hours. Thus, the effect of an unfavorable direct labor efficiency variance is to decrease an unfavorable variable overhead spending variance or to increase a favorable variable overhead spending variance.
  - Answer (B) is **correct**. An unfavorable direct labor efficiency variance indicates that actual hours exceeded standard hours. Too many hours may have been used because of inefficiency on the part of employees, excessive coffee breaks, machine down-time, inadequate materials, or materials of poor quality that required excessive rework. An unfavorable direct materials usage variance might be related to an unfavorable labor efficiency variance. Working on a greater quantity of direct materials may require more direct labor time.
  - Answer (C) is **incorrect**. The fixed overhead volume variance does not affect, and is not affected by, a direct labor efficiency variance. It equals the difference between budgeted fixed overhead and the fixed overhead applied based on the standard rate and the standard input (e.g., direct labor) allowed for the actual output.

- Answer (D) is **incorrect**. The variable overhead spending variance may be affected by, but does not affect, a direct labor efficiency variance. It equals the difference between actual variable overhead, which includes indirect but not direct labor, and the variable overhead applied based on the standard rate and the actual activity level, which may or may not be measured in direct labor hours. Thus, the effect of an unfavorable direct labor efficiency variance is to decrease an unfavorable variable overhead spending variance or to increase a favorable variable overhead spending variance.

**[9] Gleim #: 7.4.62 -- Source: CMA 692 3-15**

(Refers to Fact Pattern #1)

Using a flexible budget, Zazoo's total cost planned for the review and editing of 9,500 articles should be

- A. \$9,500,000
- B. \$10,070,000
- C. \$10,100,000
- D. \$10,570,000

- Answer (A) is **incorrect**. Variable labor costs only equal \$9,500,000.
- Answer (B) is **incorrect**. This is calculated by incorrectly adjusting the fixed costs downward for production.
- Answer (C) is **correct**. The flexible budget provides for a cost of \$1,000 per article ( $\$10,000,000 \div 10,000$  articles). Each article should require 20 hours of labor ( $200 \text{ hours} \div 10 \text{ articles}$ ). Thus, the standard labor rate is \$50 per hour ( $\$1,000 \div 20 \text{ hours}$ ), and total standard variable labor cost is \$9,500,000 ( $9,500 \text{ articles} \times 20 \text{ hours} \times \$50 \text{ per hour}$ ). Accordingly, total expected costs are \$10,100,000 ( $\$9,500,000 + \$600,000 \text{ FC}$ ).
- Answer (D) is **incorrect**. Labor costs will decline as production declines, but fixed costs will not. This is incorrectly calculated by adding the standard labor costs for 10,000 articles to a reduced fixed cost calculated for 9,500 articles.

**[10] Gleim #: 7.4.63 -- Source: CMA 692 3-16**

(Refers to Fact Pattern #1)

Zazoo's fixed cost spending variance for the year is

- A. \$18,000 unfavorable.
- B. \$30,000 favorable.
- C. \$48,000 unfavorable.
- D. \$18,000 favorable.

- Answer (A) is **correct**. Budgeted fixed costs are \$600,000. The actual fixed costs were \$618,000 (\$9,738,000 total costs – \$9,120,000 flexible costs). Because actual costs were \$18,000 higher than the budget, the variance is unfavorable.
- Answer (B) is **incorrect**. The variance is unfavorable.
- Answer (C) is **incorrect**. The variance of \$48,000 is based on a false presumption that fixed costs will be less at a 9,500 production level than a 10,000 level.
- Answer (D) is **incorrect**. The variance is unfavorable.

---

**[Fact Pattern #3]**

Arrow Industries employs a standard cost system in which direct materials inventory is carried at standard cost. Arrow has established the following standards for the prime costs of one unit of product.

	Standard Quantity	Standard Price	Standard Cost
Direct materials	8 pounds	\$1.80 per pound	\$14.40
Direct labor	.25 hour	\$8.00 per hour	<u>2.00</u>
			<u>\$16.40</u>

During November, Arrow purchased 160,000 pounds of direct materials at a total cost of \$304,000. The total factory wages for November were \$42,000, 90% of which were for direct labor. Arrow manufactured 19,000 units of product during November using 142,500 pounds of direct materials and 5,000 direct labor hours.

---

**[11] Gleim #: 7.4.64 -- Source: CMA 1291 3-2**

(Refers to Fact Pattern #3)

Arrow's direct materials usage (quantity) variance for November is

- A. \$14,400 unfavorable.
- B. \$1,100 favorable.
- C. \$17,100 unfavorable.
- D. \$17,100 favorable.

- Answer (A) is **incorrect**. The direct materials quantity variance is favorable because the actual quantity used is less than the standard quantity.
- Answer (B) is **incorrect**. The direct materials quantity variance equals the standard price multiplied times the difference between the actual and standard quantities.

- Answer (C) is **incorrect**. The direct materials quantity variance is favorable because the actual quantity used is less than the standard quantity.
- Answer (D) is **correct**. The direct materials quantity variance equals the standard price (\$1.80 per pound) times the difference between the actual and standard quantities. The actual quantity used was 142,500 pounds. The standard quantity is 8 pounds per unit of product. Given that 19,000 units were produced, the standard quantity for the actual output was 152,000 pounds (8 lbs.  $\times$  19,000 units). Hence, the direct materials quantity variance is \$17,100  $[(152,000 - 142,500) \times \$1.80]$ . Since the actual quantity used was less than the standard quantity, the variance is favorable.

**[12] Gleim #: 7.4.65 -- Source: CMA 1291 3-3**

(Refers to Fact Pattern #3)

Arrow's direct labor price (rate) variance for November is

- A. \$2,200 favorable.
  - B. \$1,900 unfavorable.
  - C. \$2,000 unfavorable.
  - D. \$2,090 favorable.
- Answer (A) is **correct**. The direct labor rate variance equals the actual quantity of labor used times the difference between the actual and standard prices for labor. The actual total price of labor was \$42,000, 90% of which was for direct labor. Thus, the price of direct labor was \$37,800. A total of 5,000 hours of direct labor was worked. Thus, the actual hourly rate was \$7.56  $(\$37,800 \div 5,000 \text{ hrs.})$ , and the variance is \$2,200  $[(\$8.00 - \$7.56) \times 5,000 \text{ hrs.}]$ . The actual rate was less than standard, so the variance is favorable.
  - Answer (B) is **incorrect**. The labor rate variance equals the actual quantity of labor used times the difference between the actual and standard prices for labor.
  - Answer (C) is **incorrect**. The labor rate variance equals the actual quantity of labor used times the difference between the actual and standard prices for labor.
  - Answer (D) is **incorrect**. The labor rate variance equals the actual quantity of labor used times the difference between the actual and standard prices for labor.

**[13] Gleim #: 7.4.66 -- Source: CMA 1291 3-4**

(Refers to Fact Pattern #3)

Arrow's direct labor usage (efficiency) variance for November is

- A. \$2,200 favorable.
- B. \$2,000 favorable.
- C. \$2,000 unfavorable.
- D. \$1,800 unfavorable.

- Answer (A) is **incorrect**. The direct labor efficiency variance equals the standard labor rate times the difference between actual and standard hours.
- Answer (B) is **incorrect**. The direct labor efficiency variance equals the standard labor rate times the difference between actual and standard hours.
- Answer (C) is **correct**. The direct labor efficiency variance equals the standard labor rate times the difference between actual and standard hours. Because each unit requires .25 hours of labor, the standard hours allowed for November would have been 4,750 ( $.25 \times 19,000$  units of output). Accordingly, the variance is \$2,000 [ $(4,750 \text{ standard hrs.} - 5,000 \text{ actual hrs.}) \times \$8.00 \text{ standard rate}$ ]. This variance is unfavorable because the actual hours exceeded the standard hours.
- Answer (D) is **incorrect**. The direct labor efficiency variance equals the standard labor rate times the difference between actual and standard hours.

**[30] Gleim #: 7.4.83 -- Source: CMA 0408 2-221**

A company has a direct labor price variance that is favorable. Of the following, the most serious concern the company may have about this variance is that

- A. The circumstances giving rise to the favorable variance will not continue in the future.
  - B. The production manager may not be using human resources as efficiently as possible.
  - C. The cause of the favorable variance may result in other larger unfavorable variances in the value-chain.
  - D. Actual production is less than budgeted production.
- Answer (A) is **incorrect**. The continuation of a favorable variance is not a cause for concern; the idea of a standard cost system is that there should be no variances of any type.

- Answer (B) is **incorrect**. The production manager may be using his resources efficiently, but that cannot be determined from the information given; perhaps the manager assigned the lower-paid workers to a job even though they were slower than more highly skilled workers.
- Answer (C) is **correct**. A favorable labor rate variance means the company is using lower-paid workers than what the standard-setters thought should be used. These workers are apparently less experienced or otherwise less skilled. As a result, the use of lower-paid workers may lead to an unfavorable labor efficiency variance or an unfavorable materials usage variance as the lower-skilled workers require more hours or more materials than would more skilled employees.
- Answer (D) is **incorrect**. The labor rate variance says nothing about production levels, either actual or budgeted.

**[31] Gleim #: 7.4.84 -- Source: CMA 0408 2-233**

MinnOil performs oil changes and other minor maintenance services (e.g., tire pressure checks) for cars. The company advertises that all services are completed within 15 minutes for each service. On a recent Saturday, 160 cars were serviced, resulting in the following labor variances: rate, \$19 unfavorable; efficiency, \$14 favorable. If MinnOil's standard labor rate is \$7 per hour, determine the actual wage rate per hour and the actual hours worked.

	<u>Wage Rate</u>	<u>Hours Worked</u>
A.	\$6.55	42.00
B.	\$6.67	42.71
C.	\$7.45	42.00
D.	\$7.50	38.00

- Answer (A) is **incorrect**. Forty-two hours results from reversing the sign of the efficiency variance, and \$6.55 results from reversing the sign of the rate variance.
- Answer (B) is **incorrect**. Treating the rate variance as if it were the efficiency variance and vice versa results in \$6.67 and 42.71.
- Answer (C) is **incorrect**. Forty-two hours results from reversing the sign of the efficiency variance.

- Answer (D) is **correct**. Since 160 cars were serviced and each car requires 1/4 of an hour to service, the “expected” quantity of hours, that is, the quantity that should have been expended given the achieved level of production, was 40 ( $160 \times .25$ ). The actual number of hours expended can be found by substituting in the formula for the efficiency variance:

$$\begin{aligned}(EQ - AQ) \times SP &= \text{Labor efficiency variance} \\ (40 - AQ) \times \$7.00 &= \$14 \text{ F} \\ 40 - AQ &= 2 \\ AQ &= 38\end{aligned}$$

Substituting again allows us to derive the actual wage rate paid:

$$\begin{aligned}AQ \times (SP - AP) &= \text{Labor rate variance} \\ 38 \times (\$7.00 - AP) &= \$19 \text{ U} \\ (\$7.00 - AP) &= .5 \\ AP &= \$7.50\end{aligned}$$

**[32] Gleim #: 7.4.85 -- Source: CMA 0408 2-237**

Lee Manufacturing uses a standard cost system with overhead applied based on direct labor hours. The manufacturing budget for the production of 5,000 units for the month of May included the following information.

Direct labor (10,000 hrs. at \$15 per hr.)	\$150,000
Variable overhead	30,000
Fixed overhead	80,000

During May, 6,000 units were produced and the direct labor efficiency variance was \$1,500 unfavorable. Based on this information, the actual number of direct labor hours used in May was

- A. 9,900
- B. 10,100
- C. 11,900
- D. 12,100

- Answer (A) is **incorrect**. Using the static budget inputs for 5,000 units and reversing the sign of the variance results in 9,900 hours.

- Answer (B) is **incorrect**. Using the static budget inputs rather than the “expected” inputs results in 10,100 hours.
- Answer (C) is **incorrect**. Treating the labor efficiency variance as favorable results in 11,900 hours.
- Answer (D) is **correct**. The standard inputs per unit of output can be determined by dividing the budgeted total input hours (10,000) by the budgeted total output level (5,000), giving 2 hours of direct labor for every finished unit. Since the actual output level was 6,000, the “expected” quantity, or number of hours allowed given the achieved level of production, was 12,000 ( $6,000 \times 2$ ). These amounts can be substituted in the formula for the efficiency variance:

$$\begin{aligned}(EQ - AQ) \times SP &= \text{Labor efficiency variance} \\ (12,000 - AQ) \times \$15 &= \$1,500 \text{ U} \\ 12,000 - AQ &= 100 \\ AQ &= 12,100\end{aligned}$$

**[33] Gleim #: 7.4.86 -- Source: CMA 0408 2-239**

Randall Company uses standard costing and flexible budgeting and is evaluating its direct labor. The flexible budget variance can usually be broken down into two other variances identified as the

- A. Direct labor rate variance and direct labor efficiency variance.
  - B. Direct labor cost variance and direct labor volume variance.
  - C. Direct labor rate variance and direct labor volume variance.
  - D. Direct labor cost variance and direct labor efficiency variance.
- Answer (A) is **correct**. Any flexible budget variance for direct labor (or direct material) can be subdivided into two component variances, the rate (price) variance and the efficiency (quantity, usage) variance.
  - Answer (B) is **incorrect**. There is no recognized labor cost variance, and the labor volume variance is not a component of the flexible budget variance.
  - Answer (C) is **incorrect**. The labor volume variance is not a component of the flexible budget variance.
  - Answer (D) is **incorrect**. There is no recognized labor cost variance.

**[34] Gleim #: 7.4.87 -- Source: CMA 0408 2-242**

A company had a total labor variance of \$15,000 favorable and a labor efficiency variance of \$18,000 unfavorable. The labor price variance was

- A. \$3,000 favorable.
- B. \$3,000 unfavorable.
- C. \$33,000 favorable.
- D. \$33,000 unfavorable.

- Answer (A) is **incorrect**. Improperly reversing the sign of the efficiency variance results in \$3,000 favorable.
- Answer (B) is **incorrect**. Improperly netting the total labor variance and the labor efficiency variance results in \$3,000 favorable.
- Answer (C) is **correct**. The total variance for labor consists of a price (rate) variance and an efficiency (usage) variance. Since the total variance is \$15,000 favorable, the price variance must be \$33,000 unfavorable ( $-\$18,000 + \$33,000 = \$15,000$ ).
- Answer (D) is **incorrect**. Reversing the sign of the total labor variance results in \$33,000 unfavorable.

**[35] Gleim #: 7.4.88 -- Source: CMA 0408 2-252**

The accounting records of Foster Corporation reveal a favorable labor efficiency variance for the period just ended. Which of the following comments by Foster's executives reflect a limited knowledge of the variance investigation process?

1. "We can use statistical testing procedures to determine whether or not the variance should be investigated."
2. "Let's look into it. Yes, our operations might be fine; however, our standard labor time may need revision."
3. "I don't believe in all of these rules to decide whether or not variances should be investigated. Good judgment is the real key."
4. "Don't worry – the variance was caused by a random event and is well within our range of possible acceptable outcomes."
5. "Why are you getting so upset? This is a favorable variance, so let's forget it."

- A. 2 and 5 only.
- B. 1, 3, and 4 only.
- C. 4 and 5 only.
- D. 5 only.

- Answer (A) is **incorrect**. The impulse to investigate a variance with a view to revising a standard is a sound response.
- Answer (B) is **incorrect**. Statements 1, 3, and 4 reflect a sound understanding of variance analysis.
- Answer (C) is **incorrect**. The establishment of ranges of acceptable outcomes reflects a sound understanding of variance analysis.
- Answer (D) is **correct**. No variance by itself is either good or bad. Everything depends on context and what can be revealed by the component variances (if any) of a given variance. For example, a favorable direct materials variance may reflect unrealistically pessimistic standards for materials usage, while a favorable labor variance may reflect workers rushing the process and producing inferior goods.

[1] Gleim #: 7.5.89 -- Source: CMA 1295 3-8

The efficiency variance for either direct labor or materials can be divided into

- A. Spending variance and yield variance.
- B. Yield variance and price variance.
- C. Volume variance and mix variance.
- D. Yield variance and mix variance.

- Answer (A) is **incorrect**. A spending variance is not the same as an efficiency variance.
- Answer (B) is **incorrect**. A price variance is not the same as an efficiency variance.
- Answer (C) is **incorrect**. A volume variance is based on fixed costs, and an efficiency variance is based on variable costs.
- Answer (D) is **correct**. A direct labor or materials efficiency variance is calculated by multiplying the difference between standard and actual usage times the standard cost per unit of input. The efficiency variances can be divided into yield and mix variances. Mix and yield variances are calculated only when the production process involves combining several materials or classes of labor in varying proportions (when substitutions are allowable in combining resources).

[1] Gleim #: 7.6.100 -- Source: CMA 1289 4-6

If overhead is applied on the basis of units of output, the variable overhead efficiency variance will be

- A. Zero.
  - B. Favorable, if output exceeds the budgeted level.
  - C. Unfavorable, if output is less than the budgeted level.
  - D. A function of the direct labor efficiency variance.
- Answer (A) is **correct**. The variable overhead efficiency variance equals the product of the variable overhead application rate and the difference between the standard input for the actual output and the actual input. Hence, the variance will be zero if variable overhead is applied on the basis of units of output because the difference between actual and standard input cannot be recognized.
  - Answer (B) is **incorrect**. The variance will be zero.
  - Answer (C) is **incorrect**. The variance will be zero.
  - Answer (D) is **incorrect**. The correlation between the variable overhead and direct labor efficiency variances occurs only when overhead is applied on the basis of direct labor.

[2] Gleim #: 7.6.101 -- Source: CMA 1289 4-1

Variable overhead is applied on the basis of standard direct labor hours. If, for a given period, the direct labor efficiency variance is unfavorable, the variable overhead efficiency variance will be

- A. Favorable.
  - B. Unfavorable.
  - C. The same amount as the labor efficiency variance.
  - D. Indeterminable because it is not related to the labor efficiency variance.
- Answer (A) is **incorrect**. The efficiency variances are directly correlated.
  - Answer (B) is **correct**. The calculation of the variable overhead efficiency variance is similar to that of the direct labor efficiency variance in that both measure the effect of the difference between actual and standard hours. Assuming overhead is applied on the basis of direct labor hours, both variance calculations will be based on the same number of hours. Thus, if the direct labor efficiency variance is unfavorable, the variable overhead efficiency variance will also be unfavorable.

- Answer (C) is **incorrect**. The amount of the variance is dependent upon the actual costs incurred.
- Answer (D) is **incorrect**. The efficiency variances are directly correlated.

**[3] Gleim #: 7.6.102 -- Source: CMA 1295 3-4**

Variable overhead is applied on the basis of standard direct labor hours. If, for a given period, the direct labor efficiency variance is unfavorable, the variable overhead efficiency variance will be

- A. Favorable.
  - B. Unfavorable.
  - C. Zero.
  - D. The same amount as the direct labor efficiency variance.
- Answer (A) is **incorrect**. Both efficiency variances are based on the same number of hours worked. Thus, if one is unfavorable, the other will also be unfavorable.
  - Answer (B) is **correct**. If variable overhead is applied to production on the basis of direct labor hours, both the variable overhead efficiency variance and the direct labor efficiency variance will be calculated on the basis of the same number of hours. If the direct labor efficiency variance is unfavorable, the overhead efficiency variance will also be unfavorable because both variances are based on the difference between standard and actual direct labor hours worked.
  - Answer (C) is **incorrect**. Both efficiency variances are based on the same number of hours worked. Thus, if one is unfavorable, the other will also be unfavorable.
  - Answer (D) is **incorrect**. The amount of the variances will be different depending on the amount of the costs anticipated and actually paid.

**[4] Gleim #: 7.6.103 -- Source: CMA 0205 2-41**

Baltimore Products has an estimated practical capacity of 90,000 machine hours, and each unit requires two machine hours. The following data apply to a recent accounting period:

Actual variable overhead	\$240,000
Actual fixed overhead	\$442,000
Actual machine hours worked	88,000
Actual finished units produced	42,000
Budgeted variable overhead at 90,000 machine hours	\$200,000
Budgeted fixed overhead	\$450,000

Of the following factors, Baltimore's production volume variance is most likely to have been caused by

- A. A wage hike granted to a production supervisor.
  - B. A newly imposed initiative to reduce finished goods inventory levels.
  - C. Acceptance of an unexpected sales order.
  - D. Temporary employment of workers with lower skill levels than originally anticipated.
- 
- Answer (A) is **incorrect**. A wage hike to a production supervisor is a variable cost and would thus affect the variable, not the fixed, variance.
  - Answer (B) is **correct**. Fixed overhead was budgeted based on a practical capacity of 90,000 machine hours. Because the actual hours used were 88,000, fixed overhead was underapplied, and an unfavorable production-volume variance resulted. The only one of the four actions that would result in fewer machine hours than were budgeted being consumed is the initiative to reduce finished goods inventory levels.
  - Answer (C) is **incorrect**. An unexpected sales order would result in more machine hours than were budgeted, not fewer. In other words, an unexpected order would result in a variable volume variance.
  - Answer (D) is **incorrect**. Worker wages are a variable cost and would thus affect the variable, not the fixed, overhead variance.

[5] Gleim #: 7.6.104 -- Source: CMA 1279 4-10

The fixed overhead volume variance is the

- A. Measure of the lost profits from the lack of sales volume.
  - B. Amount of the underapplied or overapplied fixed overhead costs.
  - C. Potential cost reduction that can be achieved from better cost control.
  - D. Measure of production inefficiency.
- Answer (A) is **incorrect**. The fixed overhead volume variance concerns the application of fixed cost to product and does not encompass revenue or sales concepts in any way.
  - Answer (B) is **correct**. The fixed overhead volume variance is the difference between budgeted fixed costs and actual overhead applied, which equals the budgeted fixed overhead rate times the standard input allowed for the actual output. It is solely a measure of capacity usage and does not signify that fixed costs were more or less than budgeted.
  - Answer (C) is **incorrect**. The fixed overhead volume variance is calculated on the assumption that fixed costs are constant.
  - Answer (D) is **incorrect**. The volume variance concerns output levels rather than the efficiency of production.

[6] Gleim #: 7.6.105 -- Source: CMA 1273 4-13

Which of these variances is **least** significant for cost control?

- A. Labor price variance.
  - B. Materials quantity variance.
  - C. Fixed O/H volume variance.
  - D. Variable O/H spending variance.
- Answer (A) is **incorrect**. A labor price variance reflects a difference between the actual price of labor and the budgeted price of labor, which is useful information for cost control.
  - Answer (B) is **incorrect**. The materials quantity variance is the difference between budgeted and actual materials used during production. This is an important variance for cost control.

- Answer (C) is **correct**. The fixed O/H volume variance occurs when actual activity levels differ from anticipated levels. It is an excellent example of cost allocation as opposed to cost control. Unlike other variances, the volume variance does not directly reflect a difference between actual and budgeted expenditures. The economic substance of this variance lies in the costs or benefits of capacity usage or nonusage. For example, idle capacity results in the loss of the contribution margin from units not produced and sold.
- Answer (D) is **incorrect**. The difference between actual variable O/H and the product of the actual input and the budgeted variable O/H rate is useful information for cost control.

**[7] Gleim #: 7.6.106 -- Source: CMA 0205 2-42**

Lee Manufacturing uses a standard cost system with overhead applied based upon direct labor hours. The manufacturing budget for the production of 5,000 units for the month of May included the following information:

Direct labor (10,000 hours at \$15 per hour)	\$150,000
Variable overhead	30,000
Fixed overhead	80,000

During May, 6,000 units were produced and the fixed overhead budget variance was \$2,000 favorable. Fixed overhead during May was

- A. Underapplied by \$2,000.
- B. Underapplied by \$16,000.
- C. Overapplied by \$16,000.
- D. Overapplied by \$18,000.

- Answer (A) is **incorrect**. Misinterpreting the \$2,000 favorable budget (spending) variance results in \$2,000 underapplied.
- Answer (B) is **incorrect**. Reversing the proper order of subtraction results in \$16,000 underapplied.
- Answer (C) is **incorrect**. The production-volume variance is \$16,000 overapplied.

- Answer (D) is **correct**. First, the actual production level for the month was 6,000 units of output. Second, the standard number of labor hours consumed per unit of output is 2 (10,000 budgeted direct labor hours ÷ 5,000 budgeted units output). Third, since fixed overhead for the month was budgeted at \$80,000 and it is to be applied in proportion to 10,000 budgeted direct labor hours, the application rate is \$8 per direct labor hour (\$80,000 ÷ 10,000). Thus, the amount of fixed overhead applied for the month was \$96,000 = (6,000 × \$8 × 2). The fixed overhead budget variance was \$2,000 favorable, which means the actual fixed overhead incurred for the month was \$78,000 (\$80,000 – \$2,000). Thus, fixed overhead was overapplied by \$18,000 (\$96,000 – \$78,000).

---

**[Fact Pattern #1]**

Tiny Tykes Corporation had the following activity relating to its fixed and variable overhead for the month of July:

Actual costs

Fixed overhead	\$120,000
Variable overhead	80,000

Flexible budget

(Standard input allowed for actual  
output achieved × budgeted rate)

Variable overhead	90,000
-------------------	--------

Applied

(Standard input allowed for actual  
output achieved × budgeted rate)

Fixed overhead	125,000
----------------	---------

Variable overhead spending variance	2,000 F
-------------------------------------	---------

Production volume variance	5,000 U
----------------------------	---------

---

**[8] Gleim #: 7.6.107 -- Source: CMA 693 3-19**

(Refers to Fact Pattern #1)

If the budgeted rate for applying variable overhead was \$20 per direct labor hour, how efficient or inefficient was Tiny Tykes Corporation in terms of using direct labor hours as an activity base?

- A. 100 direct labor hours inefficient.
- B. 100 direct labor hours efficient.
- C. 400 direct labor hours inefficient.
- D. 400 direct labor hours efficient.

- Answer (A) is **incorrect**. The variances are favorable.
- Answer (B) is **incorrect**. The number of 100 direct labor hours are equivalent to the spending variance ( $100 \text{ hours} \times \$20 = \$2,000$ ).
- Answer (C) is **incorrect**. The variances are favorable.
- Answer (D) is **correct**. The variable overhead spending and efficiency variances are the components of the total variable overhead variance. Given that actual variable overhead was \$80,000 and the variable overhead based on the budgeted rate was \$90,000, the total variance is \$10,000 favorable. If the overhead spending variance is \$2,000 favorable, the efficiency variance must be \$8,000 favorable (\$10,000 total – \$2,000 spending). At a rate of \$20 per hour, this variance is equivalent to 400 direct labor hours ( $\$8,000 \div \$20$ ).

**[9] Gleim #: 7.6.108 -- Source: CMA 693 3-20**

(Refers to Fact Pattern #1)

Tiny Tykes' fixed overhead efficiency variance is

- A. \$3,000 favorable.
- B. \$3,000 unfavorable.
- C. \$5,000 favorable.
- D. Never a meaningful variance.

- Answer (A) is **incorrect**. Efficiency variances are applicable to variable costs.
- Answer (B) is **incorrect**. Efficiency variances are applicable to variable costs.
- Answer (C) is **incorrect**. Efficiency variances are applicable to variable costs.

- Answer (D) is **correct**. Variable overhead variances can be subdivided into spending and efficiency components. However, fixed overhead variances do not have an efficiency component because fixed costs, by definition, are not related to changing levels of output. Fixed overhead variances are typically subdivided into a budget (or fixed overhead spending) variance and a volume variance.

**[10] Gleim #: 7.6.109 -- Source: CMA 1295 3-7**

The variance in an absorption costing system that measures the departure from the denominator level of activity that was used to set the fixed overhead rate is the

- A. Spending variance.
- B. Efficiency variance.
- C. Production volume variance.
- D. Flexible budget variance.

- Answer (A) is **incorrect**. The fixed overhead spending variance is the difference between actual fixed costs and budgeted costs.
- Answer (B) is **incorrect**. The efficiency variance is applicable to variable overhead.
- Answer (C) is **correct**. A denominator level of activity must be used to establish the standard cost (application rate) for fixed overhead. The production volume variance is the difference between budgeted fixed costs and the standard cost per unit of input times the standard units of input allowed for the actual production.
- Answer (D) is **incorrect**. The flexible budget variance is the difference between actual and budgeted amounts in a flexible budget.

**[11] Gleim #: 7.6.110 -- Source: CMA 695 3-30**

The production volume variance is due to

- A. Inefficient or efficient use of direct labor hours.
  - B. Efficient or inefficient use of variable overhead.
  - C. Difference from the planned level of the base used for overhead allocation and the actual level achieved.
  - D. Excessive application of direct labor hours over the standard amounts for the output level actually achieved.
- Answer (A) is **incorrect**. The direct labor efficiency variance relates to inefficient or efficient use of direct labor hours.

- Answer (B) is **incorrect**. The variable overhead efficiency variance relates to efficient or inefficient use of variable overhead.
- Answer (C) is **correct**. The production volume variance (also called an idle capacity variance) is a component of the total overhead variance. It is the difference between budgeted fixed costs and the product of the standard fixed cost per unit of input times the standard units of input allowed for the actual output. Thus, the production volume variance equals under- or overapplied fixed overhead. This variance results when actual activity differs from the activity base used to calculate the fixed overhead application rate.
- Answer (D) is **incorrect**. The volume variance is related to overhead application, not direct labor.

**[12] Gleim #: 7.6.111 -- Source: CMA Sample Q3-1**

Coach Corporation is considering which capacity measure is appropriate to use as the denominator level of activity when applying fixed overhead to units produced. Assume that Coach selects direct labor hours as the cost driver and the following additional data are available from the prior year:

	<u>Hours</u>
Standard direct labor hours for normal capacity	200,000
Standard direct labor hours allowed for units produced in the prior year	210,000
Standard direct labor hours for the master budget capacity	220,000

Which of the following capacity measures for the denominator-level of activity would have resulted in an unfavorable volume variance?

- Both normal capacity and master budget capacity.
  - Neither normal capacity nor master budget capacity.
  - Normal capacity only.
  - Master budget capacity only.
- Answer (A) is **incorrect**. The standard input for the actual output exceeds normal capacity. Thus, use of normal capacity results in a favorable volume variance.
  - Answer (B) is **incorrect**. The standard input for the actual output exceeds normal capacity. Thus, use of normal capacity results in a favorable volume variance.
  - Answer (C) is **incorrect**. Use of master budget capacity results in an unfavorable variance.

- Answer (D) is **correct**. The volume (production volume or idle capacity) variance is the amount of under- or overapplied fixed overhead. It is the difference between budgeted fixed overhead and the amount applied based on a predetermined rate and the standard input allowed for actual output. It measures the use of capacity rather than specific cost outlays. The predetermined rate equals the budgeted overhead divided by a measure of capacity. Consequently, when the standard input allowed for actual output exceeds the budgeted capacity, fixed overhead is overapplied, and the volume variance is favorable. If the master budget capacity is the denominator value, the volume variance is unfavorable. Conversely, when the standard input allowed for actual output is less than the budgeted capacity, fixed overhead is underapplied, and the volume variance is unfavorable. If the normal capacity is the denominator value, the volume variance is favorable.

---

**[Fact Pattern #2]**

Nanjones Company manufactures a line of products distributed nationally through wholesalers. Presented below are planned manufacturing data for the year and actual data for November of the current year. The company applies overhead based on planned machine hours using a predetermined annual rate.

	Planning Data			Data for
	Annual	November		November
Fixed overhead	\$1,200,000	\$100,000	Direct labor hours (actual)	4,200
Variable overhead	\$2,400,000	\$220,000	Direct labor hours (plan	4,000
Direct labor hours	48,000	4,000	based on output)	
Machine hours	240,000	22,000	Machine hours (actual)	21,600
			Machine hours (plan based	21,000
			on output)	
			Fixed overhead	\$101,200
			Variable overhead	\$214,000

---

**[13] Gleim #: 7.6.112 -- Source: CMA 1292 3-15**

(Refers to Fact Pattern #2)

The predetermined overhead application rate for Nanjones Company is

- A. \$5.00
- B. \$25.00
- C. \$10.00
- D. \$15.00

- Answer (A) is **incorrect**. The fixed overhead application rate is \$5.
- Answer (B) is **incorrect**. The fixed overhead per labor hour is \$25.
- Answer (C) is **incorrect**. The variable portion of the overhead application rate is \$10.
- Answer (D) is **correct**. The predetermined overhead application rate is \$15  $[(\$1,200,000 \text{ FOH} + \$2,400,000 \text{ VOH}) \div 240,000 \text{ machine hours}]$ .

**[14] Gleim #: 7.6.113 -- Source: CMA 1292 3-16**

(Refers to Fact Pattern #2)

Nanjones' total amount of overhead applied to production for November was

- A. \$316,200
- B. \$315,000
- C. \$320,000
- D. \$300,000

- Answer (A) is **incorrect**. The total overhead applied was \$315,000 based on 21,000 hours at \$15 per hour.
- Answer (B) is **correct**. Overhead is applied on the basis of planned machine hours. The predetermined overhead application rate is \$15  $[(\$1,200,000 \text{ FOH} + \$2,400,000 \text{ VOH}) \div 240,000 \text{ machine hours}]$ . Thus, total overhead applied was \$315,000 (21,000 planned machine hours based on output  $\times$  \$15).
- Answer (C) is **incorrect**. The total overhead applied was \$315,000 based on 21,000 hours at \$15 per hour.
- Answer (D) is **incorrect**. The amount of \$300,000 is based on planned direct labor hours at \$75 per hour.

**[15] Gleim #: 7.6.114 -- Source: CMA 1292 3-17**

(Refers to Fact Pattern #2)

Nanjones' amount of over- or underapplied variable manufacturing overhead for November was

- A. \$6,000 overapplied.
- B. \$4,000 underapplied.
- C. \$20,000 overapplied.
- D. \$6,000 underapplied.

- Answer (A) is **incorrect**. The overhead was underapplied.
- Answer (B) is **correct**. Variable overhead applied in November was \$210,000 [21,000 planned machine hours based on output  $\times$  (\$2,400,000 planned annual VOH  $\div$  240,000 planned machine hours)]. Because the applied overhead was less than actual (\$214,000), underapplied variable overhead equaled \$4,000.
- Answer (C) is **incorrect**. The overhead was underapplied.
- Answer (D) is **incorrect**. The amount of \$6,000 is based on the 22,000 machine hours planned for November rather than the planned hours for actual output.

**[16] Gleim #: 7.6.115 -- Source: CMA 1292 3-18**

(Refers to Fact Pattern #2)

Nanjones' variable overhead spending variance for November was

- A. \$2,000 favorable.
  - B. \$6,000 favorable.
  - C. \$14,000 unfavorable.
  - D. \$6,000 unfavorable.
- Answer (A) is **correct**. The variable overhead spending variance equals the difference between actual variable overhead and the product of the actual input and the budgeted application rate. At a variable overhead application rate (standard cost) of \$10 per machine hour (\$2,400,000  $\div$  240,000 hours), the total standard cost for the 21,600 actual hours was \$216,000. Given actual costs of \$214,000, the favorable variance is \$2,000.
  - Answer (B) is **incorrect**. The amount of \$6,000 is based on planned machine hours of 22,000.
  - Answer (C) is **incorrect**. The variance is favorable.
  - Answer (D) is **incorrect**. The variance is favorable.

**[17] Gleim #: 7.6.116 -- Source: CMA 1292 3-19**

(Refers to Fact Pattern #2)

Nanjones' fixed overhead volume variance for November was

- A. \$1,200 unfavorable.
- B. \$5,000 unfavorable.
- C. \$10,000 favorable.
- D. \$5,000 favorable.

- Answer (A) is **incorrect**. The variance was favorable.
- Answer (B) is **incorrect**. The variance was favorable.
- Answer (C) is **incorrect**. The amount of \$10,000 is based on 22,000 planned machine hours.
- Answer (D) is **correct**. The fixed overhead volume (production volume or idle capacity) variance is the difference between budgeted fixed costs and the product of the standard fixed overhead cost per unit of input and the standard units of input allowed for the actual output. Budgeted fixed costs for the month were \$100,000. The standard cost of actual output was \$105,000 [21,000 machine hours planned for actual output  $\times$  (\$1,200,000 planned annual FOH  $\div$  240,000 planned annual machine hours) FOH application rate]. Hence, the fixed overhead volume variance was \$5,000 favorable. It was favorable because the budget for fixed overhead was less than the amount applied to jobs. An overapplication of fixed overhead suggests that output exceeded expectations.

**[18] Gleim #: 7.6.117 -- Source: CMA 693 3-26**

Which one of the following variances is of **least** significance from a behavioral control perspective?

- A. Unfavorable direct materials quantity variance amounting to 20% of the quantity allowed for the output attained.
  - B. Unfavorable direct labor efficiency variance amounting to 10% more than the budgeted hours for the output attained.
  - C. Favorable direct labor rate variance resulting from an inability to hire experienced workers to replace retiring workers.
  - D. Fixed overhead volume variance resulting from management's decision midway through the fiscal year to reduce its budgeted output by 20%.
- Answer (A) is **incorrect**. An unfavorable direct materials quantity variance affects production management and possibly the purchasing function. It may indicate an inefficient use of materials or the use of poor quality materials.
  - Answer (B) is **incorrect**. An unfavorable direct labor efficiency variance reflects upon production workers who have used too many hours.
  - Answer (C) is **incorrect**. A favorable direct labor rate variance related to hiring is a concern of the human resources function. The favorable rate variance might be more than offset by an unfavorable direct labor efficiency variance or a direct materials quantity variance (if waste occurred).

- Answer (D) is **correct**. Most variances are of significance to someone who is responsible for that variance. However, a fixed overhead volume variance is often not the responsibility of anyone other than top management. The fixed overhead volume variance equals the difference between budgeted fixed overhead and the amount applied (standard input allowed for the actual output  $\times$  standard rate). It can be caused by economic downturns, labor strife, bad weather, or a change in planned output. Thus, a fixed overhead volume variance resulting from a top management decision to reduce output has fewer behavioral implications than other variances.

**[19] Gleim #: 7.6.118 -- Source: CMA 1289 4-3**

A fixed overhead volume variance based on standard direct labor hours measures

- A. Deviation from standard direct labor hour capacity.
- B. Deviation from the normal, or denominator, level of direct labor hours.
- C. Fixed overhead efficiency.
- D. Fixed overhead use.

- Answer (A) is **incorrect**. The volume variance is not related to direct labor.
- Answer (B) is **correct**. The fixed overhead volume variance measures the effect of not operating at the budgeted (denominator) activity level. It is the difference between budgeted fixed costs and the product of the standard fixed overhead application rate and the standard activity level for the actual output. A favorable variance means that activity was greater than expected and that fixed overhead was overapplied. It might be caused by, for example, hiring more workers to provide an extra shift. An unfavorable volume variance means that activity was less than budgeted (overhead was underapplied), for example, because of insufficient sales or a labor strike. Accordingly, the volume variance is usually outside the control of production management. Moreover, unlike other variances, it does not directly reflect a difference between actual and budgeted expenditure of resources.
- Answer (C) is **incorrect**. The volume variance is not related to overhead efficiency.
- Answer (D) is **incorrect**. The volume variance is not related to overhead use.

---

**[Fact Pattern #3]**

Franklin Glass Works' production budget for the year ended November 30 was based on 200,000 units. Each unit requires 2 standard hours of labor for completion. Total overhead was budgeted at \$900,000 for the year, and the fixed overhead rate was estimated to be \$3.00 per unit. Both fixed and variable overhead are assigned to the product on the basis of direct labor hours. The actual data for the year ended November 30 are presented as follows.

Actual production in units	198,000
Actual direct labor hours	440,000
Actual variable overhead	\$352,000
Actual fixed overhead	\$575,000

---

**[20] Gleim #: 7.6.119 -- Source: CMA 1290 3-5**

(Refers to Fact Pattern #3)

The standard hours allowed for actual production for the year ended November 30 total

- A. 247,500
- B. 396,000
- C. 400,000
- D. 495,000

- Answer (A) is **incorrect**. Total standard hours allowed equal actual production multiplied times the standard hours allowed per unit.
- Answer (B) is **correct**. Two (2) standard hours are allowed for each unit of production. Given actual production of 198,000 units, total standard hours allowed equal 396,000 ( $2 \times 198,000$ ).
- Answer (C) is **incorrect**. The total standard hours allowed at a production level of 200,000 units is 400,000.
- Answer (D) is **incorrect**. Total standard hours allowed equal actual production multiplied times the standard hours allowed per unit.

**[21] Gleim #: 7.6.120 -- Source: CMA 1290 3-6**

(Refers to Fact Pattern #3)

Franklin's variable overhead efficiency variance for the year is

- A. \$33,000 unfavorable.
- B. \$35,520 favorable.
- C. \$66,000 unfavorable.
- D. \$33,000 favorable.

- Answer (A) is **correct**. The variable overhead efficiency variance equals the difference between actual and standard direct labor hours times the standard cost per hour. Fixed overhead was budgeted at \$600,000 ( $\$3 \times 200,000$  expected units). Thus, total variable overhead was estimated to be \$300,000 (\$900,000 total OH – \$600,000), and the variable overhead application rate was \$.75 per hour [ $\$300,000 \div (2 \text{ hours} \times 200,000 \text{ units})$ ]. Standard hours for actual production are 396,000 ( $198,000 \text{ units} \times 2$ ). Actual hours worked were 440,000. Hence, the variable overhead efficiency variance is \$33,000 [ $(440,000 \text{ actual hours} - 396,000 \text{ standard hours for actual output}) \times \$.75$ ]. The variance is unfavorable because actual hours exceed budgeted hours.
- Answer (B) is **incorrect**. The variable overhead efficiency variance is unfavorable because the actual hours exceed budgeted hours.
- Answer (C) is **incorrect**. The variable overhead efficiency variance of \$66,000 is calculated by incorrectly using a variable overhead application rate of \$1.50 per hour, which does not take into account that each unit of production requires 2 standard hours of labor for completion.
- Answer (D) is **incorrect**. The variable overhead efficiency variance is unfavorable because the actual hours exceed budgeted hours.

**[22] Gleim #: 7.6.121 -- Source: CMA 1290 3-7**

(Refers to Fact Pattern #3)

Franklin's variable overhead spending variance for the year is

- A. \$20,000 unfavorable.
- B. \$19,800 favorable.
- C. \$22,000 unfavorable.
- D. \$20,000 favorable.

- Answer (A) is **incorrect**. The variable overhead spending variance is the difference between the actual variable factory overhead and the product of the budgeted application rate and the actual activity level.

- Answer (B) is **incorrect**. The variable overhead spending variance is unfavorable because the actual cost was higher than the standard.
- Answer (C) is **correct**. Based on the 440,000 hours actually worked and the \$.75 per hour variable overhead rate, the total standard cost for variable overhead is \$330,000. The actual variable overhead totaled \$352,000. The \$22,000 variable overhead spending variance is unfavorable because the actual cost was higher than the standard.
- Answer (D) is **incorrect**. The variable overhead spending variance is unfavorable because the actual cost was higher than the standard.

**[23] Gleim #: 7.6.122 -- Source: CMA 1290 3-8**

(Refers to Fact Pattern #3)

Franklin's fixed overhead spending variance for the year is

- A. \$19,000 favorable.
- B. \$25,000 favorable.
- C. \$5,750 favorable.
- D. \$25,000 unfavorable.

- Answer (A) is **incorrect**. The fixed overhead spending variance is calculated based on budgeted fixed overhead.
- Answer (B) is **correct**. Actual fixed overhead was \$575,000. Budgeted fixed overhead was \$3 per unit at an estimated production of 200,000 units; a total of \$600,000. The difference of \$25,000 is a favorable variance because the actual amount was less than that budgeted.
- Answer (C) is **incorrect**. The fixed overhead spending variance is the difference between the actual fixed factory overhead and the amount budgeted.
- Answer (D) is **incorrect**. The fixed overhead spending variance is favorable since the actual amount was less than budgeted.

**[24] Gleim #: 7.6.123 -- Source: CMA 1290 3-9**

(Refers to Fact Pattern #3)

The fixed overhead applied to Franklin's production for the year is

- A. \$484,200
- B. \$575,000
- C. \$594,000
- D. \$600,000

- Answer (A) is **incorrect**. The fixed overhead applied equals the budgeted fixed overhead rate multiplied times the actual units of production.
- Answer (B) is **incorrect**. The actual fixed overhead for the year is \$575,000.
- Answer (C) is **correct**. Fixed overhead is applied at the rate of \$3 per unit. The amount applied given actual production is \$594,000 ( $\$3 \times 198,000$  units).
- Answer (D) is **incorrect**. The budgeted fixed overhead at an estimated production of 200,000 units is \$600,000.

**[25] Gleim #: 7.6.124 -- Source: CMA 1290 3-10**

(Refers to Fact Pattern #3)

Franklin's fixed overhead volume variance for the year is

- A. \$6,000 unfavorable.
  - B. \$19,000 favorable.
  - C. \$25,000 favorable.
  - D. \$55,000 unfavorable.
- Answer (A) is **correct**. The fixed overhead volume variance results when production varies from the denominator amount. The denominator amount is the level of production used to determine the standard cost per unit. Because production was expected to be 200,000 units (the denominator level), but actual production was only 198,000 units, an unfavorable volume variance of 2,000 units occurred. Thus, 2,000 units were not charged with \$3 per unit of overhead, and the volume variance in dollars was \$6,000U ( $2,000 \text{ units} \times \$3$ ). This underapplication of fixed overhead is unfavorable because it indicates an underuse of facilities; that is, activity was less than budgeted. Unlike other variances, this variance does not measure deviations from expected costs but rather the departure from the expected use of productive capacity.
  - Answer (B) is **incorrect**. The fixed overhead volume variance is unfavorable because actual activity is less than budgeted.
  - Answer (C) is **incorrect**. The fixed overhead volume variance is unfavorable because actual activity is less than budgeted.
  - Answer (D) is **incorrect**. The fixed overhead volume variance equals the difference between the budgeted fixed factory overhead and the product of the budgeted application rate and the standard input allowed for the actual output.

---

**[Fact Pattern #4]**

Dori Castings, a job-order shop, uses a full-absorption, standard-cost system to account for its production costs. The O/H costs are applied on a direct-labor-hour basis.

---

**[26] Gleim #: 7.6.125 -- Source: CMA 1284 4-1**

(Refers to Fact Pattern #4)

Dori's choice of a production volume as a denominator for calculating its factory O/H rate has

- A. An effect on the variable factory O/H rate for applying costs to production.
  - B. No effect on the fixed factory O/H budget variance.
  - C. No effect on the fixed factory O/H production volume variance.
  - D. No effect on the overall (net) fixed factory O/H variance.
- Answer (A) is **incorrect**. By definition, the total variable factory O/H varies with the activity level, but total fixed O/H and unit variable O/H do not.
  - Answer (B) is **correct**. The use of a production volume as the denominator in calculating the factory O/H rate has no effect on the fixed factory O/H budget variance. This variance is the difference between actual fixed costs and budgeted (lump sum) fixed costs.
  - Answer (C) is **incorrect**. The fixed factory O/H production volume variance is the difference between budgeted fixed O/H and fixed O/H applied based on the predetermined rate.
  - Answer (D) is **incorrect**. The overall (net) fixed factory O/H variance is the difference between the actual fixed O/H and the fixed O/H applied based on the predetermined rate.

**[27] Gleim #: 7.6.126 -- Source: CMA 1284 4-2**

(Refers to Fact Pattern #4)

A production volume variance will exist for Dori in a month when

- A. Production volume differs from sales volume.
  - B. Actual direct labor hours differ from standard allowed direct labor hours.
  - C. The fixed factory O/H applied on the basis of standard allowed direct labor hours differs from actual fixed factory O/H.
  - D. The fixed factory O/H applied on the basis of standard allowed direct labor hours differs from the budgeted fixed factory O/H.
- Answer (A) is **incorrect**. Sales volume is irrelevant.

- Answer (B) is **incorrect**. The difference between actual direct labor hours and standard direct labor hours allowed is the basis of the variable O/H efficiency variance.
- Answer (C) is **incorrect**. The difference between fixed factory O/H applied on the basis of standard allowed direct labor hours and the budgeted fixed factory O/H defines the total fixed O/H variance.
- Answer (D) is **correct**. A fixed O/H production volume variance is the difference between the budgeted fixed factory O/H and the O/H applied based on a predetermined rate and standard direct labor hours allowed for the actual output.

**[28] Gleim #: 7.6.127 -- Source: CMA 1284 4-4**

(Refers to Fact Pattern #4)

The amount of fixed factory O/H that Dori will apply to finished production is the

- A. Actual direct labor hours times the standard fixed factory O/H rate per direct labor hour.
  - B. Standard allowed direct labor hours for the actual units of finished output times the standard fixed factory O/H rate per direct labor hour.
  - C. Standard units of output for the actual direct labor hours worked times the standard fixed factory O/H rate per unit of output.
  - D. Actual fixed factory O/H cost per direct labor hour times the standard allowed direct labor hours.
- Answer (A) is **incorrect**. The standard hours allowed for the actual units of finished output is used, not the AH.
  - Answer (B) is **correct**. Fixed factory O/H in a standard costing system is applied to the product based on the predetermined O/H rate multiplied by the standard hours allowed for the actual output. Thus, the applied fixed factory O/H is limited to the standard amount.
  - Answer (C) is **incorrect**. The O/H application is not based on units of production for the AH.
  - Answer (D) is **incorrect**. The applied fixed factory O/H is limited to the standard amount determined using the standard O/H rate per DL hour, not the actual O/H cost per DL hour.

**[29] Gleim #: 7.6.128 -- Source: CMA 687 4-17**

Selo Imports uses flexible budgeting for the control of costs. The company's annual master budget includes \$324,000 for fixed production supervisory salaries at a volume of 180,000 units. Supervisory salaries are expected to be incurred uniformly through the year. During September, 15,750 units were produced and production supervisory salaries incurred were \$28,000. A performance report for September should reflect a budget variance of

- A. \$350 Favorable.
- B. \$350 Unfavorable.
- C. \$1,000 Unfavorable.
- D. \$1,000 Favorable.

- Answer (A) is **incorrect**. Supervisor salaries are expected to be incurred uniformly through the year; thus, supervisor salaries are based on time, not units produced.
- Answer (B) is **incorrect**. Supervisor salaries are expected to be incurred uniformly through the year; thus, supervisor salaries are based on time, not units produced.
- Answer (C) is **correct**. The budget (spending) variance for fixed O/H equals actual minus budgeted fixed O/H. The \$324,000 cost of supervisory salaries is fixed and is incurred at \$27,000 per month. Thus, the variance is the difference between actual costs of \$28,000 and the budgeted costs of \$27,000, or \$1,000 unfavorable.
- Answer (D) is **incorrect**. The actual O/H (\$28,000) was greater than the budgeted O/H ( $\$324,000 \div 12 \text{ months} = \$27,000$ ); therefore, the variance is unfavorable.

**[48] Gleim #: 7.6.147 -- Source: CMA 0408 2-212**

A company applies variable overhead based upon direct labor hours and has a variable overhead efficiency variance that is \$25,000 favorable. A possible cause of this variance is that

- A. Higher skilled labor was used.
  - B. Electricity rates were lower than expected.
  - C. Fewer supplies were used than anticipated.
  - D. Fewer units of finished goods were produced.
- Answer (A) is **correct**. When direct labor hours are the allocation base for variable overhead, an efficiency in the use of direct labor hours will naturally result in a favorable variable overhead efficiency variance. Among the items listed, highly skilled workers would be the most likely cause of a favorable direct labor efficiency variance.

- Answer (B) is **incorrect**. Electric rates do not affect labor efficiency, which is the driver for variable overhead. Also, actual costs that were lower than expected would lead to a favorable rate or spending variance, not an efficiency variance.
- Answer (C) is **incorrect**. Using fewer indirect materials does not affect the variable overhead efficiency variance when labor hours are the allocation base.
- Answer (D) is **incorrect**. The level of output does not affect the variable overhead.

**[49] Gleim #: 7.6.148 -- Source: CMA 0408 2-240**

Brannen Videotronics uses a four-way allocation of overhead, machine hours to allocate overhead, and years of experience as the main determinant for wage increases. The standards are set and revised on an annual basis. Due to a surge in competitive pressures, Brannen's management decided to undertake downsizing. Brannen offered incentives that permitted a large number of senior employees to opt in the middle of the year for early retirement. As a result, Brannen had to bring in temporary replacements who were paid entry-level wages to see that work deadlines were met. Which one of the following is most likely to result from this situation?

- A. Unfavorable efficiency variances and favorable price variances.
  - B. Unfavorable efficiency variances and unfavorable price variances.
  - C. Favorable efficiency variances and unfavorable price variances.
  - D. Favorable efficiency variances and favorable price variances.
- Answer (A) is **correct**. The use of less-skilled workers will generally result in unfavorable labor efficiency variances. However, this is accompanied by favorable labor rate (or price) variances, which result from paying lower wages.
  - Answer (B) is **incorrect**. Favorable price variances will generally result.
  - Answer (C) is **incorrect**. Unfavorable efficiency variances and favorable price variances will generally result.
  - Answer (D) is **incorrect**. Unfavorable efficiency variances will generally result.

[50] Gleim #: 7.6.149 -- Source: CMA 0408 2-243

Honolee Manufacturing uses a standard cost system with overhead applied based on direct labor hours. The manufacturing budget for the production of 5,000 units for the month of June included 10,000 hours of direct labor at \$15 per hour, or \$150,000. During June, 4,500 units were produced, using 9,600 direct labor hours, incurring \$39,360 of variable overhead, and showing a variable overhead efficiency variance of \$2,400 unfavorable. The standard variable overhead rate per direct labor hour was

- A. \$3.85
- B. \$4.00
- C. \$4.10
- D. \$6.00

- Answer (A) is **incorrect**. Using \$2,400 U as the rate variance rather than as the efficiency variance results in \$3.85.
- Answer (B) is **correct**. Since 10,000 hours were budgeted to complete 5,000 units, the standard number of hours required for each unit of output is 2 (10,000 hours ÷ 5,000 units). Since 4,500 units were actually produced, the “expected” number of hours, that is, the number that should have been consumed given the achieved level of production, was 9,000 (4,500 units × 2 hours per unit). The actual number of labor hours expended during the month was 9,600, and the efficiency variance is given as \$2,400 U. Plugging these amounts into the formula for the efficiency variance allows us to derive the standard variable overhead rate:

$$\begin{aligned}(EQ - AQ) \times SP &= \text{Variable overhead efficiency variance} \\ (9,000 - 9,600) \times SP &= \$2,400 \text{ U} \\ SP &= \$4.00 \text{ per hour}\end{aligned}$$

- Answer (C) is **incorrect**. The actual rate applied is \$4.10.
- Answer (D) is **incorrect**. Using 10,000 hours instead of 9,000 hours as the standard hours results in \$6.00.

**[51] Gleim #: 7.6.150 -- Source: CMA 0408 2-244**

Cordell Company uses a standard cost system. On January 1 of the current year, Cordell budgeted fixed manufacturing overhead cost of \$600,000 and production at 200,000 units. During the year, the firm produced 190,000 units and incurred fixed manufacturing overhead of \$595,000. The production volume variance for the year was

- A. \$5,000 unfavorable.
- B. \$10,000 unfavorable.
- C. \$25,000 unfavorable.
- D. \$30,000 unfavorable.

- Answer (A) is **incorrect**. Attempting to combine the two elements of fixed overhead and reversing the sign results in \$5,000 unfavorable.
- Answer (B) is **incorrect**. The difference in the budgeted and actual number of units produced results in \$10,000 unfavorable.
- Answer (C) is **incorrect**. The spending variance is \$25,000 unfavorable.
- Answer (D) is **correct**. The application rate for fixed overhead is \$3.00 per unit (\$600,000 budgeted cost ÷ 200,000 budgeted units). The actual amount applied was \$570,000 (190,000 actual units × \$3.00 application rate). The production volume variance was thus \$30,000 unfavorable (\$570,000 – \$600,000).

**[52] Gleim #: 7.6.151 -- Source: CMA 0408 2-245**

Highlight, Inc. uses a standard cost system and applies factory overhead to products on the basis of direct labor hours. If the firm recently reported a favorable direct labor efficiency variance, then the

- A. Variable overhead spending variance must be favorable.
- B. Variable overhead efficiency variance must be favorable.
- C. Fixed overhead volume variance must be unfavorable.
- D. Direct labor rate variance must be unfavorable.

- Answer (A) is **incorrect**. Nothing can be concluded about the variable overhead efficiency variance from the information given.
- Answer (B) is **correct**. Highlight uses direct labor hours as the driver for variable overhead application. Thus, if the direct labor efficiency variance was favorable, the variable overhead efficiency variance must be favorable as well since the two variances are based on the same standard and actual hours.

- Answer (C) is **incorrect**. Nothing can be concluded about the fixed overhead volume variance from the information given.
- Answer (D) is **incorrect**. Nothing can be concluded about the direct labor rate variance from the information given.

**[53] Gleim #: 7.6.152 -- Source: CMA 0408 2-246**

Harper Company's performance report indicated the following information for the past month.

Actual total overhead	\$1,600,000
Budgeted fixed overhead	1,500,000
Applied fixed overhead at \$3 per labor hour	1,200,000
Applied variable overhead at \$.50 per labor hour	200,000
Actual labor hours	430,000

Harper's total overhead spending variance for the month was

- A. \$100,000 favorable.
- B. \$115,000 favorable.
- C. \$185,000 unfavorable.
- D. \$200,000 unfavorable.

- Answer (A) is **incorrect**. The total budget variance is \$100,000.
- Answer (B) is **correct**. The total overhead applied was \$1,400,000 (\$1,200,000 fixed plus \$200,000 variable). Since actual overhead was \$1,600,000, the total overhead variance was \$200,000 unfavorable. The \$200,000 total variance would be explained by three elements: the fixed overhead volume variance, the variable overhead efficiency variance, and the total spending variance. At \$3 per hour, fixed overhead was applied on the basis of 400,000 hours, but since the budget called for 500,000 hours, there was an unfavorable volume variance of 100,000 hours at \$3, or \$300,000. The variable overhead efficiency variance is calculated by multiplying the excess hours of 30,000 (430,000 – 400,000) times the variable application rate of \$.50, or \$15,000 unfavorable. Therefore, when you combine the \$300,000 unfavorable volume variance and the \$15,000 unfavorable efficiency variance, you get \$315,000 unfavorable. Since the total variance was only \$200,000 unfavorable, the spending variance must be favorable in the amount of \$115,000. Algebraically, this is solved as  $\$300,000 \text{ U} + \$15,000 \text{ U} - \text{SV} = \$200,000 \text{ U}$ . Thus  $\text{SV} = \$115,000 \text{ F}$ .
- Answer (C) is **incorrect**. The result of reversing the sign of the efficiency variance is \$185,000.

- Answer (D) is **incorrect**. The total overhead variance is \$200,000.

**[54] Gleim #: 7.6.153 -- Source: CMA 0408 2-247**

The JoyT Company manufactures Maxi Dolls for sale in toy stores. In planning for this year, JoyT estimated variable factory overhead of \$600,000 and fixed factory overhead of \$400,000. JoyT uses a standard costing system, and factory overhead is allocated to units produced on the basis of standard direct labor hours. The denominator level of activity budgeted for this year was 10,000 direct labor hours, and JoyT used 10,300 actual direct labor hours.

Based on the output accomplished during this year, 9,900 standard direct labor hours should have been used. Actual variable factory overhead was \$596,000, and actual fixed factory overhead was \$410,000 for the year. Based on this information, the variable overhead spending variance for JoyT for this year was

- A. \$24,000 unfavorable.
- B. \$2,000 unfavorable.
- C. \$4,000 favorable.
- D. \$22,000 favorable.

- Answer (A) is **incorrect**. The efficiency variance is \$24,000 unfavorable.
- Answer (B) is **incorrect**. The flexible budget variance is \$2,000 unfavorable.
- Answer (C) is **incorrect**. The static budget variance is \$4,000 favorable.
- Answer (D) is **correct**. The standard application rate for variable overhead is \$60.00 per direct labor hour (\$600,000 budgeted ÷ 10,000 budgeted direct labor hours). The variable overhead spending variance can thus be derived by using the following formula:

$$\begin{aligned}\text{Variable overhead efficiency} &= (\text{AQ} \times \text{SP}) - \text{Actual costs incurred} \\ \text{variance} &= (10,300 \times \$60.00) - \$596,000 \\ &= \$22,000 \text{ F}\end{aligned}$$

**[55] Gleim #: 7.6.154 -- Source: CMA 0408 2-248**

A company has a fixed overhead volume variance that is \$10,000 unfavorable. The most likely cause for this variance is that

- A. The production supervisory salaries were greater than planned.
  - B. The production supervisory salaries were less than planned.
  - C. More was produced than planned.
  - D. Less was produced than planned.
- Answer (A) is **incorrect**. The volume variance is not influenced by actual costs incurred.
  - Answer (B) is **incorrect**. The volume variance is not influenced by actual costs incurred.
  - Answer (C) is **incorrect**. An unfavorable fixed overhead volume variance would be caused by lower-than-planned production.
  - Answer (D) is **correct**. When production is lower than planned, fixed overhead costs are spread among fewer units of output than were planned for, generating an unfavorable volume variance.

**[56] Gleim #: 7.6.155 -- Source: CMA 0408 2-249**

When using a flexible budgeting system, the computation for the variable overhead spending variance is the difference between

- A. Actual variable overhead and the previously budgeted amount.
  - B. The previously budgeted amount and actual inputs times the budgeted rate.
  - C. The amount applied to work-in-process and actual variable overhead.
  - D. Actual variable overhead and actual inputs times the budgeted rate.
- Answer (A) is **incorrect**. The difference between the actual variable overhead and the previously budgeted amount is the static budget variance.
  - Answer (B) is **incorrect**. The difference between the previously budgeted amount and actual inputs times the budgeted rate is not a defined variance.
  - Answer (C) is **incorrect**. The difference between the amount applied to work-in-process and actual variable overhead is the flexible budget variance.
  - Answer (D) is **correct**. The variable overhead spending variance can be derived by using the following formula:

$$(AQ \times SP) - \text{Actual costs incurred}$$

[57] Gleim #: 7.6.156 -- Source: CMA 0408 2-254

Howard Company produces and sells replacement parts for cotton processing equipment. Which one of the following cost variances are **least** likely to be controllable by Howard's production manager?

- A. Variable overhead spending variance.
- B. Labor efficiency variance.
- C. Materials quantity variance.
- D. Fixed overhead production volume variance.

- Answer (A) is **incorrect**. The variable overhead spending variance is due to factors within the control of the production manager.
- Answer (B) is **incorrect**. The labor efficiency variance is due to factors within the control of the production manager.
- Answer (C) is **incorrect**. The materials quantity variance is due to factors within the control of the production manager.
- Answer (D) is **correct**. The fixed overhead production volume variance is the difference between the static/flexible budget for fixed overhead and the amount allocated based on the budgeted allocation rate and the driver level allowable for the actual production level achieved. None of these factors are under the control of the production manager.

**[Fact Pattern #1]**

Ardmore Enterprises uses a standard cost system in its small appliance division. The standard cost of manufacturing one unit of Zeb is as follows:

Direct materials -- 60 pounds at \$1.50 per pound	\$ 90
Direct labor -- 3 hours at \$12 per hour	36
Overhead -- 3 hours at \$8 per hour	<u>24</u>
Total standard cost per unit	<u><u>\$150</u></u>

The budgeted variable overhead rate is \$3 per direct labor hour, and the budgeted fixed overhead is \$27,000 per month. During May, Ardmore produced 1,650 units of Zeb compared with a normal capacity of 1,800 units. The actual cost per unit was as follows:

Direct materials (purchased and used) -- 58 pounds at \$1.65 per pound	\$ 95.70
Direct labor -- 3.1 hours at \$12 per hour	37.20
Overhead -- \$39,930 per 1,650 units	24.20
Total actual cost per unit	<u><u>\$157.10</u></u>

**[1] Gleim #: 7.7.157 -- Source: CMA 696 3-22**

(Refers to Fact Pattern #1)

Ardmore's total direct materials quantity variance for May is

- A. \$14,355 favorable.
- B. \$14,355 unfavorable.
- C. \$4,950 favorable.
- D. \$4,950 unfavorable.

- Answer (A) is **incorrect**. The amount of the direct materials price variance is \$14,355.
- Answer (B) is **incorrect**. The amount of the direct materials price variance is \$14,355.
- Answer (C) is **correct**. The direct materials quantity variance equals the difference between the standard and actual quantities times the standard price. Hence, the favorable direct materials quantity variance is \$4,950  $[1,650 \text{ units} \times (60 \text{ standard pounds} - 58 \text{ actual pounds}) \times \$1.50 \text{ standard}]$ .
- Answer (D) is **incorrect**. A favorable variance exists. The standard amount for the actual output exceeded the actual amount.

[2] Gleim #: 7.7.158 -- Source: CMA 696 3-23

(Refers to Fact Pattern #1)

Ardmore's direct materials price variance for May is

- A. \$14,355 unfavorable.
- B. \$14,850 unfavorable.
- C. \$14,355 favorable.
- D. \$14,850 favorable.

- Answer (A) is **correct**. The direct materials price variance equals the actual quantity used times the difference between the standard and actual price per unit. Thus, the unfavorable direct materials price variance is \$14,355 [1,650 units  $\times$  58 actual pounds  $\times$  (\$1.50 standard price – \$1.65 actual price)].
- Answer (B) is **incorrect**. The variance of \$14,850 is based on the standard unit quantity, not the actual quantity.
- Answer (C) is **incorrect**. The price variance is unfavorable. The actual price is greater than the standard price.
- Answer (D) is **incorrect**. The variance of \$14,850 is based on the standard unit quantity, not the actual quantity.

[3] Gleim #: 7.7.159 -- Source: CMA 696 3-1

(Refers to Fact Pattern #1)

Ardmore's direct labor rate variance for May is

- A. \$1,920 favorable.
- B. \$0
- C. \$4,950 unfavorable.
- D. \$4,950 favorable.

- Answer (A) is **incorrect**. The amount of the flexible budget overhead variance is \$1,920.
- Answer (B) is **correct**. The direct labor rate variance equals the actual hours used times the difference between the standard and actual rates. Consequently, the direct labor rate variance is zero [1,650 units  $\times$  3.1 actual hours  $\times$  (\$12 per hour standard rate – \$12 per hour actual rate)].
- Answer (C) is **incorrect**. The amount of the direct materials quantity variance is \$4,950.
- Answer (D) is **incorrect**. The amount of the direct materials quantity variance is \$4,950.

[4] Gleim #: 7.7.160 -- Source: CMA 696 3-25

(Refers to Fact Pattern #1)

Ardmore's flexible budget overhead variance for May is

- A. \$3,270 unfavorable.
- B. \$3,270 favorable.
- C. \$1,920 unfavorable.
- D. \$1,920 favorable.

- Answer (A) is **incorrect**. The flexible budget amount for an output of 1,800 units is \$3,270.
- Answer (B) is **incorrect**. The flexible budget amount for an output of 1,800 units is \$3,270.
- Answer (C) is **incorrect**. A favorable variance exists. Actual overhead is less than the standard overhead at the actual production level.
- Answer (D) is **correct**. The flexible budget overhead variance is the difference between actual overhead costs and the flexible budget amount for the actual output. Standard total fixed costs at any level of production are \$27,000. Standard variable overhead is \$9 per unit (3 labor hours  $\times$  \$3). Thus, total standard variable overhead is \$14,850 for the actual output (1,650 units  $\times$  \$9), and the total flexible budget amount is \$41,850 (\$27,000 FOH + \$14,850 VOH). Accordingly, the favorable flexible budget variance is \$1,920 favorable (\$41,850 flexible budget amount – \$39,930 actual amount).

**[Fact Pattern #2]**

Water Control Systems manufactures water pumps and uses a standard cost system. The standard overhead costs per water pump are based on direct labor hours and are as follows:

Variable overhead (4 hours at \$8 per hour)	\$32
Fixed overhead (4 hours at \$5* per hour)	20
Total overhead cost per unit	<u>\$52</u>

\* Based on a capacity of 100,000 direct labor hours per month.

The following information is available for the month of November:

- 22,000 pumps were produced although 25,000 had been scheduled for production.
- 94,000 direct labor hours were worked at a total cost of \$940,000.
- The standard direct labor rate is \$9 per hour.
- The standard direct labor time per unit is four hours.
- Variable overhead costs were \$740,000.
- Fixed overhead costs were \$540,000.

**[5] Gleim #: 7.7.161 -- Source: CMA 1294 3-26**

(Refers to Fact Pattern #2)

Water Control's fixed overhead spending variance for November was

- A. \$40,000 unfavorable.
  - B. \$70,000 unfavorable.
  - C. \$460,000 unfavorable.
  - D. \$240,000 unfavorable.
- Answer (A) is **correct**. The fixed overhead spending (budget) variance is the difference between budgeted and actual fixed overhead. Actual fixed overhead was \$540,000. Budgeted fixed overhead was \$5 per hour based on a capacity of 100,000 direct labor hours per month, or \$500,000. Because these costs are fixed, the budgeted fixed overhead is the same at any level of production. Hence, the variance is \$40,000 unfavorable (\$500,000 – \$540,000).
  - Answer (B) is **incorrect**. The difference between actual fixed overhead and the product of the standard rate and the actual direct labor hours is \$70,000 unfavorable.
  - Answer (C) is **incorrect**. The volume variance is \$460,000 unfavorable.
  - Answer (D) is **incorrect**. The difference between actual variable overhead and budgeted fixed overhead is \$240,000 unfavorable.

[6] Gleim #: 7.7.162 -- Source: CMA 1294 3-27

(Refers to Fact Pattern #2)

Water Control's variable overhead spending variance for November was

- A. \$60,000 favorable.
- B. \$12,000 favorable.
- C. \$48,000 unfavorable.
- D. \$40,000 unfavorable.

- Answer (A) is **incorrect**. The variance of \$60,000 favorable is based on 100,000 hours, not the actual hours of 94,000.
- Answer (B) is **correct**. The variable overhead spending variance is the difference between actual variable overhead and the variable overhead based on the standard rate and the actual activity level. Thus, the variable overhead spending variance was \$12,000 favorable  $[(94,000 \text{ actual hours} \times \$8 \text{ standard rate}) - \$740,000 \text{ actual cost}]$ .
- Answer (C) is **incorrect**. The variable overhead efficiency variance is \$48,000 unfavorable.
- Answer (D) is **incorrect**. The fixed overhead spending variance is \$40,000 unfavorable.

[7] Gleim #: 7.7.163 -- Source: CMA 1294 3-29

(Refers to Fact Pattern #2)

Water Control's direct labor price variance for November was

- A. \$54,000 unfavorable.
- B. \$94,000 unfavorable.
- C. \$60,000 favorable.
- D. \$148,000 unfavorable.

- Answer (A) is **incorrect**. The direct labor efficiency variance is \$54,000 unfavorable.
- Answer (B) is **correct**. The direct labor price variance equals actual labor hours times the difference between standard and actual labor rates. The actual direct labor cost was \$940,000 for 94,000 hours, or \$10 per hour. The standard rate was \$9 per hour. Thus, the variance is \$94,000 unfavorable  $[94,000 \text{ hours} \times (\$9 - \$10)]$ .
- Answer (C) is **incorrect**. The actual rate times the difference between capacity and actual hours equals \$60,000 favorable.
- Answer (D) is **incorrect**. The total direct labor variance is \$148,000 unfavorable.

**[8] Gleim #: 7.7.164 -- Source: CMA 1294 3-28**

(Refers to Fact Pattern #2)

Water Control's variable overhead efficiency variance for November was

- A. \$48,000 unfavorable.
- B. \$60,000 favorable.
- C. \$96,000 unfavorable.
- D. \$200,000 unfavorable.

- Answer (A) is **correct**. The variable overhead efficiency variance equals the standard price (\$8 an hour) times the difference between the actual hours and the standard hours allowed for the actual output. Thus, the variance is \$48,000 unfavorable  $\{[(22,000 \text{ units produced} \times 4 \text{ standard hours per unit}) - 94,000 \text{ actual hours}] \times \$8\}$ .
- Answer (B) is **incorrect**. The variable overhead spending variance calculated based on capacity, not actual hours, is \$60,000 favorable.
- Answer (C) is **incorrect**. The variance of \$96,000 unfavorable is based on the difference between standard hours allowed for the actual output and capacity hours.
- Answer (D) is **incorrect**. The excess of actual direct labor costs over actual variable overhead costs is \$200,000 unfavorable.

**[9] Gleim #: 7.7.165 -- Source: CMA 1294 3-30**

(Refers to Fact Pattern #2)

Water Control's direct labor efficiency variance for November was

- A. \$108,000 favorable.
- B. \$120,000 favorable.
- C. \$60,000 favorable.
- D. \$54,000 unfavorable.

- Answer (A) is **incorrect**. The variance of \$108,000 favorable is based on the difference between standard and capacity hours.
- Answer (B) is **incorrect**. The variance of \$120,000 favorable is based on the actual rate and the difference between standard hours and capacity.
- Answer (C) is **incorrect**. The variance of \$60,000 favorable is based on the actual rate and the difference between actual hours and capacity.

- Answer (D) is **correct**. The direct labor efficiency variance equals the difference between standard and actual hours times the standard rate. Hence, the variance is \$54,000 unfavorable  $\{[(22,000 \text{ units} \times 4 \text{ standard hours per unit}) - 94,000 \text{ hours}] \times \$9\}$ . The variance is unfavorable because the actual hours exceeded the standard hours.

**[14] Gleim #: 7.7.170 -- Source: CMA 0408 2-207**

Of the following pairs of variances found in a flexible budget report, which pair is most likely to be related?

- A. Material price variance and variable overhead efficiency variance.
- B. Labor rate variance and variable overhead efficiency variance.
- C. Material usage variance and labor efficiency variance.
- D. Labor efficiency variance and fixed overhead volume variance.

- Answer (A) is **incorrect**. The actual price charged by suppliers for raw materials and the actual number of allocation-base units expended are unrelated.
- Answer (B) is **incorrect**. The actual wage rates paid to workers and the actual number of allocation-base units expended are unrelated.
- Answer (C) is **correct**. Material usage and labor efficiency variances both result from a deviation in the quantity of input from what was budgeted. They can be either directly or indirectly related. For instance, a reduction in the amount of material used may be compensated for by an increase in the amount of labor. By the same token, a reduction in overall activity on the production line may result in a decrease in both factors.
- Answer (D) is **incorrect**. The labor efficiency variance is related to problems or the lack thereof in production departments; a volume variance is related to the use of capacity and may not be rooted in anything related to production (i.e., it could be caused by a lack of sales).

**[15] Gleim #: 7.7.171 -- Source: CMA 0408 2-215**

Underwood Corporation uses the following format to present performance results to the production managers.

	Month's <u>Actual</u>	Month's <u>Budget</u>	Price <u>Variance</u>	Quantity <u>Variance</u>
Direct materials	\$10,000	\$12,000	\$1,000 F	\$1,000 F
Direct labor	20,000	19,500	500 F	1,000 U
Variable overhead	4,000	4,000	100 U	100 F
Fixed overhead	12,000	12,200	200 F	
Sales units	50,000	52,000		

This format may be confusing to the production manager because

- A. Year-to-date information is not shown.
  - B. A fixed overhead volume variance is not shown.
  - C. More detail of variable overhead items should be included.
  - D. The report includes variances beyond the control and knowledge of the production manager.
- Answer (A) is **incorrect**. Managers are judged on individual time periods as well as cumulative year-to-date performance.
  - Answer (B) is **incorrect**. A production manager does not need to know the volume variance. That is typically outside the control of a production manager.
  - Answer (C) is **incorrect**. The concept of management by exception means that details are not necessary unless costs get out of hand; since the variance was minimal, there is no need for more detail.
  - Answer (D) is **correct**. The direct labor price variance is a function of contracts worked out with the union before the production period begins. Similarly, the material price variance is a measure of purchasing efficiency, not that of the production manager.

**[16] Gleim #: 7.7.172 -- Source: CMA 0408 2-219**

For a given time period, a company had a favorable material quantity variance, a favorable direct labor efficiency variance, and a favorable fixed overhead volume variance. Of the following, the one factor that could **not** have caused all three variances is

- A. The purchase of higher quality materials.
  - B. The use of lower-skilled workers.
  - C. The purchase of more efficient machinery.
  - D. A decrease in production supervision.
- Answer (A) is **incorrect**. The use of higher quality materials would explain a favorable material quantity variance but would tend to generate an unfavorable labor efficiency variance since higher quality materials require more careful handling and the workers would not be accustomed to working with those materials.
  - Answer (B) is **correct**. Lower-skilled workers tend to be less efficient, which would give rise to an unfavorable labor efficiency variance and possibly an unfavorable materials quantity variance.
  - Answer (C) is **incorrect**. More efficient machinery would tend to generate an unfavorable fixed overhead volume variance since the purchase resulted in higher fixed costs.
  - Answer (D) is **incorrect**. A decrease in production supervision would lead to less efficiency among laborers since there would be no one watching over their work.

**[17] Gleim #: 7.7.173 -- Source: CMA 0408 2-220**

Marten Company has a cost-benefit policy to investigate any variance that is greater than \$1,000 or 10% of budget, whichever is larger. Actual results for the previous month indicate the following.

	<u>Budget</u>	<u>Actual</u>
Raw material	\$100,000	\$89,000
Direct labor	50,000	54,000

The company should investigate

- A. Neither the material variance nor the labor variance.
- B. The material variance only.
- C. The labor variance only.
- D. Both the material variance and the labor variance.

- Answer (A) is **incorrect**. The materials variance meets one of the criteria.
- Answer (B) is **correct**. For materials, because the dollar variance is \$11,000 and 10% of budget is \$10,000, the dollar variance is the applicable test. Because  $\$11,000 > \$1,000$ , the materials variance meets the test and should be investigated. For direct labor, since the dollar variance is \$4,000 and 10% of budget is \$5,000, the percentage variance is the applicable test. Because  $\$4,000 < \$5,000$ , the labor variance fails the test and should not be investigated.
- Answer (C) is **incorrect**. Only the materials variance passes the test for investigation.
- Answer (D) is **incorrect**. Only the materials variance passes the test for investigation.

[1] Gleim #: 7.8.174 -- Source: CMA 1295 3-3

The variance that arises solely because the quantity actually sold differs from the quantity budgeted to be sold is

- A. Static budget variance.
- B. Master budget increment.
- C. Sales mix variance.
- D. Sales volume variance.

- Answer (A) is **incorrect**. A static budget variance is the difference between actual costs or revenues and those budgeted on a static budget.
- Answer (B) is **incorrect**. A master budget increment is an increase in a budgeted figure on the firm's master budget.
- Answer (C) is **incorrect**. The sales mix variance is caused when a company's actual sales mix is different from the budgeted sales mix.
- Answer (D) is **correct**. If a firm's sales differ from the amount budgeted, the difference could be attributable either to the sales price variance or the sales volume variance. The sales volume variance is the change in contribution margin caused by the difference between the actual and budgeted sales volumes.

[2] Gleim #: 7.8.175 -- Source: CMA 693 3-16

In analyzing company operations, the controller of the Jason Corporation found a \$250,000 favorable flexible-budget revenue variance. The variance was calculated by comparing the actual results with the flexible budget. This variance can be wholly explained by

- A. The total flexible budget variance.
- B. The total sales volume variance.
- C. The total static budget variance.
- D. Changes in unit selling prices.

- Answer (A) is **incorrect**. The total flexible budget variance includes items other than revenue.
- Answer (B) is **incorrect**. The sales volume variance represents the change in contribution margin caused by a difference between actual and budgeted units sold. However, given a flexible budget, there is no difference between budgeted and actual units sold. By definition, a flexible budget's volume is identical to actual volume.

- Answer (C) is **incorrect**. The total static budget variance includes many items other than revenue.
- Answer (D) is **correct**. Variance analysis can be used to judge the effectiveness of selling departments. If a firm's sales differ from the amount budgeted, the difference may be attributable to either the sales price variance or the sales volume (quantity) variance. Changes in unit selling prices may account for the entire variance if the actual quantity sold is equal to the quantity budgeted. None of the revenue variance is attributed to the sales volume variance because no such variance exists when a flexible budget is used. The flexible budget is based on the level of sales at actual volume.

**[3] Gleim #: 7.8.176 -- Source: CIA 593 IV-14**

The sales volume variance is partly a function of the unit contribution margin (UCM). For a single-product company, it is

- A. The difference between actual and master budget sales volume, times actual UCM.
- B. The difference between flexible budget and actual sales volume, times master budget UCM.
- C. The difference between flexible budget and master budget sales volume, times actual UCM.
- D. The difference between flexible budget and master budget sales volume, times master budget UCM.

- Answer (A) is **incorrect**. Budgeted, not actual, UCM is used to calculate this variance.
- Answer (B) is **incorrect**. The flexible budget volume is the actual volume, resulting in a zero variance.
- Answer (C) is **incorrect**. Budgeted, not actual, UCM is used to calculate this variance.
- Answer (D) is **correct**. For a single-product company, the sales volume variance is the difference between the actual and budgeted sales quantities times the budgeted UCM. If the company sells two or more products, the difference between the actual and budgeted product mixes must be considered. In that case, the sales volume variance equals the difference between (1) actual total unit sales times the budgeted weighted-average UCM for the actual mix and (2) budgeted total unit sales times the budgeted weighted-average UCM for the planned mix.

**[4] Gleim #: 7.8.177 -- Source: CMA 695 3-29**

For a company that produces more than one product, the sales volume variance can be divided into which two of the following additional variances?

- A. Sales price variance and flexible budget variance.
  - B. Sales mix variance and sales price variance.
  - C. Sales quantity variance and sales mix variance.
  - D. Sales mix variance and production volume variance.
- Answer (A) is **incorrect**. The sales price variance is a separate variance and is not a component of the sales volume variance.
  - Answer (B) is **incorrect**. The sales price variance is a separate variance and is not a component of the sales volume variance.
  - Answer (C) is **correct**. The sales volume variance can be divided into the sales quantity variance and the sales mix variance. The sales quantity variance is the change in contribution margin caused by the difference between actual and budgeted volume, assuming that budgeted sales mix, unit variable costs, and unit sales prices are constant. Thus, it equals the sales volume variance when the sales mix variance is zero. In a multiproduct firm, the sales mix variance is a variance caused by a sales mix that differs from that budgeted. For example, even when the sales quantity is exactly as budgeted, an unfavorable sales mix variance can be caused by greater sales of a low-contribution product at the expense of lower sales of a high-contribution product.
  - Answer (D) is **incorrect**. The production volume variance is a fixed overhead variance. It is not related to the sales volume variance.

**[Fact Pattern #1]**

Folsom Fashions sells a line of women's dresses. Folsom's performance report for November follows.

The company uses a flexible budget to analyze its performance and to measure the effect on operating income of the various factors affecting the difference between budgeted and actual operating income.

	Actual	Budget
Dresses sold	<u>5,000</u>	<u>6,000</u>
Sales	\$235,000	\$300,000
Variable costs	<u>(145,000)</u>	<u>(180,000)</u>
Contribution margin (CM)	90,000	120,000
Fixed costs	<u>(84,000)</u>	<u>(80,000)</u>
Operating income	<u>\$ 6,000</u>	<u>\$ 40,000</u>

**[8] Gleim #: 7.8.181 -- Source: CMA 1291 3-14**

(Refers to Fact Pattern #1)

The effect of the sales quantity variance on Folsom's contribution margin for November is

- A. \$30,000 unfavorable.
- B. \$18,000 unfavorable.
- C. \$20,000 unfavorable.
- D. \$15,000 unfavorable.

- Answer (A) is **incorrect**. The difference between the actual and budgeted contribution margins is \$30,000.
- Answer (B) is **incorrect**. The difference between actual and budgeted unit sales times the actual unit CM equals \$18,000.
- Answer (C) is **correct**. The sales quantity variance is the difference between the actual and budgeted units, times the budgeted unit CM.

$$(5,000 - 6,000) \times \frac{\$120,000}{6,000} = \$20,000 \text{ U}$$

- Answer (D) is **incorrect**. The sales price variance is \$15,000.

[10] Gleim #: 7.8.183 -- Source: CMA 1291 3-16

(Refers to Fact Pattern #1)

Folsom's variable cost flexible budget variance for November is

- A. \$5,000 favorable.
- B. \$5,000 unfavorable.
- C. \$4,000 favorable.
- D. \$4,000 unfavorable.

- Answer (A) is **correct**. The variable cost flexible budget variance is equal to the difference between actual variable costs and the product of the actual quantity sold and the budgeted unit variable cost ( $\$180,000 \div 6,000 = \$30$ ).

$$(\$30 \times 5,000) - \$145,000 = \$5,000 F$$

- Answer (B) is **incorrect**. The variance is favorable.
- Answer (C) is **incorrect**. The amount of the fixed cost variance is \$4,000.
- Answer (D) is **incorrect**. The amount of the fixed cost variance is \$4,000.

[11] Gleim #: 7.8.184 -- Source: CMA 1291 3-17

(Refers to Fact Pattern #1)

Folsom's fixed cost variance for November is

- A. \$5,000 favorable.
- B. \$5,000 unfavorable.
- C. \$4,000 favorable.
- D. \$4,000 unfavorable.

- Answer (A) is **incorrect**. The variable cost variance is \$5,000.
- Answer (B) is **incorrect**. The variable cost variance is \$5,000.
- Answer (C) is **incorrect**. The variance is unfavorable.
- Answer (D) is **correct**. The fixed cost variance equals the difference between actual fixed costs and budgeted fixed costs.

$$\$84,000 - \$80,000 = \$4,000 U$$

**[12] Gleim #: 7.8.185 -- Source: CMA 1291 3-18**

(Refers to Fact Pattern #1)

What additional information is needed for Folsom to calculate the dollar impact of a change in market share on operating income for November?

- A. Folsom's budgeted market share and the budgeted total market size.
- B. Folsom's budgeted market share, the budgeted total market size, and average market selling price.
- C. Folsom's budgeted market share and the actual total market size.
- D. Folsom's actual market share and the actual total market size.

- Answer (A) is **incorrect**. Folsom will need to know the actual total market size.
- Answer (B) is **incorrect**. Folsom will need to know the actual total market size.
- Answer (C) is **correct**. A change in market share reflects a change in relative competitiveness. To isolate the effect on operating income of an increase or a decrease in market share, the company must know its budgeted and actual market shares, the actual size of the market for November, and the budgeted weighted-average unit contribution margin. Such computations may help Folsom to determine whether its decline in sales resulted from a loss of competitiveness or a shrinkage of the market.
- Answer (D) is **incorrect**. Folsom will need to know the budgeted market share.

**[Fact Pattern #2]**

Clear Plus, Inc., manufactures and sells boxes of pocket protectors. The static master budget and the actual results for May appear in the opposite column.

	<u>Actuals</u>	<u>Static Budget</u>
Unit sales	<u>12,000</u>	<u>10,000</u>
Sales	\$132,000	\$100,000
Variable costs of sales	<u>(70,800)</u>	<u>(60,000)</u>
Contribution margin	61,200	40,000
Fixed costs	<u>(32,000)</u>	<u>(30,000)</u>
Operating income	<u>\$ 29,200</u>	<u>\$ 10,000</u>

**[13] Gleim #: 7.8.186 -- Source: CMA 695 3-26**

(Refers to Fact Pattern #2)

The operating income for Clear Plus using a flexible budget for May is

- A. \$12,000
- B. \$19,200
- C. \$30,000
- D. \$18,000

- Answer (A) is **incorrect**. Assuming that all costs are variable results in \$12,000.
- Answer (B) is **incorrect**. The amount of \$19,200 is based on actual variable costs.
- Answer (C) is **incorrect**. The amount of \$30,000 is based on actual sales revenues.
- Answer (D) is **correct**. A flexible budget is prepared after the budget period has ended and actual sales and costs are known. Assuming that unit sales price ( $\$100,000 \div 10,000 \text{ units} = \$10$ ) and variable costs of sales ( $\$60,000 \div 10,000 \text{ unit} = \$6$ ) and total fixed costs (\$30,000) do not change, a flexible budget may be prepared for the actual sales level (12,000 units). Hence, the budgeted contribution margin (sales – variable costs of sales) equals \$48,000 [ $(12,000 \text{ units} \times \$10) - (12,000 \text{ units} \times \$6)$ ]. The operating income is therefore \$18,000 (\$48,000 CM – \$30,000 FC).

**[14] Gleim #: 7.8.187 -- Source: CMA 695 3-27**

(Refers to Fact Pattern #2)

Which one of the following statements concerning Clear Plus's actual results for May is correct?

- A. The flexible budget variance is \$8,000 favorable.
  - B. The sales price variance is \$32,000 favorable.
  - C. The sales volume variance is \$8,000 favorable.
  - D. The flexible budget variable cost variance is \$10,800 unfavorable.
- Answer (A) is **incorrect**. The flexible budget variance is \$11,200 favorable ( $\$29,200 \text{ actual operating income} - \$18,000 \text{ flexible budget operating income}$ ).
  - Answer (B) is **incorrect**. The sales price variance is \$12,000 [ $\$132,000 \text{ actual sales} - (12,000 \text{ units sold} \times \$10)$ ].

- Answer (C) is **correct**. The sales volume variance is the change in contribution margin caused by the difference between the actual and budgeted volume. It equals the budgeted unit contribution margin times the difference between actual and expected volume, or \$8,000  $[(12,000 - 10,000) \times (\$10 - \$6)]$ . The sales volume variance is favorable because actual sales exceeded budgeted sales.
- Answer (D) is **incorrect**. The total projected variable costs at the actual sales level equal \$72,000 (12,000 units  $\times$  \$6). Thus, the variable cost variance is \$1,200 favorable (\$72,000 – \$70,800 actual).

**[17] Gleim #: 7.8.190 -- Source: CMA 687 4-16**

The following information is available for the Mitchelville Products Company for the month of July.

	<u>Master Budget</u>	<u>Actual</u>
Units	4,000	3,800
Sales revenue	\$60,000	\$53,200
Variable manufacturing costs	16,000	19,000
Fixed manufacturing costs	15,000	16,000
Variable selling and administrative expense	8,000	7,600
Fixed selling and administrative expense	9,000	10,000

The contribution margin volume variance for the month of July would be

- A. \$400 unfavorable.
  - B. \$1,800 unfavorable.
  - C. \$200 favorable.
  - D. \$6,800 unfavorable.
- Answer (A) is **incorrect**. The difference between budgeted and actual variable selling and administrative costs is \$400.

- Answer (B) is **correct**. The volume variance isolates the effect of selling more or less units than budgeted. It equals budgeted unit contribution margin (UCM) times the difference between budgeted and actual units sold. Given expected sales of 4,000 units and revenue of \$60,000, unit price is \$15. Variable costs are \$16,000 for manufacturing and \$8,000 for selling, and unit variable cost is \$6 (\$24,000 ÷ 4,000 units). The UCM is \$9 (\$15 – \$6). Since actual sales were 200 units less than budgeted (4,000 – 3,800), the lost contribution margin was \$1,800 (200 × \$9). This variance is unfavorable because actual sales were less than budgeted.
- Answer (C) is **incorrect**. The difference between budgeted and actual units is 200 units.
- Answer (D) is **incorrect**. The difference between budgeted and actual revenue is \$6,800.

**[26] Gleim #: 7.8.199 -- Source: CMA 0205 2-40**

Teaneck, Inc. sells two products, Product E and Product F, and had the following data for last month:

	Product E		Product F	
	Budget	Actual	Budget	Actual
Unit sales	5,500	6,000	4,500	6,000
Unit contribution margin	\$4.50	\$4.80	\$10.00	\$10.50

The company's sales mix variance is

- A. \$3,300 favorable.
- B. \$3,420 favorable.
- C. \$17,250 favorable.
- D. \$18,150 favorable.

- Answer (A) is **correct**. The first step is to calculate the contribution margin (CM) for a “composite” unit using budgeted mix percentages and budgeted margins:

Product E: $\{[5,500 \div (5,500 + 4,500)] \times \$4.50\}$	= \$2.475
Product F: $\{[4,500 \div (5,500 + 4,500)] \times \$10.00\}$	= <u>\$4.500</u>
Composite Budget UCM	<u><u>\$6.975</u></u>

This process is repeated using actual mix percentages and budgeted margins:

Product E: $\{[6,000 \div (6,000 + 6,000)] \times \$4.50\}$	= \$2.250
Product F: $\{[6,000 \div (6,000 + 6,000)] \times \$10.00\}$	= <u>\$5.000</u>
Composite Actual UCM	<u><u>\$7.250</u></u>

The difference between the two is multiplied by the number of units sold to arrive at the sales mix variance  $[(6,000 + 6,000) \times (\$7.250 \text{ actual} - \$6.975 \text{ budget}) = (12,000 \times \$0.275) = \$3,300 \text{ favorable}]$ .

- Answer (B) is **incorrect**. Improperly using unweighted contribution margins results in \$3,420 favorable.
- Answer (C) is **incorrect**. The amount of \$17,250 is the sales volume variance.
- Answer (D) is **incorrect**. The sales volume variance in units multiplied by the actual price equals \$18,150 favorable; it is not a mix variance.

**[27] Gleim #: 7.8.200 -- Source: CMA 0408 2-218**

The following information is from the accounting records of St. Charles Enterprises.

	Static Budget	Actual
Sales volume (units)	82,000	75,000
Selling price/unit	\$ 15.00	\$ 15.00
Variable cost/unit	9.00	9.25
Fixed cost	280,000	285,000

A staff assistant performed a comparison of budget and actual data and calculated an unfavorable operating income variance of \$65,750. The assistant concluded that performance did not meet expectations because there was an unfavorable variance in operating income. Which one of the following is the best evaluation of this preliminary conclusion?

- A. Both the conclusion and the variance calculation are correct.
  - B. The conclusion is incorrect, but the variance calculation is informative.
  - C. The conclusion is correct, but the variance calculation could be more informative.
  - D. Both the conclusion and the variance calculation are incorrect.
- Answer (A) is **incorrect**. Simply concluding that performance was inadequate does not provide a manager with useful information.
  - Answer (B) is **incorrect**. An operating income variance in isolation provides a manager with very little useful information. The conclusion was basically correct, but it was not informative.

- Answer (C) is **correct**. St. Charles' budget and actual operating income can be calculated as follows:

	Static Budget		Actual Results	
Sales	82,000 units @ \$15.00 =	\$1,230,000	75,000 units @ \$15.00 =	\$1,125,000
Variable costs	82,000 units @ \$ 9.00 =	(738,000)	75,000 units @ \$ 9.25 =	(693,750)
Contribution margin		\$ 492,000		\$ 431,250
Fixed costs		(280,000)		(285,000)
Operating income		<u>\$ 212,000</u>		<u>\$ 146,250</u>

The variance is correctly calculated at \$65,750 unfavorable (\$146,500 – \$212,000). However, an operating income variance in isolation provides a manager with very little useful information. The component of the variance attributable to a difference in budgeted and actual sales, as well as the distinction between variable and fixed costs, are lost just looking at operating income.

- Answer (D) is **incorrect**. That variance calculation is correct.

[28] Gleim #: 7.8.201 -- Source: CMA 0408 2-228

The following performance report was prepared for Dale Manufacturing for the month of April:

	Actual Results	Static Budget	Variance
Sales units	100,000	80,000	20,000 F
Sales dollars	\$190,000	\$160,000	\$30,000 F
Variable costs	125,000	96,000	29,000 U
Fixed costs	45,000	40,000	5,000 U
Operating income	<u>\$ 20,000</u>	<u>\$ 24,000</u>	<u>\$ 4,000 U</u>

If inventories did **not** change during the month, using a flexible budget, Dale's total production-volume variance is

- A. \$4,000 unfavorable.
  - B. \$6,000 favorable.
  - C. \$10,000 favorable.
  - D. \$20,000 unfavorable.
- Answer (A) is **incorrect**. The variance in net income is \$4,000.
  - Answer (B) is **incorrect**. The volume variance is \$10,000.
  - Answer (C) is **correct**. The production volume variance is based on the over- (or under-) applied fixed overhead for the period. The fixed overhead allocation rate is \$.50 per unit ( $\$40,000 \div 80,000$  units). With actual results exceeding the standard by 20,000 units, the overapplied overhead would have been \$10,000 ( $20,000 \text{ units} \times \$.50$ ).
  - Answer (D) is **incorrect**. The difference in unit sales and production is 20,000 units, not dollars.

## STUDY UNIT EIGHT RESPONSIBILITY ACCOUNTING AND FINANCIAL MEASURES

### Introduction

The objective of U.8 present a variety of tools that top managers (such as CFOs) use to evaluate mid-level managers and the organization as a whole. Mid-level managers include plant managers, product-line managers, heads of research and development (R&D) departments, and regional sales managers. They all have significant responsibility in helping the organization achieve its strategic goals.

We introduce the concept of responsibility accounting and a performance evaluation framework that consists of the following organizational subunits: cost centers, revenue centers, profit centers, and investment centers. Tied to the concept of controllability, different mechanisms are used to evaluate the short-term financial performance of each of these subunits of the organization.

The coverage in U.8 has a strong strategic focus since mid-level managers have a significant responsibility for achieving strategic goals, and it is critical that the performance evaluation be aligned with these strategic goals. Transfer pricing, covered in U.8, is an important topic for the assessment of both profit centers and investment centers. When buying and selling exist between units within the organization, the determination of the transfer price will affect the performance evaluation of both the buying unit and the selling unit. Therefore, we cover the topic of transfer pricing both as an incentive issue (having the right incentive for the unit managers to choose to trade inside or outside the firm in a manner that achieves the firm's strategic and financial goals) and as a motivation issue (the choice of a transfer price should result in a fair measure of performance for both units).

This chapter covers the measures used to evaluate management performance. These measures include the balanced scorecard, the contribution income statement, and cost allocation. These topics are covered here in the important role they play in management performance evaluation. We begin with an explanation of the broad concepts underlying performance evaluation.

**Management control** refers to the evaluation by upper-level managers of the performance of mid-level managers.

Management control,

- focuses on higher- level managers and long-term, strategic issues.
- is more consistent with the **management-by-objectives** approach, in which long-term objectives such as growth and profitability are determined and performance is periodically measured against these goals.
- has a broader and more strategic objective:
  - to evaluate the unit's overall profitability as well as the performance of its manager,
  - to decide whether the unit should be retained or closed, and
  - to motivate the manager to achieve , top management's goals.

- Because of this broader focus, various objectives for management control generally have multiple measures of performance rather than a single financial or operating measure, as is sometimes true in operational control.

## Objectives of Management Control

In a management-by-objectives approach, top management assigns a set of responsibilities to each mid-level manager. These areas of responsibility are often called *strategic business units* (SBUs). The concept of a strategic business unit is particularly useful for diversified firms that need performance measures to rationalize and manage the different business units.

Strategic performance measurement systems are implemented in four different forms, depending on the nature of the manager's responsibilities: the revenue center, cost center, profit center, and investment center.

A **strategic business unit** consists of a well-defined set of controllable operating activities over which the SBU manager is responsible.

### The objectives of management control are to:

1. **Motivate** managers to exert a high level of effort to achieve the goals set by top management.
2. Provide the right incentive for managers to make decisions consistent with the goals set by top management, that is, to align managers' efforts with desired strategic goals. The alignment of managers' goals with those of top management is also referred to as **goal congruence**.
3. Determine **fairly** the rewards earned by managers for their effort and skill and the effectiveness of their decision making.

## Characteristics of effective management control systems

- (a) closely aligned to the organization's strategy,
- (b) fit the organization's structure, and
- (c) motivate managers and employees to give effort to achieve the organization's goals.

(a) To be effective, management control systems should be closely aligned to the company's strategies and goals.

Examples of strategies are developing innovative products-to increase market share in key product areas, or maximizing short-run income by reducing costs and forgoing risky long-run investments in R&D. Suppose management decides, wisely or unwisely, to maximize short-run income. The management control system must then reinforce this goal. The control system should provide managers with information – such as contribution margins on individual products-that will help them make short-run decisions. The control system should also tie managers' rewards to short-run income.

(b) Management control systems should be designed to fit the company's structure and the decision-making responsibility of individual managers.

For example: Consider the R&D manager at GlaxoSmithKline, a pharmaceutical company.  
The management control system for this manager should focus on :

- the R&D activities required for different drug projects,
- the number of scientists needed,
- the scheduled dates for completing different projects, and
- the preparation of reports comparing actual and budgeted performance.

Now consider a product-line manager responsible for the manufacture, sale, and distribution of ketchup at Heinz, a food products company.

- The company's management control system should
- provide this manager with information about customer satisfaction, market share, manufacturing costs and product-line profitability-information that helps the manager plan and control the operations better.

The manager of the Heinz ketchup product line requires very different information than the information required by the R&D manager at GlaxoSmithKline. But, in both cases, the information provided is designed to aid the manager's decision making.

(c) Effective management control systems should also motivate managers and employees. Motivation is the desire to attain a selected goal (the goal-congruence aspect) combined with the resulting pursuit of that goal (the effort aspect).

Goal congruence exists when individuals and groups work toward achieving the organization's goals-that is, managers working in their own best interest take actions that align with the overall goals of top management.

For example, in capital budgeting, making decisions based on discounting long-run cash flows at the required rate of return best achieves company goals. But if the management control system evaluates managers on the basis of short-run accrual accounting income, managers will be tempted to make decisions to maximize accrual accounting income, which may not be in the long-run best interest of the organization as a whole.

Management control systems must fit an organization's structure. An organization whose structure is decentralized has additional issues to consider for its management control system to be effective.

## Responsibility accounting

**Responsibility accounting** : is a system that measures the plans - by budgets - and actions - by actual results- of each responsibility center, also called a strategic business unit .

Strategic performance measurement is a system used by top management to evaluate SBU managers. It is used when responsibility can be effectively delegated to SBU managers and adequate measures for evaluating the performance of the managers exist. Before designing strategic performance measurement systems, top managers determine when delegation of responsibility (called decentralization) is desirable.

### Decentralization

A firm is decentralized if it has chosen to delegate a significant amount of responsibility to SBU managers. In contrast, a centralized firm reserves much of the decision making at the top management level.

## Types of responsibility centers (Strategic Business Units)

Four types of responsibility centers are

1. Cost center-the manager is accountable for costs only.

**Cost SBU** Production or support SBUs within the firm that have the goal of providing the best quality product or service at the lowest cost

Example: The maintenance department of a Marriott hotel is a cost center because the maintenance manager is responsible only for costs, so this budget is based on costs.

- 2 Revenue center-the manager is accountable for revenues only.

**Revenue SBU** An SBU with responsibility for sales, defined either by product line or by geographical area

3. Profit center-the manager is accountable for revenues and costs.

**Profit SBU** An SBU that generates revenues and incurs the major portion of the cost for producing these revenues

4. Investment center-the manager is accountable for investments, revenues, and costs.

**Investment SBU** An SBU that includes assets employed by the SBU as well as profits in performance evaluation

A responsibility center can be structured to promote better alignment of individual and company goals.

## Which type of responsibility centers will be applied?

The choice of a profit, cost, or revenue SBU depends on the nature of the production and selling environment in the firm.

Products that have little need for coordination between the manufacturing and selling functions are good candidates for cost centers. These include many commodity products such as food and paper products.

For such products, the production manager rarely needs to adjust the functionality of the product or the production schedule to suit a particular customer. For this reason, production managers should focus on reducing cost while sales managers focus on sales; this is what cost and revenue SBUs accomplish.

In contrast, sometimes close coordination is needed between the production and selling functions. For example, high-fashion and consumer products require close coordination so that consumer information coming into the selling function reaches the design and manufacturing function. Cost and revenue SBUs could fail to provide the incentive for coordination; in this case, production managers would be focusing on cost and not listening to the ever-changing demands coming from the selling function. A preferred option is to use the profit center for both the revenue and production managers so that both coordinate efforts to achieve the highest overall profit.

When a firm has many different profit SBUs because it has many different. Product lines, comparing their performance could be difficult because they vary greatly in size and in the nature of their products and services. A preferred approach is to use **investment SBUs**, which include assets employed by the SBU as well as profits in the performance evaluation.

## Objectives and applications of strategic performance measurement in three common strategic business units: cost centers, revenue centers, and profit centers.

### COST STRATEGIC BUSINESS UNITS

Cost SBUs include direct manufacturing departments such as assembly and finishing and manufacturing support departments such as materials handling, maintenance, and engineering. The direct manufacturing and manufacturing support departments are often evaluated as cost SBUs since these managers have significant direct control over costs but little control over revenues or decision making for investment in facilities.

#### Strategic Issues Related to Implementing Cost SBUs

- cost shifting,
- excessively focusing on short-term objectives, and
- the tendency of managers and top management to miscommunicate because of the pervasive problem of budget slack.

### Cost Allocation and SBU evaluation

A pervasive issue when using cost SBUs is how to allocate the jointly incurred costs of service departments, such as IT, engineering, human resources, or maintenance, to the departments using the service.

The choice of method affects the amount of cost allocated to each cost SBU and therefore is critical in effective cost SBU evaluation.

For example, if the cost of maintenance is allocated based on the square feet of space in each production department, the departments with more space have higher costs. The incentives of such an allocation method are not clear because the production departments likely cannot control the amount of space they occupy. Alternatively, if maintenance costs are allocated on the basis of the number of maintenance jobs requested, the production departments can control their allocated maintenance costs by controlling usage.

#### The criteria for choosing the cost allocation method, are the same as the objectives for management control: to

- (1) motivate managers to exert a high level of effort,
- (2) provide an incentive for managers to make decisions consistent with top management's goals, and
- (3) provide a basis for a fair evaluation of managers' performance.

For example, when management wants to encourage production departments to *reduce* the amount of maintenance, allocation based on usage provides the desired incentive. In contrast, if management wants the departments to increase the use of maintenance to improve the serviceability of the equipment, the most effective incentive might be not to allocate the maintenance cost or perhaps to subsidize it in some way.

A useful guide in choosing the cost allocation method, in addition to the three criteria just explained, is to use dual allocation. **Dual allocation** is a cost allocation method that separates fixed and variable costs. Variable costs are directly traced to user departments, and fixed costs are allocated on some logical basis.

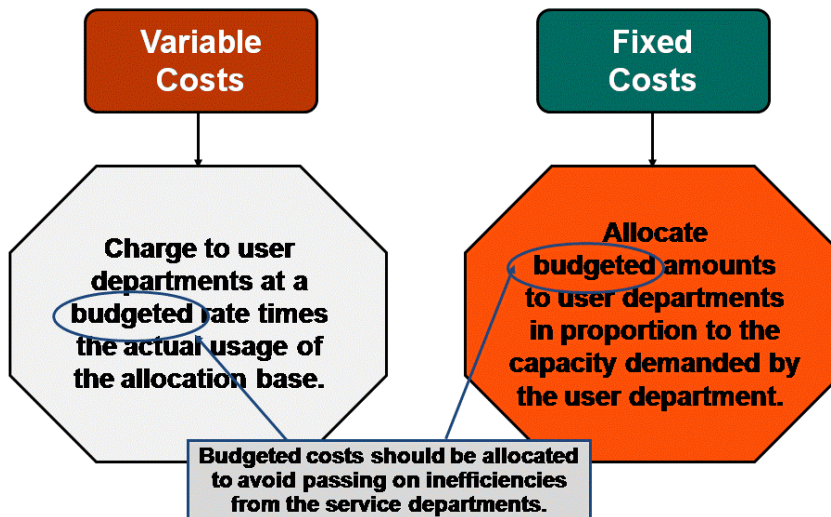

For example, the variable costs of maintenance, such as supplies, labor, and parts, can be traced to each maintenance job and charged directly to the user department. This approach is both fair and positively motivating. In contrast, the fixed costs of the maintenance department (training, manuals, equipment, etc.) that cannot be traced to each maintenance job should be allocated to the user departments using a basis that fairly

reflects each department's use of the service. For example, those departments whose maintenance jobs require more expensive equipment might be allocated a higher proportion of the maintenance department's fixed costs. To improve on dual allocation, indirect costs could be traced to cost SBUs using activity-based costing.

This approach tends to produce the most accurate cost assignment and therefore would be the most motivating and fairest to the SBU managers.

## Separate Fixed and Variable Costs: Dual Allocation

## Separate Fixed and Variable Costs: Dual Allocation

**Ace Co. has a maintenance department and two operating departments: cutting and assembly. Variable maintenance costs are budgeted at \$0.60 per machine hour. Fixed maintenance costs are budgeted at \$200,000 per year. Data relating to the current year are:**

User Departments	Percent of Capacity Demanded	Actual Hours Used
Cutting	60%	80,000
Assembly	40%	40,000
Total hours	100%	120,000

**Allocate maintenance costs to the two operating departments.**

THE AMERICAN UNIVERSITY IN CAIRO  
School of Continuing Education

	Cutting Department	Assembly Department
Variable cost allocation:		
\$0.60 × 80,000 hours used	\$ 48,000	
\$0.60 × 40,000 hours used		\$ 24,000
Fixed cost allocation		
Total allocated cost		

**Variable costs are allocated based on hours used.**

	Cutting Department	Assembly Department
Variable cost allocation:		
\$0.60 × 80,000 hours used	\$ 48,000	
\$0.60 × 40,000 hours used		\$ 24,000
Fixed cost allocation		
60% of \$200,000	120,000	
Total allocated cost	\$ 168,000	

**Variable costs are allocated based on hours used.  
Fixed costs are allocated based on  
capacity demanded..**

	Cutting Department	Assembly Department
Variable cost allocation:		
\$0.60 × 80,000 hours used	\$ 48,000	
\$0.60 × 40,000 hours used		\$ 24,000
Fixed cost allocation		
60% of \$200,000	120,000	
40% of \$200,000		80,000
Total allocated cost	\$ 168,000	\$ 104,000

**Variable costs are allocated based on hours used.  
Fixed costs are allocated based on  
capacity demanded..**

## RESPONSIBILITY AND CONTROLLABILITY

Controllability is the degree of influence that a specific manager has over costs, revenues, and related items for which he or she is responsible. A controllable cost is any cost that is primarily subject to the influence of a given *responsibility center manager* for a given *period*.

A responsibility accounting system could either exclude all uncontrollable costs from a manager's performance report or segregate such costs from the controllable costs. For example, a machining supervisor's performance report might be confined to quantities not costs - of direct materials, direct manufacturing labor, power, and supplies.

### In practice, controllability is difficult to pinpoint for at least two reasons:

1. Few costs are clearly under the sole influence of one manager. For example, *prices* of direct materials may be influenced by a purchasing manager, but these prices also depend on market conditions beyond the manager's control. *Quantities* used may be influenced by a production manager, but quantities used also depend on the quality of materials purchased. Moreover, managers often work in teams. How can individual responsibility be evaluated in a team situation?
2. With a long enough time span, all costs will come under somebody's control. However, most performance reports focus on periods of a year or less. A current manager may have inherited a predecessor's problems and inefficiencies. For example, present managers may have to work under undesirable contracts with suppliers or labor unions that were negotiated by their predecessors. How can we separate what the current manager actually controls from the results of decisions made by others? Exactly what is the current manager accountable for? Answers may not be clear-cut.

Executives differ in how they embrace the controllability notion when evaluating those reporting to them. Some company presidents regard the budget as a firm commitment that must be met. Failure to meet the budget is viewed unfavorably. Other presidents believe a more risk-sharing approach with managers is preferable, in which noncontrollable factors and performance relative to competitors are taken into account when judging the performance of managers who fail to meet their budgets.

<b>Controllable cost</b> .A cost that a manager or employee has discretion in choosing to incur or can significantly influence the amount of within a given, usually short, period of time. In other words, <b>Controllable cost</b> . Any cost that is primarily subject to the influence of a given responsibility center manager for a given period.
---

<b>Controllability</b> . Degree of influence that a specific manager has over costs, revenues, and related items for which he or she is responsible.
--

## PROFIT STRATEGIC BUSINESS UNITS

The profit SBU manager's goal is to earn profits. A key advantage of the profit SBU is that it brings the manager's incentives into congruence with those of top management: to improve the firm's profitability. Moreover, the profit SBU should also motivate individual managers because by earning profits, the managers are contributing directly to the firm's success. For these reasons, the profit SBU meets the management control objectives of motivation and decision making explained earlier.

### **Strategic Role of Profit SBUs**

Three strategic issues cause firms to choose profit SBUs rather than cost or revenue SBUs.

- **First, profit SBUs provide the incentive for the desired coordination among the marketing, production, and support functions. The handling of rush orders is a good example**
- **A second reason that firms use profit SBUs rather than cost SBUs is to motivate managers to consider their product as marketable to outside customers.**
- **The third reason for choosing profit SBUs is to motivate managers to develop new ways to make profit from their products and services**

## The Contribution Income Statement

The **contribution margin approach** to performance evaluation is emphasized in responsibility accounting because it focuses on controllability, as opposed to the gross margin approach which is used for external reporting. The contribution margin approach lends itself to relevant revenue and relevant cost analysis.

**Contribution margin** = Revenues – Variable costs, both manufacturing and S&A

**Gross margin** = Revenues – Manufacturing costs, both variable and fixed

A **segment** is a product line, geographical area, or other meaningful subunit of the organization.
